Bibliography

Index
About this information

These topics provide command syntax and usage information for the IMS™ type-1 and type-2 commands /NRESTART through /VUNLOAD. The topics also describe the IMS command language and how to send commands to IMS in different environments. Information about all non-type-1 and non-type-2 IMS commands is in IMS Version 14 Commands, Volume 3: IMS Component and z/OS Commands.

This information is available in IBM® Knowledge Center.

Prerequisite knowledge

Before using this information, you should have knowledge of either IMS Database Manager (DB) or IMS Transaction Manager (TM). You should also understand basic z/OS® and IMS concepts, your installation’s IMS system, and have general knowledge of the tasks involved in project planning.

**Recommendation:** Before using this information, you should be familiar with the following resources:
- IMS Version 14 Operations and Automation
- z/OS JES2 Commands
- z/OS JES3 Commands
- z/OS MVS™ System Commands

You can learn more about z/OS by visiting the “z/OS basic skills” topics in IBM Knowledge Center.

You can gain an understanding of basic IMS concepts by reading An Introduction to IMS, an IBM Press publication.

IBM offers a wide variety of classroom and self-study courses to help you learn IMS. For a complete list of courses available, go to the Resources section of the IMS home page at ibm.com/ims and link to the Training and Certification page.

How new and changed information is identified

New and changed information in most IMS library PDF publications is denoted by a character (revision marker) in the left margin. The first edition (-00) of Release Planning, as well as the Program Directory and Licensed Program Specifications, do not include revision markers.

Revision markers follow these general conventions:
- Only technical changes are marked; style and grammatical changes are not marked.
- If part of an element, such as a paragraph, syntax diagram, list item, task step, or figure is changed, the entire element is marked with revision markers, even though only part of the element might have changed.
- If a topic is changed by more than 50%, the entire topic is marked with revision markers (so it might seem to be a new topic, even though it is not).
Revision markers do not necessarily indicate all the changes made to the information because deleted text and graphics cannot be marked with revision markers.

How to read syntax diagrams

The following rules apply to the syntax diagrams that are used in this information:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line. The following conventions are used:
  - The >>--- symbol indicates the beginning of a syntax diagram.
  - The ---> symbol indicates that the syntax diagram is continued on the next line.
  - The >--- symbol indicates that a syntax diagram is continued from the previous line.
  - The -->< symbol indicates the end of a syntax diagram.
- Required items appear on the horizontal line (the main path).

- Optional items appear below the main path.

If an optional item appears above the main path, that item has no effect on the execution of the syntax element and is used only for readability.

- If you can choose from two or more items, they appear vertically, in a stack.
  If you must choose one of the items, one item of the stack appears on the main path.

- If one of the items is the default, it appears above the main path, and the remaining choices are shown below.
An arrow returning to the left, above the main line, indicates an item that can be repeated.

If the repeat arrow contains a comma, you must separate repeated items with a comma.

A repeat arrow above a stack indicates that you can repeat the items in the stack.

Sometimes a diagram must be split into fragments. The syntax fragment is shown separately from the main syntax diagram, but the contents of the fragment should be read as if they are on the main path of the diagram.

In IMS, a b symbol indicates one blank position.

Keywords, and their minimum abbreviations if applicable, appear in uppercase. They must be spelled exactly as shown. Variables appear in all lowercase italic letters (for example, column-name). They represent user-supplied names or values.

Separate keywords and parameters by at least one space if no intervening punctuation is shown in the diagram.

Enter punctuation marks, parentheses, arithmetic operators, and other symbols, exactly as shown in the diagram.

Footnotes are shown by a number in parentheses, for example (1).

### Accessibility features for IMS 14

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

#### Accessibility features

The following list includes the major accessibility features in z/OS products, including IMS 14. These features support:

- Keyboard-only operation.
- Interfaces that are commonly used by screen readers and screen magnifiers.
- Customization of display attributes such as color, contrast, and font size.
Keyboard navigation

You can access IMS 14 ISPF panel functions by using a keyboard or keyboard shortcut keys.

For information about navigating the IMS 14 ISPF panels using TSO/E or ISPF, refer to the z/OS TSO/E Primer, the z/OS TSO/E User’s Guide, and the z/OS ISPF User’s Guide Volume 1. These guides describe how to navigate each interface, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Related accessibility information

Online documentation for IMS 14 is available in IBM Knowledge Center.

IBM and accessibility

See the IBM Human Ability and Accessibility Center at www.ibm.com/able for more information about the commitment that IBM has to accessibility.

How to send your comments

Your feedback is important in helping us provide the most accurate and highest quality information. If you have any comments about this or any other IMS information, you can take one of the following actions:

- Click the Feedback link at the bottom of any IBM Knowledge Center topic.
- Send an email to imspubs@us.ibm.com. Be sure to include the book title and the publication number.
Chapter 1. /NRESTART command

The /NRESTART command is used to cold start IMS or warm start IMS following an orderly termination accomplished with a /CHECKPOINT shutdown command.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 3
- “Usage notes” on page 6
- “Examples” on page 8

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 1. Valid environments for the /NRESTART command and keywords

Syntax

Cold start with no previous shutdown

`/NRESTART CHKP 0`
Notes:

1. The FORMAT keyword must be followed by at least one of the SM, LM, QC, RS, WA, or ALL parameters.

Warm start after a /CHECKPOINT FREEZE command

Notes:

1. The FORMAT keyword must be followed by at least one of the SM, LM, QC, RS, WA, or ALL parameters.

Warm start after a /CHECKPOINT PURGE or /CHECKPOINT DUMPQ command
Keywords

The following keywords are valid for the /NRESTART command:

BUILDQ | NOBUILDQ

BUILDQ requests that the message queues dumped on the log be loaded into
the message queue data sets. BUILDQ is optional for a warm start after a
/CHECKPOINT PURGE or /CHECKPOINT DUMPQ.

The BUILDQ keyword must be included if the message queues are to be
restored after being formatted. If the BUILDQ keyword is specified, the log
from the last /CHECKPOINT DUMPQ or /CHECKPOINT PURGE is required,
slowing down the restart process.

If /NRESTART FORMAT is specified without the BUILDQ keyword, the
NOBUILDQ keyword must be specified. Specifying NOBUILDQ reformats
the queues in question and all messages are lost.

If an /NRESTART BUILDQ command fails, and then the /ERESTART
CHECKPOINT 0, /ERESTART COLDCOMM, or /ERESTART COLDSYS
command is performed, the messages are lost. IBM IMS Queue Control Facility
for z/OS can be used to recover the local message queues.

In a shared-queues environment, the BUILDQ keyword is ignored because the
message queue data sets are not used.
CHECKPOINT
Identifies the shutdown/restart sequence. CHECKPOINT 0 must be specified for a cold start.

CMDAUTH
Specifies that both signon (user identification verification) and command authorization for static and ETO terminals are in effect at the end of the emergency restart. (Command authorization is same as specifying RCF=S on the startup parameter.)

To specify CMDAUTH, you must specify RCF=A|Y|T|C|S as an initialization EXEC parameter.

CMDAUTHE
Specifies that command authorization for ETO terminals (same as RCF=S on the startup parameter) is in effect at the end of the emergency restart. CMDAUTHE also resets command authorization for static terminals, if it was set.

To specify CMDAUTHE, you must specify RCF=A|Y|T|C|S as an initialization EXEC parameter.

FORMAT
Specifies which queues or data sets should be formatted as part of the restart process when:
• A message queue or data set I/O error occurs.
• The size of a message queue or data set is to be changed.
• A message queue or data set is to be reallocated.

Specify one or more of the following or ALL:

**SM**  Short-message queue
**LM**  Long-message queue
**QC**  Control record data set
**RS**  Restart data set
**WA**  Write-ahead data set
**ALL**  All message queues (SM and LM) and data sets (QC, WA, and RS)

When FORMAT ALL is specified, do not also specify SM, LM, QC, WA, or RS. FORMAT ALL is only required at IMS initialization (first time use of the system).

You can specify any combination of SM, LM, QC, WA, and RS; for example, FORMAT LM RS.

In a shared-queues environment, the LM, SM, and QC parameters are ignored because the message queue data sets are not used. If you specify ALL, IMS does not attempt to format the message queue data sets.

The following table shows the environments in which the parameters are valid.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>LM</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>QC</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>RS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Table 2. /NRESTART FORMAT command parameter environments (continued)

<table>
<thead>
<tr>
<th>Parameter</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>WA</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>ALL</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Note:
1. Supports only RS and WA parameters.

**MSDBLOAD**
Requests that the MSDBs be loaded from the z/OS sequential data set MSDBINIT instead of the MSDB checkpoint data set. Use the MSDBLOAD keyword only when an MSDB initial load is required; otherwise, omit it from the /NRESTART command. After you modify an MSDB DBD, you must specify MSDBLOAD on the next warm start of IMS in order for the changes to be effective.

MSDBLOAD is not required:
- For warm starts when the MSDB checkpoint data set is used.
- For a cold start because the MSDBs are loaded from the z/OS sequential data set MSDBINIT and the MSDB checkpoint data sets are formatted.

**MULTSIGN**
Permits multiple signons for each user ID.

In an IMSplex with Resource Manager and a resource structure, if MULTSIGN conflicts with the single user signon definition for the IMSplex, a warning message will be issued.

**NOCMDAUTH**
Resets command authorization on static and ETO terminals.

**NOCMDAUTH**
Resets command authorization for static and ETO terminals. The command authorization is reset for static terminals because the command authorization for static terminals cannot exist without the command authorization for ETO terminals.

**NOTRANAUTH**
Turns off transaction authorization. NOTRANAUTH is not the opposite of TRANAUTH. TRANAUTH sets transaction authorization and also turns on signon (user identification verification).

If you specify NOTRANAUTH, it is rejected with an error message if TRN=F was specified as a JCL EXEC parameter.

**NOUSER**
Specifies that none of the following is in effect at the end of the emergency restart:
- transaction authorization
- user identification verification
- command authorization

You can use /NRESTART NOUSER for a warm start, but if transaction or command authorization is set from the checkpoint data, NOUSER is ignored, and signon (user identification verification) is set on.

**SNGLSIGN**
Permits a single signon for each user ID.
In an IMSplex with Resource Manager and a resource structure, if SNGLSIGN conflicts with the single user signon definition for the IMSplex, a warning message will be issued.

**TRANAUTH**

Specifies both transaction authorization and user identification verification, with or without RACF®.

To specify TRANAUTH, you must specify $RCF=A|Y|T|C|S$ as an initialization EXEC parameter.

**USER**

Specifies user identification verification. User identification verification means that signon is required by static terminals. This keyword has no effect on ETO terminals, because they are always required to sign on. User identification verification can be forced on by the TRANAUTH or CMDAUTH keyword.

To specify USER, you must specify $RCF=A|Y|T|C|S$ as an initialization EXEC parameter.

**Usage notes**

This command can be issued to an IMSplex using the Batch SPOC utility.

The /NRESTART command has three forms. The selected form depends on the following conditions:

- Whether a cold start or warm start is required
- In the case of warm starts, whether the previous orderly shutdown was accomplished with:
  - /CHECKPOINT FREEZE
  - /CHECKPOINT PURGE or DUMPQ

**Attention:** A cold start performed after a processing failure could cause processing against uncommitted data. To ensure data integrity, be sure necessary backout or recovery operations have been performed before restarting.

When IMS initializes, the system parameters used for this initialization can come from the IMS system generation, from a PROCLIB member, or from EXEC statements that can override both the defaults and the PROCLIB members. Therefore, message DFS1929I is displayed showing the system parameters used for this particular initialization. The system parameters are also written to the job log.

For an IMS cold start, the base security definition is created from the IMS system definition and EXEC parameter specifications. For an /NRESTART warm restart, the base security definition is created from the IMS checkpoint data.

To override the base security definitions on a cold start, the security keywords of the /NRESTART command must be used.

The SGN=, TRN=, and RCF= startup parameters can be overridden by the /NRESTART command using the security keywords shown in the following table. A brief description of the keywords is also included.
Table 3. Security keywords and their startup parameter equivalents

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
<th>Startup parameter</th>
</tr>
</thead>
<tbody>
<tr>
<td>CMDAUTH</td>
<td>RACF command authorization on static and ETO terminals only.</td>
<td>RCF=S</td>

<tr>
<td>TRANAUTH</td>
<td>Transaction authorization.</td>
<td>TRN=F or Y</td>
</tr>
<tr>
<td>USER</td>
<td>Sets user identification verification.</td>
<td>SGN=Y</td>
</tr>
</tbody>
</table>

If IMS is enabled to use the IMSRSC repository, IMS calls Resource Manager (RM) during warm start to read the change list, if one exists, for the IMS. The IMS change list is maintained by RM and is built if the IMPORT command with the SCOPE(ALL) keyword is issued while the IMS is down.

If a change list exists for the IMS that is being restarted, the database, program, transaction, and routing code resources and descriptors in the IMS change list and that apply to the IMS environment are quiesced and are not available for use until the stored resource definitions are imported from the repository.

After the IMS log is processed, IMS imports the stored resource definitions from the repository for the database, program, transaction, and routing code resources and descriptors in the IMS change list. It then applies the changes to the runtime resource and descriptor definitions in the IMS.

For the resources or descriptors that are in the IMS change list and that do not exist in IMS, the runtime resource definitions are created from the stored resource definitions in the repository. For the resource or descriptors that exist in IMS, the runtime resource definitions are updated with the stored resource definitions from the repository. The change list for the IMS system is deleted at the end of the warm start.

During cold start, if IMS is enabled to use the repository, the stored resource definitions are read from the repository. The change list is not processed during cold start because all the resource definitions are imported as part of cold start processing. Any change list in RM for the IMS being restarted is deleted.
Examples

The following are examples of the /NRESTART command:

Example 1 for /NRESTART command

This is an example of a cold start with new message queue data sets.

Entry ET:
/NRESTART CHECKPOINT 0 FORMAT ALL

Response ET:

DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS994I *CHKPT 82274/114447**SIMPLE*

Explanation: IMS is started at 114447 (time) on 82274 (Julian date). A simple checkpoint is written on the system log. All message queue data sets are formatted. 82274/114447 is the checkpoint number.

Example 2 for /NRESTART command

This is an example of a warm start from a FREEZE checkpoint.

Entry ET:
/NRESTART

Response ET:

DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82273/180000
DFS994I *CHKPT 82274/082217**SIMPLE*

Explanation: The restart is being performed from checkpoint 82273/180000, which was written at the most recent IMS shutdown. IMS is restarted at 082217 (time) on 82274 (Julian date). A simple checkpoint is written on this system log. 82274/082217 is the checkpoint number.

Example 3 for /NRESTART command

This is an example of a warm start to format WADS.

Entry ET:
/NRESTART FORMAT WA

Response ET:

DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82119/230000
DFS994I *CHKPT 82120/101318**SIMPLE*

Explanation: The restart is being performed from checkpoint 82119/230000, which was written at the most recent IMS shutdown. IMS is restarted at 101318 (time) on 82120 (Julian date). A simple checkpoint is written on the system log. 82120/101318 is the checkpoint number.

Example 4 for /NRESTART command

This is an example of a warm start from a PURGE or DUMPQ checkpoint.
Entry ET:
/NRESTART BUILDQ

Response ET:
DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82080/214240
DFS994I *CHKPT 82081/060000**SIMPLE*

Explanation: IMS is restarted at 060000 (time) on 82081 (Julian date) from checkpoint 82080/214240, which was written at the most recent IMS shutdown. 82081/060000 is the checkpoint number.

Example 5 for /NRESTART command

This is an example of a warm start from a PURGE or DUMPQ checkpoint. The large and small message queue data sets have been reallocated.

Entry ET:
/NRESTART BUILDQ FORMAT SM LM

Response ET:
DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82170/085236
DFS994I *CHKPT 82170/085820**SIMPLE*

Explanation: IMS is restarted at 085820 (time) on 82170 (Julian date) from checkpoint 82170/085236, which was written at the most recent IMS shutdown. The large and small message queue data sets are reformatted. 82170/085820 is the checkpoint number.

Example 6 for /NRESTART command

This is an example of a warm start from a PURGE or DUMPQ checkpoint. An initial set of MSDBs is needed.

Entry ET:
/NRESTART BUILDQ MSDBLOAD

Response ET:
DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82068/180000
DFS2554 MSDB MSDBHJ01 LOADED
DFS2554 MSDB MSDBHJ02 LOADED
DFS2554 MSDB MSDBAK01 LOADED
DFS2554 MSDB MSDBAK02 LOADED
DFS2554 MSDB MSDBPS01 LOADED
DFS994I *CHKPT 82069/080000**SIMPLE*

Explanation: IMS is restarted at 080000 (time) on 82069 (Julian date) from checkpoint 82068/180000, which was written at the most recent IMS shutdown. A simple checkpoint is written on the system log. 82069/080000 is the checkpoint number. An initial set of MSDBs is loaded from the z/OS sequential data set MSDBINIT.

Example 7 for /NRESTART command
This is an example of a warm start from a PURGE or DUMPQ checkpoint with a request for transaction command security.

**Entry ET:**
/NRESTART TRANCMDS

**Response ET:**
DFS058I (time stamp) NRESTART COMMAND IN PROGRESS
DFS680I USING CHKPT 82080/214240
DFS994I *CHKPT 82274/114447**SIMPLE*

**Explanation:** The master terminal operator is warm starting IMS and requesting that transaction command security be in effect at the completion of the normal restart.

**Example 8 for /NRESTART command**

This is an example of a warm start from a PURGE or DUMPQ checkpoint with a request to negate transaction command security.

**Entry ET:**
/NRESTART NOTRANCMDS

**Response ET:**
DFS2181I CANNOT OVERRIDE FORCED COMMAND SECURITY

**Explanation:** The master terminal operator is warm starting IMS with a request to negate transaction command security. IMS system definition precludes the authority of the master terminal operator to enter the NOTRANCMDS keyword. IMS returns the DFS2181 message.

**Example 9 for /NRESTART command**

This is an example of a warm start from a PURGE or DUMPQ checkpoint. The data sets are formatted without rebuilding the message queues.

**Entry ET:**
/NRESTART FORMAT SM LM NOBUILDQ

**Response ET:**
DFS058 NRESTART COMMAND IN PROGRESS

**Explanation:** The master terminal operator is warm starting IMS with a request to reformat the data sets without rebuilding the message queues. IMS comes up, but all messages are lost.

IMS Queue Control Facility overview
Chapter 2. /OPNDST command

The /OPNDST command is a multisegment command that causes IMS to initiate a session with either an ISC TCP/IP or a VTAM® terminal.

For VTAM terminals, if the USER keyword is specified, the user is signed on automatically to the terminal after successful session initiation.

For ISC TCP/IP terminals, the user is signed on automatically after successful session initiation.

Syntax

The /OPNDST command without the USER keyword: Use this form of the command for all static and ETO terminals except ETO SLU P and Finance terminals, ETO output-only devices, and all ISC parallel sessions.
The /OPNDST command with the USER keyword for non-ISC: Use this form of the command for:

- ETO SLU P and Finance terminals
- ETO output-only devices, for example, 3284, 3286, and SLU P1 with a single component of PRINTER1

```
/OPNDST
/OPN
NODE nodename
USER username
MODE modename
Q
```

The /OPNDST command with the USER keyword for ISC TCP/IP: Use this form of the command for all ISC parallel sessions, both static and ETO.

```
/OPNDST
/OPN
NODE nodename
USER username
ID idname
```

The /OPNDST command with the USER keyword for ISC VTAM: Use this form of the command for all ISC parallel sessions, both static and ETO.

```
/OPNDST
/OPN
NODE nodename
USER username
ID idname
MODE modename
Q
```

Keywords

The following keywords are valid for the /OPNDST command:

**ID** Is applicable only if the USER keyword is specified and the node is a parallel session ISC VTAM node. ID must not be specified for a single session ISC node.

For ISC VTAM parallel sessions, ID identifies the other system half-session qualifier. ID idname must be specified to open ISC nodes defined with users. The ID idname is passed to the other half-session with the session initiation request. If the other system is another IMS system, idname is the name of an ISC user in that system.

For ISC TCP/IP parallel sessions, the ID keyword does not apply. If the ID keyword is specified, it is ignored.
**LOGOND**

Indicates the logon descriptor used for session establishment. LOGOND is supported for both dynamic ISC TCP/IP nodes and dynamic non-ISC nodes.

If a logon descriptor name is provided by the Logon exit routine (DFSLGNX0), the name provided by the exit routine overrides the name specified on the LOGOND keyword.

For ISC TCP/IP nodes, the name specified on the LOGOND keyword must match a logon descriptor that specifies the LCLICON keyword for TCP/IP support. If the logon descriptor does not specify TCP/IP support, IMS attempts to open the session as a VTAM node.

**MODE**

Identifies the LOGON MODE table entry that VTAM must use and can determine operating characteristics for certain VTAM terminals. If a list of node names is given, the MODE keyword is applied to each of them. The command checks whether each node has been defined to accept IMS initiated connections. If the node was defined as NOPNDST, the /OPNDST command accepts all the nodes except the node defined as NOPNDST.

ISC TCP/IP sessions do not support the MODE keyword.

**NODE**

Specifies the node with which IMS initiates a session.

The /OPNDST NODE ALL command opens sessions for all static terminals except ISC parallel sessions. The command has considerable concurrent activity, both for IMS and for VTAM. Ensure that the system has sufficient pool sizes, buffer sizes, and number of concurrent IMS tasks defined.

If the USER keyword is not specified in the command, the NODE parameter can be generic or ALL, or a range of static nodes, or there can be multiple NODE parameters. If a generic, ALL, or range of node names is specified, any nodes defined with users are ignored and flagged with an error message.

The /OPNDST NODE USER command logs on and signs on a user at the same time, except for ISC terminals. On ISC terminals, the session is allocated.

The following list includes sample /OPNDST NODE USER commands:

- To log on and sign on to a static non-ISC terminal:
  
  `/OPNDST NODE nodename USER username UDATA userdata`

  This command marks a statically defined terminal as signed on by the user.

- To log on and sign on to an ETO non-ISC terminal:
  
  `/OPNDST NODE nodename USER username MODE modename LOGOND logondname USERD userdname UDATA userdata`

  This command creates the terminal and user structures, and allocates the newly created user structure to the terminal structure created to indicate signed on status.

- To log on and sign on to a static ISC terminal:
  
  `/OPNDST NODE nodename USER username ID idname`

  This command finds the subpool structure and allocates the subpool (user) structure to the statically defined ISC terminal. If the terminal is defined to use ISC TCP/IP, the ID keyword does not apply and is ignored by IMS.

- To log on and sign on to an ETO ISC VTAM terminal:
  
  `/OPNDST NODE nodename USER username ID idname MODE modename LOGOND logondname USERD userdname UDATA userdata`
This command creates the terminal and subpool (user) structure and allocates the newly created user structure to the terminal structure created. The command also signs on the user with the username (the username must be defined to RACF), and remains signed on until the user issues a /SIGN OFF command, or the session is terminated.

- To log on and sign on to an ETO ISC TCP/IP terminal:
  ```
  /OPNDST NODE nodename USER username LOGOND logondname
  ```
  This command creates the terminal and subpool (user) structure and allocates the newly created user structure to the terminal structure created. The command also signs on the user with the username (the username must be defined to RACF), and remains signed on until the user issues a /SIGN OFF command, or the session is terminated.

For ISC TCP/IP parallel sessions, a logon descriptor must exist that specifies the LCLICON keyword for TCP/IP support. IMS uses the value of the NODE keyword to search for a logon descriptor only when the LOGOND keyword is not specified. If the logon descriptor does not exist or does not specify TCP/IP support, IMS attempts to open the session as a VTAM node.

To restart failing ETO sessions (for example, ETO only or printer sessions), use the /OPNDST NODE USER command.

In an IMSplex, /OPNDST NODE specifies a VTAM node with which IMS initiates a session. Specify ROUTE(imsid), if you want to log the node onto a particular IMS. If ROUTE(imsid) is not specified, and /OPNDST is routed to all the IMS systems, IMS processes the command only on the IMS system designated as the command master. If the ROUTE keyword specifies multiple IMS systems so that the /OPNDST command is routed to more than one IMS systems, IMS processes the command only on the IMS system designated as the command master. On the other IMS systems, the /OPNDST command is rejected.

Q
Causes IMS to request VTAM to queue SIMLOGON requests for VTAM/SNA-supported terminals.

The /OPNDST NODE Q command also allows IMS to request another subsystem to share a node (usually printers) with IMS. If the other subsystem is using the printer, VTAM queues the SIMLOGON request for IMS for the printer, schedules the owning subsystem’s RELREQ VTAM exit, and acquires the printer for IMS after the current owning system releases the printer. Multiple requests for the same printer are queued by VTAM for processing.

The /DISPLAY NODE command is used to determine whether IMS has acquired the printer.

ISC TCP/IP sessions do not support the Q keyword.

UDATA
 Indicates the user data used with the signon.

The UDATA keyword is valid only if the USER keyword and parameter are also specified. The UDATA keyword is valid for static and dynamic users. It is not valid for ISC nodes. The user data can be up to 256 bytes long. Passwords can be mixed case or lowercase depending on what is specified on the PSWDC keyword in the DFSPBxxx IMS.PROCLIB member.

ISC TCP/IP sessions do not support the UDATA keyword.

RACF password phrases are not supported with UDATA.
USER

Identifies the logical terminal user to be allocated to the half-session to be created for the ISC node that is specified on the NODE keyword.

For dynamic non-ISC users, it specifies the user ID to be signed on to the dynamic node nodename.

The USER keyword applies to ISC sessions when allocating a user to an ISC node, to dynamic users when signing a dynamic user on to a dynamic node, and to static user IDs when signing a user on to a static node.

USER username must be specified to open parallel session ISC nodes with users. It must not be specified for a single session ISC node.

Restrictions for using NODE and USER parameters together:

- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- The /OPNDST NODE USER commands are valid for ISC and non-ISC nodes and users.

USERD

Specifies the user descriptor to be used with the signon. It is valid only if the USER keyword and parameter are specified. USERD is only supported for dynamic users and is only valid for dynamic non-ISC nodes. The user descriptor can also be provided through the logon or signon exits.

ISC TCP/IP sessions do not support the USERD keyword.

Usage notes

All forms of logging-on a remote VTAM terminal to IMS, including the use of the /OPNDST command, do not work until the /START DC command has been entered and accepted by IMS.

All /OPNDST formats require an EOM indication to denote end-of-message. An EOS indication must be included for all segments that precede the last segment.

You can issue /OPNDST on the XRF alternate to restart a failed backup session for a class 1 ETO terminal. To do this, the node and the user structure must still exist and be coupled together, and an active session must exist on the active system. If the node and the user are not coupled, or an active session does not exist on the active system, the command is rejected.

This command can be issued to an IMSplex using the Batch SPOC utility.

A period is normally used as the delimiter at the end of IMS commands. When support for special characters is enabled in RACF, a period becomes a valid character in the RACF password. Therefore, when a password is specified at the end of the /OPNDST command, you must insert a space before the period that you are using as the end-of-command delimiter. If a space is not added before the period that is intended to be the end-of-command delimiter and support for special characters is enabled in RACF, the period is treated as part of the password and not as a delimiter.

For IMS 14 to support special characters in RACF passwords when special characters is also enabled in RACF, install APAR/PTFs PI48111/UI34376/UI34377.
Also, ensure that all IMS systems that require support for RACF special characters are migrated to IMS 14.

Examples

The following are examples of the /OPNDST command:

Example 1 for /OPNDST command

Entry ET:
/DIS NODE L3270*

Response ET:

<td>0</td>
<td>0</td>
<td>0</td>
<td>8 IDLE CON STATIC</td>
</tr>
</tbody>
</table>

*94307/145750*

Explanation: The nodes L3270A through L3270D are logged on to IMS.

Example 2 for /OPNDST command

Entry ET:
/OPNDST NODE DT327002 USER IMSUS01 MODE LU032NT4 USERD DFSUSER
UDATA=IMSPW01.

Response ET:

DFS058I 11:07:48 OPNDST COMMAND COMPLETED

Explanation: A session with dynamic node DT327002 is established by using mode table LU032NT4. User IMSUS01 is signed on to the node using user descriptor DFSUSER, username IMSUS01, and password IMSPW01.

Example 3 for /OPNDST command

Entry ET:
/OPNDST NODE DTSLU201 USER IMSUS01 MODE SLU2MOD1 USERD DFSUSER
LOGOND DFSSLU2 UDATA=IMSPW01.
Response ET:

DFS058I 11:07:48 OPNDST COMMAND COMPLETED

Explanation: DTSLU201 is logged on. A session with dynamic node DTSLU201 is established by using logon descriptor DFSSLU2 (type SLU2), and mode table SLU2MOD1. Dynamic user IMSUS01 is signed on to the node using user descriptor DFSUSER and password IMSPW01.

Example 4 for /OPNDST command

Entry ET:

/OPNDST NODE WEST-EAST

Response ET:

DFS058I OPNDST COMMAND COMPLETED

Response RT:

DFS3650 TERMINAL CONNECTED TO IMS XXXXXXXX

Explanation: The nodes, WEST through EAST, are logged on to IMS.

Example 5 for /OPNDST command

The following set of commands illustrate the use of the MODE keyword on the /OPNDST command.

Entry ET:

/DIS NODE LUTYPEP1 MODE

Response ET:

NODE-USR TYPE DEF MODETBL ACT MODETBL
LUTYPEP1 SLUP DEFRESP
*90179/100206*

Explanation: DEFRESP is the mode table name defined for node LUTYPEP1 at system definition. The session is not active so the ACT MODETBL field is blank.

Entry ET:

/OPN NODE LUTYPEP1.

Response ET:

DFS058I OPNDST COMMAND COMPLETED

Entry ET:

/DIS NODE LUTYPEP1 MODE

Response ET:

NODE-USR TYPE DEF MODETBL ACT MODETBL
LUTYPEP1 SLUP DEFRESP DEFRESP
*90179/100508*

Explanation: A mode table name was not specified with the /OPNDST command so the default value defined at system definition was used to initiate the session.
/CLS NODE LUTYPEP1

Response ET:
  DFS058I CLSDST COMMAND COMPLETED

Entry ET:
 /DIS NODE LUTYPEP1 MODE

Response ET:
  NODE-USR TYPE  DEF MODETBL  ACT MODETBL
  LUTYPEP1 SLUP  DEFRESP
  *90179/100630*

Explanation: Active mode table name displays as blank at normal session termination.

Entry ET:
 /OPN NODE LUTYPEP1 MODE ALPHA.

Response ET:
  DFS058I OPNDST COMMAND COMPLETED

Entry ET:
 /DIS NODE LUTYPEP1 MODE

Response ET:
  NODE-USR TYPE  DEF MODETBL  ACT MODETBL
  LUTYPEP1 SLUP  DEFRESP  ALPHA
  *90179/100805*

Explanation: The mode table name specified with the /OPNDST command (ALPHA) is used to initiate the session. The default value specified at system definition (DEFRESP) is overridden by the /OPNDST command.

Example 6 for /OPNDST command

In the following example, the /OPNDST NODE command is issued for an ISC TCP/IP parallel session.

Entry ET:
 /OPN NODE CICS USER CICD.

Response ET:
  DFS058I OPNDST COMMAND COMPLETED

Entry ET:
 /DISPLAY NODE CICS USER CICD

Response ET:
  NODE-USR TYPE  CID  RECD ENQCT DEQCT QCT SENT
  CICS TCP
  -CICD  ********  0  0  0  0  0 0  SIGN(CICD ) IDLE CON
  *13175/200817*
Chapter 3. /PSTOP command

Use the /PSTOP command to stop the sending and receiving of messages to a particular communication line, terminal, or logical link.

You can also use this command to stop scheduling messages that contain specific transaction codes, to allow the queueing of output messages and input messages to continue, to halt a stalled synchronous program switch request, and to perform validity checks of all parameters entered by the terminal operator.

Syntax
Keywords

The following keywords are valid for the /PSTOP command:

LINE
   Specifies the IMS communication line to stop.

LINK
   Specifies the link to be stopped; the partner link in another IMS system stops itself and notifies the master terminal operator of that system.

PURGE
   PURGE can be used only for one logical link whose physical link is channel-to-channel. PURGE must be used when the partner link is in a system that failed. Otherwise, the link will not become idle after it is stopped.

FORCE
   The FORCE keyword is for TCP/IP and VTAM links and is intended for use when a link does not clean up and assume a PSTOPPED IDLE status during normal PSTOP processing, even though the session is terminated.
After /PSTOP processing is completed on one side of the link, the other side is displayed. If the other side is not in a PSTOPPED IDLE state, the operation must be repeated in the partner IMS system. When both sides are in the PSTOPPED IDLE state, the /RESTART LINK command can be issued to restart the link.

For TCP/IP links, the FORCE option is useful for shutting down an MSC TCP/IP link that does not shut down normally after the link was shut down in the partner IMS system. A link that does not shut down normally might have a NOTIDLE-C status or might otherwise fail to assume a PSTOPPED, IDLE status.

For TCP/IP links, you can issue /PSTOP with the FORCE option at any time. You are not required to shut down a link normally before using the FORCE option.

IMS performs the following actions when processing the FORCE option for a TCP/IP link:

- Shuts down the link in the IMS where the command is issued
- Notifies the local IMS Connect instance to clean up the send socket
- Issues error message DFS3177E MSC DETECTED AN ERROR RETCODE = 00000000, RSNCODE = 00000070, LOSTSESS = FORCESTO
- Issues informational message DFS2169I DISCONNECTION COMPLETED ON LINK
- Places the link in PSTOPPED ERE IDLE status

**Note:** To determine if a TCP/IP link session is still active in IMS Connect, issue the WTOR command VIEWMSC 1cplkid on the local IMS Connect instance. You can also use the z/OS MODIFY command QUERY MSC or the IMS type-2 command QUERY IMSCON TYPE(MSC).

For VTAM links, the FORCE option can be used with some VTAM commands to idle and clean up the VTAM link within IMS.

IMS performs the following actions when processing the FORCE option for VTAM links:

1. Determines if the link started PSTOP processing. If PSTOP processing started, the link displays as PSTOPPED NOTIDLE.
2. Tests if the hang condition is due to an outstanding VTAM request. If so, IMS issues an inquire request to VTAM to determine if the session is inactive. In that case, IMS simulates the completion of the VTAM request to enable the link to complete PSTOP processing.

You can determine if a session is still active to VTAM by issuing the command DISPLAY NET,SESSIONS,LU1=applid1,LU2=applid2,SCOPE=ALL,LIST=ALL. If it is active, note the SID of the session.

If the VTAM session is not active and it has a PSTOPPED NOTIDLE status to IMS, then issue /PSTOP LINK x FORCE.

If the session is still active to VTAM, then issue VARY NET,TERM,SID=x,NOTIFY=YES,SCOPE=ALL,TYPE=FORCE to VTAM to terminate the session.

Under normal conditions, the VTAM VARY NET,TERM command terminates the session in VTAM and cause IMS to PSTOP and IDLE the link associated with the VTAM session. If the VTAM VARY command does terminate the VTAM session but does not PSTOP and IDLE the link, then
the IMS /PSTOP LINK FORCE command can be used to complete the PSTOP and cleanup processing within IMS.

IMS replies with DFS058 /PSTOP LINK COMPLETED EXCEPT LINK x, if the /PSTOP LINK x FORCE command cannot be executed because:

- The session is still active to VTAM.
- Normal PSTOP processing is not started (issue /PSTOP without the FORCE keyword in this case).
- PSTOP processing is not completing because of some reason other than an incomplete VTAM request.

**LTERM**

Specifies the logical terminal that is to be stopped from sending and receiving messages.

The /PSTOP LTERM command has no effect on an LTERM that is in QLOCK state, or is a remote logical terminal. The LTERM parameter can be generic, where the generic parameter specifies existing LTERMs.

The /PSTOP LTERM command is valid only for LTERMs that belong to nodes that are logged on.

If time-controlled operations (TCO) is active, the /PSTOP LTERM command is valid for the DFSTCF TCO LTERM, even if the DFSTCF LTERM is not allocated to a node.

**MSPLINK**

Stops logons to an MSC TCP/IP or VTAM physical link and enables the operator to issue the /MSASSIGN command to reassign logical links to the physical link. Any links in sessions that were not stopped by the /PSTOP command are not affected by an /MSASSIGN command.

After the /PSTOP command is issued, the status of the link is either PSTOPPED or, for links in a TCP/IP generic resource group, PSTOPGEN.

After the logical link assignments are complete, issue the /RESTART command to permit logons to the physical link.

The /PSTOP MSPLINK command does not apply to CTC or MTM links.

**REGION**

If the TRAN keyword is specified, the message region is not stopped. A QC status (no more messages) is returned to the application program currently active in the specified region. The scheduler continues to schedule available transactions in the referenced region.

The /PSTOP REGION command is ignored unless both of the following occur:

- An active transaction type is specified.
- The referenced message region is processing transactions with the wait-for-input option, or the region is an MPP.

If the AOITOKEN keyword is specified, the AO application in wait AOI token state is posted and receives AIB return code X'00000004' and reason code X'0000004C'.

If JOBNAME keyword is specified, the job name for the dependent region must be 1-8 alphanumeric or national ($,#,@) characters. The first character of the job name must be either alphabetic or national.
If the SYNC keyword is specified, the user application in wait synchronous callout state is posted and receives AIB return code X'00000100' with reason code X'0000010C'.

The X'00000100' return code with the X'0000010C' reason code is also returned if the SYNC keyword is used while a user application is waiting for a reply to a synchronous program switch request.

**TRAN**

Stops the scheduling of transactions; however, the transactions will continue to be processed until the limit count is reached. If the limit count is large, the processing interval will be long. The /DISPLAY command ascertains the status of the transaction; the /ASSIGN command alters the status of the transaction.

If a region is scheduled against a process stopped transaction and there are no more messages available for that transaction, the region does not wait for the next message (wait-for-input-mode). Instead, a QC status (no more messages) is returned to the application. If the region is scheduled and waiting for the next message when the command is entered, the region is notified and a QC status is returned to the application.

A batch message processing region (BMP) scheduled against wait-for-input (WFI) transactions returns a QC status code (no more messages) for /PSTOP REGION, /DBD, /DBR, or /STA commands only.

The /PSTOP command cannot stop the scheduling of Fast Path exclusive transactions but can be used to stop Fast Path potential transactions.

The /PSTOP TRAN command cannot be used for Fast Path exclusive transactions or CPI Communications driven transaction programs.

The TRAN parameter can be generic where the generic parameter specifies transactions that already exist.

In a shared-queues environment, the /PSTOP TRAN command will result in IMS deregistering interest for the transaction, which indicates that the transaction cannot be scheduled at that IMS.

The /PSTOP TRAN command is not allowed for a transaction that is marked bad with the NOTINIT-15-REPOCHGLIST reason code because the IMS change list processing is not complete for the transaction or the change list processing failed.

**Usage notes**

If an error is detected on parameters that are independent of one another, only the invalid parameters are indicated as being in error and the /PSTOP command processes the rest of the parameters.

The /PSTOP command can be used to reset conditions previously established with the /START, /RSTART, /PURGE, or /MONITOR command.

In a single IMS system, or in the local system in a multiple system configuration, IMS system messages such as broadcast text and terminal status messages (DFS059 TERMINAL STARTED) are not affected by the /PSTOP command. In a multiple system configuration, broadcast messages are queued but not sent across stopped links.

This command can be issued to an IMSplex using the Batch SPOC utility.
If a synchronous program switch request (a DL/I ICAL request to an IMS transaction) stalls for a long period of time, you can use the /DISPLAY ACTIVE REGION command to determine which region contains the stalled application. Then, issue /PSTOP to stop the application and halt the request.

**Equivalent IMS type-2 commands**

The following table shows variations of the /PSTOP command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/PSTOP command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops the scheduling of transactions.</td>
<td>/PSTOP TRAN tranname</td>
<td>UPDATE TRAN(tranname) START(Q) STOP(SCHD)</td>

**Examples**

The following are examples of the /PSTOP command:

**Example 1 for /PSTOP command**

Entry ET:

/PSTOP LINE 4 PTERM 1

Response ET:

DFS058I PSTOP COMMAND COMPLETED

Response RT:

DFS059I TERMINAL PSTOPPED

Explanation: LINE 4 PTERM 1 is not sent application program or message switch output and is not allowed to send input. Output messages for the terminal continue to be queued.

**Example 2 for /PSTOP command**

Entry ET:

/PSTOP LINE 4 6 200

Response ET:

DFS058I PSTOP COMMAND COMPLETED EXCEPT LINE 200

Explanation: LINE 4 and LINE 6 are not allowed to send or receive messages. Message queuing continues. Line 200 is an invalid line number.

**Example 3 for /PSTOP command**
Entry ET:
/PSTOP LINK 2 3 4

Response ET:
DFS058I PSTOP COMMAND COMPLETED

Response ET:
DFS2169I DISCONNECTION COMPLETED ON LINK 2

Explanation: Logical link 2 is disconnected. This message is received for each logical link that is disconnected.

Response Remote MT:
DFS2161I LINK 2 STOPPED BY PARTNER
DFS2161I LINK 3 STOPPED BY PARTNER
DFS2161I LINK 4 STOPPED BY PARTNER

Explanation: Logical links 2, 3, and 4 stop processing messages. Output queuing continues.

Response ET:
DFS2169I DISCONNECTION COMPLETED ON LINK 3

Explanation: Logical link 3 is disconnected. This message is also received when logical link 4 disconnects.

Example 4 for /PSTOP command

Entry ET:
/PSTOP LINK ALL

Response ET:
DFS058I PSTOP COMMAND COMPLETED

Response Remote MT:
A DFS2161I LINK n STOPPED BY PARTNER message is received for each logical link that was operational when /PSTOP was entered.

Explanation: Output to all logical links stops. Output queuing continues. Input is not allowed.

Response ET:
DFS2169I DISCONNECTION COMPLETED ON LINK XXX

Explanation: As each logical link is disconnected, this message is received.

Example 5 for /PSTOP command

Entry ET:
/PSTOP LINK 1 2 3 PURGE

Response ET:
DFS2272I PURGE KEYWORD INVALID, ONLY ONE CTC LINK ALLOWED
Explanation: Only one link can be specified with the PURGE keyword.

**Example 6 for /PSTOP command**

Entry ET:
```
PSTOP LINK 2 PURGE
```

Response ET:
```
DFS2273I PURGE KEYWORD REJECTED, CURRENT STATUS OF LINK IS NORMAL
```

Explanation: The partner system has not failed and the link appears to be working.

**Example 7 for /PSTOP command**

Entry ET:
```
PSTOP LTERM APPLE, TREE
```

Response ET:
```
DFS058I PSTOP COMMAND COMPLETED
```

Response RT:
```
DFS059I TERMINAL PSTOPPED
```

Explanation: The physical terminals associated with logical terminals APPLE and TREE are not sent output that is destined for logical terminals APPLE or TREE, or allowed to enter input. Output queuing continues.

**Example 8 for /PSTOP command**

Entry ET:
```
PSTOP MSPLINK ALL
```

Response ET:
```
DFS058I COMMAND COMPLETED
```

Explanation: All the VTAM physical links are stopped from receiving logons. Any links in session are not affected.

**Example 9 for /PSTOP command**

Entry ET:
```
PSTOP TRAN SEED
```

Response ET:
```
DFS058I PSTOP COMMAND COMPLETED
```

Explanation: Transaction code SEED can no longer be scheduled. Queuing of the transaction continues.

**Example 10 for /PSTOP command**

Entry ET:
```
PSTOP TRAN ALL CLASS 3
```
Response ET:
  DFS058I  PSTOP COMMAND COMPLETED

Explanation: All transactions associated with class 3 can no longer be scheduled. Queuing of the transactions continues.

Example 11 for /PSTOP command

Entry ET:
  /PSTOP REGION 1 TRAN XYZ

Response ET:
  DFS058I  PSTOP COMMAND IN PROGRESS

Response ET:
  DFS0569I  PSTOP COMPLETE FOR REGION 1 TRAN XYZ
  DFS0566I  PSTOP NOT VALID FOR TRAN XYZ

Explanation: If the DFS0569I message prints, processing of the transaction type, xyz, is stopped in message region 1. If the DFS0566I message prints, the command was ignored because the two required conditions were not satisfied.

Example 12 for /PSTOP command

Entry ET:
  /PSTOP REGION 2 AOITOKEN AOITOK2

Response ET:
  DFS058I  PSTOP COMMAND IN PROGRESS

Response MT:
  DFS0569I  PSTOP OR STOP COMPLETE FOR REGION 2 AOIT AOITOK2.

Explanation: If the DFS0569I message prints, the AO application in region 2 waiting for a message for AOI token AOITOK2 is posted; the application receives AIB return code X'00000004' and reason code X'0000004C'.

Example 13 for /PSTOP command

Entry ET:
  /PSTOP REGION 2 AOITOKEN AOITOK2

Response ET:
  DFS058I  PSTOP COMMAND IN PROGRESS

Response MTO:
  DFS1190I REGION 2 NOT WAITING ON AOITOKEN AOITOK2

Explanation: If the DFS1190I message prints, the command is ignored because region 2 was not waiting on AOI token AOITOK2.

Example 14 for /PSTOP command

Entry ET:

Chapter 3. /PSTOP command  27
Response ET:

<table>

*08235/173441*

Explanation: Message processing program APOL1 is processing transaction APOL11, which is waiting for a response to a synchronous callout request (WAIT-CALLOUT) from transaction pipe TPIPE1.

Entry ET:

/PSTOP REGION 1 SYNC TPIPE1

Response ET:

DFS058I PSTOP COMMAND IN PROGRESS
DFS0569I PSTOP OR STOP COMPLETE FOR REGION 00001 SYNC TPIPE1
Response ET:

DFS058I PSTOP COMMAND IN PROGRESS
DFS1190I REGION 00001 NOT WAITING ON SYNTPIPE TPIPE1

Explanation: If the DFS0569I message prints, the user application in wait synchronous callout state is posted; the application receives AIB return code 'X'00000100' and reason code 'X'0000010C'. If the DFS1190I message prints, the command is ignored because region 1 was not waiting for a response to a synchronous callout request from transaction pipe TPIPE1.

Example 16 for /PSTOP command

This example demonstrates a scenario for using PSTOP to halt a stalled synchronous program switch request. The following command is issued to determine the status of a waiting program:

/PSTOP REGION 0

The following response is returned:

REGID JOBNAME TYPE TRAN/STEP PROGRAM STATUS CLASS
1 MPP1A TP APOL11 APOL1 WAIT-CALLOUT 1
       TRAN:SKS1 END TIME: 2010.172 12:45:04
       JMPRGN JMP NONE
       JBPREGND JBP NONE
       BATCHREG BMP NONE
       FPRGN FP NONE
       DBTRGN DBT NONE
       DBZCSAJ DBRC
       DLIZCSAJ DLS
*10172/120101*
*

The message processing program APOL1 is processing transaction APOL12. The transaction is waiting for a synchronous program switch response from transaction SKS2. The following command is issued to end the wait state:

/PSTOP REGION 1 SYNC SKS2

The command will receive one of the two possible responses. The following response indicates that the PSTOP command successfully ended the wait state:

DFS058I PSTOP COMMAND IN PROGRESS
DFS0569I PSTOP OR STOP COMPLETE FOR REGION 00001 SYNC SKS2

You will receive a different response if the PSTOP command executes successfully but the specified region is not waiting for the specified transaction to respond:

DFS058I PSTOP COMMAND IN PROGRESS
DFS1190I REGION 00001 NOT WAITING ON TRAN SKS2

“UPDATE TRAN command” on page 1263
Chapter 4. /PURGE command

The /PURGE command stops input for a particular communication line, terminal, or logical link path, or stops input messages destined for a particular transaction code.

Messages can be sent to the specified communication line or terminal, and transactions can still be scheduled.

Any APPC requests that are queued in 64-bit storage as a result of APPC/IMS flood control are rejected with sense code TP_Not_Available_No_Retry.

Subsections:

Syntax
Keywords

The following keywords are valid for the /PURGE command:

**APPC**

Is used to purge incoming transactions. All new requests by APPC/z/OS to schedule a transaction in IMS are rejected with TP_Not_Available_No_Retry. Transactions that IMS has already received are processed normally. Sending of output to LU 6.2 devices proceeds normally. Because /PURGE APPC does not call to APPC/z/OS, the rejection of transaction scheduling is done by the schedule exit of IMS only.

**Note:** The sense code returned to the LU 6.2 remote device for an incoming ATTACH to a purged APPC/IMS system is determined by APPC/z/OS, and it might differ from release to release. In general, the remote LU 6.2 application should wait for a period of time after rejection before any attempts to reestablish a session with IMS.

The /PURGE APPC command sets the PURGING status and resets conditions previously set by the /START APPC command. The command is rejected if the APPC is already in DISABLED, FAILED, STOPPED, or CANCEL state.
**FPFROG**
Specifies the PSB name of the message-driven program to be terminated.

/PURGE takes message-driven programs out of wait-for-input mode and terminates them as soon as their load balancing group message queue is empty.

Use the FPFROG keyword with caution, because all Fast Path message-driven programs that are using a PSB with the same name will be terminated.

**FPRGN**
Specifies the region identifier of the message-driven program to be terminated.

**LINE**
Specifies the communication line for which input is to be stopped.

**LTERM**
Specifies the logical terminal for which input is to be stopped.

The /PURGE LTERM command is rejected for LTERMs in QLOCK state. (QLOCK indicates that the LTERM is locked from sending any further output or from receiving input that can create additional output for the same LTERM until the state is reset by a specific request received on the session.) /PURGE LTERM is also rejected for remote logical terminals. The LTERM supports generic parameters where the generic parameter specifies LTERMs that already exist.

The /PURGE LTERM command is valid only for LTERMs that belong to nodes that are logged on.

**MSNAME**
Specifies the logical link path in a multiple systems configuration for which input is to be stopped. The MSNAME keyword supports generic parameters.

**TRAN**
Specifies the transaction code for which input messages are to be stopped.

The TRAN parameter can be generic where the generic parameter specifies transactions that already exist.

The /PURGE TRAN command is not allowed for a transaction that is marked bad with the NOTINIT-15-REPOCHGLIST reason code because the IMS change list processing is not complete for the transaction or the change list processing failed.

**Usage notes**

The /PURGE command validity checks all parameters entered by the terminal operator. If an error is detected on parameters that are independent of one another, only the invalid parameters are indicated as being in error and the /PURGE command processes the rest of the parameters.

The /PURGE command can be used to reset conditions previously set by the /START, /RSTART, /STOP, /PSTOP, or /MONITOR command.

This command can be issued to an IMSplex using the Batch SPOC utility.

**Equivalent IMS type-2 commands**

The following table shows variations of the /PURGE command and the IMS type-2 commands that perform similar functions.
Table 8. Type-2 equivalents for the /PURGE command

<table>
<thead>
<tr>
<th>Task</th>
<th>/PURGE command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops input messages for a particular transaction code.</td>
<td>/PURGE TRAN tranname</td>
<td>UPDATE TRAN NAME(tranname) START(SCHD) STOP(Q)</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the /PURGE command:

**Example 1 for /PURGE command**

Entry ET:
/PURGE FPPROG ALL

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Explanation: All message-driven programs are taken out of wait-for-input mode and terminated by PSB name as soon as their load balancing group message queue is empty.

**Example 2 for /PURGE command**

Entry ET:
/PURGE FPRGN ALL

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Explanation: All message-driven programs are taken out of wait-for-input mode and terminated by region identifier as soon as their load balancing group message queue is empty.

**Example 3 for /PURGE command**

Entry ET:
/PURGE LINE 4

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Response RT:
DFS059I  TERMINAL PURGING

Explanation: All physical terminals associated with line 4 can receive output sent to them but are not allowed to enter input.

**Example 4 for /PURGE command**

Entry ET:
/PURGE LINE 5 7 400

Response ET:
Explanation: All physical terminals associated with line 5 and line 7 can receive output but are not allowed to enter input. Line 400 is an invalid line number.

Example 5 for /PURGE command

Entry ET:
/PURGE MSNAME BOSTON

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Explanation: All messages from a terminal (primary requests), except messages continuing a conversation, will not be queued for the destinations represented by MSNAME BOSTON. This includes all messages destined for remote transactions with the SYSID of the MSNAME, and for remote logical terminals associated with this MSNAME.

Example 6 for /PURGE command

Entry ET:
/PURGE TRAN PIT, SEED

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Explanation: Transactions PIT and SEED can still be scheduled but input for these transactions cannot be queued unless the input originates as output from an application program.

Example 7 for /PURGE command

Entry ET:
/PURGE TRAN ALL CLASS 2

Response ET:
DFS058I  PURGE COMMAND COMPLETED

Explanation: All transactions associated with class 2 are marked as purged. No further transactions are queued from terminals.

Chapter 5. QUERY commands

Use the IMS QUERY commands to display information about IMS resources.

The QUERY commands return information based on the keyword specified. All of the QUERY commands are type-2 commands and can be issued from the OM API.

These commands can be issued through TSO SPOC, IBM Management Console for IMS and DB2® for z/OS, the Manage Resources options in the IMS Applications menu, or other user-written programs that issue commands through OM API. These commands can also be issued to an IMSplex by using the Batch SPOC utility.

The value shown in the QCNT column of the command output has different meanings for different commands, as described in individual QUERY command topics.

QUERY commands are:

- “QUERY AREA command” on page 38
- “QUERY DB command” on page 51
- “QUERY DBDESC command” on page 99
- “QUERY IMS command” on page 114
- “QUERY IMSCON commands” on page 125
- “QUERY IMSPLEX command” on page 275
- “QUERY LE command” on page 286
- “QUERY LTERM command” on page 293
- “QUERY MEMBER command” on page 313
- “QUERY MSLINK command” on page 332
- “QUERY MSNAME command” on page 356
- “QUERY MSPLINK command” on page 365
- “QUERY NODE command” on page 380
- “QUERY ODBM commands” on page 405
- “QUERY OLC command” on page 430
- “QUERY OLREORG command” on page 439
- “QUERY OTMADESC command” on page 446
- “QUERY OTMATT command” on page 459
- “QUERY PGM command” on page 467
- “QUERY PGMDDESC command” on page 492
- “QUERY POOL command” on page 509
- “QUERY RM command” on page 531
- “QUERY RTC command” on page 538
- “QUERY RTCDESC command” on page 555
- “QUERY STRUCTURE command” on page 567
- “QUERY TRAN command” on page 572
- “QUERY TRANDESC command” on page 621
- “QUERY USER command” on page 650
- “QUERY USEREXIT command” on page 668
Use the QUERY AREA command, which is a type-2 command, to display information about DEDB areas and area data set information.

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY AREA command and keywords can be issued.

Table 9. Valid environments for QUERY AREA command and keywords

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>

<td></td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>STATUS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

QUERY AREA NAME(*) OPTIONAL(REFRESH)
Keywords

The following keywords are valid for the QUERY AREA command:

NAME()

Specifies the names of the specific areas that are to be processed or the group of areas whose names match the generic or wildcard parameter specified.

If the STATUS filter is not specified, all the area names that match the NAME parameter are returned. The NAME keyword is optional and the default is NAME(*).

OPTION(REFRESH)

Specifies the additional functions to be performed.

REFRESH

Refreshes the control interval information for the sequential dependent space and the independent overflow part of the direct addressable space for the area. OPTION(REFRESH) returns the CI information even if SHOW(CI) is not specified. OPTION(REFRESH) results in an I/O request that is performed only at the command master IMS if the area is open at the master. If the command is routed to multiple IMS systems in the IMSplex, all non-master IMS systems return local CI information. The age of the local information shown on the non-master IMS systems is at most as old as the value set on the IOVFI= IMS control region startup parameter.

The CI information is returned only if the area is open at the IMS. If the area is not open, blanks will be returned in the output CI columns SDA, SDAU, LDA, and LDAU. If the area is not open at the command master IMS, no refresh of the control intervals is performed. The QRY AREA NAME(area name) SHOW(CI) OPTION(REFRESH) must be routed to the IMS where the area is open to get the current SDEP and IOVF CI information.
If the default NAME(*) is used with the REFRESH keyword, or if large numbers of areas are processed with the REFRESH keyword, performance may be affected depending on the size and number of areas involved. If large areas, numerous areas, or both are involved, the control regions processing the command may appear stopped.

**SHOW()**

Specifies the area output fields to be returned. The area name, the DEDB name, and the area data set information are always returned along with the name of the IMS that created the output for the area and the completion code.

The filters supported with the SHOW keyword are:

**ACCTYPE**

Returns DEDB area access when the area access has been changed explicitly by an UPDATE AREA START(ACCESS) SET(ACCTYPE()) command. If an area access is not changed explicitly by an UPDATE AREA command, the area access is blank. If none of the areas specified in the NAME() keyword of the QUERY AREA NAME() SHOW(ACCTYPE|ALL) command has an explicit area access value, then the area access (LAcc) output field column is not displayed.

Type of access to the DEDB area, which can be one of the following:

- **BRWS** - Read only
- **EXCL** - Exclusive
- **READ** - Read
- **UPD** - Update

**ALL**

Returns all the output fields.

If global area status is maintained, the QUERY AREA command will return global information from the RM resource structure. The command master IMS returns the status on a separate response line. The area does not have to be defined at the command master.

**CI**

Control intervals.

Returns the total and unused control intervals defined for the sequential dependent space and the total and unused control intervals for the independent overflow part of the direct addressable space.

**LOCAL**

For output fields that have both local and global values, this option returns only the local values. If used with another SHOW keyword to request a specific output field, this option requests that only the local value of the specified output field is returned. Local output is returned by each IMS that processes the command.

**GLOBAL**

For output fields that have both local and global values, this option returns only the global values. If used with another SHOW keyword to request a specific output field, this OPTION requests that only the global value of the specified output field is returned. IMS retrieves global information from RM. Global output is returned only by the command master IMS.
If global area status is maintained, the QUERY AREA command will return global information from the RM resource structure. The command master IMS returns the status on a separate response line. The area does not have to be defined at the command master.

**STATUS**
Local and global area status.

Global status is returned if global area status is maintained in RM. Global status is returned only by command master IMS and is returned on a separate response line.

If the area has an EEQE status, the count of I/O errors or write error EEQE for the area are also returned. If an area’s status is OPEN, that status is not maintained in the RM resource structure.

If global area status is maintained, the QUERY AREA command will return global information from the RM resource structure. The command master IMS returns the status on a separate response line. The area does not have to be defined at the command master.

**UTILITY**
Returns the utility information about the utility that has the area open. The utility name, the total and available buffers in the private pool, and the utility UOW are returned.

**STATUS()**
Selects areas for display that match the NAME parameter and possess at least one of the specified area status locally.

The status filter allows for additional filtering by area status. The output returned when the STATUS filter is specified includes the status of the area that caused the area name to be displayed even if the SHOW(STATUS) is not specified.

Status parameters are the same as the values displayed in the QUERY AREA local status output column. See [Table 11 on page 42](#).

**Usage notes**
The command can only be specified through the Operations Manager (OM) API and can only be processed by DB/DC and DBCTL environments. In addition, the QUERY AREA command is valid on the XRF alternate as well as the RSR tracker.

The command syntax for this command is defined in XML and is available to automation programs which communicate with OM.

*How the SHOW keyword on QUERY AREA determines the type of output*

The following table provides some examples of how the SHOW keyword determines the type of output returned on the QUERY AREA command.

<table>
<thead>
<tr>
<th>Form of SHOW keyword used</th>
<th>Type of output returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW(LOCAL)</td>
<td>Only those fields that are local to an IMS system. SHOW(ALL,LOCAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM. SHOW(ALL,GLOBAL) provides the same output.</td>
</tr>
</tbody>
</table>

(Table 10, How the SHOW keyword on QUERY AREA determines the type of output)
Table 10. How the SHOW keyword on QUERY AREA determines the type of output (continued)

<table>
<thead>
<tr>
<th>Form of SHOW keyword used</th>
<th>Type of output returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW(ALL)</td>
<td>All of the output fields for those fields that have both local and global data. Both values are returned in the output.</td>
</tr>
<tr>
<td>SHOW(STATUS,GLOBAL)</td>
<td>Only global STATUS values.</td>
</tr>
<tr>
<td>SHOW(STATUS,LOCAL)</td>
<td>Only local STATUS values.</td>
</tr>
<tr>
<td>SHOW(STATUS)</td>
<td>Both local and global STATUS values.</td>
</tr>
<tr>
<td>SHOW(ALL,GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM. SHOW(GLOBAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(ALL,LOCAL)</td>
<td>Only those output fields that are local to an IMS system. SHOW(LOCAL) provides the same output.</td>
</tr>
</tbody>
</table>

**QUERY AREA status**

The following table lists the local and global area status conditions that may be returned when SHOW(STATUS) is specified.

Table 11. Status conditions for QUERY AREA

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>

Output fields

The following table shows the QUERY AREA output fields. The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

Scope
Identifies the scope of the output field.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY AREA command. The OM return and reason codes that may be returned as a result of the QUERY AREA command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 15. Return and reason code for the QUERY AREA command

<table>
<thead>
<tr>

<tr>
<td>10</td>
<td>Resource not found. The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERY AREA command:

Example 1 for QUERY AREA command

In this example, the command returns the CI and STATUS information for the area, DB21AR0, from all the IMS systems in the IMSPlex. Any ADS information, if available, is also returned by each IMS.

TSO SPOC input:
QRY AREA NAME(DB21AR10) SHOW(STATUS,CI)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AreaName</th>
<th>ADSName</th>
<th>MbrName</th>
<th>DBName</th>
<th>CC</th>
<th>SDep-T</th>
<th>SDep-U</th>
<th>Dir-T</th>
<th>Dir-U</th>
<th>EQCnt</th>
<th>LclStat</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB21AR0</td>
<td>IMS2</td>
<td>DEDBJN21</td>
<td>0</td>
<td>1303</td>

<td>74</td>
<td>74</td>
<td>10</td>
<td>PREOPEN, NOTOPEN</td>
<td></td>
</tr>
<tr>
<td>DB21AR0</td>
<td>SYS3</td>
<td>DEDBJN21</td>
<td>0</td>
<td>10</td>
<td>10</td>
<td></td>
<td></td>
<td></td>
<td>PREOPEN, OPEN, SHARED</td>
<td></td>
</tr>
</tbody>
</table>

OM API input:
CMD(QRY AREA NAME(DB21AR10) SHOW(STATUS,CI))
Example 2 for QUERY AREA command

In this example, the command returns all the areas that match the wildcard name and have a status of SHARED. The status is also returned. The ADS information for the AREAs is also returned if it is available. Command response lines are not returned from IMS2 because no AREAs match the status specified. A return and reason code is returned from IMS2.

TSO SPOC input:
QRY AREA NAME(DB21AR1*) STATUS(SHARED)

TSO SPOC output:
Log for . . . : QRY AREA NAME(DB21AR1*) STATUS(SHARED)
IMSPlex . . . . . . . : PLEX1
Routing . . . . . . . :
Return code . . . . : 0200000C
Reason code . . . . : 00003000

Example 3 for QUERY AREA command

In this example, the QUERY AREA SHOWSTATUS command also returns the global status for the area. The global status is returned by the master IMS on a separate global response line.

TSO SPOC input:
QRY AREA NAME(DB21AR0, DB21AR1) SHOW(STATUS)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AreaName</th>
<th>ADSName</th>
<th>MbrName</th>
<th>DBName</th>
<th>CC</th>
<th>Status</th>
<th>LclStat</th>
</tr>
</thead>

</tr>
</tbody>
</table>

Example 4 for QUERY AREA command

In this example, the QUERY AREA SHOW(STATUS) command also returns the global status for the area. The global status is returned by the master IMS on a separate global response line.

TSO SPOC input:
QRY AREA NAME(DB21AR0, DB21AR1) SHOW(STATUS)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AreaName</th>
<th>ADSName</th>
<th>MbrName</th>
<th>DBName</th>
<th>CC</th>
<th>Status</th>
<th>LclStat</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Example 5 for QUERY AREA command

The following example is of a query of the databases that have a status of quiesced.
Example 6 for QUERY AREA command

Example 7 for QUERY AREA command

Explanation: Database access for DEDB DEDBJN21 is UPD (Update). Area access for area DB21AR1 is READ. Area access for areas DB21AR10 and DB21AR11 are UPD, which they inherit from DEDB DEDBJN21 implicitly. Area access for areas DB21AR10 and DB21AR11 are not displayed because their area access is not changed by the UPDATE AREA START(ACCESS) SET(ACCTYPE()) command explicitly.

</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY DB command:

**NAME()**

Specifies the 1- to 8-character name of the database (DBD name). Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*), which returns all database resources.

If the STATUS filter is not specified, all the database names that match the NAME parameter are returned.

The database names that match the generic or wildcard parameters are processed. Response lines are returned for all the databases names that are processed.

The database name specified can be a HALDB master or a HALDB partition. If the database name is the HALDB master, response lines are returned for the HALDB master and all of its partitions. If the database name is the HALDB partition, response lines are returned for the HALDB master and the partition name if the HALDB master has not been taken offline.

If the database name specified is a DEDB name, response lines are returned for the DEDB name and all the DEDB areas.

DEDB area information is not returned if SHOW(DEFN) is specified.

**SHOW()**

Specifies the database output fields to be returned. The database name and type are always returned, along with the name of the IMS that created the output for the database and the completion code. The filters supported with the SHOW keyword are:

**ACCTYPE**

Returns the type of access to the database or the area.
If SHOW(ACCTYPE) is specified, and IMS is not using the IMSRSC repository and global DB status is maintained, the global access type from the resource structure is returned.

If SHOW(ACCTYPE) is specified, the command master IMS is using the repository, and global status is also enabled, the global access type from the resource structure is not returned. The access type from the repository is returned.

The access type from the repository is returned if SHOW(DEFN), SHOW(DEFN,ACCTYPE), SHOW(DEFN,GLOBAL), or SHOW(DEFN,ACCTYPE,GLOBAL) is specified.

**ALL**

Returns all information about the database itself. Other SHOW keywords can be specified to return information about resources related to the database.

The command master IMS returns global information from the RM resource structure on a separate line, even if the database is not defined at the command master.

**Restriction:** The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

**DEFN**

Specifies that the resource definitions are to be returned.

The database attributes that can be returned are ACCTYPE, RESIDENT, the repository create and update time stamps, and the IMS runtime create, update, import, and access time stamps.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS.

SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.
If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:
- You cannot specify SHOW(DEFN) with DEFNTYPE, MODEL, STATUS, WORK, or PGM.
- When querying database information from the repository, the SHOW(DEFN) filter is not supported when used with either the TYPE or STATUS filter. The runtime filters of TYPE and STATUS are not valid with SHOW(DEFN), SHOW(DEFN,GLOBAL), SHOW(DEFN,LOCAL), SHOW(DEFN,IMSID), SHOW(DEFN,IMSID,GLOBAL) or SHOW(DEFN,IMSID,LOCAL).
- The AreaName, LcStat, LModelName, LModelType, and LDefnType columns, which are returned on the QUERY DB SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition. There will be some performance overhead for SHOW(DEFN,IMSID) because a list of the IMS systems that have the resource defined is also to be obtained, along with the resource definition.

DEFNTYPE
Returns the definition type. This is how the resource was defined.

EXPORTNEEDED
Specifies that only the database resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(\*) is specified, only the names of the resources that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(\*) is specified on the NAME keyword, a response line is returned for each resource name specified on the command. If the specified resource does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY DB SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

Tip: For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGEONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

GLOBAL
For output fields that have both local and global values, this option returns
only the global values. If used with another SHOW keyword to request a specific output field, this option requests that only the global value of the specified output field is returned. IMS retrieves global status information from RM. Global output is returned only by the command master IMS.

The command master IMS returns global status information from the RM resource structure on a separate line, even if the database is not defined at the command master.

If the database name is a HALDB master, global information is returned only for the master database, not for the HALDB partitions associated with the master. If the database name specified is a DEDB, global information is returned only for the DEDB, not the DEDB areas associated to the DEDB.

If SHOW(GLOBAL) is specified without SHOW(DEFN), the repository information is not returned. If GSTSDB=Y is set in IMS, SHOW(GLOBAL) returns global status information from the RM resource structure.

If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

**IMSID**

Returns the IMSIDs of the IMS systems whose resource lists contain the resource name specified.

SHOW(IMSID) is processed only by the command master IMS and is valid only when command master IMS is enabled to use the repository.

If SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

If SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID).

SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

**LOCAL**

For output fields that have both local and global values, this option returns only the local values. If used with another SHOW keyword to request a specific output field, this option requests that only the local value of the specified output field is returned. Local output is returned by each IMS that processes the command.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

**MODEL**

The model name and model type used to create this resource. The model name and model type are blanks for databases generated in the MODBLKS data set. The CREATE command specified without the LIKE keyword creates a resource using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSDDB1 or user-defined. The CREATE command specified with the LIKE keyword creates a resource using a model. The resource is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the
model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The resource attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource.

**PGM**

The names of the programs that reference the specified database.

The QRY DB SHOW(PGM) command will not show the area names if the DB is a DEDB or the partition names if the DB is a HALDB master.

The QRY DB SHOW(PGM) command will not show dynamic (DOPT) PSBs and database names for which the DOPT PSB has intent.

**Note:** You cannot specify this filter with other SHOW filters; you must specify SHOW(PGM) individually.

**RESIDENT**

Returns the local runtime value for the resident option. The value returned is always RESIDENT(Y) for Fast Path DEDBs. The resident option definition is also shown, if it is different from the runtime value. The RESIDENT(Y) option takes effect at the next restart, unless the database was created or updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart.

**SNDX**

Returns the names of the associated Fast Path secondary index databases for a DEDB database.

**Restriction:** You cannot specify this filter with other SHOW filters. You must specify SHOW(SNDX) individually.

**STATUS**

Returns the local and global database status.

If global status is maintained, the command master IMS returns global information from the RM resource structure on a separate line. The global status information is returned even if the database is not defined at the command master. For a description of the possible database status returned, see the STATUS keyword in the Output fields table under "Output fields” on page 61.

**TIMESTAMP**

The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS) time, and import time (TIMEIMPORT) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:

- **YYYY** is the year.
- **JJJ** is the Julian day (001 - 365).
- **HH** is the hour (01 - 24).
- **MM** is the minute (00 - 59).
- **SS** is the seconds (00 - 59).
- **TH** is the tenths and hundredths of a second (00 - 99).
**VERSION**

Returns the version number of the database that is currently active in the online IMS system. The active version number of a database is stored in the database control blocks that are loaded by the online IMS system. The control blocks define the actual physical structure of the database to the online IMS system.

The possible version numbers range from 0 - 2147483647.

You cannot specify this filter with other SHOW filters; you must specify SHOW(VERSION) individually.

SHOW(VERSION) is valid only for the following database access types:

- HDAM
- HIDAM
- PHDAM
- PHIDAM
- DEDB

If SHOW(VERSION) is specified for an unsupported database access type, completion code BD is returned in the CC column of the output. This completion code indicates that the query is invalid for the access type of the database.

If SHOW(VERSION) is specified for a HALDB master, the output includes response lines for the HALDB master name and for each of its partitions. Each partition of the HALDB inherits the version number from the HALDB master, so each response line displays the same version number.

If SHOW(VERSION) is specified for a HALDB partition, the output lists a response line for just that partition. The version number that is displayed is that of the HALDB master. If the partition is disconnected from the HALDB master, such as might happen when the /DBR command is in effect on the database, completion code 10 is returned in the CC column of the output to indicate that no resource was found.

If SHOW(VERSION) is specified for a DEDB, the output lists a response line for only the DEDB. Area information is not listed in the output response.

**WORK**

Work is in progress for the database that is specified on the NAME parameter and its associated resources. The QRY DB SHOW(WORK) command can be issued before a DELETE, IMPORT or UPDATE command to check for any work in progress for the specified database and any of its associated resources. Any work in progress might cause the subsequent DELETE, IMPORT or UPDATE command to fail. The QRY DB SHOW(WORK) command returns the status for the work in progress for the database that is specified on the NAME parameter.

Specifying SHOW(WORK) with NAME(*) might take a long time to process.

The QRY DB SHOW(WORK) command for a HALDB master database will show the master name if the master has work in progress. The HALDB partition names are shown only if the partitions have work in progress.

**Notes:**
1. You cannot specify this filter with other SHOW filters; you must specify
   SHOW(WORK) individually.

2. The QRY DB SHOW(WORK) command is not valid on an XRF
   alternate.

**STATUS()**

Selects databases for display that match the NAME parameter and possess at
least one of the specified database statuses. This selection allows for additional
filtering by database status.

The output returned when the STATUS filter is specified includes the status of
the database that caused the database name to be displayed even if
SHOW(STATUS) is not specified.

**ALLOC**

Sets the STATUS() filter to return information about databases that have
allocation failure.

**ALLOCs**

Sets the STATUS() filter to return information about databases that are
allocated successfully.

**BACKOUT**

Sets the STATUS() filter to return information about databases for which
incomplete backout exists that prevents the use of the databases.

**EEQ**

Sets the STATUS() filter to return information about databases for which
one or more extended error queue elements exist.

**LOCK**

Sets the STATUS() filter to return information about databases that are
locked.

**NOTINIT**

Sets the STATUS() filter to return information about databases that are not
initialized and therefore cannot be used.

**NOTOPEN**

Sets the STATUS() filter to return information about databases that are not
open.

**OFR**

Sets the STATUS() filter to return information about databases that have
online forward recovery in progress to bring them to the current tracking
level.

**OLR**

The QUERY DB STATUS(OLR) command displays the status of all
‘authorized’ partitions with HALDB OLR in progress. The rate information
is not returned. Instead, the rate information is returned on the QUERY
OLREORG command output. A partition can be authorized by issuing a
/START DB partname OPEN or UPDATE DB NAME(partname)
OPTION(OPEN) command or by accessing the partition from an
application. The SSYS record from a RECON listing can be used to
determine whether a partition is authorized and to which subsystem.

**OPEN**

Sets the STATUS() filter to return information about databases that are
open.
QUIESCED
Sets the STATUS() filter to return information about databases that are currently quiesced by a previous UPDATE DB START(QUIESCE) command.

QUIESCING
Sets the STATUS() filter to return information about databases that are undergoing quiesce by a previous UPDATE DB START(QUIESCE) command.

RECALL
Sets the STATUS() filter to return information about databases for which database recalls are in progress.

RECOV
Sets the STATUS() filter to return information about databases for which database recovery is in progress.

RNL
Sets the STATUS() filter to return information about DEDB databases for which randomizers are not loaded.

STOACC
Sets the STATUS() filter to return information about databases that are stopped for access locally or globally and are offline. The SHOW(STATUS) keyword on the QUERY DB command returns a status of STOACC for a DEDB. A status of STOACC indicates that the DEDB is stopped from further access because of a prior /DBR DB or UPDATE DB STOP(ACCESS) command.

STOSCHD
Sets the STATUS() filter to return information about databases that are stopped locally.

STOUPDS
Sets the STATUS() filter to return information about databases that are stopped for updates locally.

TYPE()
Selects databases for display that match the NAME parameter and specific TYPE filter. The supported TYPE filters are:

- DEDB
- DHISNDX (refers to Fast Path secondary index databases)
- DLI
- MSDB
- PART
- PHDAM
- PHIDAM
- PSINDEX

TYPE can be specified with the STATUS filter. If both TYPE and STATUS filters are specified, a response line is returned for each database that matches the NAME parameter and the TYPE and STATUS filters specified.
Usage notes

The command can be specified only through the OM API and can be processed only in DB/DC and DBCTL environments. In addition, QUERY DB is valid on the XRF alternate as well as the RSR tracker.

The command syntax for QUERY DB is defined in XML and is available to automation programs that communicate with OM.

When you enter this command, the database name can be an existing non-HALDB, a HALDB master, or a HALDB partition. A command against a HALDB partition operates exactly like a command against a non-HALDB except for the /START DB command and the UPDATE DB START(ACCESS) command. A HALDB partition is not allocated during the command unless it was previously authorized but not allocated, the OPEN keyword was specified, or the partition has EEQEs. The partition is allocated at first reference.

The HALDB partition reflects conditions such as STOPPED (shown as STOACC or STOSCHD or STOUPDS on QUERY DB), LOCKED, or NOTOPEN. When a HALDB partition is stopped, it must be explicitly started again. The type-1 commands with the keyword ALL, type-2 commands with NAME(*), and commands against a HALDB master do not change the STOPPED (shown as STOACC, STOSCHD or STOUPDS on QUERY DB) and LOCKED indicators in each HALDB partition.

When the command target is a HALDB master, processing acts on all HALDB partitions. For example, if the IMS command is /DBR on the HALDB master, all of the HALDB partitions are closed, deallocated, and deauthorized. On a /DISPLAY DB command, only the HALDB master displays STOPPED (each HALDB partition does not display STOPPED unless it was itself stopped). If a /DBR command was issued against a HALDB master, the display output of a /DISPLAY DB command shows the HALDB master (as STOPPED), but does not display the status of the partitions.

Each partition inherits the access limitations of its HALDB master. If the /DBD command is issued against a HALDB master, all of its partitions close. A subsequent reference to any of the partitions results in the partition opening for input, although the partition’s access might be UPDATE or EXCLUSIVE. The DBRC authorization state reflects the limited access.

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

Equivalent IMS type-1 commands

The following table shows variations of the QUERY DB command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>QUERY DB command</th>
<th>Similar IMS type-1 commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY DB</td>
<td>/DIS DB dbname1...dbnamen</td>
</tr>
</tbody>
</table>

Table 18. Type-1 equivalents for the QUERY DB command
Output fields

The following table shows the QUERY DB output fields. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Scope**
Identifies the scope of the output field.

**Meaning**
Provides a brief description of the output field.

**QUERY DB status**

The following table lists local area status conditions that can be returned when SHOW(STATUS) is specified.

*Table 20. Local status conditions for QUERY DB*

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOCF</td>
<td>Database has an allocation failure.</td>
</tr>
<tr>
<td>ALLOCS</td>
<td>Database is allocated successfully.</td>
</tr>
<tr>
<td>BACKOUT</td>
<td>Incomplete backout exists for the database that prevents the use of the database.</td>
</tr>
<tr>
<td>EEQF</td>
<td>One or more extended error queue elements exist for the database.</td>
</tr>
<tr>
<td>IC</td>
<td>Area image copy is active.</td>
</tr>
<tr>
<td>LOCK</td>
<td>Database is locked locally.</td>
</tr>
<tr>
<td>NONE</td>
<td>Database has no global status.</td>
</tr>
<tr>
<td>NOTINIT-xx-reason</td>
<td>Database is not initialized and therefore cannot be used. NOTINIT displays in the format NOTINIT-xx-reason, where xx is the reason code that identifies the unique location in one module where this reason code is set. NOTINIT-00 indicates that the reason is unknown. Action: 1. DFSDDIR MACRO defines each reason code that might be set in the database bad reason code (field DDIBADR) and identifies the module that sets it. reason explains the reason code xx in abbreviated text format up to 13 characters.</td>
</tr>
<tr>
<td>NOTOPEN</td>
<td>Area or database is not open.</td>
</tr>
<tr>
<td>OFR</td>
<td>Area or database has online forward recovery in progress to bring it up to current tracking level.</td>
</tr>
<tr>
<td>OLR</td>
<td>Database partition has an online reorganization in progress.</td>
</tr>
<tr>
<td></td>
<td>The QUERY DB STATUS(OLR) command displays the status of all databases with HALDB OLR in progress. Rate information is not returned. Instead, the rate information is returned on the QUERY OLREORG command output.</td>
</tr>
<tr>
<td>OPEN</td>
<td>Area or database is open. Not maintained in the RM resource structure.</td>
</tr>
<tr>
<td>PRELOAD</td>
<td>Area is defined to be preloaded.</td>
</tr>
<tr>
<td>PREOPEN</td>
<td>Area is defined to be preopened.</td>
</tr>
<tr>
<td>QUIESCED</td>
<td>Area or database is currently quiesced by a previous UPDATE DB START(QUIESCE) or UPDATE AREA START(QUIESCE) command.</td>
</tr>
<tr>
<td>QUIESCING</td>
<td>Area or database is currently undergoing quiesce by a previous UPDATE DB START(QUIESCE) or UPDATE AREA START(QUIESCE) command.</td>
</tr>
<tr>
<td>RECALL</td>
<td>Area or database recall is in progress.</td>
</tr>
<tr>
<td>RECOVINP</td>
<td>Area or database recovery is in progress.</td>
</tr>
<tr>
<td>RECOVNEEDED</td>
<td>Area needs recovery.</td>
</tr>
<tr>
<td>RNL</td>
<td>Randomizer is not loaded for the DEDB database.</td>
</tr>
</tbody>
</table>
### Table 20. Local status conditions for QUERY DB (continued)

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>

<tr>
<td>DUPLICATEAREA</td>
<td>Duplicate area name found in this DEDB. Action: 4.</td>
</tr>
<tr>
<td>EOD</td>
<td>EOD marker found before DMB.</td>
</tr>
<tr>
<td>FPDB</td>
<td>The database is a Fast Path MSDB or DEDB that is defined in a non-Fast Path (FP=N) system. The database cannot be used.</td>
</tr>
<tr>
<td>LOADCOMPRESS</td>
<td>An error occurred loading the compression routine.</td>
</tr>
<tr>
<td>LOADRANDOMIZE</td>
<td>An error occurred loading the randomizer routine.</td>
</tr>
<tr>
<td>MAXDBEXCEEDED</td>
<td>Database exceeded maximum database limit of 32767. The database cannot be used. The database can be recovered at IMS cold start from RDDS auto import if the total number of databases in a local system is less than 32767.</td>
</tr>
<tr>
<td>MOLCCOMMIT</td>
<td>Member OLC COMMIT MEMBER failed.</td>
</tr>
<tr>
<td>MSDBCHANGE</td>
<td>MSDB added or changed by online change, which is not allowed. Action: 4.</td>
</tr>
<tr>
<td>MSDBLEVEL</td>
<td>MSDB level of MSDB in ACBLIB is incorrect. Action: 4.</td>
</tr>
<tr>
<td>NODB</td>
<td>No database DDIR control block exists. Action: 5.</td>
</tr>
<tr>
<td>NODMB</td>
<td>No database DMB exists in ACBLIB. For a Fast Path database, this could be an MSDB or a DDB. Action: 2.</td>
</tr>
<tr>
<td>NOMSDB</td>
<td>No MSDBs defined in system.</td>
</tr>
</tbody>
</table>
Table 21. Reason information for NOTINIT-xx-reason status (continued)

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOSHRINRXDDIR</td>
<td>No shared index database DDIR control block. Action: 5.</td>
</tr>
<tr>
<td>NOSHRINRXDMB</td>
<td>No DMB in ACBLIB for shared index. Action: 2.</td>
</tr>
<tr>
<td>NOTDMB</td>
<td>Not a DMB. A PSB by the same name as the database is defined in ACBLIB instead of a DMB. If this resource should be a program, create the program with a CREATE PGM command. If this resource should be a database, perform a DBDGEN, PSBGEN, ACBGEN, and ACBLIB online change to define this resource as a DMB instead of a PSB. Action: 4.</td>
</tr>
<tr>
<td>PARTBUILD</td>
<td>Partition build failed.</td>
</tr>
<tr>
<td>PSBINCOMPTBL</td>
<td>PSB incompatibility.</td>
</tr>
<tr>
<td>REPOCHGLIST</td>
<td>The database name exists in the change list in the IMSRSC repository for this IMS, and the change list is being processed or the change list processing failed because of an error. This database cannot be used, scheduled, updated, exported, or referenced as a model until it is successfully imported so that the runtime database definition and the stored definition in the repository are synchronized. Action: 6.</td>
</tr>
<tr>
<td>RSCNEEDOLC</td>
<td>A Fast Path DEDB database is created with the IMPORT DEFN command. The DEDB database cannot be brought online for use with the IMPORT DEFN command. Perform ACBLIB online change to bring Fast Path DEDB database online. Action 2.</td>
</tr>
<tr>
<td>RSCNEEDSTADB</td>
<td>A full-function HALDB is created with the IMPORT DEFN command. HALDB master is created. To create HALDB partition databases, issue either the /START DB command or the UPDATE DB command on the HALDB master database.</td>
</tr>
<tr>
<td>SEGMENTNUM</td>
<td>Segment number error. ACBGEN error, more than 127 segments. Action: 4.</td>
</tr>
<tr>
<td>WRONGDMB</td>
<td>Wrong DMB.</td>
</tr>
<tr>
<td>WRONGPSB</td>
<td>Wrong PSB.</td>
</tr>
</tbody>
</table>

Note: Actions that can be taken to initialize the database are:
1. Call IBM.
2. Perform ACBLIB online change to add the DMB to ACBLIB.
3. Perform ACBLIB online change to add the PSB to ACBLIB.
4. Perform ACBLIB online change to correct PSBs or DMBs.
5. Perform MODBLKS online change or issue the CREATE DB command to create the database.
6. If IMS change list processing failed and message DFS4411E was issued, correct the problem and take one of the following actions:
   • Shut down IMS and restart it in order to try processing the change list again.
   • Issue the IMPORT DEFN SOURCE(REPO) NAME(dbname) TYPE(DB) command to import the database, where dbname is the database name.

How the SHOW keyword on QUERY DB determines the type of output

Some examples of how the SHOW keyword determines the type of output returned on the QUERY DB command are provided in the following table.
Table 22. How the SHOW keyword on QUERY DB determines the type of output

<table>
<thead>
<tr>
<th>Form of SHOW keyword used</th>
<th>Type of output returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW(LOCAL)</td>
<td>Only those output fields that are local to an IMS system. SHOW(ALL,LOCAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM. SHOW(ALL,GLOBAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(ALL)</td>
<td>All of the output fields for those fields that have both local and global data. Both values are returned in the output.</td>
</tr>
<tr>
<td>SHOW(STATUS,GLOBAL)</td>
<td>Only global STATUS values.</td>
</tr>
<tr>
<td>SHOW(STATUS,LOCAL)</td>
<td>Only local STATUS values.</td>
</tr>
<tr>
<td>SHOW(STATUS)</td>
<td>Both local and global STATUS values.</td>
</tr>
<tr>
<td>SHOW(ALL,GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM. SHOW(GLOBAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(ALL,LOCAL)</td>
<td>Only those output fields that are local to an IMS system. SHOW(LOCAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(DEFN)</td>
<td>The runtime definitions from IMS and the stored definitions from the repository are returned.</td>
</tr>
<tr>
<td>SHOW(DEFN,IMSID)</td>
<td>The runtime definitions from IMS and the stored definitions from the repository are returned. A response line is returned along with the definitional attribute for each IMS that has the resource defined in the repository.</td>
</tr>
<tr>
<td>SHOW(DEFN,LOCAL)</td>
<td>The runtime definitions from IMS are returned.</td>
</tr>
<tr>
<td>SHOW(DEFN,GLOBAL)</td>
<td>The stored definitions from the repository are returned.</td>
</tr>
<tr>
<td>SHOW(DEFN,IMSID,LOCAL)</td>
<td>The runtime definitions from IMS are returned. SHOW(DEFN,IMSID,LOCAL) is the same as SHOW(DEFN,LOCAL).</td>
</tr>
<tr>
<td>SHOW(DEFN,IMSID,GLOBAL)</td>
<td>The stored definitions from the repository are returned. A response line is returned along with the definitional attribute for each IMS that has the resource defined in the repository.</td>
</tr>
<tr>
<td>SHOW(EXPORTNEEDED)</td>
<td>Only those runtime resources whose definitions has not been exported to the repository.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY DB command. The OM return and reason codes that might be returned as a result of the QUERY DB command are standard for all commands entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 23. Return and reason codes for the QUERY DB command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY DB command completed successfully.</td>
</tr>
</tbody>
</table>
| X'00000004' | X'00001010' | No resources were found to be returned. The resource names specified might be invalid, or:  
  • There were no resources that match the filter specified.  
  • There were no resources that had work to display for the SHOW(WORK) specified.  
  • If SHOW(EXPORTNEEDED) was specified, no resources needed to be exported to the IMSRSC repository. |
| X'00000008' | X'00002004' | Invalid command keyword or invalid command keyword combination. |
| X'00000008' | X'00002014' | The QUERY DB command is not processed because an invalid character is found in the database name parameter. |
| X'00000008' | X'00002040' | More than one filter or keyword value is specified on the QUERY DB command. Either more than one keyword or an invalid combination of filters was specified. Check the input command and reenter the correct combinations. |
| X'0000000C' | X'00003000' | The QUERY DB command was successful for some resources but failed for others. The completion code indicates the reason for the error with the resource name. The completion codes that can be returned by the QUERY DB command are listed in the QUERY DB completion code table. |
| X'0000000C' | X'00003004' | The QUERY DB command was not successful for any of the resource names specified. The completion code indicates the reason for the error with the resource name. The completion codes that can be returned by the QUERY DB command are listed in the QUERY DB completion code table. |
| X'00000010' | X'00004004' | No CQS address space. |
| X'00000010' | X'00004018' | No resource structure. Or, the resource structure is not available. |
| X'00000010' | X'00004100' | Resource structure is full. |
| X'00000010' | X'00004104' | No RM address space. |
| X'00000010' | X'00004108' | No SCI address space. |
| X'00000010' | X'00004300' | Command is not allowed because online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx is defined with MODBLKS=OLC, or MODBLKS is not defined). |
| X'00000010' | X'00004500' | IMS is not enabled to use the repository. |
| X'00000010' | X'00004501' | RM is not enabled to use the repository. |
| X'00000010' | X'00004502' | Repository is not available. |
| X'00000010' | X'00004503' | Repository is stopped. |
Table 23. Return and reason codes for the QUERY DB command (continued)

<table>

Commands, Volume 2: IMS Commands N - V
Explanation: The QUERY DB command is specified with the SHOW keyword to display the resident attribute and the database status. All definition and status information is returned for databases BANKATMS, DEDBJN21, and DBHDOK01 from IMS1. All of the database output fields do not fit on one screen, so you must scroll to the right for additional output fields. The database name, area name, and member name that built the line of output are displayed on every screen. Database BANKATMS has a status of NOTINIT-1E-NODMB, which means there is no DMB.
in ACBLIB for BANKATMS and BANKATMS cannot be used. DEDBJN21 is a DEDB and the area information is also returned, along with the DEDB information. No model information is returned because the database was loaded from MODBLKS and not created from a model. Time stamps for the DEDB areas are not maintained and so they are not returned.

**Example 2 for QUERY DB command**

**TSO SPOC input:**

```
QUERY DB NAME(BE3PARTS,CUSTDB) SHOW(PGM)
```

**TSO SPOC output:**

```
  DBName  MbrName  CC   TYPE    LpgmName
BE3PARTS IMS1  0 DL/I  PE4CODEL
BE3PARTS IMS1  0 DL/I  PE4COINQ
BE3PARTS IMS1  0 DL/I  PE4CORDR
BE3PARTS IMS1  0 DL/I  PE4CPINV
BE3PARTS IMS1  0 DL/I  PE4CPPUR
CUSTDB IMS1    0 DEDB  PSBBA
CUSTDB IMS1    0 DEDB  PSBNO
CUSTDB IMS1    0 DEDB  PSBOS
CUSTDB IMS1    0 DEDB  PSBPA
```

**OM API input:**

```
OM(QUERY DB NAME(BE3PARTS,CUSTDB) SHOW(PGM))
```

**OM API output:**

<userid>USRT005</userid>
<verb>QRY</verb>
<kwd>DB</kwd>
<input>QUERY DB NAME(BE3PARTS,CUSTDB) SHOW(PGM)</input>
</cmd>
</cmdrsphdr>
```

76 Commands, Volume 2: IMS Commands N - V
Explanation: Database BE3PARTS has programs BE3PARTS, PE4COINQ, and PE4CORDR referring to it. Database CUSTDB has programs CUSTDB, PSBOS, and PSBPA referring to it.

Example 3 for QUERY DB command

TSO SPOC input:
QRY DB NAME(DEDBRN01,DX41M401,DB000001) SHOW(RESIDENT,STATUS)

OM API input:
CMD(QRY DB NAME(DEDBRN01,DX41M401,DB000001) SHOW(RESIDENT,STATUS) )
### Explanation:
The QUERY DB command is specified with SHOW keywords to display the resident attribute and the database status for a few different types of databases. DEDBRN01 is a DEDB. DEDBs are always resident and defined with RESIDENT(Y). DX41M401 is a DLI database. DX41M401 is defined as Resident(N) and its local runtime resident value is RESIDENT(N). Because Rsdnt and LRsdnt values of database DX41M401 are the same, only LRsdnt value is displayed. DB0000001 is a new database created by a CREATE DB command. DB0000001 shows a status of NOTINIT-34-NODMB, which means it has no DMB defined in ACBLIB and cannot be used. Since there is no DMB, the database type is shown as blanks, because IMS does not know what type of database DB0000001 is intended to be. DB0000001 is defined as RESIDENT(Y), but because the resident option will not take effect until the next IMS restart, the local resident value is N. If all of the databases being displayed have a LRsdnt (Local Resident) value that is the same as the Rsdnt (Definitional Resident) value, the QRY DB output displays the LRsdnt header and value, but not the Rsdnt header and value. Since database DB0000001 is defined with RESIDENT(Y) but its local runtime resident value is N, both Rsdnt and LRsdnt columns are displayed in the QUERY DB output.

### Example 4 for QUERY DB command

**TSO SPOC input:**

`QRY DB NAME(*) SHOW(STATUS) STATUS(QUIESCING)`

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>DB</th>
<th>MBR</th>
<th>CC</th>
<th>TYP</th>
<th>LRsdnt</th>
<th>LSTT</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEDBRN01</td>

  </cmdrsphdr>
</imsout>
```
**Explanation:** DEDB DEDBJ001 has database access of UPD (update). Area access for areas D0010001, D00010002, and D0010004 has been changed with the command; that is, area D0010001 has area access of READ (read), area D0010002 has area access of BRWS (read only), and area D0010004 has area access of UPD (update). Areas D0010003 and D0010005 inherit DEDBJ001 database access of UPD (update).

**Example 6 for QUERY DB command**

The table above shows the IMS commands and their corresponding options. The IMS commands are organized based on their volume and are presented in a clear, readable format.
Explanation: This example shows the result of query for the runtime definitions and the definitions stored in the repository for databases BANKATMS, BE3PARTS, DEDBJN21, and NEWDB1, for an IMSplex that contains IMS1, IMS2, and IMS3. IMS1 is the command master IMS.

- In the TSO SPOC output, the response lines 1-4 show the repository and local information for DB BANKATMS.
  - Line 1 indicates that database BANKATMS is defined to the repository, the line was built by command master IMS1, and that the database has a global access type of EXCL and a global resident value of N. The Repo column shows a value of Y, which indicates the global values for database BANKATMS in the repository. The IMSid column is blank, which indicates that this is the global definition of BANKATMS for all IMS systems that it is defined to.
  - Lines 2, 3, and 4 indicate that database BANKATMS is defined locally to IMS1, IMS2, and IMS3 with local access type and resident runtime values that are the same as the repository values. The MbrName column is the IMSID of the IMS that built the response line. The IMSid column shows the IMSID of the IMS to which the resource or descriptor is defined. The command master IMS1 already built repository information for BANKATMS. The output does not indicate whether database BANKATMS is defined in the resource lists for IMS1, IMS2, or IMS3, because SHOW(IMSID) was not specified.

- The response lines 5-10 show the repository and local information for DB BE3PARTS.
  - Line 5 indicates that database BE3PARTS is defined to the repository, the line was built by command master IMS1, and that the database has a global access type of EXCL and a global resident value of N. The Repo column shows a value of Y, which indicates the global values for database BE3PARTS in the repository. The IMSid column is blank, which indicates that this is the global definition of BE3PARTS for all IMS systems that it is defined to and that do not have their own specific definitions.
  - Line 6 indicates that database BE3PARTS is defined to the repository with unique values for IMS2 (the access type is UPD instead of EXCL), different from the global values. When IMS2 next imports database BE3PARTS from the repository, it will get its unique access type value of UPD, but the global resident value of N. The resource list for IMS2 contains database BE3PARTS because it must, in order for its unique attributes, be stored in the repository.
  - Line 7 indicates that database BE3PARTS is defined to the repository with unique values for IMS3 (the resident value is Y instead of N), different from the global values. When IMS3 next imports database BE3PARTS from the repository, it will get its unique resident value of Y, but the global access type of EXCL. The resource list for IMS3 contains database BE3PARTS because it must, in order for its unique attributes, be stored in the repository.
  - Lines 8-10 indicate that database BE3PARTS is defined locally to IMS1, IMS2, and IMS3 with various local access type and resident runtime values. The output does not indicate whether database BE3PARTS is in the resource lists for IMS1, IMS2, or IMS3, because SHOW(IMSID) was not specified. These IMS systems do not access repository information; the command master IMS1 already accessed it. Runtime values for IMS1, IMS2, and IMS3 match the stored values in the repository, so their definitions are synchronized with the repository and no import is needed.

- The response lines 11-14 show the repository and local information for database DEDBJN21.
Line 11 indicates that database DEDBJN21 is defined to the repository, the line was built by command master IMS1, and that the database has a global access type of UPD and a global resident value of Y. The Repo column shows a value of Y and indicates the global values for database DEDBJN21 in the repository.

Lines 12-14 indicate that database DEDBJN21 is defined locally to IMS1, IMS2, and IMS3 with the local access type UPD and resident Y runtime values. The command master IMS1 already built repository information for DEDBJN21. Runtime values for IMS1, IMS2, and IMS3 match the stored values in the repository, so their definitions are synchronized with the repository, and no import is needed. The output does not indicate whether database DEDBJN21 is defined in the resource lists for IMS1, IMS2, or IMS3, because SHOW(IMSID) was not specified.

- The response lines 15-18 shows the information for DB NEWDB1.
  - Line 15 indicates that the database NEWDB1 is not defined to the repository.
  - Line 16 indicates that database NEWDB1 is defined locally to IMS1.
  - Line 17-18 indicate that the database NEWDB1 is not defined locally to IMS2 and IMS3.

Chapter 5. QUERY commands
Explanation: A line is returned for each resource that matches the wildcard name. The resource definitions from each IMS that has the resource defined and the global repository definition are returned. The repository information is returned by the command master IMS. There are no IMS-specific sections in the repository for each resource name that matches the wildcard name.

Example 8 for QUERY DB command

TSO SPOC input:
QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS,NEWDB1) SHOW(DEFN,IMSID,ACCTYPE,RESIDENT)

TSO SPOC output:

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
<th>Repo</th>
<th>IMSid</th>
<th>TYPE</th>
<th>Acc</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANKATMS</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td></td>
<td>Y</td>
<td>EXCL</td>
</tr>
<tr>
<td>BANKATMS</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>IMS1</td>
<td>EXCL</td>
<td></td>
</tr>
<tr>
<td>BANKATMS</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>IMS2</td>
<td>EXCL</td>
<td></td>
</tr>
<tr>
<td>BANKATMS</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>IMS3</td>
<td>EXCL</td>
<td></td>
</tr>
<tr>
<td>BANKATMS</td>

<td>0</td>
<td></td>
<td></td>
<td>IMS4</td>
<td>EXCL</td>
<td></td>
</tr>
</tbody>
</table>
OM API input:
CMD(QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS,NEWDB1)
SHOW(DEFN,IMSID,ACCTYPE,RESIDENT))

OM API output:
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.181 22:47:45.395196</statime>
Commands, Volume 2: IMS Commands N - V

Commands, V

88
Explanation: Because SHOW(IMSID) is specified, a line is returned for each IMS that has the resource defined in the repository. Line 5 indicates that the
BANKATMS definition for IMS4 is defined in the repository for IMS4, but the definition has not yet been imported into IMS4 because IMS4 shows no local line for database BANKATMS.

**Example 9 for QUERY DB command**

**TSO SPOC input:**

```
QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS,NEWDB1) SHOW(DEFN,GLOBAL)
```

**TSO SPOC output:**

(Scrolled right to screen 2)

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>Repo</th>
<th>TimeCreate</th>
<th>TimeUpdate</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANKATMS</td>
<td>IMS1</td>
<td>Y</td>
<td>2011.181</td>
<td>15:22:52.65</td>
</tr>
<tr>
<td>BE3PARTS</td>
<td>IMS1</td>
<td>Y</td>

</cmdrsphdr>
</cmdrspdata>
</imsout>

**Explanation:** The stored resource definition information from the repository is returned for the specified resource names because SHOW(DEFN,GLOBAL) is specified. The access type, resident, create time, and update time from the stored resource definitions in the repository are returned. The output contains generic resource definitions and any IMS-specific sections. The generic resource definition has a blank in the IMSid column. The IMS-specific section includes an IMSID of...
the IMS whose definition is different from the generic definition. For readability, the DBName and MbrName columns are repeated when the output is scrolled to the right.

**Example 10 for QUERY DB command**

TSO SPOC input:

```
QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS,NEWDB1) SHOW(DEFN,LOCAL)
```

TSO SPOC output:

```

Chapter 5. QUERY commands 93
Explanation: The runtime resource definitions at the IMS system are returned for the specified resource names. Because SHOW(LOCAL) is specified, only the local runtime definitions from each IMS system are returned. No stored resource definitions from repository are returned.

Example 11 for QUERY DB command

TSO SPOC input:
QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS) SHOW(IMSID)

TSO SPOC output:

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
<th>Repo</th>
<th>IMSid</th>
</tr>
</thead>
<tbody>
<tr>
<td>BANKATMS</td>

</tr>
</tbody>
</table>

OM API input:
CMD(QRY DB NAME(BANKATMS,DEDBJN21,BE3PARTS) SHOW(IMSID))

OM API output:

<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.181 23:14:08.509271</statime>
<stotime>2011.181 23:14:08.533678</stotime>
<staseq>C800657988557848</staseq>
Explanation: The SHOW(IMSID) keyword without the DEFN filter is specified. The IMSID information from the repository is returned for the specified resource.
names. The IMSIDs that have the specified resource names in their IMS resource list in the repository are returned in the IMSid column. All the IMSID information is returned in the IMSid column.

**Example 12 for QUERY DB command**

In this example, TYPE is set to DHISNDX for a HISAM or a SHISAM secondary index database.

**TSO SPOC input:**

```
QUERY DB NAME(D*) SHOW(ACCTYPE)
```

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>DATABASE</th>
<th>TYPE</th>

<td></td>
</tr>
<tr>
<td>FPSI1AH2</td>
<td></td>
<td></td>
<td>IMS1</td>
<td>193</td>
<td>NOT A DEDB</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: DEDBG51A is a DEDB database with seven areas: GS1AAR0, GS1AAR1, GS1AAR2, GS1AAR3, GS1AAR4, GS1AAR5, and GS1AAR6. DEDBG51A has three HISAM or SHISAM secondary index databases: FPSI1AHA, FPSI1AH1, and FPSI1AH2. Because databases FPSI1AHA, FPSI1AH1, and FPSI1AH2 are not DEDB databases, they cannot have Fast Path secondary index databases defined. These databases get a completion code of 193, which indicates that they are not DEDB databases.

Example 16 for QUERY DB command

The following example shows a HALDB master database, DBVHDJ05, and two partitions, PVHDJ5B and PVHDJ5D, that are currently being processed by the HALDB online alter function.

TSO SPOC input:
QRY DB NAME(DBVHDJ05) SHOW(WORK)

TSO SPOC output:
**Example 17 for QUERY DB command**

**TSO SPOC input:**
```
QUERY DB NAME(DB0*) SHOW(EXPORTNEEDED)
```

**TSO SPOC output:**
```
<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
<th>TYPE</th>
<th>ExportNeeded</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB000001</td>
<td>IMS1</td>
<td>0</td>
<td>N</td>
<td></td>
</tr>
<tr>
<td>DB000002</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td></td>
</tr>
</tbody>
</table>
```

**OM API input:**
```
CMD(QUERY DB SHOW(EXPORTNEEDED))
```

**OM API output:**

**Related concepts:**
- Commands, Volume 2: IMS Commands N - V
QUERY DBDESC command

Use the QUERY DBDESC command to query information about database descriptors. A descriptor is a model that can be used to create descriptors or resources.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 100
- “Usage notes” on page 103
- “Output fields” on page 103
- “Return, reason, and completion codes” on page 108
- “Examples” on page 110

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY DBDESC</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>DEFAULT</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SHOW</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
The following keywords are valid for the QUERY DBDESC command:

**DEFAULT()**
- Specifies which descriptor or descriptors to display.
- **N** Displays all the database descriptors that are not the default.
- **Y** Displays the default database descriptor.

**NAME()**
- Specifies the 1-8 character name of the database descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*), which returns all database descriptors.

**SHOW()**
- Specifies the database descriptor output fields to be returned. The database descriptor name is always returned, along with the name of the IMS that created the output for the database descriptor and the completion code. The filters supported with the SHOW keyword are:
  - **ALL**
    - Returns all information about the database descriptor itself.

  **Restriction:** The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

**ACCTYPE**
- Type of access to the database created using this database descriptor.

**DEFAULT**
- Default descriptor option.

**DEFN**
- Specifies that the resource definitions are to be returned.
  - The database descriptor attributes that can be returned are: ACCTYPE, DEFAULT, RESIDENT, the repository create and update time stamps, and the IMS runtime create, update, import, and access time stamps.
  - If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned.
  - The runtime resource definitions from the IMS system are returned by each
IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:

- SHOW(DEFN) cannot be specified with DEFNTYPE or MODEL.
- The LModelName, LModelType, and LDefnType columns, which are returned on the QRY DBDESC SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

When querying database descriptor information from the repository, the resource definitions stored in the repository are used to determine the response lines with the repository information, and the runtime resource definitions are used to determine the response lines with the IMS runtime resource information. The response lines are returned for each stored resource or runtime resource definition that matches the specified filter. If SHOW(DEFN,GLOBAL) is specified, only the stored resource definitions that match the specified filter are returned. If SHOW(DEFN,LOCAL) is specified, only the runtime resource definitions that match the specified filter are returned.

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

**DEFNTYPE**

Definition type. This is how the descriptor was defined.

**EXPORTNEEDED**

Specifies that only the database descriptors that match the NAME
parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the database descriptors that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each database descriptor name specified on the command. If the specified database descriptor does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY DBDESC SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

Tip: For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

GLOBAL
Specifies that the stored resource definitions from the repository are to be returned.

If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS.
SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

IMSID
Specifies that the IMSID of the IMS systems whose resource lists contain the resource name are to be returned.

SHOW(IMSID) is processed only by the command master IMS and is valid only when command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

LOCAL
Specifies that the runtime resource definitions from the IMS system are to be returned.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.
MODEL
The model name and model type used to create this descriptor. The model name and model type is blank for the IMS-defined descriptor DFSDSDB1. The CREATE command specified without the LIKE keyword creates a descriptor using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSDB1 or user-defined. The CREATE command specified with the LIKE keyword creates a descriptor using a model. The descriptor is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The descriptor attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify descriptors that were created with the same model. The model name and model type of a descriptor are exported and imported. The IMPORT command does not use the model name and model type when creating a descriptor.

RESIDENT
Specifies the resident option. The value is always RESIDENT(Y) for Fast Path DEDBs. The RESIDENT(Y) option takes effect at the next restart, unless the database descriptor was created or updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart.

TIMESTAMP
The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS) time, and import time (TIMEIMPORT) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:
• YYYY is the year.
• JJJ is the Julian day (001 - 365).
• HH is the hour (01 - 24).
• MM is the minute (00 - 59).
• SS is the seconds (00 - 59).
• TH is the tenths and hundredths of a second (00 - 99).

Usage notes
This command can be issued only through the Operations Manager API. This command applies to DB/DC and DBCTL systems. This command is allowed on XRF alternate and RSR tracker systems. The QUERY DBDESC command is not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined).

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

Output fields
The following table shows the QUERY DBDESC output fields. The columns in the table are:
**Short label**  
Contains the short label generated in the XML output.

**Long label**  
Contains the long label generated in the XML output.

**Keyword**  
Identifies keyword on the command that caused the field to be generated.  
N/A appears for output fields that are always returned. *error* appears for output fields that are returned only in case of an error.

**Scope**  
Identifies the scope of the output field.

**Meaning**  
Provides a brief description of the output field.

---

### Table 26. Output fields for the QUERY DBDESC command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>N/A</td>

</tr>
<tr>
<td>CCTXT</td>
<td>CCTxt</td>
<td><em>error</em></td>
<td>LCL</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code.</td>
</tr>
<tr>
<td>DESC</td>
<td>DescName</td>
<td>DBDESC</td>
<td>N/A</td>
<td>Database descriptor name.</td>
</tr>
</tbody>
</table>
| DFLT        | LDflt      | DBDESC  | LCL   | Default descriptor (Y) or not (N).  

- **N** The descriptor is not the default.  
- **Y** The descriptor is the default.  

When a descriptor or resource is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type.  
IMS defines a database descriptor called DFSDSDB1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor.

<td>TIMESTAMP</td>
<td>LCL</td>
<td>The last time the attributes of the runtime resource definition were updated as a result of the UPDATE DBDESC command or the IMPORT command. The update time is retained across warm start and emergency restart. The output value is obtained from the local IMS.</td>
</tr>
</tbody>
</table>

### Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 27. Return and reason codes for the QUERY DBDESC command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| X’00000004’ | X’00001010’ | No resources were found to be returned. The descriptor names specified might be invalid, or:  
  - There were no resources that match the filter specified.  
  - If SHOW(EXPORTNEEDED) was specified, no resources needed to be exported to the IMSRSC repository. |
| X’00000008’ | X’00002004’ | Invalid command keyword or invalid command keyword combination. |
| X’00000010’ | X’00003004’ | No requests were successful. |
| X’00000010’ | X’00004004’ | No CQS address space. |
| X’00000010’ | X’00004018’ | No resource structure, or resource structure is not available. |
| X’00000010’ | X’00004100’ | Resource structure is full. |
| X’00000010’ | X’00004104’ | No RM address space. |
| X’00000010’ | X’00004108’ | No SCI address space. |
| X’00000010’ | X’00004300’ | Command is not allowed because online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). |
| X’00000010’ | X’00004500’ | IMS is not enabled to use the repository. |
| X’00000010’ | X’00004501’ | RM is not enabled with the repository. |
| X’00000010’ | X’00004502’ | Repository is not available. |
| X’00000010’ | X’00004503’ | Repository is stopped. |
| X’00000010’ | X’00004504’ | Repository spare recovery is in progress. |
| X’00000010’ | X’00004505’ | No IMS resource list exists, or no resources for the resource type exist in the IMS resource list. |
| X’00000010’ | X’00004507’ | Repository access was denied. |
| X’00000010’ | X’00004508’ | Repository maximum put length exceeded. |
| X’00000010’ | X’00004509’ | RM data version is lower than IMS data version. |
| X’00000010’ | X’0000450A’ | Repository Server is being shut down. |
| X’00000010’ | X’0000450B’ | Repository Server is not available. |
| X’00000010’ | X’0000450C’ | Repository Server is busy. |
| X’00000010’ | X’0000450D’ | RM failed to define some of the internal fields that are related to the IMSRSC repository. |
| X’00000014’ | X’0000501C’ | IMODULE GETMAIN error. |
| X’00000014’ | X’00005100’ | RM request error. |
| X’00000014’ | X’00005104’ | Unexpected CQS error. |
| X’00000014’ | X’00005108’ | SCI request error. |
| X’00000014’ | X’00005110’ | Repository error. |

<cmdrspdata>
<rsp>DESC(DEDBDESC) MBR(IMS1 ) CC( 0) LACC(EXCL) IMSID(IMS1 )</rsp>
</cmdrspdata>
Explanation: The stored resource definitions and the runtime resource definitions for the specified resources are returned. DBDESC1 and DEDBDESC have the stored resource definitions in the repository and also at the IMS systems. The descriptor NEWDESC is created at IMS1 but does not exist in the repository or at any other IMS systems.

Because SHOW(ACCTYPE,RESIDENT) is specified, only the resident and access type information is returned. DFSDSDB1 is the default descriptor and is only at each of the IMS systems. The default descriptor definitions are not in the repository.

Example 3 for QUERY DBDESC command

TSO SPOC input:
QUERY DBDESC DEFAULT(Y)

TSO SPOC output:

<table>
<thead>
<tr>
<th>DescName</th>
<th>MbrName</th>
<th>CC</th>
<th>LDflt</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFSDSDB1</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>DFSDSDB1</td>
<td>IMS2</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>DFSDSDB1</td>
<td>IMS3</td>
<td>0</td>
<td>Y</td>
</tr>
</tbody>
</table>

OM API input:

CMD(QUERY DBDESC DEFAULT(Y))

OM API output:

<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.18118:26:10.474718</statime>
<stotime>2011.18118:26:10.490099</stotime>
<staseq>C800251C1D2DEC12</staseq>
<staseq>C800251C22E33512</staseq>
</cmdrspdata>
**Explanation:** Only the local default descriptors are returned.

**Example 4 for QUERY DBDESC command**

**TSO SPOC input:**

```plaintext
QUERY DBDESC SHOW(EXPORTNEEDED)
```

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>MbrName</th>
<th>Code</th>
<th>Code</th>
<th>Reason text</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>00000004</td>
<td>00001010</td>
<td>No resources or matches found</td>
</tr>
</tbody>
</table>

**OM API input:**

```plaintext
CMD(QUERY DBDESC SHOW(EXPORTNEEDED))
```

**Related concepts:**

---

**QUERY IMS command**

Use the QUERY IMS command, which is a type-2 command, to display status and attributes information from IMS.

The information that is returned to the user is the IMS status that can be modified with the UPDATE IMS command. The QUERY MEMBER command is used to return other IMS status.
Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 116
- “Output fields” on page 116
- “Return, reason, and completion codes” on page 118
- “Examples” on page 119

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY IMS command and keywords can be issued.

Table 29. Valid environments for QUERY IMS command and keywords

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY IMS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TYPE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

The following keywords are valid for the QUERY IMS command:

SHOW()
(Required) - Specifies the output fields to be returned.

ALL
Returns all possible output fields for the data specified in the TYPE parameter.

AUTOEXPORT
Returns the AUTOEXPORT status. AUTOEXPORT applies to TYPE(LCLPARM) only.

GENIMSID
Returns the value of the GENIMSID parameter of the IMS DFSDCxxx PROCLIB member. The GENIMSID parameter defines a shared generic IMS ID for an MSC TCP/IP generic resource group.

GLOBAL
Returns the global values for the specified TYPE options.
LOCAL
Returns the local values for the specified TYPE options.

REPO
Returns the IMSRSC repository parameters and indicates whether IMS is enabled with the repository. If IMS is not enabled with the repository, the return and reason codes that indicate “IMS is not enabled with the repository” are returned. REPO applies to TYPE(LCLPARM) only.

TYPE()
Specifies the data to be returned.

ALL
Returns data for all possible types. ALL is the default.

LCLPARM
Displays the local LCLPARM values at the current IMS. Information is returned based on the SHOW options specified.

You cannot specify SHOW(GLOBAL) with TYPE(LCLPARM). SHOW(ALL) and SHOW(LOCAL) return the same local parameter information.

PLEXPARM
Displays the global PLEXPARM values at the current IMS.

If global values are requested, the values from the global PLEXPARM entry in RM are returned by the IMS command master. If local values are requested, the values from each IMS that processes the command are returned.

Usage notes
This command can be specified only through the Operations Manager API.

Output fields
The output provided by QUERY IMS is described in the following table. Specifying SHOW parameter options determines what is returned in the output. Specifying SHOW(ALL) returns all output fields.

The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

Scope
Identifies the scope of the output field.

Meaning
Provides a brief description of the output field.

</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMS command are standard for all commands that are entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMS command completed successfully.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001000'</td>
<td>The QUERY IMS command is not processed on the IMS system because the IMS system is not the command master.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002040'</td>
<td>The QUERY IMS command is not processed because no filter or an invalid filter was specified for the SHOW keyword.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>No requests were successful.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004500'</td>
<td>IMS is not enabled to use the repository.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005004'</td>
<td>The QUERY IMS command is not processed because the DFSOCMD0 GETBUF storage could not be obtained.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

The following table contains completion codes can be returned on a QUERY IMSPLEX command.

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The QUERY IMS command completed successfully.</td>
</tr>
<tr>
<td>50</td>
<td>The QUERY IMS command is not processed because CQS is not available.</td>
</tr>
<tr>

---

120 Commands, Volume 2: IMS Commands N - V
Explanation: All the local parameter information from all IMS systems, IMS1 and IMS2, is returned. IMS1 is enabled with the IMSRSC repository, Fast Path 64-bit buffers, MSC TCP/IP generic IMS ID, and VTAM generic IMS ID, while IMS2 does not have any of these parameters enabled. IMS2, which is the command master, returns the IMSplex parameter information.

Example 2 for the QUERY IMS command

TSO SPOC input:
QRY IMS TYPE(LCLPARM) SHOW(ALL)

TSO SPOC output:

(screen 1)
MbrName  CC  FPBP64STAT  MSG  MSGOPT  BMP  BMPOPT  AutoExport  RepositoryType
IMSI  0  Y  N/A  ABEND  N/A  ABEND  N  IMSRSC

Explanation: This example shows QUERY IMS command output for TYPE(LCLPARM) when IMS is enabled with IMSRSC repository but is not enabled with Fast Path 64-bit buffer manager or generic IMS ID.

**Example 4 for the QUERY IMS command**

**TSO SPOC input:**

QUERY IMS TYPE(LCLPARM) SHOW(REPO)

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>MbrName</th>
<th>CC</th>
<th>RepositoryType</th>
<th>RepositoryName</th>
<th>LastExportTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>0</td>
<td>IMSRSC</td>
<td>IMSRSC_REPOSITORY</td>
<td>2011.213 08:57:00.39</td>
</tr>
<tr>
<td>IMS2</td>
<td>0</td>
<td>IMSRSC</td>
<td>IMSRSC_REPOSITORY</td>
<td>2011.213 08:57:08.14</td>
</tr>
</tbody>
</table>

**OM API input:**

CMD(QUERY IMS TYPE(LCLPARM) SHOW(REPO))

**OM API output:**

```xml
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.213 15:57:56.076888</statime>
<stotime>2011.213 15:57:56.095315</stotime>
<staseq>C82B3FA885550D6E</staseq>
<stoseq>C82B3FA885550D6E</stoseq>
<rqsttkn1>USRTO11 10085755</rqsttkn1>
<rqsttkn2>USRTO11 10085755</rqsttkn2>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>IMS</master>
<userid>USRTO11</userid>
</cmd>
</imsout>
```
Explanation: The local parameters at IMS for the repository settings are returned. Only the repository information is returned because the SHOW(REPO) keyword is specified.

QUERY IMSCON commands

Use the QUERY IMSCON commands to display the status and activity of one or more IMS Connect resources.

The TYPE keyword specifies the type of IMS Connect resource to display. The default is TYPE(CONFIG), which displays general IMS Connect information.

The QUERY IMSCON command is processed by every IMS Connect to which OM routes the command, whether or not OM has designated a particular IMS Connect as the command master.

Subsections:

- “QUERY IMSCON TYPE(ALIAS) command” on page 126
- “QUERY IMSCON TYPE(CLIENT) command” on page 131

Related reference:
QUERY IMSCON TYPE(ALIAS) command

Use the QUERY IMSCON TYPE(ALIAS) command to display the status and activity of one or more IMS aliases and the associated ODBMs defined to IMS Connect.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 127
- “Usage notes” on page 127
- “Equivalent WTOR and z/OS commands” on page 128
- “Output fields” on page 128
- “Return, reason, and completion codes” on page 129
- “Examples” on page 130

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax
Keywords

The following keywords are valid for the QUERY IMSCON TYPE(ALIAS) command.

NAME
   Specifies the name of one or more IMS aliases to be displayed. You can specify a single alias name or a list of alias names separated by commas. Wildcards can be used in the names.

   You can specify NAME(*) to display all IMS aliases. NAME(*) is the default.

ODBM
   Selects aliases for display that are associated with the specified ODBM name. You can specify a single ODBM name or a list of ODBM names separated by commas. Wildcards can be used in the names.

   Only the aliases that are associated with a specified ODBM name are displayed. Aliases that match the NAME parameter, but are not associated with the specified ODBM name, are not displayed.

   If the ODBM keyword is specified, ODBM information is displayed even if SHOW(ODBM) is not specified.

SHOW
   Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the alias name, the name of the IMS Connect that processes the command, and the completion code.

   The filters that are supported with the SHOW keyword, which can be specified in any order, are:

      ALL
         Displays all output fields.

      ODBM
         Displays the name of the ODBM for which the alias is defined.

      STATUS
         Displays the status of the alias. For a description of the possible alias status returned, see the STATUS keyword in Table 34 on page 128.

      STATUS
         Displays the ODBM aliases that are in at least one of the specified states. You can specify a single status, or a list of statuses separated by commas, in any order.

         ACTIVE
            The alias is active.

         NOTACTIVE
            The alias is not active, either in IMS Connect, ODBM, or both.

   If the STATUS keyword is specified, status information is displayed even if SHOW(STATUS) is not specified.

Usage notes

You can issue the QUERY IMSCON TYPE(ALIAS) command only through the Operations Manager (OM) API.
IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of *ACTIVE*.

**Equivalent WTOR and z/OS commands**

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the `QUERY IMSCON TYPE(ALIAS)` command.

**Notes:**
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect *jobname*.

<table>
<thead>
<tr>
<th>QUERY IMSCON TYPE(ALIAS) command</th>
<th>Equivalent IMS Connect WTOR command</th>
<th>Equivalent IMS Connect z/OS command</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>QUERY IMSCON TYPE(ALIAS)</code> NAME(*) SHOW(ALL</td>
<td>VIEWIA ALL</td>
<td>QUERY ALIAS NAME(*)</td>
</tr>
<tr>
<td>`NAME(alias_name) SHOW(ALL</td>
<td>VIEWIA alias_name</td>
<td>QUERY ALIAS NAME(aliasName)</td>
</tr>
<tr>
<td>`NAME(alias_name) ODBM(odbm_name)</td>
<td>VIEWIA alias_name</td>
<td>QUERY ALIAS NAME(aliasName) ODBM(odbmName)</td>
</tr>
</tbody>
</table>

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the column heading displayed on the TSO SPOC screen.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. *error* appears for output fields that are returned only in the case of an error.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALIAS</td>
<td>AliasName</td>
<td>N/A</td>
<td>The alias name of an IMS data store defined to the instance of ODBM. The alias name is always returned.</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned. See <a href="#">Table 36 on page 130</a></td>
</tr>
</tbody>
</table>

<td></td>
<td></td>
<td>The alias has been deactivated in ODBM by using the ODBM type-2 UPDATE ODBM STOP(CONNECTION) ALIAS command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td><strong>NOTACTIVE(IMSCON,ODBM)</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>The alias has been deactivated both in IMS Connect (by using the STOPIA command or equivalent) and in ODBM (by using the ODBM type-2 UPDATE ODBM STOP(CONNECTION) ALIAS command).</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(ALIAS) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 35. Return and reason codes for the QUERY IMSCON TYPE(ALIAS) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(ALIAS) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>
Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 36. Completion codes for the QUERY IMSCON TYPE(ALIAS) command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY IMSCON TYPE(ALIAS) command completed successfully for the resources.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If a wildcard was specified in the command, there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

Examples

Example 1 for QUERY IMSCON TYPE(ALIAS) command

TSO SPOC input:
QUERY IMSCON TYPE(ALIAS) NAME(*) SHOW(ALL)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AliasName</th>
<th>MbrName</th>
<th>CC</th>
<th>ODBMName</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSA</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM1OD</td>
<td>NOTACTIVE(IMSCON)</td>
</tr>
<tr>
<td>IMSA</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM2OD</td>
<td>NOTACTIVE(ODBM)</td>
</tr>
<tr>
<td>IMS1</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM1OD</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>IMS1</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM2OD</td>
<td>NOTACTIVE(IMSCON,ODBM)</td>
</tr>
<tr>
<td>IMS2</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM2OD</td>
<td>ACTIVE</td>
</tr>
<tr>
<td>IMS3</td>
<td>HWS1</td>
<td>0</td>
<td>ODBM3OD</td>
<td>NOTACTIVE(IMSCON)</td>
</tr>
</tbody>
</table>

OM API input:
CMD ( QUERY IMSCON TYPE(ALIAS) NAME(*) SHOW(ALL) )

OM API output:

<imsout>
<ctl>
  <omname>OM1OM</omname>
  <omvsn>1.5.0</omvsn>
  <xmlvsn>20</xmlvsn>

  <rsn>00000000</rsn>
</ctl>
<cmd>
  <master>HWS1</master>
  <userid>USRT001</userid>
  <verb>QRY</verb>
  <kwd>IMSCON</kwd>
  <input>QUERY IMSCON TYPE(ALIAS) NAME(*) SHOW(ALL)</input>
</cmd>
</cmdrsphdr>
<hdr sbl="ALIAS" sbl="AliasName" scope="LCL" sort="a" key="1" scroll="no" len="8" dtype="CHAR" align="left" skipb="no"/>
Explanation: There are two ODBM resources that have aliases currently defined. IMSA and IMS1 are aliases defined to both ODBM1OD and ODBM2OD. IMS2 is an alias defined only to ODBM2OD, and IMS3 is an alias defined only to ODBM3OD. The status NOTACTIVE(IMSCON) indicates that the alias has been deactivated by the IMS Connect STOPIA (or equivalent) command. The status NOTACTIVE(ODBM) indicates that the alias has been deactivated by the UPDATE ODBM STOP(CONNECTION) ALIAS command.

- VIEWIA command (Commands)

**QUERY IMSCON TYPE(CLIENT) command**

Use the QUERY IMSCON TYPE(CLIENT) command to display the status and activity of one or more active client socket connections on which IMS Connect receives messages from a client.

If the connection is to another instance of IMS Connect or a CICS® subsystem, IMS Connect uses a separate send socket on a different port to send transactions and reply data. The QUERY IMSCON TYPE(CLIENT) command does not display these send client socket connections. To display information about send client socket connections, use the QUERY IMSCON TYPE(SENDCLNT) command.

Subsections:
- “Environment” on page 132
- “Syntax” on page 132
- “Keywords” on page 133
- “Usage notes” on page 136
- “Equivalent WTOR and z/OS commands” on page 138
Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
QUERY IMSCON TYPE(CLIENT)
   | NAME(+)
   |   |
   |   |
   | DATASTORE( 'datastore_name' )
   |   |
   |   |

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(CLIENT) command.

**DATASTORE**

Selects clients for display that have a transaction submitted to the specified data store. You can specify a single data store name or a list of data store names separated by commas. Wildcards can be used.

If the DATASTORE keyword is specified, data store information is displayed even if SHOW(DATASTORE) is not specified.

**NAME**

Specifies the name of one or more clients to be displayed. You can specify a single client name or a list of client names separated by commas. Wildcards can be used.

You can specify NAME(*) to display all clients. NAME(*) is the default.

IMS Connect uses the client name to identify the client socket connection. The name of an IMS Connect client can be provided by the client or, if the client does not provide it, IMS Connect randomly generates the name.

IMS Connect always generates the client name for connections with another IMS Connect instance or a CICS subsystem. In these cases, the first characters of the client name identify the IMS communication type. For example:

- **ISC**  ISC communication with a CICS subsystem
- **MSC**  MSC communication between IMS systems
- **OTM**  OTMA communication between IMS systems

To display the active socket connections for one of the preceding types of IMS communication, you can specify the character identifier followed by a wildcard character. For example, NAME(MSC*), returns all IMS-to-IMS send socket connections for MSC communications.

**PORT**

Selects clients for display that are active on the specified port. You can specify a single port number or a list of port numbers separated by commas. Wildcards can be used.
To filter on the local port used by the IMS TM Resource Adapter, specify NAME(LOCAL).

The SSL port is displayed with the character “S” appended to the end of the port number. To filter on the SSL port, specify the port number either with or without the character “S” appended to the end of the port number.

The port defined for ODBM use is displayed with the character “D” appended to the end of the port number. To filter on the ODBM port, specify the port number either with or without the character “D” appended to the end of the port number.

The port defined for ISC links to CICS is displayed with the character “C” appended to the end of the port number. To filter on a CICS port, specify the port number either with or without the character “C” appended to the end of the port number.

If the PORT keyword is specified, port information is displayed even if SHOW(PORT) is not specified.

**RTTOKEN**

Selects clients for display that are currently issuing a RESUME TPIPE call and have a matching RESUME TPIPE token. Each RESUME TPIPE token is up to 16 hexadecimal digits in length. You can specify a single RESUME TPIPE token or a list of RESUME TPIPE tokens separated by commas.

When the RTTOKEN filter is specified, the RESUME TPIPE token is displayed even if SHOW(RTTOKEN) is not specified.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the client name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Displays all output fields.

**ALTCID**

Display the alternate client ID specified by the client issuing a Resume TPIPE.

**APSBTOKEN**

Displays the ODBM APSB token in use by the client for ODBM access.

**CLNTPORT**

Displays the client port number, which is a random number that TCP/IP generates to represent a connection from a client.

**DATASTORE**

Displays the data store to which the transaction was submitted.

**IPADD**

Displays the IP address being used by the connection of the client to IMS Connect.

**ISC**

Displays the name of the Intersystem Communication (ISC) resource that this client is associated with. This value is specified on the ID parameter of the ISC statement in the IMS Connect configuration member.
LCLPLKID
Displays the local MSC physical link ID that is using this connection, as specified on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member. This filter is valid for MSC messages only.

PORT
Displays the port number of the port on which the client is active. If the port is a local port used by the TM Resource Adapter, LOCAL is displayed. If the port is an SSL port, character “S” is appended to the end of the port number. If the port is an ODBM port, character “D” is appended to the end of the port number.

If the port is a CICS port, character “C” is appended to the end of the port number.

RTTOKEN
Displays the Resume TPIPE token of the clients that are issuing a Resume TPIPE.

SECOND
Displays the number of seconds that the client has been in its current status.

STATUS
Displays the status of the client. For a description of the possible status returned, see the STATUS keyword in Table 37 on page 136.

TRAN
Displays the transaction code submitted by the client.

USERID
Displays the user ID passed to IMS Connect.

STATUS
Displays the clients that are in at least one of the specified states. You can specify a single client status, or a list of client statuses separated by commas, in any order.

CONN
Waiting for output from IMS.

CONV
In a conversational state.

READ
Reading an input message from the client.

RECV
Waiting for input from the client (in a receive state).

WFCM
Waiting for confirmation (ACK, NAK, or DEALLOCATE) from the client.

XMIT
Sending data to the client.

If the STATUS keyword is specified, status information is displayed even if SHOW(STATUS) is not specified.

TRAN
Selects clients for display that have a specified transaction submitted to a data store. You can specify a single transaction name or a list of transaction names separated by commas. Wildcards can be used.
If the TRAN keyword is specified, transaction information is displayed even if SHOW(TRAN) is not specified.

**USERID**
- Selects clients for display that have one of the specified user IDs. You can specify a single user ID or a list of user IDs separated by commas. Wildcards can be used.

  If the USERID keyword is specified, user ID information is displayed even if SHOW(USERID) is not specified.

**Usage notes**

You can issue the QUERY IMSCON TYPE(CLIENT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

**Output fields**

**Short label**
- Contains the short label that is generated in the XML output.

**Long label**
- Contains the column heading displayed on the TSO SPOC screen.

**Keyword**
- Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

**Meaning**
- Provides a brief description of the output field.

Table 37. Output fields for the QUERY IMSCON TYPE(CLIENT) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTCID</td>
<td>AltCID</td>
<td>ALTCID</td>
<td>The alternate client ID that is specified by a client that is issuing a RESUME TPIPE call.</td>
</tr>

<tr>
<td>UID</td>
<td>UserID</td>
<td>USERID</td>
<td>User ID for the client that is passed to IMS Connect.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(CLIENT) command are standard for all commands entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 38. Return and reason codes for the QUERY IMSCON TYPE(CLIENT) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(CLIENT) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C000014'</td>
<td>X'00005008'</td>
<td>The command processor failed to obtain storage via BPEGETM.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 39. Completion codes for the QUERY IMSCON TYPE(CLIENT) command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY IMSCON TYPE(CLIENT) command completed successfully for the resources.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If a wildcard was specified in the command, there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

Equivalent WTOR and z/OS commands

There are no equivalent WTOR and z/OS commands because CLIENT is not supported as a resource type for WTOR and z/OS commands for IMS Connect. You can display client information by using the VIEWPORT and QUERY PORT commands, but you cannot use the client name as a search argument.

Examples

Example 1 for QUERY IMSCON TYPE(CLIENT) command

TSO SPOC input:

QUERY IMSCON TYPE(CLIENT) NAME(CLIENT*,MSC*) SHOW(ALL)

TSO SPOC output:

(Screen 1)
CLIENT01 MbrName CC Port UserID LclPlkID Trancode DataStore Second
CLIENT01 WSS1 0 9999 USRT003 FESTX2 IMS1 2468
OM API input:

```
CMD ( QUERY IMSCON TYPE(CLIENT) NAME(CLIENT*) SHOW(ALL) )
```

OM API output:

```
<imsout>
<ctl>
<omname>OM1OM </omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20 </xmlvsn>
<stotime>2010.297 22:46:36.444137</stotime>
<staseq>C6C74EEA6CC7302A</staseq>
<stoseq>C6C74EEA6D1E9C6A</stoseq>
<rqsttkn1>USRT001 10154636</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</cmd>
<master>HWS1 </master>
<userid>USRT001 </userid>
<verb>QRY </verb>
<kwd>IMSCON </kwd>
<input>QUERY IMSCON TYPE(CLIENT) NAME(CLIENT*,MSC*) SHOW(ALL)</input>
</cmdrsphdr>
```
example:

```
/DISPLAIMPORT

Explanation: In the preceding example, there are seven clients, two of which are associated with an MSC physical link on port 9999, one client, which is also on port 9999, that is issuing a RESUME TPIPE call with an alternate client ID specified, and one client on port 12345. Each line of output displays information and status specific to each of the clients that are active on the port.

CLIENT03 is issuing the RESUME TPIPE call and has specified an alternate client ID of CLIENT99. To match CLIENT03 with its specific RESUME TPIPE call in OTMA, issue the IMS command /DISPLAY TMEMBER, as in the following example:
Then issue the QUERY IMSCON TYPE(CLIENT) command with the RRTOKEN keyword specified with SHOW(ALTCID), as in the following example:

```plaintext
QRY IMSCON TYPE(CLIENT) RRTOKEN(CBB45E89A9F02E8A) SHOW(ALTCID RRTOKEN)
```

The client ID that corresponds to the RRTOKEN and the ALTID is displayed with the RRTOKEN and ALTID values:

<table>
<thead>
<tr>
<th>ClientID</th>
<th>MbrName</th>
<th>CC</th>
<th>ALTID</th>
<th>RToken</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLIENT03</td>
<td>IMSPLEX1</td>
<td>0</td>
<td>CLIENT99</td>
<td>CBB45E89A9F02E8A</td>
</tr>
</tbody>
</table>

**Example 2 for QUERY IMSCON TYPE(CLIENT) command**

**TSO SPOC input:**

```plaintext
QUERY IMSCON TYPE(CLIENT) USERID(USRT002)
```

**TSO SPOC output:**

```plaintext
ClientID  MbrName  CC  ALTID  RToken
CLIENT12  HWS1    0  CLIENT99 | CBB45E89A9F02E8A |
```

**OM API input:**

```plaintext
CMD(QUERY IMSCON TYPE(CLIENT) USERID(USRT002))
```

**OM API output:**

```xml
<imsout>
<ctl>
<omname>OM10M </omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20 </xmlvsn>
<statime>2010.297 23:08:15.607128</statime>
<stotime>2010.297 23:08:15.608263</stotime>
<staseq>C6C753C167958165</staseq>
<stoseq>C6C753C167958165</stoseq>
<rqsttkn1>USRT001 10160815</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>HWS1 </master>
<userid>USRT001 </userid>
<verb>QRY </verb>
<kwd>IMSCON </kwd>
<input>QUERY IMSCON TYPE(CLIENT) USERID(USRT002)</input>
</cmd>
</cmdrsphdr>
```

Chapter 5. QUERY commands 141
**Explanation:** The command requests any client with a user ID of USRT002. CLIENT12 is the only client with this user ID. The SHOW keyword was not specified, but SHOW(USERID) is assumed because the USERID keyword was specified.

**Example 3 for QUERY IMSCON TYPE(CLIENT) command**

In the following example, four clients active on the system. One client is an OTMA client on port 9999 that has sent an IMS transaction to the IMS1 datastore. Two clients are ISC clients on CICS port 9876 that are associated with the ISC datastore named IMSICIC4. One client is an MSC client on port 9999 that is associated with the MSC datastore named MSC12.

**TSO SPOC input:**

```plaintext
QUERY IMSCON TYPE(CLIENT) SHOW(ALL)
```

**TSO SPOC output:**

Chapter 5. QUERY commands 143
QUERY IMSCON TYPE(CONFIG) command

Use the QUERY IMSCON TYPE(CONFIG) command to display the status and activity of IMS Connect. Unlike the similar WTOR command VIEWHWS or the z/OS command QUERY MEMBER TYPE(IMSCON), individual resources such as PORT and DATASTORE are not displayed with this command.

Subsections:
- "Environment"
- "Syntax"
- "Keywords" on page 145
- "Usage notes" on page 147
- "Equivalent WTOR and z/OS commands" on page 148
- "Output fields" on page 148
- "Return, reason, and completion codes" on page 152
- "Examples" on page 152

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax
Keywords

The following keywords are valid for the QUERY IMSCON TYPE(CONFIG) command.

SHOW

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

ALL

Displays all output fields.

ADAPTER

Displays whether XML adapter support is enabled, the maximum number of XML converters that this instance of IMS Connect can load, and the current number of XML converters that this instance of IMS Connect has loaded.

CM0ATOQ

Display the name of the OTMA CM0 ACK timeout queue, as specified by the CM0ATOQ= keyword in the IMS Connect configuration file.

CASCADE

Displays the IMS Connect default setting for whether data store
connections from this IMS Connect support the cascading of global z/OS
Resource Recovery Services transactions to IMS TM data stores that are
located on different z/OS images (LPARs) than IMS Connect. The IMS
Connect default for cascaded transaction support is set either by the
CASCADE= parameter on the HWS= statement in the HWSCFGxx member
of the IMS PROCLIB data set or by using the IMS type-2 command
UPDATE IMSCON TYPE(CONFIG) SET(CASCADE()).

ICONID
Display the name of the IMS Connect, as defined in the ID substatement of
the HWS configuration statement in the HWSCFGxx configuration
member.

IPADDR
Displays the IP address for this instance of IMS Connect. Client application
programs use this IP address to connect to IMS Connect.

MAXLSSSZ
Displays the maximum language structure segment size. This value is
passed to the XML converter when it is called.

MAXSOC
Displays the maximum total number of sockets that this instance of IMS
Connect can open. The maximum number of physical connections that can
be made is the MAXSOC= value minus the number of ports, because IMS
Connect uses one socket on each port for listening.

MULTIRTP
Displays the current specification of the MULTIRTP keyword for this IMS
Connect instance. The value displayed is the default value for all
DATASTORE connections that do not specify a MULTIRTP value
themselves. The MULTIRTP value determines whether the OTMA tpipes
support multiple active resume tpipe requests.

NUMSOC
Displays the current number of sockets.

ODBMAC
Displays the ODBM auto connection value, which indicates whether the
instance of IMS Connect identified in the ID field is configured to
automatically connect to the instances of ODBM in the IMSplex in which
IMS Connect is a member.

ODBMIIPMEM
Displays the ODBM IMSplex member name, which is the name of the IMS
Connect that SCI uses to manage communications between IMS Connect
and ODBM.

ODBMTMEM
Displays the ODBM IMSplex TMEMBER name, which is the name of the
SCI that manages the communication between IMS Connect and ODBM.

ODBMTD
Displays the ODBM timeout value, which is the time interval that IMS
Connect waits before disconnecting a client application program that uses
the Open Database architecture.

PSWMDC
Indicates whether mixed-case password support is currently enabled for
this instance of IMS Connect.

RACF
Indicates whether RACF support is currently enabled for this instance of
IMS Connect.
RECODER
Indicates whether the line trace data set is open or closed.

RRS
Displays the following z/OS Resource Recovery Services (RRS) information for this instance of IMS Connect:
• Whether RRS is enabled in the HWS configuration file
• The current status of RRS

SMEM
Displays the OTMA super member name.

TCPIPQ
Displays the maximum number of queued connection requests without assigned sockets that this IMS Connect can maintain.

TIMEOUT
Displays the interval of time IMS Connect waits before disconnecting a client application program after either of the following situations:
• Waiting for a response for the client from IMS
• Waiting for data from the client after the client opens a socket connection

UIDAGE
Displays the RACF user ID aging value in seconds. When the RACF user ID aging value is reached, IMS Connect refreshes the user ID before it processes the next input message for that user ID. Valid values are from 0 to 2,147,483,647 seconds. UIDAGE is only effective when RACF user ID caching is enabled.

UIDCACH
Displays whether RACF user ID caching is used when RACF authentication is enabled.

VERSION
Displays the version of this instance of IMS Connect.

WARNINC
Displays the warning incremental percentage, which is a decimal value between 1 - 50. After the warning level (WARNSOC value in the TCPIP configuration statement) has been reached, IMS Connect will reissue an HWS0772W message each time the number of sockets increases by the warning incremental percentage.

WARNSOC
Displays the warning level as a percentage of the maximum sockets limit (MAXSOC= value in the TCPIP configuration statement), which is a decimal value between 50 - 99. When the number of sockets increases to this warning level, IMS Connect issues an HWS0772W message.

Usage notes
You can issue the QUERY IMSCON TYPE(CONFIG) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.
Equivalent WTOR and z/OS commands

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(CONFIG) command.

Notes:

- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 40. WTOR and IMS Connect z/OS equivalents for the QUERY IMSCON TYPE(CONFIG) command

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Chapter 5. QUERY commands 153
Explanation: This command shows general status related to IMS Connect.

Related concepts:

- How to interpret CSL request return and reason codes (System Programming APIs)

Related reference:

- VIEWHWS command (Commands)
- IMS Connect QUERY MEMBER command (Commands)

### QUERY IMCON TYPE(CONVERTER) command

Use the QUERY IMCON TYPE(CONVERTER) command to display the status of IMS Connect XML converters.

Subsections:

- “Environment” on page 155
- “Syntax” on page 155
- “Keywords” on page 155
- “Usage notes” on page 156
- “Equivalent WTOR and z/OS commands” on page 156
Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
QUERY IMSCON TYPE(CONVERTER)
```

```
NAME ( converter_name, converter_name* )
SHOW ( ALL, TIMESTAMP, USECOUNT )
```

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(CONVERTER) command.

NAME

Specifies one or more XML converter names to display. You can specify one or more full and wildcard-prefix names in a comma-separated list. If you do not specify this keyword and a value, all XML converters are displayed.

SHOW

Specifies which optional output fields to display in addition to the standard output fields. You can specify the following additional output fields:

- ALL: Display all available output fields.
- TIMESTAMP: Display the timestamp of the last successful load (TimeCreate) and execution (TimeAccess) for each converter. The timestamp is local time. Timestamps are displayed in the following format:

  `YYYY, JJJ HH:MM:SS.TH`

  - `YYYY`: Year
  - `JJJ`: Julian day
  - `HH`: Hour
  - `MM`: Minute
  - `SS`: Second
  - `TH`: Tenths and hundredths of a second
**USECOUNT**

The number of times the converter was executed since it was loaded.

**Usage notes**

You can issue the QUERY IMSCON TYPE(CONVERTER) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

The QUERY IMSCON TYPE(CONVERTER) command is only processed by IMS Connect.

**Equivalent WTOR and z/OS commands**

The QUERY IMSCON TYPE(CONVERTER) type-2 command does not have an equivalent WTOR or z/OS command.

**Output fields**

**Short label**

Contains the short label that is generated in the XML output.

**Long label**

Contains the column heading displayed on the TSO SPOC screen.

**Keyword**

Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) is shown for output fields that are always returned. error is shown for output fields that are returned only in the case of an error.

**Meaning**

Provides a brief description of the output field.

</tr>
</thead>
</table>
| TMAC        | TimeAccess | TIMESTAMP | The date and time that this XML converter was last executed. This field is returned only if SHOW(TIMESTAMP) is specified in the command. The timestamp is local time. The timestamp is in the following format: YYYYY.JJJ HH:MM:SS.TH
|             |            |           | YYYYY Year |
|             |            |           | JJJ Julian day |
|             |            |           | HH Hour |
|             |            |           | MM Minute |
|             |            |           | SS Second |
|             |            |           | TH Tenths and hundredths of a second |
| TMCR        | TimeCreate | TIMESTAMP | The date and time that this XML converter was loaded. This field is only returned if SHOW(TIMESTAMP) is specified in the command. The field format is the same as for the TMAC output field and the timestamp is local time. |
| UCNT        | UseCount   | USECOUNT  | The number of times that this XML converter was executed since the last time it was loaded. This field is returned only if SHOW(USECOUNT) is specified in the command. |

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(CONVERTER) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 45. Return and reason codes for the QUERY IMSCON TYPE(CONVERTER) command

<table>
<thead>
<tr>

**QUERY IMSCON TYPE(DATASTORE) command**

Use the QUERY IMSCON TYPE(DATASTORE) command to display the status and activity of one or more data stores defined to IMS Connect.

Subsections:

- “Environment”
- “Syntax”
- “Keywords” on page 160
- “Usage notes” on page 162
- “Equivalent WTOR and z/OS commands” on page 163
- “Output fields” on page 163
- “Return, reason, and completion codes” on page 166
- “Examples” on page 167

**Environment**

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**
Keywords

The following keywords are valid for the QUERY IMSCON TYPE(DATASTORE) command.

**NAME**

Specifies one or more data store names to be displayed. You can specify a single data store name or a list of data store names separated by commas. Wildcards can be used in the names. You can specify NAME(*) to display all data stores. NAME(*) is the default.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the data store name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Displays all output fields.
ACKTO
Displays the OTMA CM1 ACK timeout value, as specified by the ACKTO= keyword in the IMS Connect configuration file.

APPL
Displays the RACF APPL name for PassTicket and data store access control, as specified by the APPL= keyword in the IMS Connect configuration file.

CASCADE
Displays the CASCADE value that is specified in the data store definition and whether the support is currently enabled. The CASCADE keyword applies to support for cascading global z/OS Resource Recovery Services transactions to an IMS TM data store that is located on a different z/OS image (LPAR) than IMS Connect.

CM0ATOQ
Displays the name of the OTMA CM0 ACK timeout queue, as specified by the CM0ATOQ= keyword in the IMS Connect configuration file.

DRU
Displays the name of the OTMA destination resolution user exit that is to be passed to OTMA, as specified by the DRU= keyword in the IMS Connect configuration file.

GROUP
Displays the name of the z/OS cross-system coupling facility (XCF) group, as specified by the GROUP= keyword in the IMS Connect configuration file. This is the XCF group to which IMS Connect and IMS OTMA belong.

LPAR
Displays the name of the z/OS image (LPAR) that the data store is running on and whether the LPAR is the same or different than the LPAR IMS Connect is running on.

MAXI
Displays the OTMA input message flood control value, as specified by the MAXI= keyword in the IMS Connect configuration file.

MEMBER
Displays the name of the IMS Connect member in the XCF group, as specified by the MEMBER= keyword in the IMS Connect configuration file.

MULTIRTP
Displays the current MULTIRTP setting in the data store connection definition. For a description of the possible values returned, see the MRTP row in Table 48 on page 163.

OAAV
Displays the current OTMA accessor environment element (ACEE) aging value, as specified by the OAAV= keyword in the IMS Connect configuration file. This value determines how frequently OTMA refreshes the security definitions that are cached in an ACEE for IMS Connect.

RRNAME
Displays the name of an alternate destination specified in a client reroute request, as specified by the RRNAME= keyword in the IMS Connect configuration file.

SMEM
Displays the OTMA super member name, as specified by the SMEMBER= keyword in the IMS Connect configuration file.
STATE
Displays the state of the OTMA server. For a description of the possible state returned, see the STATE keyword in Table 48 on page 163.

STATUS
Displays the status of the data store. For a description of the possible state returned, see the STATUS keyword in Table 48 on page 163.

TMEM
Displays the name of the IMS OTMA member in the XCF group, as specified by the TMEMBER= keyword in the IMS Connect configuration file.

SMEM
Selects data stores for display that have one of the specified super member names specified. You can specify a single super member name or a list of super member names separated by commas. Wildcards can be used in the names.

STATE
Selects data stores for display that are in at least one of the specified states. The filters supported with the STATE keyword, which can be specified in any order, are:

AVAIL
Selects data stores that have a state of AVAIL, which means that the OTMA server is available.

WARN
Selects data stores that have a state of WARN, which means that the OTMA server has one or more resources in warning state.

SEVERE
Selects data stores that have a state of SEVERE, which means that the OTMA server is experiencing some severe resource issues.

STATUS
Selects data stores for display that possess at least one of the specified statuses. The filters supported with the STATUS keyword, which can be specified in any order, are:

ACTIVE
Selects data stores that have a status of ACTIVE, which means that the data store is connected and active.

DISCONNECT
Selects data stores that have a status of DISCONNECT, which means that the data store resource in IMS Connect is properly started, but actual communications with IMS are not currently available.

NOTACTIVE
Selects data stores that have a status of NOTACTIVE, which means that the data store resource has been stopped in IMS Connect.

Usage notes

You can issue the QUERY IMSCON TYPE(DASTORE) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.
Equivalent WTOR and z/OS commands

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(DATASTORE) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 47. WTOR and IMS Connect z/OS equivalents for the QUERY IMSCON TYPE(DATASTORE) command

</tbody>
</table>

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Table 48. Output fields for the QUERY IMSCON TYPE(DATASTORE) command

</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(DATASTORE) command are standard for all commands entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 49. Return and reason codes for the QUERY IMSCON TYPE(DA TASTORE) command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(DA TASTORE) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

**Table 50. Completion codes for the QUERY IMSCON TYPE(DA TASTORE) command**

<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY IMSCON TYPE(DA TASTORE) command completed successfully for the resources.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If a wildcard was specified in the command, there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

**Examples**

**Example 1: QUERY IMSCON TYPE(DA TASTORE) SHOW(ALL)**

In the following example, IMS1 and IMSA represent two data stores defined in the IMS Connect configuration file. NAME is omitted, so IMS Connect displays all data stores (the default is NAME(*)).

**TSO SPOC input:**

QUERY IMSCON TYPE(DA TASTORE) SHOW(ALL)

**TSO SPOC output:**

```
Datastore MbrName CC XCFGroup Member TMember State Status
IMS1 HWS1 0 XCFGRP1 HWS1 IMS1 AVAIL ACTIVE
IMSA HWS1 0 XCFGRP1 HWSA IMSA N/A DISCONNECT
```

Example 2: QUERY IMSCON TYPE(DATASTORE) SHOW(CASCADE, LPAR)

In the following example, the QUERY IMSCON TYPE(DATASTORE) SHOW(CASCADE, LPAR) is issued to show which IMS data store connections support the cascading of global RRS (synchlevel=syncpoint) transactions.

The specification of LPAR on the SHOW() keyword displays the z/OS image (LPAR) that each IMS data store is running on. If the IMS data store is on the same z/OS image as IMS Connect, cascaded transaction support is not needed and is therefore disabled.

For data store IMS1, the "Y" in the Cascade column indicates that cascaded transaction support is specified in the definition of the data store connection. The support is enabled, as indicated by ENABLED in the CascadeStatus column, because the IMS data store and IMS Connect are running on different LPARs.

For data store IMS2, cascaded transaction support is not explicitly enabled or disabled in the definition of the data store connection. Support is determined by the default setting that is specified for IMS Connect, which can be determined with the QUERY IMSCON TYPE(CONFIG) SHOW(CASCADE) command. However, because the IMS data store and IMS Connect are running on the same LPAR, support is disabled.

For data store IMS3, cascaded transaction support is explicitly turned off (CASCADE=N) in the definition of the data store connection. Therefore, even though the IMS data store and IMS Connect are running on different LPARs, support for cascaded transactions is disabled.

TSO SPOC input:
QUERY IMSCON TYPE(DATASTORE) SHOW(CASCADE, LPAR)
TSO SPOC output:

<table>

Related reference:

- VIEWDS command (Commands)
QUERY IMSCON TYPE(IMSPLEX) command

Use the QUERY IMSCON TYPE(IMSPLEX) command to display the status and activity of the IMSpex.

An IMSpex is primarily defined with the IMSPLEX configuration statement in the IMS Connect configuration file. An IMSpex can also be defined using the IMSPLEX keyword in either the ODACCESS or MSC configuration statement in the IMS Connect configuration file.

Subsections:
- "Environment"
- "Syntax"
- "Keywords"
- "Usage notes" on page 172
- "Equivalent WTOR and z/OS commands" on page 173
- "Output fields" on page 173
- "Return, reason, and completion codes" on page 174
- "Examples" on page 175

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
QUERY QRY IMSCON TYPE(IMSPLEX)
   NAME(*), NAME(imsplex_name*),
   SHOW(ALL), MEMBER STATUS,
   STATUS(ACTIVE, DISCONNECT, NOTACTIVE)
```

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(IMSPLEX) command.
NAME
Specifies one or more IMSplex names to be displayed. The IMSplex name is defined in the TMEMBER parameter of the IMSplex configuration statement in the IMS Connect configuration file.

You can specify a single IMSplex name or a list of IMSplex names separated by commas. Wildcards can be used in the names. You can specify NAME(*) to display all IMSplex resources. NAME(*) is the default.

SHOW
Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the IMSplex name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

ALL
Displays all output fields.

MEMBER
Displays the name of the IMS Connect member in the IMSplex, as specified by the MEMBER= keyword in the IMSPLEX statement in the IMS Connect configuration file.

STATUS
Displays the status of the IMSplex. For a description of the possible state returned, see the STATUS keyword in Table 52 on page 173.

If the IMSplex goes down, IMS Connect is notified (through SCI) of the status of the IMSplex. When the IMSplex is brought back up and restarted, IMS Connect is notified and automatically reconnects to the IMSplex.

STATUS
Selects IMSplex resources for display that possess at least one of the specified statuses. The filters supported with the STATUS keyword, which can be specified in any order, are:

ACTIVE
Selects IMSplex resources that have a status of ACTIVE, which means that the IMSplex is connected and active.

DISCONNECT
Selects IMSplex resources that have a status of DISCONNECT, which means that SCI is not active so that communication between IMS Connect and the IMSplex is currently not available.

NOTACTIVE
Selects IMSplex resources that have a status of NOTACTIVE, which means that communication between IMS Connect and the IMSplex is stopped.

Usage notes
You can issue the QUERY IMSCON TYPE(IMSPLEX) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.
Equivalent WTOR and z/OS commands

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(IMSPLEX) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(IMSPLEX) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 53. Return and reason codes for the QUERY IMSCON TYPE(IMSPLEX) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(IMSPLEX) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.
Table 54. Completion codes for the QUERY IMSCON TYPE(IMSPLEX) command

</cmd>
```

Chapter 5. QUERY commands 175
Explanation: PLEX1 and PLEX2 represent two IMSplex resources defined in the IMS Connect configuration file. NAME is omitted, so IMS Connect displays all IMSplex resources (the default is NAME(*)).

Related concepts:
- How to interpret CSL request return and reason codes (System Programming APIs)

Related reference:
- VIEWIP command (Commands)

QUERY IMSCON TYPE(ISC) command

Use the QUERY IMSCON TYPE(ISC) command to display the status and attributes of one or more ISC links that are defined to IMS Connect.

An ISC link represents the connection between an ISC node in IMS and a remote CICS subsystem. An ISC link in IMS Connect and an ISC node in IMS have a one-to-one relationship.

An ISC link can support multiple ISC parallel sessions (ISCUSERS). ISCUSERs are displayed only when they are active.

Subsections:

</table>

Keywords

The following keywords are valid for the `QUERY IMSCON TYPE(ISC)` command.

**ISCUSER**

This filter selects ISC link resources for display that have one of the specified ISC parallel sessions (ISCUSERs) defined. You can specify a single ISCUSER name, a wildcard name, or a list of ISCUSER names separated by commas.

Only those ISC link resources that have a specified ISCUSER are displayed. ISC link resources that match the `NAME()` parameter, but that do not have the specified ISCUSER, are not displayed.

When the ISCUSER filter is specified, ISCUSER information is displayed even if `SHOW(ISCUSER)` is not specified.

Only those ISCUSERs that match the names specified by the ISCUSER filter are displayed. ISCUSERs that are associated with the ISC link that do not match the filter are not displayed.

**IUSTATUS**

This filter selects ISC link resources for display that have at least one ISC parallel session (ISCUSER) that is in the specified state.
The parameter supported with the IUSTATUS keyword is:

**ACTIVE**
This ISCUSER is active.

Only those ISC links that have an ISCUSER that is in the specified state are displayed. ISC links that match the NAME() parameter, but that do not have such an ISCUSER, are not displayed.

When the IUSTATUS filter is specified, ISCUSER information is displayed even if SHOW(ISCUSER) is not specified.

Only those ISCUSERs that are in the specified state are displayed. ISCUSERs that are not in the specified states are not displayed.

**NAME**
Specifies one or more ISC links to be displayed. You can specify a single ISC link name or a list of ISC link names separated by commas. Wildcards can be used in the name.

You can specify NAME(*) to display all ISC link definitions. NAME(*) is the default.

If the NAME keyword is omitted, then all ISC link resources are displayed.

**SHOW**
Specifies the optional output fields to be displayed.

Certain output fields that are always displayed, even when they are not specified in the SHOW keyword. Output fields that are always displayed include the ISC link name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**
Displays all output fields.

**CICSAPPL**
Displays the APPLID of the remote CICS subsystem, as defined to IMS Connect on the CICSAPPL parameter of the ISC configuration statement. This value matches the APPLID value defined to CICS on the APPLID parameter of the DFHSITxx member.

**CICSNETID**
Displays the network ID of the remote CICS subsystem.

**CICSPORT**
Displays the port on which an ISC link receives transactions and data replies from CICS. This receive port is defined in IMS Connect on the CICSPORT keyword in both the TCPIP and ISC configuration statements. This port number must be specified to the CICS subsystem on the PORT keyword of the IPCONN resource definition.

**HOSTNAME**
Displays the host name of the remote CICS subsystem. The host name of a remote CICS is defined in the RMTCICS parameter of the ISC statement in the IMS Connect configuration member.

**IMSPLEX**
Displays the name of the IMSplex, as defined in the TMEMBER subparameter of the IMSPLEX parameter of the ISC statement in the IMS Connect configuration member.
IPADDR
Displays the IP address of the remote CICS subsystem.

IPMEMBER
Displays the IMSplex member name, as defined in the MEMBER subparameter of the IMSPLEX parameter of the ISC statement in the IMS Connect configuration member. This is the IMS Connect member name registered to the IMSplex.

ISCUSER
Display information and status for the ISC parallel sessions (ISCUSERs) that are active on the specified ISC link. If the ISC link has one or more active ISCUSERs, the command output includes information about each ISCUSER. A separate output line is displayed for each ISCUSER. This is in addition to any output lines that display general ISC link information. If there are no active ISCUSERs, then no additional output line is displayed.

Information displayed for the ISCUSER includes:
• The name of the ISCUSER.
  For ISC terminals that are statically defined in IMS, the ISCUSER name is derived from the NAME keyword of the IMS SUBPOOL stage-1 system definition macro. For ISC terminals that are dynamically defined in IMS gen, the ISCUSER name is derived from the USER keyword on the /OPNDST NODE command.
• The receive client name, which is the client name that IMS Connect assigns to the receive socket for this ISCUSER.
• The send client name, which is the client name that IMS Connect assigns to the send socket for this ISCUSER.
• The status or state of the ISCUSER. The possible states of an ISCUSER can be:
  ACTIVE
  The ISCUSER is active.

LCLIMS
Displays the name of the local IMS as defined in the LCLIMS parameter of the ISC statement in the IMS Connect configuration member.

NODE
Displays the ISC node names as they are defined to IMS Connect and the local IMS system. Node names are defined to IMS Connect on the NODE parameter of the ISC statements that define the ISC links.

PORT
Displays the port on which the remote CICS subsystem receives transactions and data replies from IMS Connect on this ISC link. This port is defined in CICS on the PORT keyword of the TCPIPSERVICE resource definition. This port is specified in IMS Connect on the PORT keyword of the RMTCICS statement that defines the connection to the remote CICS subsystem.

RMTCICS
Displays the name of the remote CICS connection as defined in the RMTCICS parameter of the ISC statement in the IMS Connect configuration member.

STATUS
Displays the status of the ISC link. The status can be one of the following:
**ACTIVE**
The link is active.

**DISCONNECT**
The link is active, but communication with IMS is not currently available because IMS or SCI has terminated, or the IMSpex datastore associated with the ISC link has been stopped.

**NOTACTIVE**
The link is not active.

For a description of the possible state returned, see the STATUS keyword in Table 55 on page 181.

**SUMMARY**
Displays summary information related to the ISC parallel sessions (ISCUSERs) that are active on the ISC link. To view specific ISCUSER information, specify the ISCUSER parameter in addition to the SUMMARY parameter.

Information displayed includes:
- Total number of ISCUSERs active on the ISC link.
- Total number of ISCUSERs in ACTIVE state.
- Total number of ISCUSERs not in any of these states.

**STATUS**
Selects ISC links for display that possess at least one of the specified statuses.

When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

**ACTIVE**
Selects ISC links that have a status of ACTIVE.

**DISCONNECT**
Selects ISC links that have a status of DISCONNECT.

**NOTACTIVE**
Selects ISC links that have a status of NOTACTIVE.

**Usage notes**

You can issue the QUERY IMSCON TYPE(ISC) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSpex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each ISC link definition being displayed. However, if SHOW(ISCUSER) or ISCUSER(iscuser_name) is specified, an additional line is displayed for each ISC parallel sessions (ISCUSERs) associated with the specified ISC link definition that matches the ISCUSER() filter.
Equivalent WTOR and z/OS commands

The QUERY IMSCON TYPE(ISC) command does not have any equivalent WTOR or z/OS MODIFY commands.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(ISC) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 56. Return and reason codes for the QUERY IMSCON TYPE(ISC) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(ISC) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C000008'</td>
<td>X'00002004'</td>
<td>An invalid keyword or keyword parameter was specified.</td>
</tr>
<tr>
<td>X'0C000008'</td>
<td>X'00002014'</td>
<td>An invalid character was specified in the NAME() parameter.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>

</tr>
</tbody>
</table>

**Examples**

In the following example, IMS1CIC4 is the ID of the ISC statement that defines the ISC link to IMS Connect. The link is between a local IMS system that is name IMS1 and a remote CICS system that is identified by its APPLID: CICS1.

The TCP/IP connection to the CICS subsystem is defined by a RMTCICS statement. The ID of the RMTCICS statement is CICS4.

In IMS, the connection is identified by its ISC node name, CIC4.

Two parallel sessions are active on the ISC link: CIC4U07 and CIC4U08.

Chapter 5. QUERY commands 185
QUERY IMSCON TYPE(ISCUSER) command

Use the QUERY IMSCON TYPE(ISCUSER) command to display the current status of one or more ISC parallel sessions that are active in IMS Connect.

You specify the ISC parallel sessions that you need to display by the user name of the parallel session. The ISC parallel session is associated with an ISC link. ISC links are defined to IMS Connect by ISC statements in the IMS Connect configuration member.

Subsections:
- “Environment”
- “Syntax” on page 187
- “Keywords” on page 187
- “Usage notes” on page 190
- “Equivalent WTOR and z/OS commands” on page 190
- “Output fields” on page 190
- “Return, reason, and completion codes” on page 192
- “Examples” on page 193

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.
Syntax

```
QUERY IMSCON TYPE(ISCUSER)
   NAME(*)
   NAME(iscuser_id)
   SHOW(ALL)
   STATUS(ACTIVE)
```

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(ISCUSER) command.

**NAME**

Specify the ISC user names (ISCUSER) of the parallel sessions that you need to display. You can specify one or more ISC user names separated by commas. Wildcards can be used in the name.

The ISC user names that you specify must match the user names that were used when the parallel session was started.

If the ISC terminals were statically defined in IMS, the user names are defined on the NAME keyword of the SUBPOOL macro.

If the ISC terminals are dynamically defined and the parallel session was started from IMS, the user name is defined on the USER keyword of the /OPNDST NODE command that started the session. If the parallel session of a dynamically defined terminal is started from CICS, the user name is defined on the NAME and APPLID parameters of the IPCONN resource definition.

You can specify NAME(*) to display all ISCUSER resources. NAME(*) is the default.

If the NAME keyword is omitted, all ISCUSER resources are displayed.

**SHOW**

Specifies the optional output fields to be displayed.
Certain output fields that are always displayed, even when they are not specified in the SHOW keyword. Output fields that are always displayed include the ISCUSER name, the name of the IMS Connect that processes the command, and the completion code.

The SHOW keyword supports the following parameters, which can be specified in any order:

**ALL**
- Displays all output fields.

**CICSAPPL**
- Displays the APPLID of the remote CICS subsystem, as defined to IMS Connect on the CICSAPPL parameter of the ISC configuration statement. This value matches the APPLID value defined to CICS on the APPLID parameter of the DFHSIT<xx> member.

**CICSNETID**
- Displays the network ID of the remote CICS subsystem.

**CICSPORT**
- Displays the port on which an ISC link receives transactions and data replies from CICS. This receive port is defined in IMS Connect on the CICSPORT keyword in both the TCPIP and ISC configuration statements. This port number must be specified to the CICS subsystem on the PORT keyword of the IPCONN resource definition.

**HOSTNAME**
- Displays the host name of the remote CICS subsystem. The host name of a remote CICS is defined in the RMTCICS parameter of the ISC statement in the IMS Connect configuration member.

**IMSPLEX**
- Displays the name of the IMSplex, as defined in the TMEMBER subparameter of the IMSPLEX parameter of the ISC statement in the IMS Connect configuration member.

**IPADDR**
- Displays the IP address of the remote CICS subsystem.

**IPMEMBER**
- Displays the IMSplex member name, as defined in the MEMBER subparameter of the IMSPLEX parameter of the ISC statement in the IMS Connect configuration member. This is the IMS Connect member name registered to the IMSplex.

**ISC**
- Displays the name of the ISC link that is associated with the ISCUSER, as defined by the ID parameter of the ISC statement in the IMS Connect configuration member.

**ISTATUS**
- Displays the status of the ISC terminal. The status can be one of the following:
  - **ACTIVE**
    - The terminal is active.
  - **NOTACTIVE**
    - The terminal is not active.
**LCLIMS**
Displays the name of the local IMS as defined in the LCLIMS parameter of the ISC statement in the IMS Connect configuration member.

**NODE**
Displays the ISC node names as they are defined to IMS Connect and the local IMS system. Node names are defined to IMS Connect on the NODE parameter of the ISC statements that define the ISC links.

**PORT**
Displays the port on which the remote CICS subsystem receives transactions and data replies from IMS Connect on this ISC link. This port is defined in CICS on the PORT keyword of the TCPIPSERVICE resource definition. This port is specified in IMS Connect on the PORT keyword of the RMTCICS statement that defines the connection to the remote CICS subsystem.

**RECVCLNT**
Displays the receive client name that identifies the socket on which IMS receives transactions and reply data from the remote CICS subsystem for this ISC parallel session (ISCUSER). The receive client name is randomly generated by IMS Connect and persists only while the ISC parallel session is active. Receive client names for ISC parallel sessions start with the characters “ISC”.

**RMTCICS**
Displays the name of the remote CICS connection as defined in the RMTCICS parameter of the ISC statement in the IMS Connect configuration member.

**SENDCLNT**
Displays the send client name that identifies the socket that IMS uses to send transactions and reply data to the remote CICS subsystem for this ISC parallel session (ISCUSER). The send client name is randomly generated by IMS Connect and persists only while the ISC parallel session is active. Send client names for ISC parallel sessions start with the characters “ISC”.

**STATUS**
Displays the status of the ISCUSER. The status can be one of the following:

**ACTIVE**
The ISCUSER is active.

For a description of the possible state returned, see the STATUS keyword in Table 58 on page 190.

**STATUS**
This filter selects ISCUSER resources for display that possess at least one of the specified statuses.

When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

**ACTIVE**
Selects ISC links that have a status of ACTIVE.
### Usage notes

You can issue the QUERY IMSCON TYPE(ISCUSER) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

This command results in one output display line for each ISCUSER that is displayed.

### Equivalent WTOR and z/OS commands

The QUERY IMSCON TYPE(ISCUSER) command does not have any equivalent WTOR or z/OS MODIFY commands.

### Output fields

**Short label**  
Contains the short label that is generated in the XML output.

**Long label**  
Contains the column heading displayed on the TSO SPOC screen.

**Keyword**  
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. *error* appears for output fields that are returned only in the case of an error.

**Meaning**  
Provides a brief description of the output field.

<table>

- “Examples” on page 201

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax
**Keywords**

The following keywords are valid for the QUERY IMSCON TYPE(LINK) command.

**NAME**

Specifies one or more MSC logical links to be displayed. You can specify a single MSC logical link name or a list of MSC logical link names separated by commas. Wildcards can be used in the names.

You can specify NAME(*) to display all MSC logical link definitions. NAME(*) is the default.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the MSC logical link name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Displays all output fields.

**GENIMSID**

Displays the name of the generic IMS as defined in the GENIMSID parameter of the MSC statement in the IMS Connect configuration member. If there is any active MSC logical link, specifying this keyword also displays the IMS ID that the MSC logical link has affinity with.

**HOSTNAME**

Displays the host name of the remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.
IMSPLEX
Displays the name of the IMSplex, as defined in the TMEMBER subparameter of the IMSPLEX parameter of the MSC statement in the IMS Connect configuration member.

IPADDR
Displays the IP address of the remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

IPMEMBER
Displays the IMSplex member name, as defined in the MEMBER subparameter of the IMSPLEX parameter of the MSC statement in the IMS Connect configuration member. This name is the IMS Connect member name registered to the IMSplex.

LCLIMS
Displays the name of the local IMS as defined in the LCLIMS parameter of the MSC statement in the IMS Connect configuration member.

MSC
Displays the name of the MSC physical link associated with this logical link, as defined by the MSC statement in the IMS Connect configuration member.

MSTATUS
Displays the status of the MSC physical link associated with the logical link. The status can be either ACTIVE or NOT ACTIVE.

PARTNER
Displays the name of the partner ID associated with the logical link.

PORT
Displays the port of the associated remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

RECVCLNT
Displays the receive client name, which is the name of the client ID of the remote IMS Connect that this IMS Connect receives messages from for this logical link.

RMTIMS
Displays the name of the remote IMS as defined in the RMTIMS parameter of the MSC statement in the IMS Connect configuration member.

RMTIMSCON
Displays the name of the remote IMS Connect connection as defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

RMTPLKID
Displays the name of the remote MSC physical link ID as defined in the RMTPLKID parameter of the MSC statement in the IMS Connect configuration member.

SENDCLNT
Displays the send client name, which is the name of the client ID that IMS Connect uses to send messages to the remote IMS Connect for this logical link.
**STATUS**
Displays the status of the logical link. The status can be **ACTIVE**, which indicates that the logical link is active.

**STATUS**
Selects logical links for display that possess the following status. When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified. The filter supported with the STATUS keyword is:

**ACTIVE**
Selects logical links that have a status of **ACTIVE**.

**Usage notes**

You can issue the QUERY IMSCON TYPE(LINK) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of **ACTIVE**.

**Equivalent WTOR and z/OS commands**

There are no equivalent WTOR and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(LINK) command.

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the column heading displayed on the TSO SPOC screen.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. **error** appears for output fields that are returned only in the case of an error.

**Meaning**
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(LINK) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 62. Return and reason codes for the QUERY IMSCON TYPE(LINK) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(LINK) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

**QUERY IMSCON TYPE(MSC) command**

Use the QUERY IMSCON TYPE(MSC) command to display the status of one or more MSC physical links defined to IMS Connect.

Subsections:
- "Environment"
- "Syntax"
- "Keywords" on page 204
- "Usage notes" on page 206
- "Equivalent WTOR and z/OS commands" on page 206
- "Output fields" on page 207
- "Return, reason, and completion codes" on page 209
- "Examples" on page 210

**Environment**

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**
Keywords

The following keywords are valid for the QUERY IMSCON TYPE(MSC) command.

**LINK**
Selects MSC physical link resources for display that have one of the specified logical links defined. You can specify a single logical link name or a list of logical link names separated by commas. Wildcards can be used in the names.

Only those MSC physical link resources that have a specified logical link are displayed. MSC physical link resources that match the NAME() parameter, but do not have the specified logical link, are not displayed.

When the LINK filter is specified, logical link information is displayed even if SHOW(LINK) is not specified. Logical links that match the names specified by the LINK filter are displayed. Logical links that are associated with the MSC physical link, but which do not match the filter, are not displayed.

**LSTATUS**
Selects MSC physical link resources for display that have at least one logical link that is in the following state:

**ACTIVE**
This logical link is active.

MSC physical links that match the NAME() parameter, but do not have such a logical link, are not displayed.

When the LSTATUS filter is specified, logical link information is displayed even if SHOW(LINK) is not specified. Logical links that are in this state are displayed.

**NAME**
Specifies one or more MSC physical links to be displayed. You can specify a single MSC physical link name or a list of MSC physical link names separated by commas. Wildcards can be used in the name.

You can specify NAME(*) to display all MSC physical link definitions. NAME(*) is the default.

**SHOW**
Specifies the optional output fields to be displayed. Output fields that are...
always displayed, regardless of whether SHOW is specified, include the MSC physical link name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**
Displays all output fields.

**GENIMSID**
Displays the name of the generic IMS as defined in the GENIMSID parameter of the MSC statement in the IMS Connect configuration member. If there is any active MSC logical link, specifying this keyword also displays the IMS ID that the MSC logical link has affinity with.

**HOSTNAME**
Displays the host name of the remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

**IMSPLEX**
Displays the name of the IMSplex, as defined in the TMEMBER subparameter of the IMSPLEX parameter of the MSC statement in the IMS Connect configuration member.

**IPADDR**
Displays the IP address of the remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

**IPMEMBER**
Displays the IMSplex member name, as defined in the MEMBER subparameter of the IMSPLEX parameter of the MSC statement in the IMS Connect configuration member. This is the IMS Connect member name registered to the IMSplex.

**LCLIMS**
Displays the name of the local IMS as defined in the LCLIMS parameter of the MSC statement in the IMS Connect configuration member.

**LINK**
Displays information and status for logical links associated with the specified MSC physical link. If the MSC physical link has one or more associated logical links, the command output includes information about each logical link. A separate output line is displayed for each logical link. This output line is in addition to any output lines that display general MSC physical link information. If there are no logical links, no additional output line is displayed.

Information displayed for the logical link includes:

- The name of the logical link.
- The name of the partner ID.
- The receive client name, which is the name of the client ID of the remote IMS Connect that this IMS Connect receives messages from for this logical link.
- The send client name, which is the name of the client ID that IMS Connect uses to send messages to the remote IMS Connect for this logical link.
- Status or state of the logical link, which is the following:
ACTIVE
This logical link connection is active.

PORT
Displays the port of the associated remote IMS Connect. The remote IMS Connect is defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

RMTIMS
Displays the name of the remote IMS as defined in the RMTIMS parameter of the MSC statement in the IMS Connect configuration member.

RMTIMSCON
Displays the name of the remote IMS Connect connection as defined in the RMTIMSCON parameter of the MSC statement in the IMS Connect configuration member.

RMTPLKID
Displays the name of the remote MSC physical link ID as defined in the RMTPLKID parameter of the MSC statement in the IMS Connect configuration member.

STATUS
Displays the status of the MSC physical link. For a description of the possible state returned, see the STATUS keyword in Table 65 on page 207.

STATUS
Selects MSC physical links for display that possess at least one of the specified statuses. When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified. The filters supported with the STATUS keyword, which can be specified in any order, are:

ACTIVE
Selects MSC physical links that have a status of ACTIVE.

NOTACTIVE
Selects MSC physical links that have a status of NOTACTIVE.

Usage notes
You can issue the QUERY IMSCON TYPE(MSC) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each MSC physical link definition being displayed. However, if the SHOW(LINK) keyword is specified, an additional line is displayed for each logical link associated with the specified MSC definition.

Equivalent WTOR and z/OS commands
The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(MSC) command.

Notes:
• IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

**Table 64. WTOR and IMS Connect z/OS equivalents for the QUERY IMSCON TYPE(MSC) command**

<table>

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the column heading displayed on the TSO SPOC screen.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

**Meaning**
Provides a brief description of the output field.

**Table 65. Output fields for the QUERY IMSCON TYPE(MSC) command**

<table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(MSC) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 66. Return and reason codes for the QUERY IMSCON TYPE(MSC) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(MSC) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Chapter 5. QUERY commands 211
Explanation: MSC12 is a valid MSC physical link definition. It is currently active, with three associated logical links. Two of the logical links are currently active.

Related concepts:
- How to interpret CSL request return and reason codes (System Programming APIs)

Related reference:
- MSC statement (System Definition)

QUERY IMSCON TYPE(ODBM) command

Use the QUERY IMSCON TYPE(ODBM) command to display the status, alias, and activity of one or more ODBMs defined to IMS Connect.

Subsections:
- "Environment"
- "Syntax"
- "Keywords" on page 213
- "Usage notes" on page 214
- "Equivalent WTOR and z/OS commands" on page 215
- "Output fields" on page 215
- "Return, reason, and completion codes" on page 216
- "Examples" on page 217

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
QUERY QRY_Imsc Type(ODBM) NAME(*)
    NAME(odbm_name*)
    ALIAS(alias_name*)
    ASTATUS(ACTIVE NOTACTIVE)
```
Keywords

The following keywords are valid for the QUERY IMSCON TYPE(ODBM) command.

**ALIAS**

Selects ODBM resources for display that have one of the specified aliases defined on the port. You can specify a single alias name, or a list of alias names separated by commas. Wildcards can be used in the names.

Only those ODBM resources that have a specified alias are displayed. ODBMs that match the NAME() parameter, but do not have the specified alias, are not displayed.

When the ALIAS filter is specified, alias information is displayed even if SHOW(ALIAS) is not specified. Aliases that match the names specified by the ALIAS filter are displayed. Aliases that are associated with ODBM, but which do not match the filter, are not displayed.

**ASTATUS**

Selects ODBM resources for display that have at least one alias that is in one of the specified states. You can specify a single alias status, or a list of alias statuses separated by commas.

The filters supported with the ASTATUS keyword, which can be specified in any order, are:

**ACTIVE**

The alias is active.

**NOTACTIVE**

The alias is not active in IMS Connect, ODBM, or both.

Only those ODBM resources that have an alias that is in one of the specified states are displayed. ODBMs that match the NAME() parameter, but do not have such an alias, are not displayed.

When the ASTATUS filter is specified, alias information is displayed even if SHOW(ALIAS) is not specified. Aliases that are in one of the specified states are displayed.

**NAME**

Specifies one or more ODBM resources to be displayed. You can specify a single ODBM name or a list of ODBM names separated by commas. Wildcards can be used in the name.

You can specify NAME(*) to display all ODBMs. NAME(*) is the default.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the ODBM name, the name of the IMS Connect that processes the command, and the completion code.
The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**
Displays all output fields.

**ALIAS**
Displays the alias name of an IMS data store defined to the instance of ODBM. If an ODBM has one or more aliases, the command output includes information about each alias. A separate output line is displayed for each alias. This output line is in addition to any output lines that display general ODBM information. If the ODBM resource has no aliases, no additional output line is displayed.

Information displayed for the alias includes:
- Name of the alias
- Status of the alias

For a description of the possible alias status returned, see the ALIAS keyword in Table 68 on page 215.

**RRS**
Displays whether ODBM is using the z/OS Resource Recovery Services (RRS). When IMS Connect registers with ODBM, the ODBM provides IMS Connect with its RRS setting.

**STATUS**
Displays the status of the ODBM. For a description of the possible status returned, see the STATUS keyword in Table 68 on page 215.

**STATUS**
Selects ODBMs for display that possess at least one of the specified statuses. When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

**REGISTERED**
Selects ODBMs that have a status of REGISTERED, which means that this instance of IMS Connect is registered with the ODBM.

**NOTACTIVE**
Selects ODBMs that have a status of NOTACTIVE, which means that the ODBM is not active.

**Usage notes**

You can issue the QUERY IMSCON TYPE(ODBM) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each ODBM displayed. However, if the SHOW(ALIAS) keyword is specified, an additional line is displayed for each alias associated with the specified ODBM.
Equivalent WTOR and z/OS commands

There are no equivalent WTOR and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(ODBM) command.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMS CON TYPE(ODBM) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 69. Return and reason codes for the QUERY IMS CON TYPE(ODBM) command

Keywords

The following keywords are valid for the QUERY IMS CON TYPE(PORT) command.

CLIENT
Selects ports for display that have one of the specified clients active on the port. You can specify a single client name or a list of client names separated by commas. Wildcards can be used in the names.

Only those ports that have a specified client active are displayed. Ports that match the NAME() parameter, but do not have the specified client active, are not displayed.

When the CLIENT filter is specified, client information is displayed even if SHOW(CLIENT) is not specified.

Only those clients that match the names specified by the CLIENT filter are displayed. Clients that are active on the port, but which do not match the filter, are not displayed.

CSTATUS
Selects ports for display that have at least one active client that is in one of the specified states. You can specify a single client status, or a list of client statuses separated by commas.

The filters supported with the CSTATUS keyword, which can be specified in any order, are:

CONN
Waiting for output from IMS.

CONV
In a conversational state.

READ
Reading an input message from the client.

RECV
Waiting for input from the client (in other words, in a receive state).

WFCM
Waiting for confirmation (ACK, NAK, or DEALLOCATE) from the client.

XMIT
Sending data to the client.

Only those ports that have an active client that is in one of the specified states are displayed. Ports that match the NAME() parameter, but do not have such an active client, are not displayed.

When the CSTATUS filter is specified, client information is displayed even if SHOW(CLIENT) is not specified. Only those clients that are in one of the specified states are displayed.

DATASTORE
Selects ports for display that have at least one active client with a transaction submitted to the specified data store. You can specify a single data store name or a list of data store names separated by commas. Wildcards can be used in the names.

Only those ports that have an active client with a transaction submitted to the specified data store are displayed. Ports that match the NAME() parameter, but do not have such an active client, are not displayed.
When the DATASTORE filter is specified, client information is displayed even if SHOW(CLIENT) is not specified. Only those clients that have submitted a transaction to the specified data store are displayed.

**NAME**

Specifies one or more ports to be displayed. You can specify a single port number or a list of port numbers separated by commas. Wildcards can be used in the port numbers.

To display the local port used by the IMS TM Resource Adapter, specify NAME(LOCAL).

An SSL port is displayed with the character “S” appended to the end of the port number. To display the SSL port, specify the port number either with or without the character “S” appended to the end of the port number.

A port defined for ODBM use is displayed with the character “D” appended to the end of the port number. To display the ODBM port, specify the port number either with or without the character “D” appended to the end of the port number.

A port defined for an ISC link to a CICS subsystem is displayed with the character “C” appended to the end of the port number. To display a CICS port, specify the port number either with or without the character “C” appended to the end of the port number.

You can specify NAME(*) to display all ports. NAME(*) is the default.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the port number, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

- **ALL**
  
  Displays all output fields.

- **CLIENT**
  
  Displays the active client socket connections that are associated with the port. If a port has one or more active clients, the command output includes information about each client socket connection. A separate output line is displayed for each active client. This output line is in addition to any output lines that display general port information. If a port has no active clients, no additional output line is displayed.

  To view client summary information, including the total number of clients active and in various states, specify the SUMMARY filter in addition to the CLIENT filter.

Information displayed for the client includes:

- Name of the client.
  
  IMS Connect uses the client name to identify the client socket connection. The name of an IMS Connect client can be provided by the client or, if the client does not provide it, IMS Connect randomly generates the name.

- User ID passed to IMS Connect.

- If the connection is used for MSC messages, the local MSC physical link ID.
• If a connection is used for ISC messages, the ISC link ID.
• Transaction code submitted by the client.
• Data store to which the transaction was submitted.
• Number of seconds that the client has been in the specified status.
• The client port number, which is a random number that TCP/IP generates to represent a connection from a client.
• The IP address being used by the connection of the client to IMS Connect.
• The APSB token for ODBM.
• Status or state of the thread of the client. For a description of the possible client status returned, see the CLIENT keyword in Table 72 on page 224.
• The alternate client ID specified by the client that issued the RESUME TPIPE request.
• The RESUME TPIPE token of the client that issued the RESUME TPIPE request.

**EDITRTN**
Displays the name of the Port Input/Output Edit Exit routine, as defined by the EDIT= parameter of the port definition in the IMS Connect configuration file.

**KEEPAV**
Displays the amount of time a connection remains idle before the z/OS TCP/IP layer sends a packet to maintain the connection. The value displayed is specified by the KEEPAV= keyword in either the TCPIP or the ODACCESS statement in the IMS Connect configuration file.

**NUMSOC**
Displays the number of active sockets that are used on a port. The number includes the active client sockets plus one listening socket.

**STATUS**
Displays the status of the port. For a description of the possible status returned, see the STATUS keyword in Table 72 on page 224.

**SUMMARY**
Displays summary information related to the clients active on the port. To view specific client information, specify the CLIENT filter in addition to the SUMMARY filter.

Information displayed includes:
• Total number of clients active on the port
• Total number of clients in RECV state
• Total number of clients in READ state
• Total number of clients in CONN state
• Total number of clients in XMIT state
• Total number of clients not in any of these states

**TIMEOUT**
Displays the amount of time IMS Connect waits before terminating a client connection if no messages are received from the client.
STATUS
Selects ports for display that possess at least one of the specified statuses. When the STATUS keyword is specified, status information is displayed even if SHOW(STATUS) is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

ACTIVE
Selects ports that are active.

NOTACTIVE
Selects ports that are not active.

TRAN
Selects ports for display that have at least one active client with a specified transaction submitted to a data store. You can specify a single transaction name or a list of transaction names separated by commas. Wildcards can be used in the names.

Only those ports that have an active client with a specified transaction are displayed. Ports that match the NAME() parameter, but do not have such an active client, are not displayed.

When the TRAN filter is specified, client information is displayed even if SHOW(CLIENT) is not specified. Only those clients that have submitted a specified transaction are displayed.

USERID
Selects ports for display that have one of the specified user IDs active on the port. You can specify a single userid name or a list of userid names separated by commas. Wildcards can be used in the user IDs.

Only those ports that have a specified user ID active are displayed. Ports that match the NAME() parameter, but do not have the specified user ID active, are not displayed.

When the USERID filter is specified, client information is displayed even if SHOW(CLIENT) is not specified. Only those clients that have a user ID specified by the CLIENT filter are displayed. Clients that are active on the port, but which do not have a user ID that matches the filter, are not displayed.

Usage notes
You can issue the QUERY IMSCON TYPE(PORT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each port displayed. However, if the SHOW(CLIENT) keyword is specified, an additional line is displayed for each client associated with the specified port.

Equivalent WTOR and z/OS commands
The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(PORT) command.
Notes:

- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(PORT) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 73. Return and reason codes for the QUERY IMSCON TYPE(PORT) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>

```
Example 3 for QUERY IMSCON TYPE(PORT) command

In the following example, the command requests any port that has a client active with a client ID that begins with CLIENT1. Port 9999 has one such client active: CLIENT12. Other clients might be active on the port, but they are not displayed because their client IDs do not match the CLIENT keyword filter. Likewise, other ports might be in use, but because no clients match the CLIENT keyword filter, the port information is not displayed for those ports.

Although the SHOW keyword was not specified, SHOW(CLIENT) is assumed because the CLIENT keyword was specified.

In the output, the first line displays information and status related to the port. In this case, the first line only displays that it exists because no other SHOW keyword parameter was specified. The remaining line of output displays information and status for CLIENT12.

Example 5 for QUERY IMSCON TYPE(PORT) command

In the following example, the command requests information about port 9876. Because the port is defined by the CICSPOR parameter of the TCPIP and ISC statements, a C is appended to the port number.

Two client connections are active on port 9876. The client IDs start with the characters ISC, which also indicate that these clients are using ISC connections. Both clients are using an ISC connection that is defined to IMS Connect by the ISC configuration statement, IMS1CIC4.

TSO SPOC input:

QUERY IMSCON TYPE(PORT) NAME(9876) SHOW(ALL)

## QUERY IMSCON TYPE(RMTCICS) command

The QUERY IMSCON TYPE(RMTCICS) command is used to display the attributes and status of one or more ISC links to a remote CICS subsystem that is defined to IMS Connect.

- IMS Connect QUERY PORT command (Commands)
Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
QUERY IMSCON TYPE(RMTCICS)
```

```
QRY NAME(*)
```

```
NAME(RMTCICS_name*)
```

```
SCSTATUS(CONN)
```

```
SENDCLNT(sendclient_name*)
```

```
SHOW(ALL)
```

```
HOSTNAME
```

```
IPADDR
```

```
NUMSOC
```

```
PORT
```

```
SENDCLNT
```

```
SUMMARY
```

Usage notes

You can issue the QUERY IMSCON TYPE(RMTCICS) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each remote CICS definition being displayed. However, if the SHOW(SENDCLNT) keyword is specified, an additional line is displayed for each send client associated with the specified remote CICS definition.

Equivalent WTOR and z/OS commands

The QUERY IMSCON TYPE(RMTCICS) command does not have an equivalent WTOR or z/OS MODIFY command. However, the WTOR VIEWHWS command
and the z/OS MODIFY QUERY MEMBER TYPE(IMSCON) command also display some of the same attribute and status fields as the QUERY IMSCON TYPE(RMTCICS).

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(RMTCICS) command.

**NAME**
Specify the ID values from one or more RMTCICS configuration statements to display the status and attributes of the corresponding remote CICS connections. You can specify a single RMTCICS ID or a list of RMTCICS IDs separated by commas. You can use wildcards.

You can specify NAME(*) to display all RMTCICS resources. NAME(*) is the default.

**SCSTATUS**
A filter that selects remote CICS resources for display that have at least one send client that is in one of the specified states. You can specify a single send client status, or a list of send client statuses separated by commas.

The filters supported with the SCSTATUS keyword, which can be specified in any order, are:

**CONN**
This connection is in connect state. It can send messages to the remote CICS.

**RECV**
This connection is in receive state. It is waiting to receive a response from the remote CICS.

Only those remote CICS resources that have a send client that is in one of the specified states are displayed. Remote CICS resources that match the NAME() parameter, but do not have such a send client, are not displayed.

When the SCSTATUS filter is specified, send client information is displayed even if SHOW(SENDCLNT) is not specified.

**SENDCLNT**
Selects remote CICS resources for display that have one of the specified send
clients defined. You can specify a single send client name or a list of send client names separated by commas. Wildcards can be used in the names.

Only those remote CICS resources that have a specified send client are displayed. Remote CICS resources that match the NAME() parameter, but do not have the specified send client, are not displayed.

When the SENDCLNT filter is specified, send client information is displayed even if SHOW(SENDCLNT) is not specified. Only those clients that match the names specified by the SENDCLNT filter are displayed. Send clients that are associated with the remote CICS, but which do not match the filter, are not displayed.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the remote CICS name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

- **ALL**
  Displays all output fields.

- **HOSTNAME**
  Displays the host name of the remote CICS subsystem. The host name of a remote CICS is defined in the RMTCICS parameter of the ISC statement in the IMS Connect configuration member.

- **IPADDR**
  Displays the IP address of the remote CICS subsystem.

- **NUMSOC**
  Displays the current number of sockets that are being used for this remote CICS connection.

- **PORT**
  Displays the port on which the remote CICS subsystem receives transactions and data replies from IMS Connect on this ISC link. This port is defined in CICS on the PORT keyword of the TCP/IPSERVICE resource definition. This port is specified in IMS Connect on the PORT keyword of the RMTCICS statement that defines the connection to the remote CICS subsystem.

- **SENDCLNT**
  Displays information and status for the send sockets of the active parallel sessions (ISCUSERs) that are using the connection to the remote CICS subsystem. If one or more parallel sessions are active with a remote CICS, a separate output line is displayed for each parallel session. If there are no active parallel sessions, no additional output lines are displayed.

Information displayed for the send socket includes:

- The send client ID that IMS Connect randomly generates and assigns to the send socket.
- Status or state of the send socket connection, which is one of the following types:

  - **CONN**
    The send socket connection is in connect state. It can send messages to the remote CICS.
RECV  The send socket connection is in receive state. It is waiting to receive a response from the remote CICS.

- Number of seconds that this socket connection is in the specified state.
- The local port to which the send socket belongs.

STATUS
Displays the state of the remote CICS connection. For a description of the status returned, see the STATUS keyword in Table 76 on page 243.

SUMMARY
Displays summary information related to the send clients that are active on the remote CICS connection. To see specific send client information, specify the SENDCLNT parameter in addition to the SUMMARY parameter.

Information displayed includes:
- Total number of send clients that are active on the remote CICS connection
- Total number of send clients in RECV state
- Total number of send clients in CONN state
- Total number of send clients in XMIT state
- Total number of send clients that are not in any of these states

STATUS
Selects remote CICS resources for display that possess at least one of the specified statuses. When the STATUS filter is specified, status information is displayed even if SHOWSTATUS is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

ACTIVE
Selects remote CICS resources that have a status of ACTIVE, meaning that the connection to the remote CICS subsystem is active.

NOTACTIVE
Selects remote CICS resources that have a status of NOTACTIVE, meaning that the connection to the remote CICS is not active.

STOPPED
Selects remote CICS resources for which a command stopped communications between IMS Connect and the remote CICS subsystem that is identified on the NAME keyword. Any messages to be sent to the CICS subsystem that is specified on the NAME keyword are rejected and an error message is sent back to the requester.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.
### Meaning

Provides a brief description of the output field.

**Table 76. Output fields for the QUERY IMSCON TYPE(RMTCICS) command**

<table>
<thead>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(RMTCICS) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 77. Return and reason codes for the QUERY IMSCON TYPE(RMTCICS) command

<table>
<thead>
<tr>
<th>Return code</th>

<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY IMSCON TYPE(RMTCICS) command was completed successfully for the resources.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If a wildcard was specified in the command, there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

Examples

In the following example, the output shows the current status of the RMTCICS resource “ICONTT1”. The status of ICONTT1 is ACTIVE, so it can be used for ISC communication between IMS and CICS. Two send clients are shown that are associated with ICONTT1: “ISC111111” and “ISC222222”. Both send clients were created for the ISC resource “LU6TCP1” and are both in CONN state.

QUERY IMSCON TYPE(RMTIMSCON) command

Use the QUERY IMSCON TYPE(RMTIMSCON) command to display the status of one or more remote IMS Connects that are defined to IMS Connect.

Subsections:
- “Environment”
- “Syntax” on page 248
- “Keywords” on page 248
- “Usage notes” on page 251
- “Equivalent WTOR and z/OS commands” on page 251
- “Output fields” on page 252
- “Return, reason, and completion codes” on page 255
- “Examples” on page 256

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
QUERY IMSCON TYPE(RMTIMSCON)
```

**Keywords**

The following keywords are valid for the QUERY IMSCON TYPE(RMTIMSCON) command.

**NAME**

Specifies one or more remote IMS Connect resources to be displayed. You can specify a single remote IMS Connect name or a list of remote IMS Connect names separated by commas. Wildcards can be used in the names.

You can specify NAME(*) to display all remote IMS Connect resources. NAME(*) is the default.

**SCSTATUS**

Selects remote IMS Connect resources for display that have at least one send client that is in one of the specified states. You can specify a single send client status, or a list of send client statuses separated by commas.

The filters supported with the SCSTATUS keyword, which can be specified in any order, are:
**CONN**

This connection is in connect state. It can send messages to the remote IMS Connect.

**RECV**

This connection is in receive state. It is waiting to receive a response from the remote IMS Connect.

Only those remote IMS Connect resources that have a send client that is in one of the specified states are displayed. Remote IMS Connect resources that match the NAME() parameter, but do not have such a send client, are not displayed.

When the SCSTATUS filter is specified, send client information is displayed even if SHOW(SENDCLNT) is not specified. Only those send clients that are in one of the specified states are displayed.

**SENDCLNT**

Selects remote IMS Connect resources for display that have one of the specified send clients defined. You can specify a single send client name or a list of send client names separated by commas. Wildcards can be used in the names.

Only those remote IMS Connect resources that have a specified send client are displayed. Remote IMS Connect resources that match the NAME() parameter, but do not have the specified send client, are not displayed.

When the SENDCLNT filter is specified, send client information is displayed even if SHOW(SENDCLNT) is not specified. Only those clients that match the names specified by the SENDCLNT filter are displayed. Send clients that are associated with the remote IMS Connect, but which do not match the filter, are not displayed.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the remote IMS Connect name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Displays all output fields.

**APPL**

Displays the APPL name that is used to generate the RACF PassTicket. The PassTicket is then sent to the remote IMS Connect and used to authenticate the user ID.

**AUTOCONN**

Displays whether this instance of IMS Connect automatically connects to the remote IMS Connect when this instance of IMS Connect starts.

**RESVSOC**

Displays the number of send sockets available for this remote IMS Connect connection. This value is defined in the RESVSOC parameter of the RMTIMSCON statement in the IMS Connect configuration member.

**HOSTNAME**

Displays the host name of the remote IMS Connect.

**IDLETO**

Displays the idle timeout interval to keep this socket connection before closing it due to inactivity.
IPADDR
Displays the IP address of the remote IMS Connect.

NUMSOC
Displays the current number of sockets being used for this remote IMS Connect connection.

PERSISTENT
Displays whether the connections to the remote IMS Connect are persistent.

PORT
Displays the port number of the remote IMS Connect that this IMS Connect instance communicates on.

SENDCLNT
Displays information and status for active connections (send clients) to this remote IMS Connect. If this instance of IMS Connect has one or more active connections to this remote IMS Connect, the command output includes information about each connection. A separate output line is displayed for each connection. This output line is in addition to any output lines that display general remote IMS Connect information. If there are no active connections, no additional output line is displayed.

Information displayed for the send client includes:

- The client ID that this instance of IMS Connect used to connect to the remote IMS Connect.
- The user ID specified by the local IMS to be sent to the remote IMS for transaction authorization. This information is valid for OTMA messages only.
- The local MSC physical link ID that is using this connection.
- Status or state of the remote IMS Connect connection, which is one of the following:
  
  CONN
  This connection is in connect state. It can send messages to the remote IMS Connect.

  RECV
  This connection is in receive state. It is waiting to receive a response from the remote IMS Connect.

  • Number of seconds that this connection is in the specified state.
  • The port that this instance of IMS Connect used to connect to the remote IMS Connect.

STATUS
Displays the state of the remote IMS Connect. For a description of the status returned, see the STATUS keyword in Table 80 on page 252.

SUMMARY
Displays summary information related to the send clients that are active on the remote IMS Connect. To see specific send client information, specify the SENDCLNT parameter in addition to the SUMMARY parameter.

Information displayed includes:

- Total number of send clients that are active on the remote IMS Connect
- Total number of send clients in RECV state
- Total number of send clients in CONN state
- Total number of send clients in XMIT state
• Total number of send clients that are not in any of these states

**USERID**
Displays the user ID to use for generating the RACF PassTicket, which is sent to the remote IMS Connect and used to authenticate the user ID.

**STATUS**
Selects remote IMS Connect resources for display that possess at least one of the specified statuses. When the STATUS filter is specified, status information is displayed even if SHOWSTATUS is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

**ACTIVE**
Selects remote IMS Connect resources that have a status of ACTIVE, meaning that the connection to the remote IMS Connect is active. IMS Connect with this status has at least one socket connection to the remote IMS Connect identified in the RMTIMSCON field.

**NOTACTIVE**
Selects remote IMS Connect resources that have a status of NOTACTIVE, meaning that the connection to the remote IMS Connect is not active. IMS Connect with this status does not have any socket connections to the remote IMS Connect identified in the RMTIMSCON field.

**RETRYCONN**
Selects remote IMS Connect resources that have a status of RETRYCONN, meaning that IMS Connect had failed to make a connection to the remote IMS Connect and is retrying to make a connection every two minutes.

**STOPPED**
Selects remote IMS Connect resources that have a status of STOPPED. A STOPRMT command has stopped communications between this IMS Connect and the remote IMS Connect identified in the RMTIMSCON field. Any messages to be sent to the IMS Connect that is shown in the RMTIMSCON field is rejected, and an error is sent back to the requester. The STOPRMT command is equivalent to the UPD IMSCON TYPE(RMTIMSCON) NAME(...) STOP(COMM) command.

**Usage notes**

You can issue the QUERY IMSCON TYPE(RMTIMSCON) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each remote IMS Connect definition being displayed. However, if the SHOW(SENDCLNT) keyword is specified, an additional line is displayed for each send client associated with the specified remote IMS Connect definition.

**Equivalent WTOR and z/OS commands**

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(RMTIMSCON) command.
Notes:

- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect *jobname*.

Table 79. WTOR and IMS Connect z/OS equivalents for the QUERY IMSCON TYPE(RMTIMSCON) command

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. *error* appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(RMTIMSCON) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 81. Return and reason codes for the QUERY IMSCON TYPE(RMTIMSCON) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>

Chapter 5. QUERY commands
Explanation: There are two RMTIMSCON definitions in IMS Connect: CONNECT2 and CONNECT3. Each remote connection is active. CONNECT2 is used for MSC purposes and has two MSC links active. CONNECT3 is used for OTMA purposes and has four connections active.

Related concepts:

How to interpret CSL request return and reason codes (System Programming APIs)

QUERY IMSCON TYPE(SENDCLNT) command

Use the QUERY IMSCON TYPE(SENDCLNT) command to display the status and activity of one or more active send client socket connections with another instance of IMS Connect or with a CICS subsystem.

IMS Connect uses a separate receive socket on a different port to receive transactions and reply data from another IMS Connect instance or from a CICS subsystem. The QUERY IMSCON TYPE(SENDCLNT) command does not display receive client socket connections. To display information about receive client socket connections, use the QUERY IMSCON TYPE(CLIENT) command.

Subsections:

- “Environment”
- “Syntax” on page 259
- “Keywords” on page 259
- “Usage notes” on page 261
- “Equivalent WTOR and z/OS commands” on page 261
- “Output fields” on page 261
- “Return, reason, and completion codes” on page 263
- “IMS to IMS connections example” on page 264

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
QUERY IMSCON TYPE(SENDCLNT)

NAME(*),
NAME(sendclient_name)

, RMTIMSCON(rmtimscon_name)

, SHOW(ALL)

, STATUS(CONN,RECV)
```

**Keywords**

The following keywords are valid for the QUERY IMSCON TYPE(SENDCLNT) command.

**NAME**

Specifies one or more send client resources to be displayed. You can specify a single send client name or a list of send client names separated by commas. Wildcards can be used in the names.

You can specify NAME(*) to display all send client resources. NAME(*) is the default.

IMS Connect always generates the client name for connections with another IMS Connect instance or a CICS subsystem. In these cases, the first characters of the client name identify the IMS communication type. For example:

**ISC** ISC communication with a CICS subsystem

**MSC** MSC communication between IMS systems
OTM  OTMA communication between IMS systems

To display the active socket connections for one of the preceding types of IMS communication, you can specify the character identifier followed by a wildcard character. For example, NAME(MSC*), returns all IMS-to-IMS send socket connections for MSC communications.

RMTCICS
Selects send client resources for display that are associated with the specified remote CICS name, as defined on the ID keyword of the RMTCICS statement in the IMS Connect configuration member.

You can specify a single remote CICS name or a list of remote CICS names separated by commas. Wildcard characters are supported.

Only the send client resources that are associated with the specified remote CICS name are displayed. Send clients that match the NAME() parameter, but that are not associated with the specified remote CICS name, are not displayed.

When the RMTCICS filter is specified, remote CICS resource information is displayed even if SHOW(RMTCICS) is not specified.

RMTIMSCON
Selects send client resources for display that are associated with the specified remote IMS Connect definition. You can specify a single remote IMS Connect name or a list of remote IMS Connect names separated by commas. Wildcards can be used in the names.

Only those send client resources that are associated with the specified remote IMS Connect resource are displayed. Send clients that match the NAME() parameter, but are not associated with the specified remote IMS Connect name, are not displayed.

When the RMTIMSCON filter is specified, remote IMS Connect resource information is displayed even if SHOW(RMTIMSCON) is not specified.

SHOW
Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the send client name, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

ALL
Displays all output fields.

ISC
Displays the name of the Intersystem Communication (ISC) resource that this send client is associated with. This value is specified on the ID parameter of the ISC statement in the IMS Connect configuration member.

MSC
Displays the name of the Multiple Systems Coupling (MSC) physical link that this send client is associated with. This value is specified on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member.

RMTCICS
Displays the name of the remote CICS resource that this send client is associated with.
RMTIMSCON
Displays the name of the remote IMS Connect resource that this send client is associated with.

SECOND
Displays the number of seconds that this connection is in the specified state.

SENDPORT
Displays the local port of the send client socket connection.

STATUS
Displays the state of the send client connection. For a description of the status returned, see the STATUS keyword in Table 83 on page 262.

USERID
Displays the user ID specified by the local IMS to be sent to the remote IMS for transaction authorization. This field is valid for OTMA messages only.

STATUS
Selects send clients for display that possess at least one of the specified statuses. When the STATUS filter is specified, status information is displayed even if SHOW(STATUS) is not specified.

The filters supported with the STATUS keyword, which can be specified in any order, are:

CONN
Selects send client connections that have a status of CONN, meaning that the connection is in connect state.

RECV
Selects send client connections that have a status of RECV, meaning that the connection is in receive state.

Usage notes
The port number for each port displayed is repeated on each line of information that applies to that port. The first line of information for a port shows the status and statistics for the port. Each subsequent line for the port shows information about an active client socket on the port.

You can issue the QUERY IMSCON TYPE(SENDCLNT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSpex from which the commands were issued has a status of ACTIVE.

Equivalent WTOR and z/OS commands
There are no equivalent WTOR and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(SENDCLNT) command.

Output fields
Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.
**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. *error* appears for output fields that are returned only in the case of an error.

**Meaning**
Provides a brief description of the output field.

</table>
**IMS to IMS connections example**

In the following example, there are two RMTIMSCON definitions in IMS Connect: CONNECT2 and CONNECT3. Each remote connection is active. CONNECT2 is used for MSC purposes and has two MSC links active. CONNECT3 is used for OTMA purposes and has four connections active.

**TSO SPOC input:**

```
QUERY IMSCON TYPE(SENDCLNT) NAME(*) SHOW(ALL)
```

**TSO SPOC output:**

```
(Screen 1)
SendClnt MbrName CC UserID MscName Second SendPort RmtImsCon Status

ISC TCP/IP connections example

In the following example, two send clients are identified by names that begin with ISC. Both send clients are associated with the remote CICS resource CICS2 and the ISC resource IMS1CIC1.

TSO SPOC input:
QUERY IMSCON TYPE(SENDCLNT) NAME(ISC*) SHOW(ALL)

TSO SPOC output:

OM API input:
CMD ( QUERY IMSCON TYPE(SENDCLNT) NAME(ISC*) SHOW(ALL) )

OM API output:
QUERY IMSCON TYPE(UOR) command

Use the QUERY IMSCON TYPE(UOR) command to display the status and activity of one or more unit of recovery (UOR) identifiers in IMS Connect.

Subsections:
- “Environment”
- “Syntax” on page 267
- “Keywords” on page 267
- “Usage notes” on page 269
- “Equivalent WTOR and z/OS commands” on page 269
- “Output fields” on page 269
- “Return, reason, and completion codes” on page 271
- “Examples” on page 272

Environment

The QUERY IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.
Syntax

```
QUERY IMSCON TYPE(UOR) NAME(*)

NAME(uor_name)

SHOW(ALL)

STATE(FORGOTTEN)

SUMMARY

XID
```

Keywords

The following keywords are valid for the QUERY IMSCON TYPE(UOR) command.

**NAME**

Specifies one or more UOR identifiers to be displayed. You can specify a single UOR ID or a list of UOR identifiers separated by commas. Wildcards can be used in the identifiers.

You can specify NAME(*) to display all UOR identifiers. NAME(*) is the default.

**SHOW**

Specifies the optional output fields to be displayed. Output fields that are always displayed, regardless of whether SHOW is specified, include the UOR identifier, the name of the IMS Connect that processes the command, and the completion code.

The filters that are supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Displays all output fields.

**STATE**

Displays the state of the UOR. For a description of the states returned, see the STATE keyword in Table 87 on page 270.

**SUMMARY**

Displays summary information related to all UORs specified by the NAME keyword. This information is displayed on its own output line. Specific UORs are displayed on separate output lines.

Information displayed includes:
• Total number of UORs in any state.
• Total number of UORs in IN_DOUBT state.
• Total number of UORs in IN_BACKOUT state.
• Total number of UORs in IN_COMMIT state.
• Total number of UORs not in one of these states.

XID
Displays the X/Open identifier, which identifies the distributed transaction used by the X/Open architecture. The XID consists of four parts:

   FMID  4-byte fixed-format ID
   GTRID  4-byte fixed GTRID length
   BQUAL  4-byte fixed BQUAL length
        128-byte character XID

STATE
Selects UORs for display that are in at least one of the specified states.
The filters supported with the STATE keyword, which can be specified in any order, are:

FORGOTTEN
   Selects UORs for display that have a status of FORGOTTEN.
INBACKOUT
   Selects UORs for display that have a status of IN_BACKOUT.
INCOMMIT
   Selects UORs for display that have a status of IN_COMMIT.
INCOMPLETION
   Selects UORs for display that have a status of IN_COMPLETION.
INDOUBT
   Selects UORs for display that have a status of IN_DOUBT.
INEND
   Selects UORs for display that have a status of IN_END.
INFLIGHT
   Selects UORs for display that have a status of IN_FLIGHT.
INFORGET
   Selects UORs for display that have a status of IN_FORGET.
INONLYAGENT
   Selects UORs for display that have a status of IN_ONLY_AGENT.
INPREPARE
   Selects UORs for display that have a status of IN_PREPARE.
INRESET
   Selects UORs for display that have a status of IN_RESET.
INSTATECHECK
   Selects UORs for display that have a status of IN_STATE_CHECK.
Usage notes

You can issue the QUERY IMSCON TYPE(UOR) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Typically, this command results in one output display line for each UOR displayed. However, if the SHOW(SUMMARY) keyword is specified, one additional line is displayed for each specific or generic name specified by the NAME() keyword. In this line, summary totals for UORs are displayed in various states. For example, if NAME(*) is specified, IMS Connect builds one output line with a UOR name of ‘*’ to display the totals, and one additional output line for each UOR found in IMS Connect.

Equivalent WTOR and z/OS commands

The following table lists WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the QUERY IMSCON TYPE(UOR) command.

Notes:
• IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
• IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 86. WTOR and IMS Connect z/OS equivalents for the QUERY IMSCON TYPE(UOR) command

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.
### Table 87. Output fields for the QUERY IMSCON TYPE(UOR) command

</thead>
<tbody>
<tr>
<td>IN_COMMIT</td>
<td>One of the following actions occurred: * The PREPARE exit routines replied YES. * The DSRM or SDSRM told RRS to commit an IN_DOUBT UOR. * The installation used the RRS panels to commit an IN_DOUBT UOR.</td>
</tr>
<tr>
<td>IN_COMPLETION</td>
<td>The resources have been updated, and RRS has completed processing the UOR.</td>
</tr>
<tr>
<td>IN_DOUBT</td>
<td>RRS is waiting for the resource manager to tell it whether to resolve the UOR by a commit or by a backout.</td>
</tr>
<tr>
<td>IN_END</td>
<td>The resources have been updated.</td>
</tr>
<tr>
<td>IN_FLIGHT</td>
<td>The UOR can access resources and has the potential to change resources, but the changes are not committed.</td>
</tr>
<tr>
<td>IN_FORGET</td>
<td>During distributed processing, the UOR has completed, but RRS is waiting for the SDSRM to indicate how long it takes to process the log records for the UOR.</td>
</tr>
<tr>
<td>IN_ONLY_AGENT</td>
<td>Only one resource manager expressed interest in the UOR.</td>
</tr>
<tr>
<td>IN_PREPARE</td>
<td>The UOR in the proper state issues a commit, and RRS invokes the PREPARE exit routine.</td>
</tr>
<tr>
<td>IN_RESET</td>
<td>The UOR is starting and has not yet changed any resources.</td>
</tr>
<tr>
<td>IN_STATE_CHECK</td>
<td>The UOR issues a commit and waits for the STATE_CHECK exit routine of the resource manager to check if the resources are in the correct state.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSCON TYPE(UOR) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 89. Return and reason codes for the QUERY IMSCON TYPE(UOR) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSCON TYPE(UOR) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C00000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.
Table 90. Completion codes for the QUERY IMSCON TYPE(UOR) command

```
There is one UOR active in IMS Connect. The first display line includes the summary total information for all UORs that follow. The second display line represents the UOR, which includes its state and XID information. The NAME keyword is omitted, so IMS Connect displays all data stores (the default is NAME(*)).

**Related concepts:**
- How to interpret CSL request return and reason codes (System Programming APIs)

**Related reference:**
- VIEWUOR command (Commands)
- IMS Connect QUERY UOR command (Commands)

**QUERY IMSPLEX command**

Use the QUERY IMSPLEX command, which is a type-2 command, to display information about one or more IMSplex members.

**Subsections:**
- “Environment” on page 276
- “Syntax” on page 276
- “Keywords” on page 276
- “Usage notes” on page 278
- “Output fields” on page 280
- “Return, reason, and completion codes” on page 280
- “Examples” on page 282
Environment

The QUERY IMSPLEX command does not run in the address space of any IMS control or dependent region. QUERY IMSPLEX is processed in an OM command processing environment.

Syntax

```
QUERY QRY IMSPLEX
   NAME(*)
   NAME(imsplexname*)
   TYPE(
      AOP
      BATCH
      CQS
      DBRC
      IMS
      IMSCON
      ODBM
      OM
      OTHER
      REPO
      RM
      SCI
   )
   SHOW(
      ALL
      JOB
      OS
      STATUS
      SUBTYPE
      TYPE
      VERSION
   )
   STATUS(
      ABENDED
      ACTIVE
      NOTREACHABLE
      OLD
      READY
   )
```

Keywords

The following keywords are valid for the QUERY IMSPLEX command:

**NAME()**

Specifies the name of the IMSplexes for which member information is to be returned. The IMSplex name can be a generic parameter, to allow easy specification of a group of IMSplexes whose names match a generic parameter mask. For example, QUERY IMSPLEX NAME(*PLEX*).

You must include the prefix, CSL, to the name of the IMSplex for which you want member information. Add CSL in front of the IMSplex name that you specified in the IMSPLEX= parameter in the DFSCGxxx PROCLIB member. For example, if you specified IMSPLEX=PLEX1 in your DFSCGxxx member, you must specify QUERY IMSPLEX NAME(CSLPLEX1).

**SHOW()**

Specifies the output fields to be returned. If SHOW is not specified, only the IMSplex names, IMSplex member names, IMSplex member that builds the output line, and completion codes are returned. This provides a method for a
system management application to obtain a list of all IMSplex member names that are currently known in the IMSplexes.

**ALL**
Returns all output fields.

**JOB**
Job name of the IMSplex member.

**OS**
Name of the OS image on which the IMSplex member is executing.

**STATUS**
IMSplex member status.

**SUBTYPE**
IMSplex member subtype.

**TYPE**
IMSplex member type.

**VERSION**
IMSplex member version.

**STATUS()**
Displays IMSplex members that have at least one of the specified statuses.

**ABENDED**
IMSplex member has ended abnormally.

**ACTIVE**
IMSplex member is active.

**NOTREACHABLE**
The local SCI responsible for the member is not currently active. The status displayed is the current status for the member.

*Note:* The status output is NOT-REACHABLE (with a hyphen).

**OLD**
The SCI responsible for the member is not currently active. The status displayed is the last known status for the member. The actual status might be different.

**READY**
IMSplex member is ready to receive messages and requests that are routed to it by any method, including by TYPE.

**TYPE()**
Displays IMSplex members that possess at least one of the specified member types.

**AOP**
Automated Operator Program. Examples of AOPs are a SPOC application that an operator uses to interact with an IMSplex or a program that is monitoring an IMSplex.

**BATCH**
IMS batch job.

**CQS**
Common Queue Server address space.

**DBRC**
DBRC address space.
IMS
IMS region.

IMSCon
An address space that serves as an interface between IMS and a protocol that is not directly supported by IMS (for example, TCP/IP).

ODBM
Open Database Manager address space.

OM
Operations Manager address space.

OTHER
Other non-IMS address space or job.

REPO
Repository Server (RS) address space. The Repository Server information is returned if the Repository Server is registered to the Structured Call Interface (SCI) address space.

RM
Resource Manager address space.

SCI
Structured Call Interface address space.

Usage notes
This command can be issued only through the OM API.

QUERY IMSPLEX status
The following table shows the possible IMSplex member status. The table contains information about status such as the STATUS keyword to specify to select members with the specified status, the status that is returned, and the meaning of the status.

<table>
<thead>
<tr>
<th>Status keyword</th>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ABENDED</td>
<td>ABENDED</td>
<td>IMSplex member has abended.</td>
</tr>
<tr>
<td>ACTIVE</td>
<td>ACTIVE</td>
<td>IMSplex member is active.</td>
</tr>
<tr>
<td>NOTREACHABLE</td>
<td>NOT-REACHABLE</td>
<td>The local SCI responsible for the member is currently not active. The status displayed is the current status for the member.</td>
</tr>
<tr>
<td>OLD</td>
<td>OLD</td>
<td>The SCI responsible for the member is not currently active. The status displayed is the last known status for the member. The actual status might be different.</td>
</tr>
<tr>
<td>READY</td>
<td>READY</td>
<td>IMSplex member is ready to receive messages and requests that are routed to it by any method, including by TYPE.</td>
</tr>
</tbody>
</table>

QUERY IMSPLEX types
The following table shows the possible IMSplex member types. The table contains information about member types such as the TYPE keyword to specify to select members with the specified type, the type that is returned, and the meaning of the member type.
### QUERY IMSPLEX member types

</table>

Output fields

The following table shows the output fields for the QUERY IMSPLEX command. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY IMSPLEX command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 95. Return and reason codes for the QUERY IMSPLEX command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY IMSPLEX command completed successfully.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002048'</td>
<td>The QUERY IMSPLEX command has more than one filter value specified. Only one of the TYPE or STATUS filters can be specified.</td>
</tr>
<tr>

<td>An invalid keyword parameter value was specified.</td>
</tr>
<tr>
<td>X'0200000C'</td>
<td>X'00003000'</td>
<td>The QUERY IMSPLEX command is successful for at least one resource name. The QUERY IMSPLEX command is not successful for one or more resource names. The completion code indicates the reason for the error with the resource name. The completion codes that can be returned by the QUERY IMSPLEX command are listed in the QUERY IMSPLEX completion code table.</td>
</tr>
<tr>
<td>X'0200000C'</td>
<td>X'00003004'</td>
<td>No resources were found to be returned. The resource names specified might be invalid or there were no resources that match the filter specified.</td>
</tr>
<tr>
<td>X'0200000C'</td>
<td>X'00003008'</td>
<td>The QUERY IMSPLEX command was routed to multiple clients. None of the clients that processed the command returned a return code and reason code to the OM. At least one command client returned either command response data or a response message.</td>
</tr>
<tr>
<td>X'02000014'</td>
<td>X'00005020'</td>
<td>The QUERY IMSPLEX command processing terminated. OM was unable to obtain storage for a system AWE while processing the command.</td>
</tr>
<tr>
<td>X'02000014'</td>
<td>X'0000502C'</td>
<td>The QUERY IMSPLEX command processing terminated. OM was unable to obtain storage for the command output header.</td>
</tr>
<tr>
<td>X'02000014'</td>
<td>X'00005030'</td>
<td>The QUERY IMSPLEX command processing terminated. OM was unable to obtain storage for the command output response.</td>
</tr>
<tr>
<td>X'02000014'</td>
<td>X'00005040'</td>
<td>The QUERY IMSPLEX command processing terminated because of an SCI error.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

The following table contains completion codes that can be returned on a QUERY IMSPLEX command.

Table 96. Completion codes for the QUERY IMSPLEX command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The QUERY IMSPLEX command completed successfully for the resource.</td>
</tr>
<tr>
<td>4</td>
<td>The IMSplex name is unknown to the client that is processing the request. The IMSplex name might have been typed in error or the IMSplex might not be active at this time. If this is a wildcard request there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
</tbody>
</table>

</omname>
</imsout>
```
Explanation: The QUERY IMSPLEX command displays the IMSplex members that compose IMSplex CSLPLEX1. This IMSplex contains three IMS systems (IMS1, IMS2, and IMS3), a TSO SPOC (USR011), a CQS (CQSRE1), RM (RM1), and OM (OM1). OM1 is the command master that built the output.

**Example 3 for QUERY IMSPLEX command**

**TSO SPOC input:**
QUERY IMSPLEX TYPE(REPO) SHOW(ALL)

**TSO SPOC output:**
OM API input:

CMD(QUERY IMSPLEX TYPE(REPO) SHOW(ALL))

<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</imsout>

Explanation: The QUERY IMSPLEX TYPE(REPO) SHOW(ALL) command returns information about the Repository Server address spaces registered to SCI. The REPO1RP member is the master server and the REPO2RP server is the subordinate server because REPO2RP has not yet issued the SCI Ready request.

**QUERY LE command**

Use the QUERY LE command to display Language Environment® (LE) runtime parameter overrides defined by a previous UPDATE LE command. The query can use filters on transaction code, LTERM, user ID, or program name.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 287
- “Usage notes” on page 288
- “Output fields” on page 288
- “Return, reason, and completion codes” on page 288
- “Examples” on page 289

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY LE command and keywords can be issued.

*Table 97. Valid environments for the QUERY LE command and keywords*

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY LE</td>
<td>X</td>
<td>X</td>
<td>X</td>

</tr>
<tr>
<td>TRAN</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USERID</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
QUERY LE
  TRAN(tranname)
  LTERM(ltermname)
```
Keywords

The following keywords are valid for the QUERY LE command:

The parameters support a generic or wildcard parameter. A generic parameter is a 1-8 character name that includes an asterisk or a percent sign. An asterisk can be replaced by a zero or more characters to create a valid resource name. A percent sign can be replaced by exactly one character to create a valid resource name.

**LTERM()**
- Specifies the 1-8 character name of the LTERM or LTERMs matching the generic or wildcard parameter.

**PGM()**
- Specifies the 1-8 character name of the program or programs matching the generic or wildcard parameter.

**SHOW()**
- Specifies the output fields to be returned. At least one SHOW field is required on the command.
  - **ALL**
    - Returns all the output fields. This is the same as if the following was specified: SHOW(TRAN,LTERM,USERID,PGM,LERUNOPTS).
  - **LERUNOPTS**
    - Returns all of the LE override parameters associated with the transaction, LTERM, user ID, or program name.

**LTERM**
- Returns the logical terminal name field.

**PGM**
- Returns the program name field.

**TRAN**
- Returns the transaction name field.

**USERID**
- Returns the user identifier field.

**TRAN()**
- Specifies the 1-8 character name of the transaction or transactions matching the generic or wildcard parameter. If the TRAN, LTERM, USERID, or PGM resource filters are not specified, all parameter overrides are returned.

**USERID()**
- Specifies the 1-8 character name of the userid or userids matching the generic or wildcard parameter. If the TRAN, LTERM, USERID, or PGM resource filters are not specified, all parameter overrides are returned.
Usage notes

Any combination of parameters can be used to qualify the application instance. All entries found that match the criteria are returned. Specify on the command which output fields should be returned in the command response. You can ask for all information that includes transaction code, LTERM name, user ID, program name, and runtime parameters.

This command can be specified only through the Operations Manager API.

The command syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

The following table shows the QUERY LE output fields. The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY LE command. The OM return and reason codes that may be returned as a result of the QUERY LE command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 99. Return and reason codes for the QUERY LE command

<table>

<tbody>
<tr>
<td>0</td>
<td>The QUERY LE command completed successfully for the specified resource.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERY LE command:

Example 1 for QUERY LE command

Assume the following filters are specified on QRY LE commands:

1. TRAN(PART) SHOW(ALL) Returns entries #1, 2, 3, 5, 6, 8.
2. TRAN(PART) LTERM(TERM1) SHOW(ALL) Returns entries #3, 5, 6.
3. LTERM(TERM2) USERID(BETTY) SHOW(ALL) Returns entry #7.
4. TRAN(PART) LTERM(TERM1) USERID(BETTY) SHOW(ALL) Does not return any entries.
5. TRAN(PART) LTERM(TERM*) SHOW(ALL) Returns entries #3, 5, 6, 8.
6. USERID(B*) SHOW(ALL) Returns entries #2, 5, 6, 7.

Rules for matching an entry which results in it being returned on QUERY command:

- If a filter is specified on the command for a particular resource it must match the resource filter defined in the entry. The resource in the QUERY LE command may be specified with wildcards as defined previously.
- A resource filter that is not specified on a QUERY LE command will match on any filter for the specific resource defined in the entry. A non-specified filter is treated as a wildcard. For instance if the LTERM filter is not specified on a QRY LE command it will match on any LTERM resource defined in an entry, as if LTERM(*) was specified on the command.

The following table is a logical representation of the parameter override table entries prior to any of the above query commands being processed.
Table 101. Parameter override table entries for example 1

<rsn>00000000</rsn>
</ctl>
<cmd>
<master>SYS3</master>
<userid>USRT002</userid>
<verb>QRY</verb>
<kwd>LE</kwd>
<input>QRY LE SHOW(ALL)</input>
</cmd>
</cmdrsphdr>
dttype="CHAR" align="left" />
<hdr slbl="PRM" llbl="LERunOpts" scope="LCL" sort="N" key="0" scroll="YES" len="*"
dtype="CHAR" align="left" />
</cmdrsphdr>
<cmdrspdata>
<rsp>MBR(SYS3 ) CC( 0) TRAN( ) LTRM( ) UID( ) PGM(IAPMDI29)
PRM(CCCC ) </rsp>
<rsp>MBR(SYS3 ) CC( 0) TRAN(IAPMDI26) LTRM( ) UID(USRTO01) PGM( )
PRM(RPTOPTS=((ON),NOOVR),RPTSTG=((OFF),NOOVR) )</rsp>
<rsp>MBR(SYS3 ) CC( 0) TRAN(IAPMDI27) LTRM(IMS1 ) UID(USRTO01) PGM(IAPMDI27)
PRM(AAAA ) </rsp>
</cmdrspdata>
</imsout>

Explanation: The SHOW(ALL) parameter is specified, so all four filters and the runtime option string are shown for each table entry. Furthermore, no filters are specified in the command, so all table entries are shown. In this example, there are three table entries. The first specifies one filter (program) and the parameter string for this entry is CCCC. The second entry specifies two filters, trancode and user ID, and its parameter string is RPTOPTS=((ON),NOOVR),RPTSTG=((OFF),NOOVR). The last entry specifies all four filters and a parameter string of AAAA.

Example 3 for QUERY LE command

TSO SPOC input:
QRY LE SHOW(LTERM,USERID)

TSO SPOC output:
MbrName CC Lterm Userid
SYS3 0
SYS3 0 USRT001
SYS3 0 IMS1 USRT001

OM API input:
CMD(QRY LE SHOW(LTERM,USERID))

OM API output:
<imsout>
<ctl>
<omname>OM1OM </omname>
<omvsn>1.1.0</omvsn>
<xmlvsn>1 </xmlvsn>
<statime>2002.163 17:36:27.588393</statime>
<stotime>2002.163 17:36:27.589261</stotime>
<staseq>87C4C5E703729D6F</staseq>
<stoseq>87C4C5E703A8D467</stoseq>
<rqsttkn1>USRT002 10103627</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>SY S3 </master>
<userid>USRT002 </userid>
<verb>QRY </verb>
<kwd>LE </kwd>
<input>QRY LE SHOW(LTERM,USERID) </input>
</cmd>
<cmdrsphdr>
</cmdrsphdr>
<cmdrspsphdr>
<hdr slbl="MBR" llbl="MbrName" scope="LCL" sort="A" key="1" scroll="NO" len="8"
dtype="CHAR" align="left" />
<hdr slbl="CC" llbl="CC" scope="LCL" sort="N" key="0" scroll="YES" len="4"
Explanation: This command uses the SHOW parameter to limit the amount of data that is shown for each entry in the table. All three table entries are shown, but only the LTERM and TRAN filters are shown for each one. The first entry has neither an LTERM filter nor a USERID filter defined, so it is blank except for the MbrName and CC.

**Example 4 for QUERY LE command**

**TSO SPOC input:**

QRY LE USERID(USRT*) SHOW(LTERM,USERID)

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>MbrName</th>
<th>CC</th>
<th>Lterm</th>
<th>Userid</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS3</td>
<td>0</td>
<td>USRT001</td>
<td></td>
</tr>
<tr>
<td>SYS3</td>
<td>0</td>
<td>IMS1</td>
<td>USRT001</td>
</tr>
</tbody>
</table>

**OM API input:**

CMD(QRY LE USERID(USRT*) SHOW(LTERM,USERID))

**OM API output:**

```xml
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.1.0</omvsn>
<xmlvsn>1</xmlvsn>
<statime>2002.163 17:50:24.925819</statime>
<stotime>2002.163 17:50:24.926381</stotime>
<staseq>B7C49058F078B484</staseq>
<stoseq>B7C49058FAAD324</stoseq>
<rqsttkn1>USR002 10105024</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>SYS3</master>
<userid>USRT002</userid>
<verb>QRY</verb>
<kwd>LE</kwd>
<input>QRY LE USERID(USRT*) SHOW(LTERM,USERID)</input>
</cmd>
</cmdrsphdr>
```
Explanation: This command uses both the USERID filter and the SHOW parameter to limit the amount of data shown in the output. The USERID(USRT*) parameter limits the output to only those table entries that define a USERID filter that fits the specified pattern (USRT*). The SHOW parameter limits how much information is returned about each table entry in this case, only the LTERM and USERID are shown.

MSGAGE(number)
    QCNT(number)
    LE
    LT
    GE
    GT
    EQ
    NE
```

A:
The following keywor\(d s\) are valid for the QUER\(Y\) LTERM command:

**MSGAGE(\(\))**

Selects only those logical terminals that have at least one message whose message age is greater than the message age value specified. This applies only to messages in the shared message queues. The value specified is the number of days. Valid values are 0-365.

The information displayed includes the total count of messages on the queue, the count of messages with a message age greater than or equal to the message age specified, the time stamp of the oldest message, and the time stamp of the newest message.

When the MSGAGE filter is specified, the output returned includes the queue count of the LTERM even if SHOW(QCNT) is not specified, and the message age information even if SHOW(MSGAGE) is not specified.

MSGAGE(\(\)) applies only to a shared-queues environment, and is processed only by the command master IMS. It is valid only when SHOW(GLOBAL) is specified.

The OPTION keyword tells IMS whether the message queue structure (OPTION(MSGQ)) or the EMH queue structure (OPTION(EMHQ)) is to be read. OPTION(MSGQ) is the default. OPTION(EMHQ) is valid only if shared EMH is used.

The performance implication is that in order to obtain message age information, all of the shared-queues LTERM messages on the Coupling Facility must be read.

If MSGAGE(\(\)) is specified with the QCNT(\(\)) or STATUS(\(\)) filters, then IMS selects those LTERMs that match any of the specified filters (they do not need to match all specified filters).

**NAME(\(\))**

Specifies the names of one or more logical terminals that are to be displayed. Valid names are 1-8 characters, and wildcards can be specified. To display all logical terminals, specify NAME(\(\ast\)). NAME(\(\ast\)) is the default.

There are some special considerations when specifying certain specific LTERM names.
The primary and secondary MTO LTERM names may have generic names associated with them, as specified by the PMTOG and SMTOG keywords in the DFSDCxxx PROCLIB member. To display the primary or secondary MTO LTERMs on all systems, the operator should specify the generic LTERM name. When this is done, the output displayed will show the real LTERM names on each system, not the generic name.

The system console LTERM has a generic name of ‘WTOR’. When shared queues are not enabled, ‘WTOR’ is also the real name of the system console LTERM. When shared queues are enabled in a non-XRF system, the real name is the IMS system ID (IMSID). When shared queues are enabled in an XRF system, the real name is the Recoverable Service Element (RSENAME). To display the system console LTERMs on all systems, the operator should specify the generic LTERM name ‘WTOR’. When this is done, the output displayed will show the real LTERM names on each system, not the generic name.

Logical terminals associated with VTAM nodes might exist either locally, in the resource structure, or both. Logical terminals associated with the system console, SPOOL or SYSOUT devices will exist only in local systems.

**OPTION()**

Specifies additional information to process the command. This keyword is valid only with the MSGAGE() or QCNT() filter.

**MSGQ**

Specifies that queue count information should be retrieved from the shared message queue structure, or the local message queues if shared queues are not enabled (for QCNT filter only).

**EMHQ**

Specifies that queue count information should be retrieved from the expedited message handler queue structure. EMHQ is valid only when EMH queues are used.

**QCNT()**

Selects only those logical terminals that have a queue count less than (LT), less than or equal to (LE), greater than (GT), greater than or equal to (GE), equal to (EQ), or not equal to (NE) the specified number. The specified number cannot be a 1 when LT is specified, and cannot be a 0 when EQ, GE, LE, or LT is specified. Regardless of the condition specified, only LTERMs with a queue count greater than 0 are returned when the QCNT filter is specified. LTERms with a queue count of 0 are not returned.

The QCNT filter is valid in both a shared-queues environment and in a non-shared-queues environment.

In a shared-queues environment, the global queue count values are used to determine the LTERMs to be displayed. Therefore, SHOW(LOCAL) is invalid with the QCNT filter. In this environment, only the command master processes the command. All other IMS systems ignore the command. The OPTION keyword tells IMS whether the message queue structure (OPTION(MSGQ)) or the EMH queue structure (OPTION(EMHQ)) is to be read. OPTION(MSGQ) is the default. OPTION(EMHQ) is only valid if shared EMH is used. If QCNT is specified with a wildcard LTERM name, the performance implication is that all of the shared-queues LTERM messages on the Coupling Facility must be read.

In a non-shared-queues environment, the local queue count values are used to determine the LTERMs to be displayed. In this environment, the command is processed by each IMS that the command is routed to because the queues are local. Each IMS returns all of the LTERMs that it finds locally that match the
queue count filter specified. Because there is no local EMH queue count, OPTION(EMHQ) is invalid in this environment, and if specified, the command will be rejected.

When the QCNT filter is specified, the output returned includes the queue count of the LTERM, even if SHOW(QCNT) is not specified.

If QCNT() is specified with the MSGAGE() or STATUS() filters, then IMS selects those LTERMs that match any of the specified filters (they do not need to match all specified filters).

SHOW()

This specifies the LTERM output fields to be returned. If SHOW is not specified, and if none of the three keywords MSGAGE, QCNT, or STATUS is specified, then only the LTERM names are returned. This provides a method for a system management application to obtain a list of all LTERM names that are currently known in the IMSplex.

Two parameters, GLOBAL and LOCAL, are used to specify the location (global resources or local resources) where IMS should obtain the information that is to be displayed. The default is both GLOBAL and LOCAL.

The rest of the parameters are used to specify what information is displayed. The parameters supported with the SHOW keyword, which can be specified in any order, are:

- **ALL**
  Returns all of the output fields.

- **COMPONENT**
  Displays the input and output component for the LTERM. The component numbers are defined in the NAME macro, user descriptor, signon user exit (DFSSGNX0), or the /ASSIGN LTERM command, and represent the component of a terminal that is used for input or output.

- **DEFNTYPE**
  Displays the definition type that the resource was defined with. This parameter is applicable only to the MSC remote LTERM.

- **EMHQ**
  Displays the LTERM message queue count in the Expedited Message Handler (EMH) queues.

  EMHQ is valid only when the GLOBAL parameter is specified on the SHOW keyword. If GLOBAL is not specified, then the EMHQ parameter is ignored.

  EMHQ is processed only by the command master. It is ignored by all other IMS systems.

  EMHQ is valid only if shared EMH is used in a shared queues environment. Otherwise, this parameter is ignored.

- **GLOBAL**
  The GLOBAL parameter is processed by the command master only. All other IMS systems ignore this parameter. If LOCAL is not also specified, then all IMS systems other than the command master ignore the command.

  If shared queues are enabled, and global queue counts are requested, then the command master will make requests to CQS to determine the appropriate queue counts. This includes both MSGQ and EMHQ.
If sysplex terminal management is enabled, then the command master will make requests to RM to determine the appropriate global status.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

**LOCAL**

All IMS systems including the command master display local information, depending on the other SHOW parameters specified. This includes information local to the IMS processing the command.

The LOCAL parameter is processed by all IMS systems, including the command master.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

**MSGAGE**

Displays the count of messages whose ages are greater than the value specified by the MSGAGE() filter. If the MSGAGE() filter is not specified, then the value is assumed to be 0, and the count displayed is the total message queue count for the LTERM. The time stamp of the oldest and newest message on the LTERM queue is also displayed.

SHOW(QCNT) and SHOW(EMHQ) determine whether IMS reads the shared message queues, or the EMH queues. If neither is specified, then SHOW(QCNT) is assumed.

The performance implication is that in order to obtain message age information, all of the shared-queues LTERM messages on the Coupling Facility must be read.

The MSGAGE parameter is valid only in a shared-queues environment, and is ignored in all other environments. It is processed by the command master only. All other IMS systems ignore this parameter.

**MSNAME**

Displays the MSC logical link path name (msname) associated with the remote LTERM, and the remote and local system identifiers (SYSIDs). This applies only to LTERMs that are defined as MSC remote LTERMs.

**NODE**

Displays the node, if any, associated with the LTERM. For VTAM terminals, this is the terminal name. For LTERMs associated with non-VTAM devices (system console, SPOOL, SYSOUT, and TCO), IMS displays a node name of DFSLNxxx, where xxx is the line number, and the line and PTERM number of the non-VTAM device.

**OWNER**

Displays the owner of the associated user or node resource in the resource structure. This applies only when sysplex terminal management is enabled, and is only processed by the command master. All other IMS systems ignore this parameter.

The owner is the IMSID (or RSENAME for XRF systems) of the IMS system that owns the associated user or node. An IMS system owns a user
or node resource if the resource is active (the user is signed on, or the node is logged on), or an IMS system is maintaining significant status for that resource.

**Qcnt**
Displays the LTERM message queue count.

The local queue counts value returned on this command represents the messages being processed by the IMS system where this command is issued. In a shared-queues environment, do not use the local queue counts for queue evaluation purposes. The global queue counts, which are returned on this command, represent the current message queue counts on the shared queues structure.

If the LOCAL parameter is also specified on the SHOW keyword, then all IMS systems that process the command, including the command master, display the local queue count. This is valid whether or not shared message queues are enabled.

If the GLOBAL parameter is also specified on the SHOW keyword, and shared message queues are enabled, then the command master displays the global queue count on the shared message queues (MSGQ).

The local and global queue counts are displayed as separate output fields.

**Status**
Returns local and global status of the LTERM. See “QUERY LTERM status” on page 304 for a list and meaning of possible status that can be returned.

**Timestamp**
Displays the creation time (TimeCreate), last update time (TimeUpdate), last access time (TimeAccess), and last import time (TimeImport) timestamps are returned. This parameter is applicable only to the MSC remote LTERM. The time is returned in local time in the format YYYY.JJJ HH:MM:SS:TH:

- **YYYY**
  - The year
- **JJJ**
  - The Julian day (001 - 365)
- **HH**
  - The hour (01 - 24)
- **MM**
  - The minute (00 - 59)
- **SS**
  - The seconds (00 - 59)
- **TH**
  - The tenths and hundredths of a second (00 - 99)

**User**
Displays the dynamic or ISC user, if any, associated with the LTERM.

**Version**
Displays the RM version number of the LTERM resource. This is the version number assigned to the LTERM, which is assigned by MVS, and maintained by RM, when the resource is created or updated in the resource structure. VERSION applies only when sysplex terminal management is enabled. VERSION is ignored when sysplex terminal management is not enabled.
STATUS()
Selects LTERM for display that possess at least one of the specified LTERM statuses. The status might exist locally or globally if sysplex terminal management (STM) is enabled.

The STATUS filter is valid in both a sysplex terminal management environment and in a non sysplex terminal management environment.

In a sysplex terminal management environment, the status selected might exist locally, globally, or both. If sysplex terminal management is not enabled, then the status only exists locally.

If SHOW(LOCAL) is specified, then IMS will select only those LTERM with the appropriate status in the local system. The command is processed by all IMS systems, including the command master.

If SHOW(GLOBAL) is specified, and sysplex terminal management is enabled, then IMS will select only those LTERM with the appropriate status in the resource structure. The command is processed only by the command master.

If SHOW(GLOBAL) is specified, but sysplex terminal management is not enabled, then the command is rejected.

If SHOW(GLOBAL,LOCAL) is specified, which is the default, then IMS will select those LTERM with the appropriate status either locally or in the resource structure (if sysplex terminal management is enabled). The command is processed by all IMS systems. The command master processes both global and local information.

The output returned when the status filter is specified includes the status of the LTERM, even if SHOW(STATUS) is not specified.

If STATUS() is specified with the MSGAGE() or QCNT() filters, then IMS selects those LTERM that match any of the specified filters (they do not need to match all specified filters).

See "QUERY LTERM status" on page 304 to determine which filters can be used to select nodes with corresponding status.

Usage notes
The QUERY LTERM command can be specified only through the OM API.

QUERY LTERM can be issued on an XRF alternate system, but SHOW(GLOBAL) is not supported. Only local information can be displayed.

The processing of the QUERY LTERM command is different depending on whether IMS sysplex terminal management is enabled.

- If IMS sysplex terminal management is not enabled, processing is local for each system. The results of type-1 and type-2 commands are similar.
- If IMS sysplex terminal management is enabled, type-1 and type-2 command processing is similar when displaying local information. However, they differ in how global information is displayed.
- For type-1 /DISPLAY commands with IMS sysplex terminal management enabled, the command master displays information from either the resource structure or the local system, but not both. If the resource being displayed is not owned by any system or is owned by the command master, the command master displays the global resource. However, if the resource is owned by a
system other than the command master, the command master displays only the local resource, and the owning system is responsible for displaying the global resource.

- For type-2 QUERY commands with IMS sysplex terminal management enabled, the command master is the only system that displays global resource information, regardless of whether the resource is owned. In addition, the command master displays local resource information. All other IMS systems that process the command display local resource information only. This approach allows more flexibility in displaying all information in an IMSplex.

The SHOW keyword determines which IMS systems process the command, and what information is displayed.

- If SHOW(GLOBAL) is specified, then the command master displays global information, which can include the global queue count if shared queues are enabled, and status from the resource structure if sysplex terminal management is enabled (STM=YES defined in DFSDCxxx PROCLIB member). This is true whether or not the LTERM is active on any particular IMS system. All other IMS systems ignore the GLOBAL parameter with return code X'00000004' and reason code X'00001000'.

- If SHOW(LOCAL) is specified, then each IMS system to which OM routes the command (including the command master) processes the command, and displays information that is local to each system.

- If both GLOBAL and LOCAL are specified, which is the default, then both global and local information are displayed. Each IMS system to which OM routes the command, including the command master, processes the command, and displays local information. In addition to local information, the command master displays global information.

**Equivalent IMS type-1 commands**

The following table shows variations of the QUERY LTERM command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>QUERY LTERM command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY LTERM SHOW(COMPONENT)</td>
<td>/DISPLAY ASMT LTERM ltermname</td>
</tr>
<tr>
<td>QUERY LTERM SHOW(EMHQ)</td>
<td>/DISPLAY LTERM ltermname QCNT EMHQ</td>
</tr>
<tr>
<td>QUERY LTERM SHOW(MSNAME)</td>
<td>/DISPLAY LTERM ltermname</td>
</tr>
<tr>
<td>QUERY LTERM SHOW(NODE)</td>
<td>/DISPLAY ASMT LTERM ltermname</td>
</tr>
<tr>
<td>QUERY LTERM SHOW(QCNT)</td>
<td>/DISPLAY LTERM ltermname QCNT</td>
</tr>
<tr>
<td>QUERY LTERM SHOW(STATUS)</td>
<td>/DISPLAY LTERM ltermname /DISPLAY STATUS LTERM</td>
</tr>
<tr>

</tr>
</tbody>
</table>
Output fields

The following table shows the QUERY LTERM output fields. The columns in the table are:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the column heading for the output field in the formatted output.

**SHOW parameter**
Identifies the parameter on the SHOW keyword that caused the field to be generated. *Error* appears for output fields that are returned for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

**Scope**
Identifies the scope of the output field. GBL indicates that the field can be generated only by the command master when displaying global information for SHOW(GLOBAL). LCL indicates that the field can be generated by any IMS displaying local information for SHOW(LOCAL). N/A (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>SHOW parameter</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>N/A</td>
<td>Completion code. The completion code indicates whether IMS was able to process the command for the specified resource. See “Return, reason, and completion codes” on page 305 for more information. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTX</td>
<td>CCText</td>
<td>Error</td>
<td>N/A</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code. This field is returned only for an error completion code.</td>
</tr>
</tbody>
</table>
| DFNT        | LDefnType  | DEFNTYPE       | LCL   | Definition type, which can be one of the following:

- **CREATE**
  Defined by the CREATE LTERM command.
- **DFSDSCMx**
  Defined by an MSC descriptor in the DFSDSCMx member of the IMS PROCLIB data set.
- **DFSDSCTx**
  Defined by an MSC descriptor in the DFSDSCTx member of the IMS PROCLIB data set.
- **DFSINSX0**
  Defined by the user exit DFSINSX0 to represent an LTERM that is defined remotely in an IMS system in a shared-queues group.
- **MSGGEN**
  Defined by system definition in the DFSCLRx member of the IMS RESLIB. This field is applicable only to the MSC remote LTERM. |
<p>| EAGE        | EmhqAged   | MSGAGE         | GBL   | Count of EMHQ messages with a message age greater than or equal to the message age specified by the MSGAGE() filter. If no filter is specified, the count is the total number of messages queued. |
| EMHQ        | EMHQCnt    | EMHQ           | GBL   | Global LTERM queue count in the EMH (Expedited Message Handler) queues. EMHQ is displayed only if shared EMH is used. |
| ETNEW       | EmhqTStampNew | MSGAGE     | GBL   | The time stamp of the newest EMHQ message for the LTERM on the shared queues. |
| ETOLD       | EmhqTStampOld  | MSGAGE      | GBL   | The time stamp of the oldest EMHQ message for the LTERM on the shared queues. |</p>

QUERY LTERM status

The following table shows the possible LTERM status that can be displayed. The columns in the table are:

Status The LTERM status that is displayed.

STATUS parameter

The STATUS() filter that will select LTERM$s with the specified status.

Scope The scope of the status. GBL indicates that the status can be global (it exists in the resource structure when STM is enabled), and is returned with the STT short label. LCL indicates that the status can be local, and is returned with the LSTT short label.

Meaning Provides a brief description of the status.

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY LTERM command. The OM return and reason codes that may be returned as a result of the QUERY LTERM command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 106. Return and reason codes for the QUERY LTERM command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The command completed successfully.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001000'</td>
<td>The command was not processed on the IMS system as the IMS system is not the command master. No resource information is returned.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002014'</td>
<td>An invalid character was specified in the resource name.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002040'</td>
<td>An invalid parameter value was specified. An invalid SHOW or STATUS value might have been specified. A value of 0 might have been specified for QCNT with LE, GE or, EQ. Or a value of 1 might have been specified for QCNT with LT.</td>

<td>X'00005108'</td>
<td>Command processing terminated because of an SCI error.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005FFF'</td>
<td>Command processing terminated because of an internal IMS error.</td>
</tr>
</tbody>
</table>

The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 107. Completion codes for the QUERY LTERM command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY LTERM command completed successfully for the resource.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If this is a wildcard request there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
<tr>
<td>98</td>
<td>CQS REQUEST ERROR</td>
<td>Global queue counts could not be obtained because of a CQS error.</td>
</tr>
<tr>
<td>1A0</td>
<td>Lterm resource is in error</td>
<td>The LTERM resource was found in the resource structure. An associated resource was needed, but it was either not found or appeared to be in error. This is normally an error condition, but it could be a temporary condition caused by terminal or command activity. Retry the command.</td>
</tr>
</tbody>
</table>
Examples

The following are examples of the QUERY LTERM command:

Example 1 for QUERY LTERM command

Example 2 for QUERY LTERM command

TSO SPOC input:
QRY LTERM NAME(LTERM0*)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Lterm</th>
<th>MbrName</th>
<th>CC</th>
<th>Gbl</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTERM01</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM03</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM05</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>LTERM05</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global and local information. IMS2 displays global information only.

- LTERM01 exists on IMS1 only.
- LTERM02 exists on IMS1 and IMS2, and in the resource structure.
- LTERM03 exists on IMS2 only.
- LTERM04 exists on IMS1, IMS2, and in the resource structure.
- LTERM05 exists on IMS1 and in the resource structure.

Example 3 for QUERY LTERM command

TSO SPOC input:
QRY LTERM NAME(LTERM0*) SHOW(GLOBAL,STATUS,QCNT,OWNER)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Lterm</th>
<th>MbrName</th>
<th>CC</th>
<th>Gbl</th>
<th>QCnt</th>
<th>Owner</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTERM02</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td>0</td>
<td>IMS2</td>
<td>STATIC,RM,RMACTIVE,RMOWNED</td>
</tr>
<tr>
<td>LTERM03</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td>1</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td>3</td>
<td>IMS2</td>
<td>STATIC,RM,RMOWNED</td>
</tr>
<tr>
<td>LTERM05</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td>0</td>
<td>STOQ,STOSEND,RM</td>
<td></td>
</tr>
<tr>
<td>LTERM06</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td>2</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are enabled. IMS1, the command master, displays global information. IMS2 ignores the command (RC=4, RSN=x1000) because SHOW(GLOBAL) is specified.

- LTERM02 exists in the resource structure, is currently active on IMS2, and has no messages in the shared queues.
- LTERM03 does not exist in the resource structure, but has one message in the shared queues.
- LTERM04 exists in the resource structure, is not currently active, but is owned by IMS2 which indicates status exists on IMS2, and has three messages in the shared queues.
• LTERM05 exists in the resource structure, is stopped, is not currently active or owned, and has no messages in the shared queues.
• LTERM06 does not exist in the resource structure, but has two messages in the shared queues.

Example 4 for QUERY LTERM command

TSO SPOC input:
QRY LTERM NAME(LTERM01,LTERM02,LTERM04) SHOW(QCNT,EMHQ)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Lterm</th>
<th>MbrName</th>
<th>CC</th>
<th>CText</th>
<th>Gbl</th>
<th>QCnt</th>
<th>EMHQCnt</th>
<th>LQCnt</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTERM01</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>Y</td>
<td>0</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM01</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LTERM01</td>
<td>IMS2</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>10 NO RESOURCES FOUND</td>
<td></td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>Y</td>
<td>0</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LTERM02</td>
<td>IMS2</td>
<td>0</td>
<td></td>
<td></td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>Y</td>
<td>3</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LTERM04</td>
<td>IMS2</td>
<td>0</td>
<td></td>
<td>0</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are enabled. IMS1, the command master, displays global and local information. IMS2 displays local information only.
• LTERM01 exists on IMS1 only, and has no messages in shared queues.
• LTERM02 exists on IMS1 and IMS2, and has one message in shared EMH.
• LTERM04 exists on IMS1 and IMS2, and has three messages in shared queues.

Example 5 for QUERY LTERM command

TSO SPOC input:
QRY LTERM MSGAGE(7) QCNT(GE,3)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Lterm</th>
<th>MbrName</th>
<th>CC</th>
<th>Gbl</th>
<th>QCnt</th>
<th>QCntAged</th>
<th>TStmpOld</th>
<th>TStmpNew</th>
</tr>
</thead>
<tbody>
<tr>
<td>LTERM04</td>
<td>IMS1</td>
<td>0</td>
<td>3</td>
<td>0</td>
<td>07128/140758</td>
<td>07128/141005</td>
<td></td>
</tr>
<tr>
<td>LTERM06</td>
<td>IMS1</td>
<td>0</td>
<td>2</td>
<td>2</td>
<td>07120/110113</td>
<td>07120/110240</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is irrelevant because global status other than queue counts is not requested. Shared queues are enabled. IMS1, the command master, displays global information. IMS2 ignores the command (RC=4, RSN=x1000) because QCNT() in a shared-queues environment is processed by the command master only.
• LTERM04 has three messages queued, which satisfies the QCNT filter, and all messages are less than 7 days old.
• LTERM06 has two messages queued that are older than 7 days, which satisfies the MSGAGE filter.

Example 6 for QUERY LTERM command

TSO SPOC input:
QRY LTERM NAME(*) QCNT(GE,2)

TSO SPOC output:
Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. STM is irrelevant because only queue information is requested. Shared queues are enabled. IMS1, the command master, displays global information. IMS2 ignores the command (RC=4, RSN=x1000) because QCNT() in a shared-queues environment is processed by the command master only. The QCNT output is displayed even if SHOW(QCNT) was not specified.

- LTERM04 has three messages in the shared queues.
- LTERM06 has two messages in the shared queues.

Example 7 for QUERY LTERM command

TSO SPOC input:
QRY LTERM NAME(LTERM04,LTERM05,LTERM11) SHOW(LOCAL,ALL)

TSO SPOC output:

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. STM is enabled. Shared queues are irrelevant because global queue counts are not requested. IMS1, the command master, displays local information only because only LOCAL is specified. IMS2 displays local information only.

- LTERM04 exists on IMS1 and IMS2. The LTERM is statically allocated to NODE04 on all systems.
- LTERM05 exists on IMS1 only. The LTERM is dynamic, allocated to USER05, and is stopped. There is no node because the user is not signed on.
• LTERM11 exists on IMS2 only. It is defined as a remote LTERM. The associated logical link name is LINK2111, and the remote and local SIDs are 21 and 11.

</table>
Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. STM and shared queues are enabled. IMS1, the command master, displays global and local information. IMS2 displays local information only.

- LTERM04 exists on IMS1, IMS2, and in the resource structure. Global status indicates it is not currently active, but is owned by IMS2 which indicates significant status exists for the node on IMS2. The LTERM is statically allocated to NODE04 on all systems.
- LTERM05 exists on IMS1 and in the resource structure. LTERM05 is dynamic. Global status indicates it is stopped, but is not active or owned on any system. The local status on IMS1 indicates it is stopped. The LTERM is allocated to user USER05 in both IMS1 and RM. There is no node because the user is not signed on. LTERM11 exists on IMS2 only, so there is no global status. It is defined as a remote LTERM. The associated logical link name is LINK2111, and the remote and local SIDs are 21 and 11.

Chapter 10, “/RDISPLAY command,” on page 703

**QUERY MEMBER command**

Use the QUERY MEMBER command to display status or attribute information about one or more members of the IMSplex.

Subsections:

- “Environment”
- “Syntax” on page 314
- “Keywords” on page 314
- “Usage notes” on page 315
- “Output fields” on page 325
- “Return, reason, and completion codes” on page 326
- “Examples” on page 327

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY MEMBER command and keywords can be issued.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY MEMBER</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>ALL</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>ATTRIB</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>STATUS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TYPE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```plaintext
QUERY MEMBER TYPE(IMS) SHOW(ATTRIB, MODID, STATUS, TYPE) ALL
```

Keywords

The following keywords are valid for the QUERY MEMBER command:

- **SHOW()**
  - Specifies the output fields to be returned.
  - **ALL**
    - Returns all the output fields.
  - **ATTRIB**
    - Displays the IMSplex member attributes. These are static definitions.
  - **LOCAL**
    - Displays the local status information about one or more members of the IMSplex.
  - **GLOBAL**
    - Displays the global status information about one or more members of the IMSplex.
  - **MODID**
    - Displays the online change modify id. The modify id is incremented by each successful online change. During a global online change, an IMS’s local modify id indicates whether the IMS has reached the online change commit phase 2 and is synchronized with the OLCSTAT data set. If the modify id is initialized to zero by the Global Online Change utility, the modify id represents the number of global online changes that have successfully completed.
    - The local modify id on an XRF alternate system indicates whether the XRF alternate has gotten the X'70' log record, performed online change, and is synchronized with the OLCSTAT data set. If the XRF alternate’s modid matches the OLCSTAT data set modid as displayed by the QUERY OLC LIBRARY (OLCSTAT) command, the XRF alternate is synchronized with the OLCSTAT data set.
  - **STATUS**
    - Displays the IMSplex member status. IMSplex member status can change dynamically.
  - **TYPE**
    - Shows the IMSplex member type. The IMSplex member type can be IMS, for the IMS address space.
  - **TYPE()**
    - Specifies the IMSplex member type for which information will be displayed. IMS is the only type available.
Usage notes

The QUERY MEMBER command can be specified only through the OM API.

The QUERY MEMBER command shows whether dynamic resource definition is enabled for MSC and MODBLKS resources. When the QUERY MEMBER command is issued with either SHOW(ALL) or SHOW(ATTRIB) specified, the LclAttr column displays DYNMODBLKS if dynamic resource definition is enabled for MODBLKS resources and displays DYNMSC if dynamic resource definition is enabled for MSC resources.

The QUERY MEMBER TYPE(ATTRIB) command shows an attribute of DIRECTORY if the IMS system is enabled with IMS management of ACBs. An attribute of DIRECTORY is shown if the IMS system is enabled with the IMS catalog and IMS management of ACBs.

There are two commands named QUERY MEMBER. QUERY MEMBER TYPE(IMS) is a type-2 command that gets information about IMS members from TSO SPOC or the OM API. QUERY MEMBER TYPE(IMSCON) is a z/OS modify command that gets information about IMS Connect members. See IMS Connect QUERY MEMBER command (Commands) for more information.

QUERY MEMBER attributes

The following table shows the possible IMS attributes. The table contains information about attributes such as the attribute that is returned, the scope of the attribute, and the meaning of the attribute. Global attributes are returned with the ATTR short label. Local attributes are returned with the LATTR short label.

Table 109. Attributes for QUERY MEMBER command

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DYNMODBLKS</td>
<td>LCL</td>
<td>Dynamic resource definition is enabled for MODBLKS resources.</td>
</tr>
<tr>
<td>DYNMSC</td>
<td>LCL</td>
<td>Dynamic resource definition is enabled for Multiple Systems Coupling (MSC) resources.</td>
</tr>
<tr>
<td>GBLOLC</td>
<td>LCL</td>
<td>Global online change is enabled.</td>
</tr>
<tr>
<td>NO-STM</td>
<td>LCL</td>
<td>IMS is not sharing terminal resources because STM=NO was specified in DFSDCxxx PROCLIB member or IMS is registered to an RM that is not using a resource structure.</td>
</tr>
<tr>
<td>RMENVNO</td>
<td>LCL</td>
<td>No RM environment is running.</td>
</tr>
<tr>
<td>RSRTRK</td>
<td>LCL</td>
<td>Remote Site Recovery tracker.</td>
</tr>
<tr>
<td>SHAREDQ</td>
<td>LCL</td>
<td>Shared queues are enabled.</td>
</tr>
</tbody>
</table>

QUERY MEMBER status

The following table shows the possible member status. The table contains information about status such as the status that is returned, the scope of the status, and the meaning of the status. Global status is returned with the STT short label. Local status is returned with the LSTT short label. A scope of LCL means that the status is local to the IMS specified and is returned with the LSTT short label. A scope of GBL means that the status is global to all the IMS systems and is returned with the STT short label.
The output from the QUERY MEMBER command may contain an additional value to reflect that the OPTION(UPDATEPSB) or OPTION(REFRESHPSB) is in progress on a given IMS system in the IMSplex.

Table 110. Status for QUERY MEMBER command

<table>
<thead>
<tr>

Output fields

The following table shows information about the QUERY MEMBER TYPE(IMS) output fields. The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated.
error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

**Scope**  Identifies the scope of the output field.

**Meaning**  Provides a brief description of the output field.

**Table 111. Output fields for QUERY MEMBER command**

**Return, reason, and completion codes**

The return and reason codes that can be returned as a result of the QUERY MEMBER command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 112. Return and reason codes for QUERY MEMBER command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'0000000000'</td>
<td>X'0000000000'</td>
<td>The QUERY MEMBER TYPE(IMS) command completed successfully.</td>
</tr>
<tr>
<td>X'000000014'</td>
<td>X'00005004'</td>
<td>The QUERY MEMBER command failed because a DFSOCMD response buffer could not be obtained.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual member.

The following table contains the completion code that can be returned on a QUERY MEMBER command.
Table 113. Completion codes for QUER Y MEMBER

Explanation: IMS2 is the command master for the ACB member online change process. All IMS systems finished online change commit phase 1. The member OLC is currently in commit phase 2. The online change process cannot be terminated using a TERM OLC command. All updated members will be committed to the active ACBLIB.

Example 5 for QUERY MEMBER TYPE(IMS) SHOW(ATTRIB) command
In the following example, the QUERY MEMBER TYPE(IMS) SHOW(ATTRIB) command is issued to determine if dynamic definition is enabled for MSC in the IMS system IMS1. In the IMS system, dynamic definition is enabled for both MSC and MODBLKS resources. The value of NO_STM indicates that sysplex terminal management is not enabled in the IMS system.

TSO SPOC input:
QUERY MEMBER TYPE(IMS) SHOW(ATTRIB)

TSO SPOC output:
MbrName CC LclAttr
IMS1 0 NO-STM,DYNMODBLKS,DYNMSC

OM API input:
CMD (QUERY MEMBER TYPE(IMS) SHOW(ATTRIB))

OM API output:

Syntax

```
QUERY MSLINK

NAME(*)

NAME( linkname )
```

Examples
Keywords

The following keywords are valid for the QUERY MSLINK command:

**BANDWIDTH()**

This filter selects logical links that are either using, or not using, bandwidth mode.

When you specify the BANDWIDTH keyword, the output returned includes the bandwidth mode, even if you do not specify SHOW(BANDWIDTH).
ON  Selects only logical links that are using bandwidth mode.

OFF  Selects only logical links that are not using bandwidth mode.

NAME()  Specifies the 1- to 8-character names of the logical links displayed. NAME(*) indicates that the command is to be applied to ALL the links in the system. Wildcards (*) can be specified in the name. The default is NAME(*) which returns all MSLINK resources. The logical link number, assigned during system generation, cannot be specified. Instead, the logical link name must be specified. The logical link number is returned as command output.

SHOW()  Specifies the MSLINK output fields to be returned. If you do not specify the SHOW() parameter, only the logical link names and associated logical link numbers are returned.

The MSLINK logical link name is always returned along with the name of the IMS that created the output for the link and the completion code. The filters supported with the SHOW parameter are:

AFFIN  In an IMS system that uses either TCP/IP or VTAM generic resources, AFFIN identifies the specific IMS system in the generic resources group with which the specified logical link has an affinity. For TCP/IP generic resources AFFIN displays the IMS ID of the IMS system. For VTAM generic resources, AFFIN displays the APPLID name of the IMS system.

ALL  Includes all of the information in the other SHOW parameters, except for MSNAME.

BACKUP  For XRF-capable IMS systems, displays how the automatic restart of TCP/IP and VTAM links after an XRF takeover are controlled.

The specification of BACKUP in the definition of a logical link overrides any switching options that are specified in the definition of the associated physical link. Use only if HSB=YES is specified on the IMSCTRL macro.

BACKUP is an MSC physical link attribute that you can set by using the CREATE MSPLINK, CREATE MSLINK, or UPDATE MSPLINK command. You can display the physical link BACKUP value by using the QUERY MSPLINK and QUERY MSLINK commands.

Important: Even though BACKUP is a physical link attribute, the CREATE MSLINK NAME(linkname) SET(MSPLINK(msplinkname)) command can also change the BACKUP value of the specified physical link. You can use the QUERY MSPLINK command to display the updated BACKUP value. You can also use the QUERY MSLINK command and specify the MSC logical links, including the newly created logical link, that are assigned to the physical link to display the updated BACKUP value.

The displayed value can be a numeric integer from 1 to 7, inclusive, which is the priority for reestablishing the session that has been set. When either the BACKUP keyword is omitted or no value is specified for BACKUP in the definition of either the physical or logical link, the default is 4. NO means that the session recovery of the physical link at takeover has been suppressed.
Although BACKUP displays the priority of the order in which IMS restarts TCP/IP and VTAM links, the active requests might be completed in any order because of variables such as internal VTAM conflicts and pacing, TCP/IP network traffic, and so on.

BANDWIDTH
Displays whether the link is using bandwidth mode.

BUFSIZE
Displays the current input and output buffer size for the logical links.

CID
Displays the VTAM Communication Identifications (CIDs) for the logical links.

COUNT
Displays the number of messages sent to and received from the specified logical links.

DEFNTYPE
Displays the definition type that the resource was defined with.

MODETBL
Displays the mode table names that are associated with the specified links. The output includes DEF MODETBL and ACT MODETBL. DEF MODETBL is the default mode table name that is set by system definition or by issuing an UPDATE command. The name can be overridden with the UPDATE command or, for non-IMS session initiations, the LOGON exit. ACT MODETBL is the mode table name used to initiate the session. This name is displayed only while the session is active. The field is blank at normal session termination.

MSNAME
Displays the MSNAMEs assigned to the specified logical link, and their remote and local SYSIDs. When SHOW(MSNAME) is specified, STATUS() is invalid. MSNAME is mutually exclusive of all other SHOW filters.

MSPLINK
Displays the physical link to which this logical link is assigned.

PARTNER
Displays the current partner ID for this logical link.

STATISTICS
Displays the statistics for the logical link.

Additional I/O statistics are recorded for TCP/IP links, including the high, low, and total send I/O times for both the local and remote SCI, IMS Connect, and TCP/IP components.

Important: To be accurate, the I/O statistics for CTC, TCP/IP, and VTAM links require synchronized clocks on the local and remote IMS installations.
If the clocks are not synchronized, elapsed I/O times can be calculated as negative values on one of the send I/O paths. The QUERY MSLINK command does not display negative values for elapsed I/O times.

IMS cannot determine if clocks are synchronized. Unless both partner IMS systems are on the same processor or are within the same sysplex, clocks are typically synchronized using an external method, such as an External Time Reference (ETR) hardware device.

MTM link partners are always on the same processor, so the timers are always synchronized. Partner IMS systems within the same SYSPLEX also have synchronized timers.

**STATUS**
Displays the logical link status.

**TIMESTAMP**
Displays the creation time (TimeCreate), last update time (TimeUpdate), last access time (TimeAccess), and last import time (TimeImport) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS:TH:

<table>
<thead>
<tr>
<th>YYYY</th>
<th>The year</th>
</tr>
</thead>
<tbody>
<tr>
<td>JJJ</td>
<td>The Julian day (001 - 365)</td>
</tr>
<tr>
<td>HH</td>
<td>The hour (01 - 24)</td>
</tr>
<tr>
<td>MM</td>
<td>The minute (00 - 59)</td>
</tr>
<tr>
<td>SS</td>
<td>The seconds (00 - 59)</td>
</tr>
<tr>
<td>TH</td>
<td>The tenths and hundredths of a second (00 - 99)</td>
</tr>
</tbody>
</table>

**STATUS()**
Displays logical links that possess at least one of the specified status. When you specify the STATUS keyword, the output returned includes the logical link status even if you do not specify SHOW(STATUS). The STATUS keyword cannot be specified with SHOW(MSNAME).

**ACTIVE**
Indicates, for the logical link, that link startup processing is complete and the line is available for message transfer.

**ASR**
Indicates the current automatic session restart designation as part of the Session Outage Notification.

**COLDSESS**
Indicates that for the logical link, startup processing is not complete.

**ERE**
Indicates that for the logical link, startup processing is not complete. However, when started, emergency restart synchronization is performed, because the previous link shutdown was either not normal or an IMS emergency restart was performed.

**FORCSESS**
Indicates that message resynchronization is attempted when the logical link is started. Even if resynchronization fails, the link is still started.
**IDLE**
Indicates that no activity is in progress for the logical link.

**INOP**
Indicates an inoperable link.

**LOST**
Indicates that the VTAM LOSTERM EXIT has been scheduled for this link.

**NOTIDLE**
Indicates that the link is waiting for the completion of a synchronous event. The status can be NOTIDLE-A, NOTIDLE-B, or NOTIDLE-Cxx, where xx represents the value of the access method operation code.

**NOTIDLE-A**
Indicates a status of NOTIDLE-POST, which means that an event has completed but the link has not been dispatched to process it.

**NOTIDLE-B**
Indicates a status of NOTIDLE-IWAIT, which means the link is waiting for completion of internal I/O.

**NOTIDLE-Cxx**
Indicates a status of NOTIDLE-TP WAIT, which means the link is waiting for completion of a TP access method request. The two characters xx indicate the value of the access method operation code. Blanks appear if the link is VTAM.

**NOTOPEN**
Indicates that the link is not in open status.

**NRE**
Indicates that startup processing is not complete for the logical link. Normal restart synchronization is performed when the logical link starts, because the previous link shutdown or IMS restart was normal.

**PRI**
Indicates that the link is the primary partner of the MSC VTAM session.

**RESYNC**
Indicates that the positive acknowledgment for an IMS recoverable output message was not received when the MSC session was terminated.

**SEC**
Indicates that the link is the primary partner of the MSC VTAM session.

**STOCOMM**
Indicates that the link was stopped for communications.

**SYNCSESS**
Indicates that message resynchronization is attempted when the logical link is started, and that the link is started only if resynchronization is successful.

**TKOTRA**
Indicates that the logical link in an XRF session is traced only during takeover, to help diagnose XRF link switch problems.

**TRACE**
Indicates that the logical link is traced.
Usage notes

You can issue this command only through the Operations Manager (OM) API. This command applies to DB/DC and DCCTL systems.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

The CREATE MSLINK NAME(mslinkname) command specified with SET(MSPLINK(mslinkname)) is rejected if at least one logical link attribute specified in the command (ASR, BACKUP, MODETBL, or SYNCOPT) conflicts with the physical link type. However, after the logical link is created, it can be reassigned to any type of physical link with an UPDATE MSLINK command or an /MSASSIGN command. If a logical link defined with attributes applicable to specific physical link types is reassigned to a different physical link type that does not support those attributes, they are ignored when the link is started.

Equivalent IMS type-1 commands

The following table shows variations of the QUERY MSLINK command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>QUERY MSLINK command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY MSLINK NAME(linkname</td>
<td>linkname*) SHOW(ALL)</td>
</tr>
<tr>
<td>QUERY MSLINK NAME(linkname</td>
<td>linkname*) SHOW(MODETBL)</td>
</tr>
<tr>
<td>QUERY MSLINK NAME(linkname</td>

<td>linkname*) SHOW(AFFIN)</td>
</tr>
<tr>
<td>QUERY MSLINK NAME(linkname</td>
<td>linkname*) SHOW(AFFIN)</td>
</tr>
</tbody>
</table>

Output fields

The query output will display a series of headers and values, including the MSLINK name and number, IMSID that processed the command, and the command condition code (CC) of the command.

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Following are the statistics headers on the QUERY MSLINK command, and their meanings. All count fields with times and rates are in seconds. For example, 1.3 is
equal to 1.3 seconds. 0.000003 is equal to 3 microseconds. The other fields such as byte or message counts are in decimal numbers. Rates are in units per second (for example, CHKW_RATE means check write calls per second).

### Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY MSLINK command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 117. Return and reason codes for the QUERY MSLINK command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY MSLINK command completed successfully.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002040'</td>
<td>More than one filter value is specified on the QUERY MSLINK command.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003000'</td>
<td>Command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code. For details on completion codes, see Table 118.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>Command was not successful for any of the resources. The command output contains a line for each resource, accompanied by its completion code. For details on completion codes, see Table 118.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'0000400C'</td>
<td>Command is not valid on the XRF alternate.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004014'</td>
<td>Command is not valid on the RSR tracker.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'0000401C'</td>
<td>Command is not valid on the FDBR region.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005004'</td>
<td>The QUERY MSLINK command processing terminated as a DFSOCMD response buffer could not be obtained.</td>
</tr>
</tbody>
</table>

Errors that are unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 118. Completion codes for the QUERY MSLINK command

<table>

Explanation: The QUERY MSLINK command is issued with a wildcard parameter to display all of the MSC logical links that match the wildcard name, and displays the MSC logical link path (MSNAME) names, local SYSID, and remote SYSIDs.

**Example 3: Querying statistics for a TCP/IP link**

In this example, the QUERY MSLINK command is issued twice against the TCP/IP link LNK12T01: first with SHOW(ALL) specified to view the buffer size and second to view the statistics.

For this example, the Batch SPOC utility (CSLUSPOC) was used and configured to print the output in a column format by specifying F=BYSOL in the JCL.

TSO SPOC input to display the buffer size for the link:

```sql
QUERY MSLINK NAME(LNK12T01) SHOW(ALL)
```

TSO SPOC output that shows the link buffer size. For TCP/IP links, the bandwidth mode is always on.

```
LNK12T01 22 IMS1 65536 ON
```
OM API input to display the buffer size for the link:

```
CMD(QRY MSLINK NAME(LNK12T01) SHOW(ALL))
```

OM API output that shows the link buffer size:

```
<imsout>

Example 4: Querying statistics for VTAM links

Explanation: In this example, the QUERY MSLINK command is issued twice: once in the IMS systems at each end of the VTAM link. The commands were issued after each side sent 10 remote transactions that processed and sent a response message back (10 transactions + 10 responses = 20 messages sent each direction).

TSO SPOC input:
QUERY MSLINK NAME(LNK12V02) SHOW(STATISTICS)

Syntax
Keywords

NAME() Specifies the 1- to 8-character names of the MSC logical link paths that are to be displayed or indicates that the command is to be applied to all the links in the system. Wildcards (*) can be specified in the name. The default is NAME(*), which returns all MSNAME resources.

QCNT() Selects logical link paths that have a queue count less than (LT), less than or equal to (LE), greater than (GT), greater than or equal to (GE), equal to (EQ), or not equal to (NE) the specified numbers. The specified number cannot be a 1 when LT is specified. This allows additional filtering by QCNT value.

Logical link paths with a queue count of 0 are not returned when you specify the QCNT parameter. When you specify the QCNT(LT,n) parameter, msnames with a queue count greater than 0 or less than 'n' are returned. If you do not specify the STATUS or QCNT parameters, all of the logical link paths that match the MSNAME names are returned.

The QCNT filter is valid in both a shared-queues environment and a non-shared-queues environment.

In a shared-queues environment, if QCNT is specified, the shared queues are slower than local queues. In this environment, the QRY MSNAME command is processed only by the master IMS because the queues are global. The command master returns all the logical link paths on the shared queues that match the specified queue count parameter. If QCNT is specified with a wildcard logical link path name, all of the shared queues logical link path messages on the coupling facility must be read.

In a non-shared-queues environment, the local queue count values are used to determine the msnames to be displayed. In this environment, the QRY
MSNAME QCNT command is processed by each IMS that the command is routed to because the queues are local. Each IMS returns all the msnames found locally that match the specified queue count parameter.

When you specify the QCNT parameter, the output returned includes the queue count, even if the SHOW(QCNT) option is not specified.

The QCNT filter is mutually exclusive with the STATUS filter. The QCNT filter is mutually exclusive with SHOW(), except for SHOW(QCNT).

SHOW() specifies the MSNAME output fields to be returned. If SHOW() is not specified, only the logical link path names and associated remote system identification and local system identification are returned. The MSNAME name is always returned, along with the name of the IMS that created the output for the link path and the completion code. Only SHOW(QCNT) is allowed with the QCNT() parameter. All other SHOW filters are mutually exclusive with the QCNT() parameter. The parameters supported with the SHOW keyword are:

- **ALL** includes all of the information in the other SHOW parameters.
- **DEFNTYPE** displays the definition type that the resource was defined with.
- **MSLINK** displays the logical link assigned to the specified logical link path.
- **MSPLINK** displays the physical link that is assigned to the specified logical link path.
- **QCNT** specifies that queue count information is returned. Both local and global queue counts are returned.

The local queue counts value returned on this command represents the messages being processed by the IMS system where this command is issued. In a shared-queues environment, do not use the local queue counts for queue evaluation purposes. The global queue counts, which are returned on this command, represent the current message queue counts on the shared queues structure.

In a shared-queues environment, the command master returns both the global and its local queue count information for all the MSNAMEs specified. The MSNAME does not have to be defined at the command master IMS. All other IMS systems return their local queue count information.

In a non-shared-queues environment, all IMS systems return their local queue count information.

- **STATUS** displays the logical link path status.
- **SYSID** displays the remote system identification and the local system identification for this logical link path.
- **TIMESTAMP** displays the creation time (TimeCreate), last update time (TimeUpdate), last access time (TimeAccess), and last import time (TimeImport) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS:TH:
The year

The Julian day (001 - 365)

The hour (01 - 24)

The minute (00 - 59)

The seconds (00 - 59)

The tenths and hundredths of a second (00 - 99)

**STATUS()**
Displays logical link paths that display at least one of the specified status. The STATUS filter is mutually exclusive with the QCNT filter. When you specify the STATUS keyword, the output returned includes the logical link path status, even if you do not specify SHOW(STATUS).

**DYN**
Displays MSNAMEs that have been dynamically created in a shared queue environment.

**QERR**
Displays MSNAMEs with the queue error status.

**STOQ**
Displays MSNAMEs with the stopped queuing status.

**STOSEND**
Displays MSNAMEs with the stopped sending status.

**Usage notes**
You can issue this command only through the Operations Manager (OM) API. This command applies to DB/DC and DCCTL systems.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

**Equivalent IMS type-1 commands**
The following table shows variations of the QUERY MSNAME and the type-1 IMS commands that perform similar functions.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY MSNAME command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Syntax

Example: `QUERY MSPLINK ...`
Keywords

The following keywords are valid for the QUERY MSPLINK command:

**NAME()**
- Specifies the 1- to 8-character names of the physical links for which physical link information is to be returned. Wildcards (*) can be specified in the name. The default is NAME(*), which returns all MSPLINK resources.

**SHOW()**
- Specifies the MSPLINK output fields to be returned. If SHOW() is not specified, only the physical names and associated link types are returned.

The MSPLINK name is always returned along with the name of the IMS that created the output for the link and the completion code. The parameters supported with the SHOW keyword are:

- **ALL**
  - Includes all of the information in the other SHOW parameters (except MSLINK and MSNAME).

- **ADDR**
  - Displays the address of the channel-to-channel adapter for CTC physical links.

- **ASR**
  - Displays the Automatic Session Restart value for VTAM links only.
  - **ON**
    - For VTAM links that are supported by the VTAM session outage notification (SON) facility, shows that Automatic Session Restart is on.
  - **OFF**
    - Shows that Automatic Session Restart is off, which is the default.

ASR is on only if both sides of the link are using the ASR option.

- **BACKUP**
  - For XRF-capable IMS systems, displays how the automatic restart of TCP/IP and VTAM links after an XRF takeover are controlled.

BACKUP is an MSC physical link attribute that you can set by using the CREATE MSPLINK, CREATE MSLINK, or UPDATE MSPLINK command. You can display the physical link BACKUP value by using the QUERY MSPLINK and QUERY MSLINK commands.

**Important:** Even though BACKUP is a physical link attribute, the CREATE MSLINK NAME(linkname) SET(MSPLINK(msplinkname)) command can also change the BACKUP value of the specified physical link. You can use the QUERY MSPLINK command to display the updated BACKUP value. You can also use the QUERY MSLINK command and specify the MSC logical links, including the newly created logical link, that are assigned to the physical link to display the updated BACKUP value.
The displayed value can be a numeric integer from 1 to 7, inclusive, which is the priority for reestablishing the session that has been set. NO means that the session recovery of the physical link at takeover has been suppressed.

Although BACKUP displays the priority of the order in which IMS restarts TCP/IP and VTAM links, the active requests might be completed in any order because of variables, such as internal VTAM conflicts and pacing, and TCP/IP network traffic.

**BUFSIZE**
Displays the current input and output buffer size for each logical link that is assigned to this physical link.

**DEFNTYPE**
Displays the definition type that the resource was defined with.

**ICONPLKID**
For TCP/IP physical links, displays the IMS Connect physical link ID as defined by the LCLPLKID keyword on the MSPLINK macro. The IMS Connect physical link ID is defined to IMS Connect on the LCLPLKID in the IMS Connect MSC configuration statement.

**IMSCON**
For TCP/IP physical links, displays the IMSplex name of the local IMS Connect instance that manages the TCP/IP connections for the physical link. The IMS Connect IMSplex name is specified on the LCLICON keyword of the MSPLINK macro.

**MAXSESS**
Displays the maximum number of sessions allowed for this physical link.

**MODETBL**
Displays the name of the VTAM logon mode table entry (logon mode name) containing the SNA bind parameters to be used when a session is established for this terminal.

**MSLINK**
Displays the logical links that are associated with the specified physical link. When the physical link is VTAM, the maximum number of allowed logical sessions for the physical link is also displayed. When SHOW(MSLINK) is specified, STATUS() is invalid. SHOW(MSNAME) and SHOW(MSLINK) are mutually exclusive with all other SHOW parameters.

**MSNAME**
Displays the logical link paths that are associated with the specified physical link. The MSNAME names, and the remote and local system identifications are displayed. When SHOW(MSNAME) is specified, STATUS() is invalid. SHOW(MSNAME) and SHOW(MSLINK) are mutually exclusive with all other SHOW parameters.

**NODE**
Displays the VTAM node name (APPLID) of the remote systems at the other end of the physical links for VTAM physical links.

**RMTIMS**
For TCP/IP physical links, displays the IMS ID of the remote IMS system, as defined on the NAME keyword of the MSPLINK macro in the remote IMS system.

**STATUS**
Displays the status of the physical link.
TIMESTAMP
Displays the following timestamps in local time:
• Creation time (TimeCreate)
• Last update time (TimeUpdate)
• Last access time (TimeAccess)
• Last import time (TimeImport)
The timestamps are returned in the format YYYY.JJJ HH:MM:SS:TH:

YYYY
The year
JJJ
The Julian day (001 - 365)
HH
The hour (01 - 24)
MM
The minute (00 - 59)
SS
The seconds (00 - 59)
TH
The tenths and hundredths of a second (00 - 99)

TYPE
Displays the type of physical link.

STATUS() Displays physical links that display at least one of the specified statuses. You cannot specify the STATUS() parameter with the SHOW(MSLINK) parameter or the SHOW(MSNAME) parameter. When you specify the STATUS keyword, the output returned includes the physical link status, even if you do not specify SHOW(STATUS).

N OTOPEN
VTAM ACB has not been opened.

STOGENLGN Displays all TCP/IP-type physical links with a local status of STOGENLGN. Only physical links that are used in a TCP/IP generic resource group can have a status of STOGENLGN.

STOGENLGN indicates that this physical link is stopped in this IMS system. While the physical link is stopped, no logical links can be started on the physical link in this IMS system and the IMS system cannot accept logical link requests for the TCP/IP generic resource group from a partner IMS system.

The STOGENLGN status of the physical link in this IMS system does not prevent other IMS systems in the TCP/IP generic resource group from starting or accepting logical links on the physical link.

To restart the physical link on this IMS system, route an UPDATE MSPLINK NAME(linkname) START(GENLOGON) command to the IMS system.

STOLGN Displays TCP/IP and VTAM physical links that have a status of STOLGN. Physical links that are used in a TCP/IP generic resource group cannot have a status of STOLGN.

STOLGN indicates that this physical link is stopped in this IMS system. While the physical link is stopped, no logical links can be started on the
physical link in this IMS system and the IMS system cannot accept logical
link requests on the physical link from a partner IMS system.

**TYPE()**
Displays physical links that possess at least one of the specified types of
physical links. When you specify the TYPE keyword, the output returned
includes the type of physical link, even if you do not specify SHOW(TYPE).

**CTC**
Channel-to-Channel adapter.

**MTM**
Memory-to-Memory.

**TCP/IP**
TCP/IP.

**VTAM**
Virtual Telecommunication Access Method.

### Usage notes
You can specify this command only through the Operations Manager (OM) API.
This command applies to DB/DC and DCCTL systems.

The syntax for this command is defined in XML and is available to automation
programs that communicate with OM.

### Equivalent IMS type-1 commands
The following table shows variations of the QUERY MSPLINK command and the
type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>QUERY MSPLINK command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY MSPLINK NAME(msplinkname</td>
<td>*) SHOW(ALL)</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>QUERY MSPLINK NAME(msplinkname</td>
<td>*) SHOW(MSLINK</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Output fields

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the long label that is generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated.
*error* appears for output fields that can appear for a nonzero completion
code. N/A (not applicable) appears for output fields that are always
returned.

**Meaning**
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY MSPLINK command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 127. Return and reason codes for the QUERY MSPLINK command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>

<td>NO RESOURCES FOUND</td>
<td>MSPLINK name is invalid, or the specified wildcard parameter does not match any resource names.</td>
</tr>
</tbody>
</table>

Example 1 for QUERY MSPLINK command

In this example, four MSC physical links of each link type are displayed, to show most of the possible headers. Some headers do not appear if no physical links of that type are specified. For example, if no TCP/IP links are specified, no TCP/IP-only headers, such as LLclPlkID or LLclImsCon, are displayed.
QUERY MSPLINK NAME(PLNKV001,PLNK23C,PLNK21TA,PLNK23M) SHOW(ALL)

### QUERY NODE command

Use the QUERY NODE command to display information about ISC TCP/IP or VTAM nodes (terminals) and non-VTAM devices (SPOOL and SYSOUT devices) in an IMSplex.

For ISC TCP/IP nodes, the command also displays the IMS Connect instance that provides the TCP/IP support.

This command can be specified only through the OM API and is valid on an XRF alternate.

Subsections:

### Syntax

```
QUERY QRY NODE
  NAME(*)
  Name(nodename*),
  NAME(nodename) USER(username*),
  NAME(nodename) USER(username*)
```
Keywords

The following keywords are valid for the QUERY NODE command:

**NAME()**

Specifies the names of one or more VTAM nodes (terminals) or non-VTAM devices that are to be displayed. Valid names are 1-8 characters, and wildcards can be specified. To display all nodes and devices, specify NAME(*). NAME(*)

Any static or dynamic VTAM terminal name can be specified. Supported terminal types are LU0, LU1, LU2, and LU6.1 (ISC only).

Any non-VTAM device can be specified. Non-VTAM devices are assigned a LINE and PTERM number during the system definition process. Supported device types are CONSOLE, SYSOUT (DISK, PUNCH, PRINTER, READER, TAPE), SPOOL, and TCO:

**CONSOLE**

This is the system console. IMS automatically assigns LINE 1 PTERM 1 to this device.

**DISK**

Defined by the LINEGRP macro, UNITYPE=DISK.

**PUNCH**

Defined by the LINEGRP macro, UNITYPE=PUNCH.

**PRINTER**

Defined by the LINEGRP macro, UNITYPE=PRINTER.

**READER**

Defined by the LINEGRP macro, UNITYPE=READER.

**SPOOL**

Defined by the LINEGRP macro, UNITYPE=SPOOL.

**TAPE**

Defined by the LINEGRP macro, UNITYPE=TAPE.
This is the device assigned as the Time Control Option. The system definition process automatically assigns the last LINE number to this device.

To specify a non-VTAM device, specify a name of DFSLNxxx, where xxx is the LINE number of the device. For example, to display the system console (LINE 1), specify NAME(DFSLN001).

**SHOW()**

Specifies the node output fields to be returned.

The node name is always returned along with the name of the IMS that created the output and the completion code. If SHOW is not specified, only the node names are returned, provided that the STATUS filter is not specified. This provides a method for a system management application to obtain a list of all node names that are currently known in the IMSplex.

Two parameters, GLOBAL and LOCAL, are used to specify the location (global resources or local resources) where IMS should obtain the information that is to be displayed. The default is both GLOBAL and LOCAL.

The rest of the parameters are used to specify what information is displayed.

The parameters supported with the SHOW keyword, which can be specified in any order, are:

**ALL**

Returns all of the output fields, except for those fields displayed when the LTERM and CONV parameters are specified. To display LTERM and conversation information with all other output, specify SHOW(ALL,LTERM,CONV).

**AFFIN**

IMS APPLID to which the node has VTAM generic resource affinity, if applicable. VTAM generic resource affinity is valid only when the GLOBAL parameter is specified on the SHOW keyword. If GLOBAL is not specified, then the AFFIN parameter is ignored.

**CICSAPPL**

For ISC TCP/IP nodes, displays the APPLID of the remote CICS subsystem.

**CICSNETID**

For ISC TCP/IP nodes, displays the NETWORK ID of the remote CICS.

**CID**

VTAM connection identifier.

**CONV**

The conversation ID, transaction, and conversation status associated with the node. Each conversation is returned on a separate command response display line. Conversation status is not included when SHOW(ALL) is specified. To display conversation information with all other output, specify SHOW(ALL,CONV).

**COUNT**

Displays the number of messages sent to and received from the specified node.

**EMHQ**

Displays the node message queue count in the Expedited Message Handler (EMH) queues. The queue count is the sum of the queue counts for each logical terminal associated with the specified node.
EMHQ is valid only when the GLOBAL parameter is specified on the SHOW keyword. If GLOBAL is not specified, then the EMHQ parameter is ignored.

EMHQ is processed by the command master only. It is ignored by all other IMS systems.

EMHQ is valid only if shared EMH is used in a shared queues environment. Otherwise, this parameter is ignored.

If the node resource exists in the resource structure, then the logical terminals associated with the global node resource are used to obtain the queue counts from the EMH queues. Otherwise, the logical terminals associated with the local node resource are used, but if the node does not exist locally on the command master, then the queue count is 0.

GLOBAL

If GLOBAL is specified, the command master displays global information, depending on the other SHOW parameters specified. This includes information from the resource structure.

The GLOBAL parameter is processed by the command master only. All other IMS systems ignore this parameter. If LOCAL is not also specified, then all IMS systems other than the command master ignore the command.

GLOBAL is applicable only when the command master is using shared queues, VTAM generic resources, sysplex terminal management, or any combination of these. GLOBAL is not applicable when the command master is not using shared queues, VTAM generic resources, or sysplex terminal management. In this environment, if LOCAL is also specified, then GLOBAL is ignored. Otherwise, the command master rejects the command.

If shared queues are enabled, and global queue counts are requested, then the command master will make requests to CQS to determine the appropriate queue counts. This includes both MSGQ and EMHQ.

If VTAM generic resources (VGR) is enabled, and VGR affinity information is requested, then the command master will make requests to VTAM to determine any VGR affinity.

If sysplex terminal management is enabled, then the command master will make requests to RM to determine the appropriate global status.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

ID

Displays the other half-session qualifier name of the ISC node.

IMSCON

For ISC TCP/IP nodes, shows the IMSplex member name of the IMS Connect instance that provides TCP/IP support for the node.

LOCAL

If LOCAL is specified, then all IMS systems including the command master display local information, depending on the other SHOW parameters specified. This includes information local to the IMS processing the command.
The LOCAL parameter is processed by all IMS systems, including the command master. LOCAL is applicable in any environment, regardless of whether shared queues or sysplex terminal management are used.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

LOGOND
For ISC TCP/IP nodes, displays the name of the ETO logon descriptor that was used to establish the session in use by the node.

LTERM
Displays the logical terminal (LTERM) names, if any, associated with the node. A node may have zero or more logical terminals associated with it.

Each logical terminal associated with the node is returned on a separate command response line.

The LTERM status is not included when SHOW(ALL) is specified. To display logical terminal information with all other output, specify SHOW(ALL,LTERM).

MODEBL
Displays the mode table names that are associated with the specified nodes. The output includes both the default mode table name and the actual mode table name. The default mode table name is the default name that is set by system definition. This name can be modified by the UPDATE NODE command, or by the LOGON exit. The actual mode table name is the actual name used to initiate the session. This name is displayed only while the session is active, and is blank at all other times.

OWNER
Displays the owner of the node resource in the resource structure. This applies only when sysplex terminal management is enabled, and is only processed by the command master. All other IMS systems ignore this parameter.

The owner is the IMSID (or RSENAME for XRF systems) of the IMS system that owns the node. An IMS system owns a node resource if the resource is active (the node is logged on), or an IMS system is maintaining significant status for that resource.

PRESET
Displays the preset destination name for a node. A node is in preset destination mode set by the /SET command. The preset destination name is either a transaction name, or a logical terminal (LTERM) name. All messages entered from this node are sent to the preset destination transaction or LTERM.

QCNT
Displays the node message queue count. The queue count is the sum of the queue counts for each logical terminal associated with the specified node.

The local queue counts value returned on this command represents the messages being processed by the IMS system where this command is issued. In a shared-queues environment, do not use the local queue counts
for queue evaluation purposes. The global queue counts, which are returned on this command, represent the current message queue counts on the shared queues structure.

If the LOCAL parameter is also specified on the SHOW keyword, then all IMS systems that process the command, including the command master, display the local queue count. This is valid whether or not shared message queues are enabled.

If the GLOBAL parameter is also specified on the SHOW keyword, and shared message queues are enabled, then the command master displays the global queue count on the shared message queues (MSGQ). If the node resource exists in the resource structure, then the logical terminals associated with the global node resource are used to obtain the queue counts from shared queues. Otherwise, the logical terminals associated with the local node resource are used, but if the node does not exist locally on the command master, then the queue count is 0.

The local and global queue counts are displayed as separate output fields.

**RECOVERY**
Displays the status recovery mode (SRM) and level of recovery for the node. End-user significant status can be conversation, Fast Path, full-function response mode, or STSN (set-and-test-sequence-number) status.

SRM determines where end-user significant status, if any exists, is recovered following a session or IMS termination. The output displays the SRM for the node as either GLOBAL (sysplex terminal management recovers it in the resource structure), LOCAL (IMS recovers it locally, which indicates an affinity to a particular IMS), or NONE (status is discarded).

Level of recovery determines what end-user significant status, if any exists, is recovered (if SRM is GLOBAL or LOCAL). The output displays whether conversation status is recovered (RCVYCONV), Fast Path status is recovered (RCVYFP), full-function response mode is recovered (RCVYRESP), and STSN status is recovered (RCVYSTSN).

**STATUS**
Returns local or global status of the node. See “QUERY NODE status” on page 395 for a list and meaning of possible status that might be returned.

**TYPE**
VTAM node type. The possible node types are AVM, FIN, LUT6, NTO, SLUP, SLU1, SLU2, 3277, 3286, 3790, CONSOLE, RDR/PTR (for SYSOUT and SPOOL), and TCO.

**USER**
Displays the dynamic or ISC user associated with the node. For ISC parallel-session nodes, this is the user structure representing the half-session qualifier. For static ISC, this is defined with the SUBPOOL macro. For non-ISC dynamic nodes, this is the user structure allocated to the node during signon of a user ID to the node. The user name might or might not be the same as the user ID, depending on installation-specific user exits or descriptors used. Static non-ISC nodes (and single-session ISC nodes) do not have users (even if a user ID is signed on).
**USERID**
Displays the user ID (for security, usually RACF), signed on to the node. This is applicable to any device type, static or dynamic, and is distinct from the user name.

**VERSION**
Displays the version number assigned to RM resources, which is assigned by MVS, and maintained by RM, when the resources are created or updated in the resource structure.

Static single-session nodes (not parallel-session ISC) are represented in RM by two resources: the node resource, and the static-node-user resource. The VERSION parameter displays the version number for each of these resources. Static parallel-session ISC nodes and all dynamic nodes are represented in RM by one resource: the node resource. The VERSION parameter displays the version number of the node resource.

VERSION applies only when sysplex terminal management is enabled. VERSION is ignored when sysplex terminal management is not enabled.

**STATUS()**
Selects nodes for display that possess at least one of the specified node statuses. The status might exist locally or globally if sysplex terminal management (STM) is enabled.

The STATUS filter is valid in both a sysplex terminal management environment and in a non-sysplex terminal management environment. In asysplex terminal management environment, the status selected might exist locally, globally, or both. If sysplex terminal management is not enabled, then the status only exists locally.

If SHOW(LOCAL) is specified, then IMS will select only those nodes with the appropriate status in the local system. The command is processed by all IMS systems, including the command master.

If SHOW(GLOBAL) is specified, and sysplex terminal management is enabled, then IMS will select only those nodes with the appropriate status in the resource structure. The command is processed only by the command master.

If SHOW(GLOBAL) is specified, but sysplex terminal management is not enabled, then the command is rejected.

If SHOW(GLOBAL,LOCAL) is specified (the default), then IMS will select those nodes with the appropriate status either locally or in the resource structure (if sysplex terminal management is enabled). The command is processed by all IMS systems. The command master processes both global and local information.

The output returned when the status filter is specified includes the status of the node, even if SHOW(STATUS) is not specified.

See “QUERY NODE status” on page 395 to determine which filters can be used to select nodes with corresponding status.

**USER()**
For a specific ISC node, specifies the names of one or more ISC user names allocated to the node. Valid names are 1-8 characters, and wildcards can be specified. To display all users allocated to the node, specify USER(*), or omit the USER keyword.

The output returned includes the user name even if SHOW(USER) is not specified.
Usage notes

QUERY NODE can be specified only through the OM API.

QUERY NODE can be issued on an XRF alternate system, but SHOW(GLOBAL) is not supported. Only local information can be displayed.

The processing of the QUERY NODE command is different depending on whether IMS sysplex terminal management is enabled.

- If IMS sysplex terminal management is not enabled, processing is local for each system. The results of type-1 and type-2 commands are similar.
- If IMS sysplex terminal management is enabled, type-1 and type-2 command processing is similar when displaying local information. However, they differ in how global information is displayed.
- For type-1 /DISPLAY commands with IMS sysplex terminal management enabled, the command master displays information from either the resource structure or the local system, but not both. If the resource being displayed is not owned by any system or is owned by the command master, the command master displays the global resource. However, if the resource is owned by a system other than the command master, the command master displays only the local resource, and the owning system is responsible for displaying the global resource.
- For type-2 QUERY commands with IMS sysplex terminal management enabled, the command master is the only system that displays global resource information, regardless of whether the resource is owned. In addition, the command master displays local resource information. All other IMS systems that process the command display local resource information only. This approach allows more flexibility in displaying all information in an IMSplex.

The SHOW keyword determines which IMS systems process the command and what information is displayed.

- If SHOW(GLOBAL) is specified, then the command master displays global information, which includes the global queue count if shared queues are enabled, generic resource affinity information if VTAM generic resource (VGR) is enabled, and status from the resource structure if sysplex terminal management is enabled (STM=YES defined in DFSDCxxx PROCLIB member). This is true whether or not the node is active on any particular IMS system. All other IMS systems to which OM routes the command ignore the GLOBAL parameter with return code 'X'00000004' and reason code 'X'00001000'.
- If SHOW(LOCAL) is specified, then each IMS system to which OM routes the command (including the command master) processes the command, and displays information that is local to each system.
- If both GLOBAL and LOCAL are specified (which is the default), then the command master displays both global and local information, and all other IMS systems to which OM routes the command displays local information.

Equivalent IMS type-1 commands

The following table shows variations of the QUERY NODE command and the type-1 IMS commands that perform similar functions.

Table 130. Type-1 equivalents for the QUERY NODE command

### Output fields

The following table shows the QUER Y NODE output fields. The columns in the table are:

**Short label**
- Contains the short label generated in the XML output.

**Long label**
- Contains the column heading for the output field in the formatted output.

**SHOW parameter**
- Identifies the parameter on the SHOW keyword that caused the field to be generated. Error appears for output fields that are returned for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

**Scope**
- Identifies the scope of the output field. GBL indicates that the field can be generated only by the command master when displaying global information for SHOW(GLOBAL). LCL indicates that the field can be generated by any IMS displaying local information for SHOW(LOCAL). N/A (not applicable) appears for output fields that are always returned.

**Meaning**
- Provides a brief description of the output field.

</table>
| RCVY        | Rcvy       | RECOVERY       | GBL   | The level of recovery for end-user significant status in the resource structure, which indicates what type of status is recoverable. Any value presented here implies that the corresponding status is recoverable. If SRM is LOCAL, the status will be recovered locally. If SRM is GLOBAL, the status will be recovered globally. These values are not applicable if SRM is NONE or there is no SRM. The status values that can be returned (more than one are possible) are:  
  - CONV: IMS conversations are recoverable (RCVYCONV=YES).  
  - STSN: STSN status is recoverable (RCVYSTSN=YES).  
  - FP: Fast Path status is recoverable (RCVYFP=YES). |
### QUERY NODE status

The following table shows the possible node status that can be displayed. The columns in the table are:

- **Status**: The node status that is displayed.
- **STATUS parameter**: The STATUS() filter that will select nodes with the specified status.
- **Scope**: The scope of the status. GBL indicates that the status can be global (it exists in the resource structure when STM is enabled), and is returned with the STT short label. LCL indicates that the status can be local, and is returned with the LSTT short label.
- **Meaning**: Provides a brief description of the status.

<table>
<thead>
<tr>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY NODE command. The OM return and reason codes that may be returned as a result of the QUERY NODE command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 133. Return and reason codes for the QUERY NODE command

<table>

<tr>
<td>X'00000014'</td>
<td>X'00005FFF'</td>
<td>Command processing terminated because of an internal IMS error.</td>
</tr>
</tbody>
</table>
The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

**Table 134. Completion codes for the QUERY NODE command**

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUER Y NODE command completed successfully for the resource.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>The resource name might have been typed in error or the resource might not be active at this time. If this is a wildcard request there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
<tr>
<td>98</td>
<td>CQS REQUEST ERROR</td>
<td>Global queue counts could not be obtained because of a CQS error.</td>
</tr>
<tr>
<td>1A1</td>
<td>Node resource is in error</td>
<td>The node resource was found in the resource structure and an associated resource was needed, but it was either not found or appeared to be in error. This is normally an error condition. However, it could be a temporary condition caused by terminal or command activity. The command should be retried.</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the QUERY NODE command:

**Example 1 for QUERY NODE command**

TSO SPOC input:

```
QRY NODE NAME(NODE2*,XYZ) SHOW(LOCAL)
```

TSO SPOC output:

```
Node  ISCUser  MbrName  CC  CCText
NODE21 IMS1  0
NODE22 IMS1  0
NODE22 IMS2  0
NODE23 IMS2  0
NODE24 USER24A IMS2  0
NODE24 USER24B IMS2  0
NODE24 N/A IMS2  0
XYZ IMS1  10 NO RESOURCES FOUND
XYZ IMS2  10 NO RESOURCES FOUND
```

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. STM and shared queues are irrelevant because only local information is requested. IMS1, the command master, displays only local information because no global information is requested. IMS2 displays local information only.

- NODE21 exists on IMS1 only.
• NODE22 exists on IMS1 and IMS2.
• NODE23 exists on IMS2 only.
• NODE24 is an ISC node with 3 parallel sessions available on IMS2, two of which are allocated.
• XYZ does not exist on any system.

Example 2 for QUERY NODE command

TSO SPOC input:
QRY NODE NAME(NODE2*)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Node</th>
<th>ISCUser</th>
<th>MbrName</th>
<th>CC</th>
<th>Glb</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE21</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>NODE21</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NODE22</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NODE22</td>
<td>IMS2</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NODE23</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
<td></td>
</tr>
<tr>
<td>NODE23</td>
<td>IMS2</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24A</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24B</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>NODE24</td>
<td>N/A</td>
<td>IMS1</td>
<td>0</td>
<td>Y</td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24A</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24B</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>NODE24</td>
<td>N/A</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global and local information. IMS2 displays local information only.
• NODE21 exists on IMS1 and in the resource structure.
• NODE22 exists on IMS1 and IMS2 only.
• NODE23 exists on IMS2 and in the resource structure.
• NODE24 is an ISC node with 3 parallel sessions available on IMS2, two of which are allocated on IMS2 and in the resource structure. IMS1 also displays an output line for NODE24 with N/A as the ISC user, which represents any global status that the node might have (that is not tied to any particular parallel session).

Example 3 for QUERY NODE command

TSO SPOC input:
QRY NODE NAME(NODE2*) STATUS(STATIC) SHOW(LOCAL)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Node</th>
<th>ISCUser</th>
<th>MbrName</th>
<th>CC</th>
<th>LclStat</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODE21</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>IDLE,CONVACT,CON,STATIC</td>
</tr>
<tr>
<td>NODE22</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>IDLE,STATIC</td>
</tr>
<tr>
<td>NODE22</td>
<td>IMS2</td>
<td>0</td>
<td></td>
<td>IDLE,STATIC</td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24A</td>
<td>IMS2</td>
<td>0</td>
<td>IDLE,CON,PRI,STATIC</td>
</tr>
<tr>
<td>NODE24</td>
<td>USER24B</td>
<td>IMS2</td>
<td>0</td>
<td>IDLE,CON,PRI,STATIC</td>
</tr>
<tr>
<td>NODE24</td>
<td>N/A</td>
<td>IMS2</td>
<td>0</td>
<td>IDLE,STATIC</td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays local information only
because SHOW(LOCAL) is specified. IMS2 displays local information only. All
static nodes are displayed, and status is displayed, because the STATUS filter was
specified.

• NODE21 exists on IMS1, is logged on, and has an active conversation.
• NODE22 exists on IMS1 and IMS2.
• NODE24 is an ISC node with 3 parallel sessions available on IMS2, two of which
are allocated and are the primary partners.

Example 4 for QUERY NODE command

TSO SPOC input:
QRY NODE NAME(NODE21) SHOW(GLOBAL,CONV,LTERM,STATUS)

TSO SPOC output:

(screenshot 1)

<td>Y</td>
<td></td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is
maintaining status (STM=YES). Shared queues are irrelevant because queue counts
are not requested. IMS1, the command master, displays global information only.
IMS2 ignores the command (RC=4, RSN=x1000) because only global information is
requested.

NODE21 exists in the resource structure. IMS1 displays a global line which shows
that the node is active in the IMSplex, and has a conversation active. There are two
logical terminals assigned to the node, and are displayed on separate output lines.
There are three conversations associated with the node, and are displayed on
separate output lines.

Example 5 for QUERY NODE command

TSO SPOC input:
QRY NODE NAME(NODE23) SHOW(CONV,STATUS,OWNER,RECOVERY)

TSO SPOC output:

(screenshot 1)

(scrolled right to screen 2)
**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global and local information. IMS2 displays local information.

NODE23 exists in IMS2 and in the resource structure. IMS1 displays a global line which shows the node is active and owned on IMS2, and its status recovery mode is LOCAL, which means conversation information is not known globally. IMS1 also displays a local line showing that NODE23 does not exist locally. IMS2 displays the local information, which includes one status line, and an additional output line for each conversation active or held locally.

Chapter 5. QUERY commands
**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are active. IMS1, the command master, displays global and local information. IMS2 displays local information.

NODE23 exists in IMS2 and in the resource structure. IMS1 displays a global line which shows global queue counts and global status from the resource structure. Global status indicates that the node is active on IMS2, has a VGR affinity with IMS2, and its status recovery mode is LOCAL, which means conversation information is not known globally. IMS1 also displays a local line showing that NODE23 does not exist locally. IMS2 displays the local information, which shows that conversation status exists locally.

**Example 7 for QUERY NODE command**

TSO SPOC input:
QRY NODE NAME(DFSLN001,DFSLN002) SHOW(LOCAL,TYPE)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Node</th>
<th>Line</th>
<th>Pterm</th>
<th>MbrName</th>
<th>CC</th>
<th>LType</th>
<th>LQCnt</th>
<th>LclImsCon</th>
<th>CICSApplid</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFSLN001</td>
<td>1</td>
<td>1</td>
<td>IMS1</td>
<td>0</td>
<td>CONSOLE</td>
<td>0</td>
<td>HWS1</td>
<td>CICS1</td>
</tr>
<tr>
<td>DFSLN002</td>
<td>1</td>
<td>1</td>
<td>IMS2</td>
<td>0</td>
<td>CONSOLE</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>DFSLN002</td>
<td>2</td>
<td>1</td>
<td>IMS1</td>
<td>0</td>
<td>RDR/PTR</td>
<td>0</td>
<td>HWS1</td>
<td></td>
</tr>
<tr>
<td>DFSLN002</td>
<td>2</td>
<td>1</td>
<td>IMS2</td>
<td>0</td>
<td>RDR/PTR</td>
<td>0</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. STM and shared queues are irrelevant because only local information is requested. IMS1, the command master, displays only local information because no global information is requested. IMS2 displays local information only.

DFSLN001 represents the system console, LINE 1 PTERM 1, on each system. DFSLN002 represents a SYSOUT or SPOOL device, LINE 2 PTERM 1, on each system.

**Example 8 for QUERY NODE command: ISC TCP/IP parallel session**

**Explanation:** In the following example, TCP is shown in the LType column to indicate that node CICS is an ISC TCP/IP terminal. In the LclLogonD column, the ETO logon descriptor that was used to establish the current session is LU6TCP1. The local IMS Connect instance that is providing TCP/IP support is identified as HWS1 in the LclImsCon column. Under the CICSApplid column, CICS1 is the APPLID of the remote CICS subsystem with which the ISC TCP/IP terminal is connected. The network ID, IMSNET, of the CICS subsystem that the ISC TCP/IP terminal is connected to is displayed under the CICSNetid column.

TSO SPOC input:
QUERY NODE NAME(CICS) SHOW(ALL)

TSO SPOC output:

(Screen 1)

<table>
<thead>
<tr>

**QUERY ODBM commands**

Use the QUERY ODBM commands to query information about Open Database Manager (ODBM), a component of the Common Service Layer (CSL).

Subsections:

- “QUERY ODBM TYPE(ALIAS) command”
- “QUERY ODBM TYPE(CONFIG) command” on page 408
- “QUERY ODBM TYPE(DATASTORE) command” on page 412
- “QUERY ODBM TYPE(SCIMEMBER) command” on page 417
- “QUERY ODBM TYPE(THREAD) command” on page 420
- “QUERY ODBM TYPE(TRACE) command” on page 427

---

**QUERY ODBM TYPE(ALIAS) command**

Use the QUERY ODBM TYPE(ALIAS) command to query information about Open Database Manager (ODBM) configuration.

Subsections:

- “Environment”
- “Syntax” on page 406
- “Keywords” on page 406
- “Usage notes” on page 406
- “Output fields” on page 406
- “Return, reason, and completion codes” on page 407
- “Examples” on page 408

**Environment**

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.
Syntax

```
QUERY ODBM TYPE(ALIAS) NAME(*)
```

```
SHOW(ALL)
```

Keywords

The following keywords are valid for the QUERY ODBM TYPE(ALIAS) command.

**NAME()**
- Specifies the alias name of the IMS data store to be queried, as defined in the ALIAS substatement of the ODBM configuration statement in the CSLDCxxx configuration member. Wildcards (* and %) can be specified for alias_name. The alias_name is a repeatable parameter. The default is NAME(*), which returns information about all aliases that are known to ODBM.

**SHOW()**
- Specifies the ODBM TYPE(ALIAS) output fields to be returned. The parameters that are supported with the SHOW keyword are:
  - **ALL**
    - Returns all information about ODBM data store alias and its status.

Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

**Short label**
- Contains the short label that is generated in the XML output.

**Long label**
- Contains the long label generated in the XML output.

**Keyword**
- Identifies keyword on the command that caused the field to be generated.
  - error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

**Meaning**
- Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALCSTT</td>
<td>AliasStatus</td>
<td>N/A</td>
<td>Alias connection status. Status can be either STARTED or STOPPED.</td>
</tr>
</tbody>
</table>

### Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY ODBM TYPE(ALIAS) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY ODBM TYPE(ALIAS) command completed successfully.</td>
</tr>
<tr>
<td>X'40000008'</td>
<td>X'00002004'</td>
<td>Invalid command keyword or invalid command keyword combination.</td>
</tr>
<tr>
<td>X'40000008'</td>
<td>X'00002008'</td>
<td>Insufficient number of keywords.</td>
</tr>
<tr>
<td>X'40000008'</td>
<td>X'00002014'</td>

</tr>
</tbody>
</table>
```

Explanation: The QUERY command displays alias information for all aliases that are known to ODBM.

**QUERY ODBM TYPE(CONFIG) command**

Use the QUERY ODBM TYPE(CONFIG) command to query information about Open Database Manager (ODBM) configuration.

Subsections:
- “Environment”
- “Syntax” on page 409
- “Keywords” on page 409
- “Usage notes” on page 410
- “Output fields” on page 410
- “Return, reason, and completion codes” on page 411
- “Examples” on page 411

**Environment**

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.
Syntax

```
QUERY ODBM-TYPE(CONFIG)
```

```
SHOW(ALL, ALIAS, TIMER, IDRETRY, FPBUF, FPBOF, CNBA, MAXTHRDS, SOD)
```

Keywords

The following keywords are valid for the QUERY ODBM TYPE(CONFIG) command.

**SHOW()**

Specifies the ODBM TYPE(CONFIG) output fields to be returned. The parameters supported with the SHOW keyword are:

- **ALL**
  Returns all information about the CSLDCxxx configuration member in PROCLIB.

- **ALIAS**
  Returns alias names for the data store, which are used by Open Database applications to access IMS data stores.

- **TIMER**
  Returns the amount of time (in seconds) between attempts by ODBM to establish a connection to an IMS data store. The value can be a number between 1–99.

- **IDRETRY**
  Returns the number of times ODBM will attempt to connect (identify) to an IMS data store after the initial attempt is unsuccessful. The value can be a number between 0–255.

- **FPBUF**
  Returns the number of Fast Path DEDB buffers to be allocated and fixed per thread. The value can be a number between 00–999.

- **FPBOF**
  Returns the number of Fast Path DEDB overflow buffers to be allocated per thread. The value can be a number between 00–999.

- **CNBA**
  Returns the total number of Fast Path NBA buffers for ODBM use. The value can be a number between 0–9999.

- **MAXTHRDS**
  Returns the maximum number of concurrent active threads to an individual IMS data store. The value can be a number between 1–999.

- **SOD**
  Returns the SYSOUT class of the SNAP dumps produced by the ODBM address space. The value returned is a single alphanumeric character.
Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Table 138. Output field descriptions for the QUERY ODBM TYPE(CONFIG) command

Explanation: The QUER Y command will display information about Open Database Manager (ODBM) configuration.

QUERY ODBM TYPE(DATASTORE) command

Use the QUER Y ODBM TYPE(DATASTORE) command to query information about an IMS data store and its associated resources.

Subsections:
- “Environment” on page 413
- “Syntax” on page 413
- “Keywords” on page 413
- “Usage notes” on page 414
Environment

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
QUERY ODBM TYPE(DATASTORE) [NAME(*), NAME(datastore_name)], SHOW(ALL), ALIAS, TIMER, IDRETRY, FPBUF, FPBOF, CNBA, MAXTHRDS
```

Keywords

The following keywords are valid for the QUERY ODBM TYPE(DATASTORE) command.

**NAME()**

Specifies the name of the data store to be displayed. Wildcards (*) and %) can be specified for `datastore_name`. The `datastore_name` is a repeatable parameter. The default is NAME(*), which returns information about all data stores that are known to ODBM.

**SHOW()**

Specifies the ODBM TYPE(DATASTORE) output fields to be returned. One or more parameters can be specified. The parameters supported with the SHOW keyword are:

- **ALL**
  
  Returns all information about the specified IMS data store.

- **ALIAS**
  
  Returns alias names for the IMS data store. Client application programs identify the IMS data store that they are accessing by the alias name.

- **TIMER**
  
  Returns the amount of time (in seconds) between attempts by ODBM to establish a connection to an IMS data store. The value can be a number between 1–99.
**IDRETRY**
Returns the number of times ODBM will attempt to connect (identify) to an IMS data store after the initial attempt is unsuccessful. The value can be a number between 0–255.

**FPBUF**
Returns the number of Fast Path DEDB buffers to be allocated and fixed per thread. The value can be a number between 00–999.

**FPBOF**
Returns the number of Fast Path DEDB overflow buffers to be allocated per thread. The value can be a number between 00–999.

**CNBA**
Returns the total number of Fast Path NBA buffers for ODBM use. CNBA pertains to each ODBM-to-IMS connection. The value can be a number between 0–9999.

**MAXTHRDS**
Returns the maximum number of concurrent active threads to an individual IMS data store. The value can be a number between 1–999.

**Usage notes**

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY ODBM TYPE(DATASTORE) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 142. Return and reason codes for the QUERY ODBM TYPE(DATASTORE) command

<table>
<thead>
<tr>

<td>10</td>
<td>IO3A,IO3B</td>
</tr>
</tbody>
</table>

Explanation: The QUERY command will display information about data store connection status, thread count, and alias names for the data store.

**QUERY ODBM TYPE(SCIMEMBER) command**

Use the QUERY ODBM TYPE(SCIMEMBER) command to query information about an Open Database Manager (ODBM) client.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 418
- “Output fields” on page 418
- “Return, reason, and completion codes” on page 418
- “Examples” on page 419

**Environment**

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

**Syntax**

```
QUERY QRY ODBM TYPE(SCIMEMBER) [NAME(*)], [NAME(scimember_name)] SHOW(ALL)
```

**Keywords**

The following keywords are valid for the QUERY ODBM TYPE(SCIMEMBER) command.

**NAME()**

Specifies the name of the ODBM client to be displayed. Wildcards (*) and %) can be specified for scimember_name. The scimember_name is a repeatable parameter. The default is NAME(*), which returns information about all SCI member names that are known to ODBM.
SHOW()

Specifies the ODBM TYPE(SCIMEMBER) output fields to be returned. One or more parameters can be specified. The parameters supported with the SHOW keyword are:

ALL

Returns all information about the ODBM clients that have the specified SCI member names.

Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

Short label

Contains the short label that is generated in the XML output.

Long label

Contains the long label generated in the XML output.

Keyword

Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning

Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>

<td>0</td>
<td>IMSCON</td>
<td>5</td>
</tr>
</tbody>
</table>

Explanation: The QUERY command will display ODBM client information about SCI members whose names begin with HWS.
QUERY ODBM TYPE(THREAD) command

Use the QUERY ODBM TYPE(THREAD) command to query information about an Open Database Manager (ODBM) thread and its associated resources.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 421
- “Usage notes” on page 423
- “Output fields” on page 423
- “Return, reason, and completion codes” on page 424
- “Examples” on page 425

Environment

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
QUERY ODBM TYPE(THREAD)

NAME(*), NAME(thread_id)

ALIAS(*), ALIAS(alias_name)

DATASTORE(*), DATASTORE(datastore_name)

PSB(*), PSB(psb_name)

SCIMEMBER(*), SCIMEMBER(scimember_name)

STATUS(ALL), STATUS(INDOUBT)

SHOW(ALL), SHOW(activetime), SHOW(applclientid), SHOW(idletime), SHOW(ps), SHOW(starttime), SHOW(time), SHOW(urid), SHOW(userid), SHOW(scimember)
```
Keywords

The following keywords are valid for the QUERY ODBM TYPE(THREAD) command.

**ALIAS(alias_name)**

Specifies the 1–4 character alias name of the data store to be used as a filter. Thread information is returned if the thread_id is associated with the specified alias_name.

Wildcards (*) and (%) can be specified for the alias_name. The alias_name is a repeatable parameter. The default is ALIAS(*), which returns thread information for the specified thread_id regardless of alias affiliation.

**DATASTORE(datastore_name)**

Specifies the 1–8 character name of the data store to be used as a filter. Thread information is returned if the specified thread_id is associated with the datastore_name specified.

Wildcards can be specified for the datastore_name. The datastore_name is a repeatable parameter. The default is DATASTORE(*), which returns thread information for the specified thread_id regardless of data store affiliation.

**NAME(thread_id)**

Specifies the thread ID of the ODBM thread you want to be displayed. Wildcards (*) and (%) can be specified for the thread_id. The thread_id is a repeatable parameter. The default is NAME(*), which returns information about all threads that are known to ODBM. The length of each thread ID can be up to 32 characters.

**PSB(psb_name)**

Specifies the 1–8 character name of the PSB to be used as a filter. Thread information is returned if the specified thread_id is associated with the psb_name specified.

Wildcards (*) and (%) can be specified for the psb_name. The psb_name is a repeatable parameter. The default is PSB(*), which returns thread information for the specified thread_id regardless of PSB affiliation.

*Note:* If a PSB name is specified for the QRY ODBM TYPE(THREAD) command, PSB names will be included in the command output even if SHOW(PSB) is not specified.

**SCIMEMBER(scimember_name)**

Specifies the 1–8 character name of the client connected to ODBM to be used as a filter. Thread information is returned if the thread_id is associated with the scimember_name specified.

Wildcards (*) and (%) can be specified for the scimember_name. The scimember_name is a repeatable parameter. The default is SCIMEMBER(*), which returns thread information for the specified thread_id regardless of ODBM client affiliation.

*Note:* If the SCIMEMBER keyword is specified for the QRY ODBM TYPE(THREAD) command, ODBM client names will be returned in the command output even if SHOW(SCIMEMBER) is not specified.

**STATUS()**

Allows for filtering on the QUERY ODBM TYPE(THREAD) command by the status of the thread. The following parameters can be specified:
**ALL**
Displays information about threads of any of the following status. 
STATUS(ALL) is the default.
- **ACTIVE** - The thread is active and is not in any of the following states.
- **INPREPARE**
- **INCOMMIT**
- **INBACKOUT**
- **INDOUBT**
- **INTERM**
- **INABTERM**

**INDOUBT**
Displays only threads with an INDOUBT status.

**SHOW()**
Specifies the ODBM TYPE(THREAD) output fields to be returned. One or more parameters can be specified. The parameters supported with the SHOW keyword are:

**ALL**
Returns all information about the ODBM thread.

**ACTIVETIME**
ACTIVETIME is defined as the time spent in a data store. Specifying SHOW(ACTIVETIME) returns the elapsed time from the time the data store is entered to the time that the QUERY command is issued. This value is not cumulative; if processing is not in a data store when the command is issued, a zero value will be returned in the ACTIVETIME column.

The format of ACTIVETIME is:
HH:MM:SS.th

If ACTIVETIME exceeds 24 hours, the ACTIVETIME column will display:
24+ HOURS

**APPLCLIENTID**
Returns the ID of the application client that originated the IMS data store connection request.

**IDLETIME**
IDLETIME is defined as the time not in a data store. Specifying SHOW(IDLETIME) returns the elapsed time between returning from data store processing and the time that the QUERY command was issued. This value is not cumulative; if processing is in a data store when the command is issued, a zero value will be returned in the IDLETIME column.

The format of IDLETIME is:
HH:MM:SS.th

If IDLETIME exceeds 24 hours, the IDLETIME column will display:
24+ HOURS

**PSB**
Returns the name of the PSB being used by the thread.

**SCIMEMBER**
Returns the name of the ODBM client that is associated with the thread.

**STARTTIME**
Returns the time that the thread started. STARTTIME is UTC and is formatted as follows:
DDD-YYYY HH:MM:SS.thmiju
TIME
Returns the three time values: STARTTIME, IDLETIME, and ACTIVETIME.

URID
Returns the UR identifier that is associated with the thread.

USERID
Returns the user ID associated with the thread.

Usage notes
You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields
Short label
Contains the short label that is generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a nonzero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

| Table 147. Output field descriptions for the QUERY ODBM TYPE(THREAD) command |
|---------------------------------|-----------------|-----------------|-----------------|
| **Short label** | **Long label** | **Keyword** | **Meaning** |
| ACID | ApplClientID | APPLCLIENTID | The ID of the application client that originated the IMS data store connection request. |
| ATIME | ActiveTime | ACTIVETIME or TIME | Elapsed time that the thread has been processing in a data store. |
| ALIAS | AliasName | N/A | The alias name associated with the thread. |
| CC | CC | N/A | Completion code. |
| CCTXT | CCText | error | Completion code text that briefly explains the meaning of the nonzero completion code. |
| DSTR | DatastoreName | N/A | Data store name associated with the thread. |
| ITIME | IdleTime | IDLETIME or TIME | Elapsed time that the thread has been idle (Not processing in a data store). |
| MBR | MbrName | N/A | Name of the ODBM member that processed the command. |
| PSB | PSB | PSB | Name of the PSB scheduled by the thread. |
| SCMBR | SCIMbrName | SCIMEMBER | The SCI member name of the client that is connected to ODBM for the thread. |
| STIME | StartTime | STARTTIME or TIME | Start time of the thread. |

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY ODBM TYPE(THREAD) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 148. Return and reason codes for the QUERY ODBM TYPE(THREAD) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY ODBM TYPE(THREAD) command completed successfully.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002004'</td>
<td>Invalid command keyword or invalid command keyword combination.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002008'</td>
<td>Insufficient number of keywords.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002014'</td>
<td>Invalid character in resource name.</td>
</tr>
<tr>
<td>X'04000008'</td>

</tr>
</tbody>
</table>

Explanation: The QUERY command will display the starting time values of the threads that are associated with ODBM.

**QUERY ODBM TYPE(TRACE) command**

Use the QUERY ODBM TYPE(TRACE) command to query information about the Open Database Manager (ODBM) trace.

Subsections:
Environment

The QUERY ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
QUERY QRY ODBM TYPE(TRACE)
SHOW(ALL)
```

Keywords

The following keywords are valid for the QUERY ODBM TYPE(TRACE) command.

```
SHOW()
```

Specifies the ODBM TYPE(TRACE) output fields to be returned. The parameters supported with the SHOW keyword are:

```
ALL
```

Returns all information about the ODBM trace.

Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

**Short label**

Contains the short label that is generated in the XML output.

**Long label**

Contains the long label generated in the XML output.

**Keyword**

Identifies keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a nonzero completion code. *N/A* (not applicable) appears for output fields that are always returned.

**Meaning**

Provides a brief description of the output field.
Table 150. Output field descriptions for the QUERY ODBM TYPE(TRACE) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>

</tr>
<tr>
<td>ODBM0200</td>
<td>System</td>
<td>IMS3</td>
<td>0</td>
<td>Inactive</td>
</tr>
</tbody>
</table>

Explanation: The QUERY command will display all ODBM trace data.

QUERY OLC command

For an IMS running with RM (RMENV=Y), the QUERY OLC command returns information about the OLCSTAT DS that is shared by all of the IMS systems participating in global online change.

Subsections:

- “Environment”
- “Syntax”
- “Keywords” on page 431
- “Usage notes” on page 431
- “Output fields” on page 432
- “Return, reason, and completion codes” on page 434
- “Examples” on page 435

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY OLC command and keywords can be issued.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY OLC</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LIBRARY</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY OLC command:

**LIBRARY**
Online change library. The library can be the following:

**OLCSTAT**
OLCSTAT data set contents.

**SHOW()**
Specifies the library information returned.

**ALL**
Returns all the output fields except the RSCLIST information.

**ACTVLIB**
Displays the suffixed online change library names that are currently active. This includes ACBLIBA or ACBLIBB, FMTLIBA or FMTLIBB, and MODBLKSA or MODBLKSB. These are the online change libraries the IMS online system must use at IMS initialization time.

**DSN**
OLCSTAT data set name.

**LASTOLC**
Displays the last online change that was successfully performed. If an IMS was down during the last online change and its restart type does not conflict with the last online change that was performed, it will be permitted to warm start. The last online change type is blank, if no online changes have been done. The last online change type is one or more of the following, if at least one online change has been done:
- ACLIB
- FMTLIB
- MODBLKS

**MBRLIST**
Displays the list of IMS systems that are current with the online change libraries. These are the IMS systems that will be permitted to warm start. The IMS systems either participated in the last online change, or cold started since the last online change.

**MODID**
Modify ID. The modify ID - 1 represents the number of global online changes that have been performed.

**RSCLIST**
Returns the ACBLIB members that are copied from the staging ACBLIB to the active ACBLIB. SHOW(RSCLIST) is valid only when TYPE(ACBMBR) OLC is in progress.

Usage notes

The command response is the same for all of the IMS systems. QUERY OLC is valid for an IMS enabled for global online change, but it is not valid for an IMS enabled for local online change. QUERY OLC is not supported on an XRF alternate, an RSR tracker, or an FDBR region. It can only be specified through the OM API.

Chapter 5. QUERY commands 431
The QUERY OLC LIBRARY command displays information about global online change, such as the current online change libraries and the IMS systems that are current with the online change libraries. QUERY OLC LIBRARY(OLCSTAT) displays the contents of the global online change status data set, OLCSTAT. Specifying the SHOW keyword may optionally show the current active online change libraries, the list of IMS systems that are current with the online change libraries, the modify ID, and the last online change that was done.

For an IMS running without RM services (RMENV=N), the QUERY OLC command returns information about the local OLCSTAT DS of an IMS system. The command response is different for each IMS because each IMS is required to have a unique OLCSTAT DC. In a no RM environment, if more than one IMS is specified in the route list for the QUERY OLC, only the OLCSTAT DS information for the command IMS master is returned. To obtain OLCSTAT DS information from each IMS that is running without RM, the QUERY OLC command must be issued separately to each IMS. To determine which IMS systems are defined with RMENVNO, issue a QUERY MEMBER SHOW(ATTRIB) command.

The command syntax for this command is defined in XML and is available to automation programs which communicate with OM.

Output fields

The following table shows the QUERY OLC output fields. The columns in the table are as follows:

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACBL</td>

</tbody>
</table>
| LAST        | LastOLC    | LASTOLC | GBL   | The last successful online change that was successfully performed. If an IMS was down during the last online change and its restart type does not conflict with the last online change that was performed, it will be permitted to warm start. The online change type may include one or more of the following:  
|             |            |         |       | • ACBLIB  
|             |            |         |       | • FMTLIB  
|             |            |         |       | • MODBLKS |
| LIB         | Library    | N/A     | GBL   | Library name. Can be OLCSTAT. |
| MBR         | MbrName    | N/A     | N/A   | IMSplex member that built output line. IMS identifier of the IMS that build the output. IMS identifier is always returned. |
| MBRL        | MbrList    | MBRLIST | GBL   | List of IMSplex members that are current with the online change libraries. These are the IMS systems that will be permitted to warm start. The IMS systems either participated in the last online change, or cold started since the last online change. |
| MODB        | MODBLKS    | ACTVLIB | GBL   | The current MODBLKS and MATRIX libraries. A means that the current libraries are MODBLKSA and MATRIXA. B means that the current libraries are MODBLKSB and MATRIXB. |
| MODI        | Modid      | MODID   | GBL   | The current modify ID. The modify ID - 1 is the number of successful global online changes that have been performed. |
| PSB         | PSBName    | RSCLIST | LCL   | The program or PSB name. |
| RFS         | RFSH       | RSCLIST | LCL   | Indicates the resource is being refreshed. |
| RSC         | RSCName    | RSCLIST | LCL   | The resource name specified on the command. |
Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY OLC command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 155. Return and reason codes for the QUERY OLC command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY OLC command completed successfully.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001000'</td>
<td>The QUERY OLC command was not processed on the IMS system as the IMS system is not the command master. No information is returned.</td>

</table>

Examples

The following are examples of the QUERY OLC command:

Example 1 for QUERY OLC command

TSO SPOC input:

```
QRY OLC LIBRARY(OLCSTAT) SHOW(ACTVLIB,MODID,MBRLIST)
```

TSO SPOC output:

```
Response for: QUERY OLC LIBRARY(OLCSTAT) SHOW(ACTVLIB,MODID,MBRLIST)
MbrName    CC Library  ACBLIB  FMLIB  MODBLKS  Modid MbrList
MS3        0           OLCSTAT  B    A     B  1 IMS3,IMS2,SY3
```

OM API input:

```
CMD (QRY OLC LIBRARY(OLCSTAT) SHOW(ACTVLIB,MODID,MBRLIST))
```

OM API output:

```
<imsout>
<ctl>

<kwd>OLC</kwd>
<input>QUERY OLC LIBRARY(OLCSTAT) SHOW(ACTVLIB,MODID,MBRLIST)</input>
```
Explanation: QUER Y OLC LIBRARY(OLCSTAT) displays the contents of the OLCSTAT data set, which contains global online change status. This command displays the active online change libraries, the modify id, and the list of IMS members that are current with the online change libraries and may therefore warm list. The output shows that the ACBLIBB data set is active, the FMTLIBB data set is active, the MODBLKSB data set is active, and the modify id is 2. SYS3 was the command master that built the output.

Example 2 for QUERY OLC command

TSO SPOC input:
QRY OLC LIBRARY(OLCSTAT) SHOW(DSN)

TSO SPOC output:
MbrName CC Library DName
IMS3 0 OLCSTAT IMSTESTL.IMS02.OLCSTAT

OM API input:
CMD (OLC LIBRARY(OLCSTAT) SHOW(DSN))

OM API output:

Command keywords and their synonyms (Commands)

QUERY OLREORG command

Use the QUERY OLREORG command to query information about an online reorganization or alteration of a HALDB partition.

Information that is returned by the QUERY OLREORG command includes the status, rate, and number of bytes that have been moved.

Reorganizing a database means modifying the structure of a database or changing how the data in the database is organized in order to improve performance.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 440
- “Usage notes” on page 442
- “Output fields” on page 442
- “Return, reason, and completion codes” on page 443
- “Example” on page 444

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY OLREORG command and keywords can be issued.

Table 157. Valid environments for the QUERY OLREORG command and keywords

<table>
<thead>
<tr>

<tr>
<td>STATUS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY OLREORG command:

NAME()

The names of the PHDAM or PHIDAM partitions that are being reorganized or altered.

NAME() is optional. A parameter with the wildcard character (*) is not allowed, except as NAME(*) for all defined HALDB partitions. NAME(*) is the default.

SHOW()

Specifies the output fields to return. The default is SHOW(STATUS).

ALL

Returns all of the following output fields on each response line.

BYTES

Returns the total number of bytes that have been moved to the output data set.

OPTION

Returns the current option, which can be one of the following:

- DEL - The output data sets will be deleted at the end of OLR
- NODEL - The output data sets will not be deleted at the end of OLR
- NOREL - Ownership of the OLR will not be released if IMS terminates before completing the reorganization
- REL - Ownership of the OLR will be released if IMS terminates before completing the reorganization

RATE

Returns the rate at which the HALDB OLR is running, from 1 to 100.

ROOTS

Returns the total number of roots that have been moved to the output data set.

SEGMENTS

Returns the total number of segments that have been moved to the output data set.

STARTTIME

Returns the local time when OLR was started.
STATUS
Returns online reorganization status.

STATUS()
Displays online reorganizations that possess at least one of the specified statuses. If the STATUS keyword is not specified, any online reorganization with a status of RUNNING, OWNED, NOTOWNED, WAITRATE, or WAITLOCK is returned.

ALTDONE
Displays all partitions for which alter processing is complete.

ALTER
Displays the status of alter processing for all partitions in a HALDB database that is being altered online. The possible statuses that can be returned are:

ALTINPRG
Alter processing is not complete for the partition.

ALTDONE
Alter processing is complete for the specified partition.
Alter processing is not complete for a HALDB database until all partitions show a status of ALTDONE. After all partitions have a status of ALTDONE, you can enable the altered database for new application programs by performing Online Change (OLC) to switch the ACB library from staging to active.

ALTINQUE
The displayed partition is waiting to be altered.

ALTINPRG
Displays all partitions that are currently being altered.

NOTOWNED
Specifies that the output is for the HALDB OLRs that have been temporarily stopped by the TERMINATE OLREORG command and, therefore, are not owned by any IMS.

To inquire on OLRs that have been terminated using the TERMINATE OLREORG command, use the commands QUERY OLREORG STATUS(NOTOWNED) with ROUTE(*) on the command request and /RMLIST DBRC='DB DBD(partname)'. If all systems on the PLEX show status, then OLR has been terminated.

OWNED
Specifies that the output is for HALDB OLRs that are owned by any IMS. The OLRs that are running on the IMS where the command is being processed displays a STATUS of RUNNING. OLRs running on other IMS subsystems displays a STATUS of OWNED.

RESUMED
OLR is resumed after being stopped for some reason such as a TERM OLREORG command or a user abend.

RUNNING
Specifies the output is for the HALDB OLRs that are owned by each IMS for the specified partname or partnames. You can use this keyword to determine which IMS has an online reorganization running for a given partname.
UNKNOWN
Specifies that the output is for those part names on each IMS for which the status of the HALDB OLR cannot be determined. This inability to determine the status can be caused by situations such as the HALDB master or partition being taken offline by a /DBR DB command, the IMS not being authorized to the named partname because of an IRLM failure, or the partition has not been accessed.

WAITLOCK
OLR is waiting for a lock.

WAITRATE
OLR is waiting because of an intentional delay. This intentional delay was caused because a value of less than 100 was specified on the RATE parameter.

Usage notes
You can issue the QUERY OLREORG command only from the OM API. Responses from each IMS to which the command was routed are consolidated by OM. If you specify names on the NAME parameter, response lines are returned for each specified part name. For the default parameter, NAME(*), response lines are returned only for the HALDB partitions that have online reorganizations in progress at each IMS.

A nonzero return code and a nonzero reason code are returned when the command is routed to an XRF alternate system and when the command is routed to an RSR tracking system.

The output for this command is defined in XML and is available to automation programs that communicate with OM.

The QRY OLREORG command can be issued to obtain OLR statistics for an OLR that has been stopped for some reason such as a TERM OLREORG command or a user abend. The data associated with the terminated OLR will be maintained and provided under any of the following conditions:
- The TERMINATE OLR command is issued.
- Abnormal OLR termination occurs (for example, DFS2971W message is issued)
- IMS is normally shut down

Note: If the partition or HALDB master has been taken offline with a /DBR command, or if IMS has been restarted to resume the OLR and the OLR ownership is requested before IMS restart, the status will not be available through the QUERY OLREORG command until the OLR is resumed. The status, however, can be obtained through the LIST.DB or LIST.RECON command.

Output fields
The following table shows the QUERY OLREORG output fields. The columns in the table are as follows:

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the long label generated in the XML output.
Show keyword
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Return, reason, and completion codes

The OM return and reason codes that might be returned as a result of the QUERY OLREORG command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 159. Return and reason codes for the QUERY OLREORG command

Example

In this example, the QUERY OLREORG command is routed to IMSA. The command is issued to obtain the information about all of the OLRs that are in progress at IMSA. The output that is returned contains the following information:

- The partition name
- The IMSID
- The status of OLRs in progress
- The rate of OLR
- The number of bytes moved

TSO SPOC input:

QRY OLREORG NAME(*) SHOW(ALL)

Chapter 5. QUERY commands 445
QUERY OTMADESC command

Use the QUERY OTMADESC command to query information about an existing IMS Open Transaction Manager Access (OTMA) destination descriptor.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 448
- “Usage notes” on page 453
- “Output fields” on page 454
- “Return, reason, and completion codes” on page 454
- Examples

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and its keywords.

Table 161. Valid environments for the QUERY OTMADESC command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY OTMADESC</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY OTMADESC command:

**ADAPTER***(adaptername)***

A 1- to 8-character name that identifies the IMS Connect adapter. This keyword is an optional parameter for TYPE(IMSCON). When an adapter name is specified, information is displayed from only the descriptors that specify that adapter name. This keyword is ignored if TYPE(NONOTMA) is specified.

**CONVRTR***(convertrname)***

A 1- to 8-character converter name associated with the adapter specified on the ADAPTER keyword. When a converter name is specified, information is displayed from only the descriptors that specify that converter name.
EXIT(Y | N)

An optional parameter that filters descriptors based on whether they allow the appropriate exit routine to override the descriptor routing information.

LTERMOVR(ltermname)

An optional parameter that filters descriptors based on the logical terminal override name.

MQAPPLID(mqmdapplidentitydata)

Filters for descriptors with the specified value or values for the MQAPPLID parameter. MQAPPLID specifies the content of the MQMD_APPLIDENTITYDATA field, a 1- to 32-character user data field in the MQMD data structure for IBM MQ messages.

MQCOPYMD(Y | N)

Filters for descriptors based on whether they specify to copy the MQMD data from the input message to the output message.

MQCORREL(mqmdcorrel)

Filters for descriptors with the specified value or values for the MQCORREL parameter. MQCORREL specifies the content of the MQMD_CORRELID field of the MQMD data structure for IBM MQ messages.

MQFORMAT(mqmdformatname)

Filters for descriptors with the specified value or values for the MQFORMAT parameter. MQFORMAT specifies the content of the MQMD_FORMAT field of the MQMD data structure for IBM MQ messages. The following values are supported by IMS:

- MQIMSVS
- MQIMS
- NONE

MQMSGID(mqmdmsgid)

Filters for descriptors with the specified value or values for the MQMSGID parameter. MQMSGID specifies the content of the MQMD_MSGID field of the MQMD data structure for IBM MQ messages.

MQPERST(N | Y)

Filters TYPE=MQSERIES descriptors based on whether they use message persistence.

MQREPORT(mqmdreportname)

Filters for descriptors with the specified value or values for the MQREPORT parameter. MQREPORT specifies the content of the MQMD_REPORT field of the MQMD data structure for IBM MQ messages. The following values are supported:

Parameter value
Equivalent MQMD structure value

NEWMSGID
MQRO_NEW_MSG_ID

PASSMSGID
MQRO_PASS_MSG_ID

COPYMTOC
MQRO_COPY_MSG_ID_TO_CORREL_ID

PASSCORR
MQRO_PASS_CORREL_ID

Chapter 5. QUERY commands  449
PASSMSCO
MQRO_PASS_MSG_ID and MQRO_PASS_CORREL_ID
NONE
MQRO_NONE

MQRTF(mqmdreplytoformatname)
Filters for descriptors with the specified value or values for the MQRTF parameter. MQRTF specifies the content of the MQMD_REPLYTOFORMAT field of the MQMD data structure for IBM MQ messages.

MQRTQ(mqmdreplytoqname)
Filters for descriptors with the specified value or values for the MQRTQ parameter. MQRTQ specifies the content of the MQMD_REPLYTOQ field of the MQMD data structure for IBM MQ messages.

MQRTQMGR(mqmdreplytoqmgrname)
Filters for descriptors with the specified value or values for the MQRTQMGR parameter. MQRTQMGR specifies the content of the MQMD_REPLYTOQMGR field of the MQMD data structure for IBM MQ messages.

NAME(destname*)
A 1- to 8-character destination name that identifies the OTMA destination descriptors to display. This keyword is required. If OPTION(WILDCARD) is also specified, an asterisk can be used as a wildcard character.

OPTION(NOWILDCARD | WILDCARD)
Determines whether an asterisk in the NAME keyword is treated as a wildcard character. When NOWILDCARD is specified, an asterisk is processed as a normal character and a descriptor is displayed only if the destination name coded in the descriptor in the DFSYDTx PROCLIB member includes a matching asterisk character. When WILDCARD is specified, an asterisk in the NAME keyword is treated as wildcard character and any descriptors that have a destination name that matches the characters not masked by the asterisk are displayed.

REPLYCHK(Y | N)
An optional parameter that filters descriptors based on whether they have OTMA DFS2082 message support enabled.

RMTIMS(imsname)
The name of a remote IMS system that is the destination for OTMA ALTPCB output. When a remote IMS name is specified, information is displayed from only the descriptors that specify that remote IMS name. The RMTIMS parameter is optional and accepts a 1- to 8-character name.

RMTIMSCON(imsconnectname)
The name of a connection to a remote IMS Connect instance that manages the TCP/IP communications for a remote IMS system that is the destination for OTMA ALTPCB output. When a remote IMS Connect connection name is specified, information is displayed from only the descriptors that specify that remote IMS Connect connection name. The RMTIMSCON parameter is optional and accepts a 1- to 8-character name of the connection.

RMTTRAN(trancode)
An optional parameter that displays the transaction code that is scheduled to process OTMA messages in a destination remote IMS system. When a remote transaction code is specified, information is displayed from only the descriptors that specify that remote transaction code. The RMTTRAN value is a 1- to 8-character name of a transaction.
SHOW()

Specifies which information to display in the output fields.

ADAPTER

Displays the name that identifies the IMS Connect adapter.

ALL

Displays all available information.

CONVRTR

Displays the converter name used by the adapter.

EXIT

For descriptors with TYPE=IMSTRAN, this field displays whether the
DFSCMUX0 exit routine can override the descriptor routing information
for late response messages.

For other types of descriptors, this field displays whether the DFSYPRX0
and DFSYDRU0 exit routines can override the descriptor routing
information for the ALT IOPCB message switch destination.

LTERMNOVR

Displays the lterm name specified in the destination descriptor.

MQAPPLID

Displays the IBM MQ user application data that is inserted into the
MQMD_APPLIDENTITYDATA field for messages that are routed with this
descriptor.

MQCOPYMD

Displays whether the original input values for the IBM MQ data structure
(MQMD) are copied to the output message.

MQFORMAT

Displays the value of the MQMD_FORMAT field for messages that are
routed to IBM MQ with this descriptor.

MQPERST

Displays whether messages that are routed to IBM MQ with this descriptor
are persistent on a synchronous pipe.

MQREPORT

Displays the value of the MQMD_REPORT field for messages that are
routed to IBM MQ with this descriptor.

MQRTF

Displays the value of the MQMD_REPLYTOFORMAT field for messages
that are routed to IBM MQ with this descriptor.

MQRTQ

Displays the value of the MQMD_REPLYTOQ field for messages that are
routed to IBM MQ with this descriptor.

MQRTQMG

Displays the value of the MQMD_REPLYTOQMGR field for messages that are
routed to IBM MQ with this descriptor.

REPLYCHK

Displays whether DFS2082 message support is enabled for the descriptor.

RMTIMS

Displays the name of the destination remote IMS systems.
RMTIMSCON
Displays the name of remote IMS Connect systems that are managing TCP/IP connections for a destination remote IMS system.

RMTTRAN
The transaction code to be scheduled in the destination remote IMS system.

SMEM
Displays the super member indicator.

SYNCTP
Displays whether messages that are routed to IBM MQ with this descriptor require a synchronous tpipe.

SYNTIMER
Displays the timeout value for synchronous callout processing.

TMEMBER
Displays the name of TMEMBER or the Super Member if SMEM indicates as such.

TPIPE
Displays the TPIPE name under a TMEMBER.

TYPE
Displays the type of descriptor.

NONOTMA
Only displays fields relevant for NONOTMA descriptors.

IMSCON
Only displays fields relevant for IMSCON descriptors.

IMSTRAN
Only displays fields relevant for IMSTRAN descriptors.

MQSERIES
Only displays fields relevant for MQSERIES descriptors.

USERID
Displays the user ID used for transaction authorization in a destination remote IMS system.

SMEM(Y | N)
An optional parameter that specifies whether the TMEMBER name is a super member. When SMEM is specified, information is displayed from only the descriptors that specify the matching Y or N value for SMEM. SMEM and TYPE(NONOTMA) are mutually exclusive.

SYNCTP(N | Y)
Filters TYPE=MQSERIES descriptors based on whether they require a synchronous tpipe.

TMEMBER(tmem)
An optional parameter that is used to filter by a 1- to 16-character TMEMBER name. When a tmember name is specified, information is displayed from only the descriptors that specify that tmember name. TMEMBER and TYPE(NONOTMA) are mutually exclusive.

TPIPE(tpipename)
An optional parameter that is used to filter by a 1- to 8-character TPIPE name.
When a tpipe name is specified, information is displayed from only the descriptors that specify that tpipe name. TPIPE and TYPE(NONOTMA) are mutually exclusive.

**TYPE(IMSCON | IMSTRAN | MQSERIES | NONOTMA)**

An optional keyword that can be IMSCON, IMSTRAN, MQSERIES, or NONOTMA. All output types are displayed if the keyword is not specified. To filter the display, specify IMSCON, IMSTRAN, MQSERIES, or NONOTMA. To include the other keywords, such as TMEMBER, TPIPE, SMEM, ADAPTER, or CONVRTR, use the SHOW keyword. If TYPE(NONOTMA) is specified, the rest of the display parameters will show blanks even if the SHOW keyword is specified.

**USERID(userid)**

An optional parameter that displays the user ID used for transaction authorization in a destination remote IMS system. When a user ID is specified, information is displayed from only the descriptors that specify that user ID. The USERID value is a 1- to 8-character RACF user ID.

**Usage notes**

The QUERY OTMADESC command is used to display the values specified in the destination routing descriptors that are identified in the NAME() keyword. The results returned by the QUERY OTMADESC command can be filtered by secondary keywords, such as TPIPE(). For example, when QUERY OTMADESC NAME(abc*) TPIPE(xyz) OPTION(WILDCARD) is specified, information is returned for only descriptors that have a destination name that starts with abc and a tpipe name of xyz.

Use the SHOW() keyword to control what information is displayed from the OTMA destination descriptors found by the command. For example, if you include SHOW(TMEMBER) in the command, the TMEMBER values are returned.

The QUERY OTMADESC command does not process asterisks as wildcard characters. However, you can use an asterisk as a wildcard character in the NAME() keyword if you specify OPTION(WILDCARD) when you issue the command.

No log records are written when the command is issued.

The QUERY OTMADESC command can be issued on an Extended Recovery Facility (XRF) alternate or a remote site recovery (RSR) tracking environment. The information retrieved might differ from the active system because of timing issues. For example, take the scenario where the UPDATE OTMADESC command is issued on the active system, the log record is written, and the QUERY OTMADESC command is issued on both the active and alternate system. The information about the active system reflects the current information whereas the alternate system reflects the old information. This is caused by the log record being read and updated in the alternate system.

You can issue a valid QUERY OTMADESC command that does not return any results because one of the filter keywords excluded the entire result set. For example, querying descriptors with both the ADAPTER keyword and the MQFORMAT keyword will never return any results because those keywords are never used together in a valid descriptor. If your query does not return any results, ensure that no mutually exclusive filtering keywords were specified.
Output fields

The following table shows the QUERY OTMADESC output fields. The columns in the table are:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the column heading for the output field in the formatted output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. `error` appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

*Table 162. Output fields for the QUERY OTMADESC command*

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY OTMADESC command. The OM return and reason codes that might be returned as a result of the QUERY OTMADESC command are standard for all commands entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 163. Return and reason codes for the QUERY OTMADESC command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each resource, accompanied by its completion code. See Table 164 for details.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002000'</td>
<td>The command contains an invalid verb or no client is registered for the verb.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002004'</td>
<td>The command contains an invalid primary keyword or no client is registered for the keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002028'</td>
<td>The command contains an invalid keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000202C'</td>
<td>The command contains an unknown positional parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002034'</td>
<td>The command contains an incomplete keyword parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002038'</td>
<td>The command is missing a required parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000203C'</td>
<td>The command contains an invalid keyword parameter value.</td>
</tr>
</tbody>
</table>

The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

**Table 164. Completion codes for the QUERY OTMADESC command**

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Command completed successfully</td>
<td>The QUERY OTMADESC command completed successfully for the resource.</td>
</tr>
<tr>
<td>165</td>
<td>No Desc found meet any criteria</td>
<td>No descriptors were found based on the filters specified.</td>
</tr>
<tr>
<td>166</td>
<td>No entries found</td>
<td>Command failed for QUERY OTMADESC, because no entries were found in the table of destination routing descriptors.</td>
</tr>
</tbody>
</table>

**Example 1 for QUERY OTMADESC command**

The following are examples of the QUERY OTMADESC command:

**Example 1 for QUERY OTMADESC command**

TSO SPOC input:

```plaintext
QUERY OTMADESC NAME(OTMACL*) SHOW(TYPE,TMEMBER,SMEM)
```

TSO SPOC output:

```
DestName  MbrName    CC Type TMember SMem
OTMACL*   IMSA         0 IMSCON HWS2  N
```
**Explanation:** An asterisk is specified in the name specified in the NAME() keyword, but because the default value for the OPTION keyword is NOWILDCARD and OPTION(WILDCARD) is not specified, the QUERY command displays only OTMACL* and not OTMACL99. It treats OTMACL* as a stand-alone entry in the table of destination routing descriptors.

**Example 2 for QUERY OTMADESC command**

**TSO SPOC input:**

QUERY OTMADESC NAME(OTMACL*) SHOW(ALL) OPTION(WILDCARD)

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>DestName</th>
<th>MbrName</th>
<th>CC</th>
<th>Type</th>
<th>TMember</th>
<th>TPipe</th>
<th>SMem</th>
</tr>
</thead>
<tbody>
<tr>
<td>OTMACL99</td>
<td>IMSA</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>HW51TP01</td>
<td>N</td>
<td></td>
</tr>
<tr>
<td>OTMACL*</td>
<td>IMSA</td>
<td>0 IMSCON</td>
<td>HW52</td>
<td>N</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation:** The QUERY command will display both OTMACL99 and OTMACL*, because the OPTION(WILDCARD) keyword is specified. It treats OTMACL* as a mask for a group of names including OTMACL99 and, the stand-alone entry OTMACL* in the table of destination routing descriptors.

**Example 3 for QUERY OTMADESC command**

**TSO SPOC input:**

QUERY OTMADESC NAME(OTMD*) TYPE(IMSCON) SHOW(TMEMBER,SMEM,SYNTIMER) OPTION(WILDCARD)

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>DestName</th>
<th>MbrName</th>
<th>CC</th>
<th>Type</th>
<th>TMember</th>
<th>TPipe</th>
<th>SMem</th>
<th>Syntimer</th>
</tr>
</thead>
<tbody>
<tr>
<td>OTMD*</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>N</td>
<td>1000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OTMDSC01</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>N</td>
<td>3500</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OTMDSC02</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>N</td>
<td>999999</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OTMDSC03</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>N</td>
<td>1000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OTMDSC04</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>SM01</td>
<td>Y</td>
<td>4000</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OTMDSC08</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>N</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Explanation:** The last descriptor, OTMDSC08, does not show any Syntimer value because this descriptor is normally not used for synchronous callout. Syntimer is only for synchronous callout processing.

**Example 4 for QUERY OTMADESC command: RMTIMSCON**

The following example shows all OTMA destination descriptors that are used to route ALTPCB output to the remote IMS Connect connection ICON2B.

**TSO SPOC input:**

QRY OTMADESC NAME(*) RMTIMSCON(ICON2B) SHOW(ALL) OPTION(WILDCARD)

**TSO SPOC output, first screen:**

PLEX1 IMS Single Point of Control
Command ==>

----------------------------------- Plex . PLEX1 Route . IMS1 Wait . 5:00
Response for: QRY OTMADESC NAME(*) RMTIMSCON(ICON2B) SHOW(ALL)... More: >
<table>
<thead>
<tr>
<th>DestName</th>
<th>MbrName</th>
<th>CC</th>
<th>Type</th>
<th>TMember</th>
<th>TPipe</th>
<th>SMem</th>
<th>Adapter</th>
<th>Converte</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESC0001</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>TPIPE01</td>
<td>N</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DESC0002</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>TPIPE02</td>
<td>Y</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DESC0003</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>TPIPE03</td>
<td>N</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>DESC0004</td>
<td>IMS1</td>
<td>0 IMSCON</td>
<td>HW51</td>
<td>TPIPE03</td>
<td>N</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Explanation: The QUERY OTMADESC command is issued to IMS1. Because NAME(*) and OPTION(WILDCARD) are specified, command processing searches all OTMA destination descriptors. However, because RMTIMSCON(ICON2B) is also specified, only descriptors that include RMTIMSCON=ICON2B are displayed. Because SHOW(ALL) is specified, all output fields are shown, even if the parameter is not specified in the descriptor. The RmtIMS, RmtTran, and Userid output fields are also related to the IMS-to-IMS TCP/IP connection.

Example 5 for QUERY OTMADESC command: RMTTRAN

The following example shows all OTMA destination descriptors that set a transaction code, APOL12, in ALTPCB messages that are routed to a remote IMS system for processing.

TSO SPOC input:
QRY OTMADESC NAME(*) RMTTRAN(APOL12) SHOW(ALL) OPTION(WILDCARD)

TSO SPOC output, first screen:

<table>
<thead>
<tr>
<th>DestName</th>
<th>MbrName</th>
<th>Converter</th>
<th>Syntimer</th>
<th>RmtIMS</th>
<th>RmtTran</th>
<th>Userid</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESC0003 IMS1</td>
<td>ICON2B</td>
<td>IMS2</td>
<td>APOL12</td>
<td>BILL</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Explanation: The QUERY OTMADESC command is issued to IMS1. Because NAME(*) and OPTION(WILDCARD) are specified, command processing searches all OTMA destination descriptors. However, because RMTTRAN(APOL12) is also specified, only descriptors that include RMTTRAN=APOL12 are displayed.
Because SHOW(ALL) is specified, all output fields are shown, even if the parameter is not specified in the descriptor. The RmtIMSCon, RmtIMS, and Userid output fields are also related to the processing of ALTPCB messages on remote IMS systems.

**Example 6 for QUERY OTMADESC command: TPIPE for connections to a remote IMS system**

The following example shows all OTMA destination descriptors that specify the same tpipe, TPSM01, which is used to route ALTPCB messages to a remote IMS system for processing.

**TSO SPOC input:**
QRY OTMADESC NAME(*) TPIPE(TPSM01) SHOW(ALL) OPTION(WILDCARD)

**TSO SPOC output, first screen:**

```
PLEX1                IMS Single Point of Control

SM01000H  IMS1    ICON2H  IMS2  
```

**Explanation:** The QUERY OTMADESC command is issued to IMS1. Because NAME(*) and OPTION(WILDCARD) are specified, command processing searches all OTMA destination descriptors. However, because TPIPE(TPSM01) is also specified, only descriptors that include TPIPE=TPSM01 are displayed. Because SHOW(ALL) is specified, all output fields are shown, even if the parameter is not specified in the descriptor. The messages queued to tpipe TPSM01 are retrieved by a local instance of IMS Connect and sent on the connection identified under RmtIMSCon to the remote IMS system identified under RmtIMS for processing.

Syntax
**Keywords**

The following keywords are valid for the QUERY OTMATIC command:

- **CMTMODE**
  - Specifies the commit mode of the workload to be displayed. Specify 0 to display all workloads that are in commit-then-send (CM0) mode, which is supported on both persistent and transaction sockets and supports only synch level CONFIRM. Specify 1 to display all workloads that are in
send-then-commit (CM1) mode, which is supported on both persistent and transaction sockets and supports synch level NONE, CONFIRM, and SYNCH.

**GRPNAME**
Specifies a 1- to 8-character RACF Group ID that is included in the security prefix of the message. Any group name that exceeds 8 characters is flagged as an error.

**LTERM**
Specifies a 1- to 8-character override LTERM name that is included in the OTMA message state prefix. Any LTERM name that exceeds 8 characters is flagged as an error.

**MODNAME**
Specifies a 1- to 8-character message output descriptor name that is included in the OTMA message state prefix. This descriptor is associated with the transaction or the program to be scheduled.

**MSGAGE**
Specifies the minimum amount of clock time since the message (YTIB) became active. The MSGAGE value has a range of 1 through 86400. This value represents the number of seconds within a 24-hour period. Any values outside of this range is an error.

**TNAME**
Specifies a 1- to 16-character OTMA target member name. The member is a client of OTMA, such as IMS Connect.

**TPIPE**
Specifies a 1- to 8-character OTMA transaction pipe name.

**TRANCODE**
Specifies a 1- to 8-character transaction code associated with the program that is scheduled.

**SYNCLVL**
Specifies the synch level. Specify 0 for a synch level of NONE, which requires no acknowledgment from the client. Specify 1 for a synch level of CONFIRM, which requires the client to acknowledge delivery of output messages. Specify 2 for a synch level of SYNCH, for two-phase commit processing that involves multiple participants in sync point processing managed through z/OS Resource Recovery Services (RRS).

**USERID**
Specifies a 1- to 8-character RACF user ID that is included in the security prefix of the message.

**SHOW**
Specifies the output fields to be returned. The filters supported with the SHOW keyword are:

**AGINGVAL**
Displays the aging value (how often the cached user ID accessor environment element (ACEE) should be refreshed). The aging value is either the message aging value or the client aging value and comes from the message control prefix or from the message state prefix, respectively.

**ALL**
Displays all information about the OTMA message workload.
CMTMODE
Displays the commit mode. 0 represents “Commint-then-send” mode, and
1 represents “Send-then-commit” mode.

CONVID
Displays the conversation ID that is associated with a message, if any.
You can use the conversation ID and the message age to identify messages
that cannot be returned to the client. If the message age of a message is
unusually large, it is likely that the client connection terminated and the
conversation cannot be continued. To terminate the conversation, note the
conversation ID and specify it in the /EXIT CONV command.

CTTKN
Displays the context token when a transaction is in a two-phase commit
that involves multiple participants in sync point processing managed
through RRS.

GRPNAME
Displays the RACF group ID.

LTERM
Displays the override LTERM name.

MODNAME
Displays the override MODNAME.

MSGAGE
Displays the minimum age in seconds since the message (TIB) became
active.

MSGCNT
Displays the total number of active TIBs associated with messages,
depending on the various parameter values requested.

MSGTKN
Displays the correlator token.

TIMEOUTVAL
Displays the timeout value for CM1 that is missing ACK.

TRANCODE
Displays the transaction code that is associated with the message.

TYPE
Displays the message type, such as SMB transaction, CPIC transaction, IMS
command, message switch, message recoverable, conversational
transaction, or response.
SMB  SMB transaction
CPC  CPIC transaction
CMD  IMS command
APC  Message switch
RCV  Recoverable transaction
CON  Conversational transaction
EMH  Fast Path transaction
RSP  Transaction response

USERID
Displays the user ID that is included in the security data prefix of the
message.

SYNCLVL
Displays the synch level of NONE, CONFIRM, or SYNCH.
**Usage notes**

The QUERY OTMATI command can be issued both in the active and the alternate system, whether it be on an XRF alternate or RSR tracker system.

The QUERY OTMATI command can be specified through the OM API, including the TSO SPOC and IBM Management Console for IMS and DB2 for z/OS (Management Console) user interface. The output of this command is displayed also in the TSO SPOC or in Management Console.

If the QUERY OTMATI command is issued without the SHOW keyword, the display will show the workloads on each of the IMS instances in the sysplex together with the TMEMBER name, TPIPE name, and the total number of active messages. If any keywords other than SHOW are specified, those keywords will be used as a filter to display the total number of messages in the queue as a subset of the total workload. If the SHOW keyword is specified, the total number of active messages will not be displayed; instead, each individual active message will be displayed together, filtered by the other specified keywords. No log records are written.

**Output fields**

The following table shows the QUERY OTMATI output fields. The columns in the table are:

- **Short label**: Contains the short label generated in the XML output.
- **Long label**: Contains the column heading for the output field in the formatted output.
- **Keyword**: Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.
- **Meaning**: Provides a brief description of the output field.

**Table 166. Output fields for the QUERY OTMATI command**

<table>
<thead>
<tr>
<th>Short label</th>

</tbody>
</table>
Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY OTMATI command. The OM return and reason codes that may be returned as a result of the QUERY OTMATI command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 167. Return and reason codes for the QUERY OTMATI command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each resource, accompanied by its completion code. See Table 168 for details.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002000'</td>
<td>The command contains an invalid verb or no client is registered for the verb.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002004'</td>
<td>The command contains an invalid primary keyword or no client registered for the keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002028'</td>
<td>The command contains an invalid keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000202C'</td>
<td>The command contains an unknown positional parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002034'</td>
<td>The command contains an incomplete keyword parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002038'</td>
<td>The command is missing a required parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000203C'</td>
<td>The command contains an invalid keyword parameter value.</td>
</tr>
</tbody>
</table>

The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 168. Completion codes for the QUERY OTMATI command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Command completed successfully</td>
<td>The QUERY OTMATI command completed successfully for the resource.</td>
</tr>
<tr>
<td>4</td>
<td>Command completed unsuccessfully</td>
<td>The QUERY OTMATI command failed.</td>
</tr>
<tr>
<td>166</td>
<td>Command completed successfully</td>
<td>The queried TMBER MEMBER currently has no transaction instance blocks (YTIBs).</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERY OTMATI command:

Example: QUERY OTMATI

TSO SPOC input:
QUERY OTMATI

TSO SPOC output:

<table>
<thead>
<tr>
<th>TMember</th>
<th>TPipe</th>
<th>MbrName</th>
<th>CC</th>
<th>MsgCnt</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQ</td>
<td>APPLA</td>
<td>IMSA</td>
<td>0</td>
<td>102</td>
</tr>
<tr>
<td>MQ</td>
<td>APPLB</td>
<td>IMSB</td>
<td>0</td>
<td>201</td>
</tr>
<tr>
<td>IMSB</td>
<td>WAS</td>
<td>APPLC</td>
<td>0</td>
<td>301</td>
</tr>
</tbody>
</table>

**Explanation:** With the QUERY OTMATI command with no parameters, the display shows the active OTMA send-then-commit messages represented by transaction instance blocks (YTIBs) that are currently running, waiting for a response, or both. TI stands for transaction instance for OTMA.

**Example:** QUERY OTMATI MSGAGE(8)

TSO SPOC input:

QRY OTMATI MSGAGE(8)

TSO SPOC output:

<table>
<thead>
<tr>
<th>TMember</th>
<th>TPipe</th>
<th>MbrName</th>
<th>CC</th>
<th>MsgCnt</th>
<th>MsgAge</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWS1</td>
<td>TPIPE1</td>
<td>IMSA</td>
<td>0</td>
<td>2</td>
<td>8</td>
</tr>
<tr>
<td>HWS2</td>
<td>TPIPE2</td>
<td>IMSA</td>
<td>0</td>
<td>3</td>
<td>9</td>
</tr>
</tbody>
</table>

**Explanation:** If the QUERY OTMATI command is issued with the MSGAGE keyword, the display will show a subset of the display of Example #1 that has messages with an age of 8 seconds or more. The MsgAge column shows the minimum age found for messages in that subset. For example, the output shows that a subset of the two messages for TPIPE(TPIPE1) contains messages that have an age of 8 seconds or more. The three messages for TPIPE (TPIPE2) contain messages that also have an age of 8 seconds or more and the least age found for its messages was 9 seconds. The display can further be filtered using any keywords, such as TRANCODE and USERID.

**Example:** QUERY OTMATI MSGAGE(8) SHOW(MODNAME)

TSO SPOC input:

QUERY OTMATI MSGAGE(8) SHOW(MODNAME)

TSO SPOC output:

<table>
<thead>
<tr>
<th>TMember</th>
<th>TPipe</th>
<th>MbrName</th>
<th>CC</th>
<th>MsgAge</th>
<th>Userid</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWS1</td>
<td>TPIPE1</td>
<td>IMSA</td>
<td>0</td>
<td>10</td>
<td>SVL01</td>
</tr>
<tr>
<td>HWS1</td>
<td>TPIPE1</td>
<td>IMSA</td>
<td>0</td>
<td>8</td>
<td>SVL08</td>
</tr>
<tr>
<td>HWS2</td>
<td>TPIPE2</td>
<td>IMSA</td>
<td>0</td>
<td>9</td>
<td>IMS02</td>
</tr>
<tr>
<td>HWS2</td>
<td>TPIPE2</td>
<td>IMSA</td>
<td>0</td>
<td>16</td>
<td>IMS07</td>
</tr>
<tr>
<td>HWS2</td>
<td>TPIPE2</td>
<td>IMSA</td>
<td>0</td>
<td>11</td>
<td>IMS08</td>
</tr>
</tbody>
</table>

**Explanation:** If the QUERY OTMATI command is issued with a MSGAGE keyword and a SHOW keyword specifying MODNAME, the display will expand the display of Example #2 but without the MsgCnt column. Instead of grouping the messages as in Example #2, each message is displayed separately.

**Example:** QUERY OTMATI TMEMBER(*) TPIPE(*) SHOW(ALL)

In the following example, TMEMBER(*) TPIPE(*) SHOW(ALL) is specified to show all of the attributes and values that are associated with processing messages on all of the tpipes of each OTMA client that is connected to OTMA. In this case, HWS1 is the only OTMA client and it has only one tpipe in OTMA, tpipe 9999. There are
three messages queued to tpipe 9999 for two different transactions: CDEBTRN4 and APOL11. Transaction CDEBTRN4 is a conversational transaction, and the messages for the two instances of CDEBTRN4 are differentiated by their conversation IDs (ConvID): 0002 and 0001.

TSO SPOC input:
QUERY OTMATI TMEMBER(*) TPIPE(*) SHOW(ALL)

TSO SPOC output:

```
<table>
<thead>
<tr>
<th>TMember</th>
<th>TPipe</th>
<th>MbrName</th>
<th>CC</th>
<th>MsgAge</th>
<th>Trancode</th>
<th>CmtrMode</th>
<th>SyncLvl</th>
<th>MsgType</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td>25</td>
<td>CDEBTRN4</td>
<td>1</td>
<td>0</td>
<td>SMB,CON</td>
</tr>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td>82</td>
<td>APOL11</td>
<td>1</td>
<td>1</td>
<td>SMB,RSP</td>
</tr>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td>58</td>
<td>CDEBTRN4</td>
<td>1</td>
<td>1</td>
<td>SMB,CON</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>GrpName</th>
<th>Userid</th>
<th>Lterm</th>
<th>MODname</th>
<th>MsgTkn</th>
<th>TimeoutVal</th>
<th>AgingVal</th>
</tr>
</thead>
<tbody>
<tr>
<td>SYS1</td>
<td>USRT003</td>
<td></td>
<td></td>
<td>0000000000000000</td>
<td>120</td>
<td>&gt;99999</td>
</tr>
<tr>
<td>SYS1</td>
<td>USRT003</td>
<td></td>
<td></td>
<td>0000000000000000</td>
<td>120</td>
<td>&gt;99999</td>
</tr>
<tr>
<td>SYS1</td>
<td>USRT003</td>
<td></td>
<td></td>
<td>0000000000000000</td>
<td>120</td>
<td>&gt;99999</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CtTkn</th>
<th>ConvID</th>
</tr>
</thead>
<tbody>
<tr>
<td>0000000000000000</td>
<td>0002</td>
</tr>
<tr>
<td>0000000000000000</td>
<td>0001</td>
</tr>
</tbody>
</table>
```

Example: QUERY OTMATI TMEMBER(*) TPIPE(*) SHOW(CONVID)

In the following example, TMEMBER(*) TPIPE(*) SHOW(CONVID) is specified to show the conversation ID, if any, that is associated with each message on all of the tpipes of each tmember (OTMA client) that is connected to OTMA. In this case, HWS1 is the only OTMA client and it has only one tpipe in OTMA, tpipe 9999. There are three messages queued to tpipe 9999. Only the first and last messages are part of a conversational transaction, as indicated by the conversation IDs 0002 and 0001.

TSO SPOC input:
QUERY OTMATI TMEMBER(*) TPIPE(*) SHOW(CONVID)

TSO SPOC output:

```
<table>
<thead>
<tr>
<th>TMember</th>
<th>TPipe</th>
<th>MbrName</th>
<th>CC</th>
<th>ConvID</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td>0002</td>
</tr>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>HWS1</td>
<td>9999</td>
<td>IMS1</td>
<td>0</td>
<td>0001</td>
</tr>
</tbody>
</table>
```

QUERY PGM command

Use the QUERY PGM command to query information about program resources.

A program resource defines the application program requirements for application programs that run under the control of the DB/TM environment, as well as for application programs that access databases through DBCTL.

Subsections:
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 169. Valid environments for the QUERY PGM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY PGM</td>
<td>X</td>
<td>X</td>

<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>STATUS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY PGM command:

NAME
Specifies the 1-8 character name of the program. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*) which returns all program resources.

SHOW
Specifies the program output fields to be returned. The program name is always returned, along with the name of the IMS that created the output, the region type, and the completion code. The filters supported with the SHOW keyword are:

ALL
Returns all information about the program itself. Other SHOW keywords can be specified to return information about resources related to the program.

Restriction: The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

BMPTYPE
BMP type option. Specifies whether the program executes in a BMP type region or not. A BMP type region might be a BMP region or a JBP region.

PSBs scheduled by DB2 stored procedures, by programs running under WebSphere® Application Server, and by other users of the ODBA interface may be defined with BMPTYPE Y or N.

DB
The databases referenced by the PSB associated with this program. If the PSB intent list is not resident, the ACBLIB is searched to obtain the database information.

The QRY PGM SHOW(DB) command will not show the database names for which the dynamic (DOPT) PSB has intent.

Note: You cannot specify this filter with other SHOW filters; you must specify SHOW(DB) individually.

DEFN
Specifies that the resource definitions are to be returned.

The program attributes that can be returned are: BMPTYPE, DOPT, FP, GPSB, LANG, RESIDENT SCHDTYPE, TRANSTAT, the repository create and update time stamps, and the IMS runtime create, update, import, and access time stamps.
If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:

• SHOW(DEFN) cannot be specified with DEFNTYPE, MODEL, STATUS, WORK, DB, RTC, or TRAN.

• The LclStat, LModelName, LModelType, and LDefnType columns, which are returned on the QRY PGM SHOW(ALL) command, are not returned with SHOW(DEFN).

• The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

• When querying program information from the repository, the SHOW(DEFN) filter is not supported when used with the STATUS filter. The runtime filter of STATUS is not valid with SHOW(DEFN), SHOW(DEFN,GLOBAL), SHOW(DEFN,LOCAL), SHOW(DEFN,IMSID), SHOW(DEFN,IMSID,GLOBAL) or SHOW(DEFN,IMSID,LOCAL).

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

DEFNTYPE
Definition type that the descriptor or resource was defined with.

DOPT
Dynamic option.
EXPORTNEEDED

Specifies that only the program resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the programs that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each program name specified on the command. If the specified program does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY PGM SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

Tip: For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

FP Fast Path option.

GLOBAL

Specifies that the stored resource definitions from the repository are to be returned. If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

GPSB

Generated PSB option.

IMSID

Specifies that the IMS IDs of the IMS systems whose resource lists contain the specified resource name are to be returned. SHOW(IMSID) is processed only by the command master IMS and is valid only when command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

LANG

Language interface of the application program. The language interface is displayed only for programs defined as GPSB(Y) and programs defined as DOPT(Y) LANG(JAVA).
LOCAL
Specifies that the runtime resource definitions from the IMS system are to be returned.
SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

MODEL
Model name and model type used to create this resource. If the descriptor or resource is created with one or more of the attributes defined and no model specified, the model name and model type is the default descriptor. The model name and model type are blank for IMS-defined resources and descriptors and queue-only transactions created by the DFSINSX0 exit. The CREATE command specified without the LIKE keyword creates a descriptor or resource using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSPG1 or user-defined. The CREATE command specified with the LIKE keyword creates a descriptor or resource using a model. The descriptor or resource is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The descriptor or resource attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource.

RESIDENT
Resident option, which indicates whether the PSB is accessed in local storage. The local runtime value for the resident option is shown. The resident option definition is also shown, if it is different from the runtime value.

The RESIDENT(Y) option takes effect at the next IMS restart, unless an error is encountered such as no ACB for the program specification block (PSB) in the ACBLIB or IMS catalog, or if the program was created or updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart.

RTC
Routing code descriptors associated with this program.

Note: You cannot specify this filter with other SHOW filters; you must specify SHOW(RTC) individually.

SCHDTYPE
Scheduling type, which indicates whether this application program can be scheduled into more than one message region or batch message region simultaneously.

STATUS
Program status. For a description of the possible program status returned, see the STATUS keyword under the Output fields table.

TIMESTAMP
The creation time (TIMECREATE), last update time (TIMEUPDATE), last
access time (TIMEACCESS), and last import time (TIMEIMPORT) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:

- YYYY is the year.
- JJJ is the Julian day (001 - 365).
- HH is the hour (01 - 24).
- MM is the minute (00 - 59).
- SS is the seconds (00 - 59).
- TH is the tenths and hundredths of a second (00 - 99).

**TRAN**

Transactions associated with this program.

**Note:** You cannot specify this filter with other SHOW filters; you must specify SHOW(TRAN) individually.

**TRANSTAT**

Transaction level statistics option.

**WORK**

Work in progress for the program specified on NAME parameter and its associated resources. The QRY PGM SHOW(WORK) command can be issued before a DELETE, IMPORT or UPDATE command to check for any work in progress for the specified program and any of its associated resources. Any work in progress might cause the subsequent DELETE, IMPORT or UPDATE commands to fail. The QRY PGM SHOW(WORK) command returns the work status for the program specified. If no work is in progress for the specified resource, a response line is returned with a work status of blanks.

**Notes:**

1. SHOW(WORK) specified with NAME(*) might have a performance impact on the processing of the command.
2. You cannot specify this filter with other SHOW filters; you must specify SHOW(WORK) individually.
3. The QRY PGM SHOW(WORK) command is not valid on an XRF alternate.

**STATUS()**

Selects programs for display that possess at least one of the specified program status. This selection allows for additional filtering by program status. The program status is returned as output, even if the SHOW(STATUS) was not specified.

**DB-NOTAVL**

A database used by this program is not available, either because it is not defined, or because it is not authorized.

**IOPREV**

A BMP, IFP, or JBP program cannot complete scheduling, because I/O prevention has not completed. Further I/O requests to data sets are inhibited.

**LOCK**

Sets the STATUS() filter to return information about programs that are locked.
NOTINIT
Sets the STATUS() filter to return information about programs that are not initialized and therefore cannot be used.

STOSCHD
Sets the STATUS() filter to return information about programs for which program scheduling is stopped.

TRACE
Sets the STATUS() filter to return information about programs that are being traced.

Usage notes
Program resources combined with transactions define the scheduling and resource requirements for an application program. The program resource describes an application program that operates in a message processing region, Fast Path message-driven program region, batch processing region, batch message processing region, or CCTL threads.

This command can be issued only through the Operations Manager API. This command applies to DB/DC, DBCTL and DCCTL systems. This command is allowed on XRF alternate and RSR tracker systems.

The output of the QUERY PGM command displays the sizes of PSBs, which you can use to determine the impact of the PSB on the PSB pools that are used in the online IMS system. This provides an alternative to using the output of the ACB Maintenance utility to calculate PSB pool size requirements.

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

Equivalent IMS type-1 commands
The following table shows variations of the QUERY PGM command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>QUERY PGM command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY PGM SHOW(ALL)</td>
<td>/DISPLAY PROGRAM, /DISPLAY STATUS PROGRAM</td>
</tr>
<tr>
<td>QUERY PGM SHOW(DB)</td>
<td>/DISPLAY PSB</td>
</tr>
<tr>
<td>QUERY PGM SHOW(RTC)</td>
<td>/DISPLAY PSB</td>
</tr>
<tr>
<td>QUERY PGM SHOW(TRAN)</td>
<td>/DISPLAY PROGRAM</td>
</tr>
<tr>
<td>QUERY PGM SHOW(WORK)</td>
<td>/DISPLAY MODIFY ALL</td>
</tr>
</tbody>
</table>

Output fields
The following table shows the QUERY PGM output fields. The columns in the table are:
**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. 
N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Scope**
Identifies the scope of the output field.

**Meaning**
Provides a brief description of the output field.

---

<td><strong>N</strong> The PSB associated with the program is not generated by IMS. The control blocks for the PSB must exist in the ACBLIB or, if the IMS management of ACBs is enabled, in the IMS catalog, otherwise the program is set to a NOTINIT-xx-reason status and cannot be scheduled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>Y</strong> The PSB and application control block (ACB) that are associated with the program are generated by IMS. The scheduling process of all environments generates a PSB containing an I/O PCB and an alternate modifiable PCB. You do not need to generate the PSB and ACB or submit DDL to define the PSB. The ACB for the PSB is not loaded from either ACBLIB or, if the IMS management of ACBs is enabled, the IMS catalog. Thus, I/O to retrieve the ACB from either the ACBLIB or the IMS catalog is eliminated. The generated PSB contains an I/O PCB named IOPCBBbbb and a modifiable, alternate PCB named TPPCBBbbb. With an alternate modifiable PCB, an application can use the CHNG call to change the output destination and send output to a destination other than the input destination.</td>

| WRK         | Work       | WORK    | LCL   | Work is in progress for the program or one of its associated resources. The work in progress can be one of the following:  
  ANOTHER CMD IN PROGRESS Another command (such as DELETE or UPDATE) to delete or update the program is already in progress, or a command to delete or update a transaction referencing the program to be updated is in progress.  
  SCHEDULED Program is scheduled. |

### Table 172. Reason information for NOTINIT-xx-reason status

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACBLIBREAD</td>
<td>I/O error reading ACBLIB.</td>
</tr>
<tr>
<td>ALIAS</td>
<td>Alias name error.</td>
</tr>
<tr>
<td>BLDL</td>
<td>BLDL miscellaneous error trying to build ACBLIB directory.</td>
</tr>
<tr>
<td>DBFINTP0</td>
<td>Module DBFINTP0 returns nonzero return code.</td>
</tr>
<tr>
<td>DBNOTINIT</td>
<td>Program references a database that is not initialized and has a NOTINIT status. Action: 2.</td>
</tr>
<tr>
<td>DMBINCOMPTBL</td>
<td>DMB incompatibility.</td>
</tr>
<tr>
<td>DMBNUM</td>
<td>No DDIR control block for database with this DMB number exists. Action: 1.</td>
</tr>
<tr>
<td>DMBPOOL</td>
<td>DMB pool shortage.</td>
</tr>
<tr>
<td>EOD</td>
<td>EOD marker found before DMB.</td>
</tr>
<tr>
<td>FPDB</td>
<td>The database is a Fast MSDB or DEDB that is defined in a non-Fast Path (FP=N) system. The database cannot be used.</td>
</tr>
<tr>
<td>FPMISMATCH</td>
<td>The Fast Path database DDIR control block does not match with the non-Fast Path PCB.</td>
</tr>
<tr>
<td>INTLISTDB</td>
<td>Intent list contains unknown database. Action: 5.</td>
</tr>
<tr>
<td>INTLISTLEN</td>
<td>Intent list read length is invalid.</td>
</tr>
<tr>
<td>INTLISTLEN0</td>
<td>Intent list read length is zero.</td>
</tr>
<tr>
<td>INTLISTREAD</td>
<td>Intent list read error.</td>
</tr>
<tr>
<td>KSDSESDS</td>
<td>Missing KSDS/ESDS.</td>
</tr>
<tr>
<td>NAMEMISMATCH</td>
<td>PSB/PDIR names do not match.</td>
</tr>
<tr>
<td>NOACB</td>
<td>No block found in ACBLIB.</td>
</tr>
<tr>
<td>NOAMP</td>
<td>DMB not pointing to access method prefix block (AMP).</td>
</tr>
<tr>
<td>NOAMPOFLWDCB</td>
<td>Access method prefix block (AMP) missing overflow DCB.</td>
</tr>
</tbody>
</table>
| NODB                 | A database this program references is not defined. No database DDIR control block exists. Action: 5.  
  See message DFS563I for the name of the database that is not defined. |
| NODMB                | No DMB exists in ACBLIB for the database. Action: 2, 5, or both.       |
Table 172. Reason information for NOTINIT-xx-reason status (continued)

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOPSB</td>
<td>No PSB exists in ACBLIB for the program. Action: 3.</td>
</tr>
<tr>
<td>NOTDMB</td>
<td>Not a DMB.</td>
</tr>
<tr>
<td>NOTPSB</td>
<td>Not a PSB. A PSB by the same name as the program is defined in ACBLIB, instead of a PSB. If this resource should be a database, create the database with a CREATE DB command. If this resource should be a program, perform a DBDGEN, PSBGEN, ACBGEN and ACBLIB online change to define this resource as a PSB instead of a DMB. Action: 4.</td>
</tr>
<tr>
<td>PROCOPTL</td>
<td>PCB specifies PROCOPT=L for online.</td>
</tr>
<tr>
<td>PSBLEN</td>
<td>Bad PSB length.</td>
</tr>
<tr>
<td>PSBLEVEL</td>
<td>The IMS release level at which this PSB is generated using ACBGEN does not match the IMS release level of this IMS. Perform a PSBGEN, ACBGEN, and ACBLIB online change as needed to generate this PSB at the correct IMS release level. Action: 4.</td>
</tr>
<tr>
<td>PSBLOGICAL</td>
<td>PSB is missing a logical relationship database. Action: 4.</td>
</tr>
<tr>
<td>PSBPOOL</td>
<td>PSB pool shortage.</td>
</tr>
<tr>
<td>REPOCHGLIST</td>
<td>The program name exists in the change list in the IMSRSC repository for this IMS, and the change list is being processed or the change list processing failed because of an error. This program cannot be used, scheduled, updated, exported, or referenced as a model until it is successfully imported so that the runtime program definition and the stored definition in the repository are synchronized. Action: 6.</td>
</tr>
<tr>
<td>SIZEMISMATCH</td>
<td>Size mismatch.</td>
</tr>
<tr>
<td>WRONGPSB</td>
<td>Wrong PSB.</td>
</tr>
</tbody>
</table>

Note: Actions that can be taken to initialize the program are:
1. Call IBM.
2. Perform an ACBLIB online change to add the DMB to ACBLIB.
3. Perform an ACBLIB online change to add the PSB to ACBLIB.
4. Perform an ACBLIB online change to correct PSBs, DMBs, or both.
5. Perform a MODBLKS online change or issue a CREATE DB command to create the database; then issue an UPDATE PGM START(SCHD) command to reset the NOTINIT status.
6. If IMS change list processing failed and message DFS4411E was issued, correct the problem and take one of the following actions:
   • Shut down IMS and restart it in order to try processing the change list again.
   • Issue the IMPORT DEFIN SOURCE(REPO) NAME(pgmname) TYPE(PGM) command to import the program, where pgmname is the program name.

Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each resource, accompanied by its completion code. See the completion code table for details.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001010'</td>
<td>No resources were found to be returned. The resource names specified might be invalid, or:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• There were no resources that match the filter specified.</td>

<td>Repository error.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'0000551C'</td>
<td>A request to view the data in the repository was rejected because a corrupted resource list was detected. The QUERYPGM command is rejected because the resource list is unusable. Contact IBM Software Support. Send in the output from the command in error, and a dump of the local RM address space where the command executed or the dump of all RM address spaces in the IMSplex. Also send a copy of the IMSRSC repository RID and RMD data sets.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. The following table includes an explanation of the completion codes.

Table 174. Completion codes for the QUERYPGM command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Command completed successfully for program.</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>Program name is invalid, or the wildcard parameter specified does not match any resource names.</td>
</tr>
<tr>
<td>28</td>
<td>NO DMB LOADED</td>
<td>The DMB that is associated with the program does not exist in ACBLIB.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERYPGM command:

Example 1 for QUERYPGM command
### TSO SPOC input:

```sql
QUERY PGM NAME(PGM0000%,APOL1,BMP255,DFV+0,DFS1P67,AUTP5B7,JAVPSB1,JAVTESTJ,DCSQL7A,DCSQL6C,JMVJBP1) SHOW(ALL)

</cmd>

486 Commands, Volume 2: IMS Commands N - V
**Explanation:** Lots of different types of programs are displayed. SHOW(ALL) is specified to show all of the possible output fields. All of the program output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The program name, member name that built the line of output, and region type in which the program can run are displayed on every screen. Program names starting with PGM0000 were dynamically created with CREATE PGM commands. DBF#FPU0 is the Fast Path Utility. JAVTESTJ is a Java message processing
program. PGM00001 has no PSB in ACBLIB, so it shows a local status of NOTINIT-26-NOPSB and cannot be scheduled. PGM00003 is a generated PSB GPSB(Y), so it does not need a PSB in ACBLIB. PGM00002 and PGM00004 are dynamic option DOPT(Y) programs, so IMS will not detect that there is no PSB for them in ACBLIB and mark their status as NOTINIT until the first time they are scheduled. A few GPSBs are displayed with different language definitions. The language attribute applies to GPSBs and DOPT PSBs defined as Java programs.

Example 2 for QUERY PGM command

TSO SPOC input:
QUERY PGM (APOL1) SHOW(DEFN,DOPT,GPSB,FP)

TSO SPOC output:

<table>
<thead>
<tr>
<th>PgmName</th>
<th>MbrName</th>
<th>CC</th>
<th>Repo</th>
<th>IMSid</th>
<th>LRgnType</th>
<th>FP</th>
<th>LFP</th>
<th>DOPT</th>

**Source:**

490 Commands, Volume 2: IMS Commands N - V
Explanation: A line is returned for each resource that matches the wildcard name. The resource definitions from each IMS that has the resource defined and the global repository definition are returned. The repository information is returned by the command master IMS. There are no IMS specific sections in the repository for each resource name that matches the wildcard name.

**Example 4 for QUERY PGM command**

**TSO SPOC input:**

`QUERY PGM SHOW(EXPORTNEEDED)`

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>PgmName</th>
<th>MbrName</th>
<th>CC</th>
<th>LRgnType</th>
<th>ExportNeeded</th>
</tr>
</thead>
<tbody>
<tr>
<td>PGM00001</td>
<td>IMS1</td>
<td>0</td>
<td>MPP</td>
<td>Y</td>
</tr>
<tr>
<td>PGM00002</td>
<td>IMS1</td>
<td>0</td>
<td>MPP</td>
<td>Y</td>
</tr>
</tbody>
</table>

**OM API input:**

`CMD(QUERY PGM SHOW(EXPORTNEEDED))`

**Explanation:** Two programs, PGM00001 and PGM00002, need to be exported to the IMSRSC repository.

**Related concepts:**

- How to interpret CSL request return and reason codes (System Programming APIs)

**Related reference:**

- `/DISPLAY MODIFY command (Commands)`
- `/DISPLAY PGM command (Commands)`
QUERY PGMDESC command

Use the QUERY PGMDESC command to query information about program descriptors. A descriptor is a model that can be used to create descriptors or resources.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 493
- “Usage notes” on page 497
- “Output fields” on page 497
- “Return, reason, and completion codes” on page 502
- “Examples” on page 504

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 175. Valid environments for the QUERY PGMDESC command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY PGMDESC</td>
<td>X</td>
<td>X</td>

<tr>
<td>NAME</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SHOW</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>STATUS</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>DEFAULT</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the QUERY PGMDESC command:

NAME
   Specifies the 1-8 character name of the program descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*) which returns all program descriptors.

DEFAULT()
   Specifies which descriptor or descriptors to display.
   N   Displays all the program descriptors that are not the default.
   Y   Displays the default program descriptor.

SHOW
   Specifies the program descriptor output fields to be returned. The program descriptor name is always returned, along with the name of the IMS that created the output, the region type, and the completion code. The filters that are supported with the SHOW keyword are:

   ALL
      Returns all information about the program descriptor itself.

   Restriction: The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

BMPTYPE
   BMP type option. Specifies whether the program runs in a BMP type region or not. A BMP type region might be a BMP region or a JBP region.

   PSBs scheduled by DB2 stored procedures, by programs running under WebSphere Application Server, and by other users of the ODBA interface can be defined with BMPTYPE Y or N.

DEFAULT
   Default descriptor option.
DEFN

Specifies that the resource definitions are to be returned.

The program descriptor attributes that can be returned are: BMPTYPE, DOPT, FP, GPSB, LANG, RESIDENT, SCHDTYPE, TRANSTAT, DEFAULT, the repository create and update time stamps, and the IMS runtime create, update, import, and access time stamps.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:

- SHOW(DEFN) cannot be specified with DEFNTYPE or MODEL.
- The LModelName, LModelType, and LDefnType columns, which are returned on the QRY PGMDESC SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

When querying program descriptor information from the repository, resource definitions stored in the repository are used to determine the response lines with the repository information, and the runtime resource definitions are used to determine the response lines with the IMS runtime resource information. The response lines are returned for each stored resource or runtime resource definition that matches the specified filter. If SHOW(DEFN,GLOBAL) is specified, only the stored resource definitions that match the specified filter are returned. If SHOW(DEFN,LOCAL) is specified, only the runtime resource definitions that match the specified filter are returned.
If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

**DEFNTYPE**
Definition type. This is how the descriptor was defined.

**DOPT**
Dynamic option.

**EXPORTNEEDED**
Specifies that only the program descriptor resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the program descriptors that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each program descriptor name specified on the command. If the specified program descriptor does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY PGMDESC SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

**Tip:** For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

**FP** Fast Path option.

**GLOBAL**
Specifies that the stored resource definitions from the repository are to be returned. If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

**GPSB**
Generated PSB option.

**IMSID**
Specifies that the IMS IDs of the IMS systems whose resource lists contain the specified resource name are to be returned. SHOW(IMSID) is processed only by the command master IMS and is valid only if the command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.
When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

**LANG**
Language interface of the application program for a GPSB.

**LOCAL**
Specifies that the runtime resource definitions from the IMS system are to be returned.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

**MODEL**
Model name and model type used to create this descriptor. If the descriptor is created with one or more attributes defined and no model specified, the model name and model type is the default descriptor. The model name and model type are blank for IMS-defined descriptors. The CREATE command specified without the LIKE keyword creates a descriptor using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSPG1 or user-defined. The CREATE command specified with the LIKE keyword creates a descriptor using a model. The descriptor is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The descriptor attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify descriptors that were created with the same model. The model name and model type of a descriptor are exported and imported. The IMPORT command does not use the model name and model type when creating a descriptor.

**RESIDENT**
Resident option.

**SCHDTYPE**
Scheduling type, which indicates whether this application program can be scheduled into more than one message region or batch message region simultaneously.

**TIMESTAMP**
The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS), and last import time (TIMEIMPORT) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:
- YYYY is the year.
- JJJ is the Julian day (001 - 365).
- HH is the hour (01 - 24).
- MM is the minute (00 - 59).
- SS is the seconds (00 - 59).
• TH is the tenths and hundredths of a second (00 - 99).

**TRANSTAT**
Transaction level statistics option.

**Usage notes**

This command can be issued only through the Operations Manager API. This command applies to DB/DC, DBCTL and DCCTL systems. This command is allowed on XRF alternate and RSR tracker systems. The QUERY PGMDESC command is not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined).

Many of the attributes defined with the program descriptor become meaningful only for programs that are created using the program descriptor. Program descriptors are never scheduled; only programs created using a program descriptor are scheduled.

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

**Output fields**

The following table shows the QUERY PGMDESC output fields. The columns in the table are as follows:

<table>
<thead>
<tr>
<th>Short label</th>
<th>Contains the short label generated in the XML output.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Long label</td>
<td>Contains the long label generated in the XML output.</td>
</tr>
<tr>
<td>Keyword</td>
<td>Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.</td>
</tr>
<tr>
<td>Scope</td>
<td>Identifies the scope of the output field.</td>
</tr>
<tr>
<td>Meaning</td>
<td>Provides a brief description of the output field.</td>
</tr>
</tbody>
</table>
### Table 176. Output fields for the QUERY PGMDESC command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BMPT</td>
<td>LBMPType</td>
<td>BMPTYPE, DEFN</td>
<td>LCL</td>
<td>BMP type. This value is obtained from IMS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>N</strong> The program does not execute in a BMP type region. It might execute in an IMS TM MPP, JMP, or IFP region, or it might use the ODBA interface or the DRA interface. Use this specification for programs that run in IMS TM MPP, JMP, and IFP regions, or PSBs scheduled by CICS programs using DBCTL and other users of the DRA interface. This is the default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>Y</strong> The program executes in a BMP type region. It might execute in an IMS BMP region or a JBP region. Any associated transactions are assigned normal and limit priority values of zero.</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>LCL</td>
<td>Completion code.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td><em>error</em></td>
<td>LCL</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code.</td>
</tr>
<tr>
<td>DESC</td>
<td>DESCName</td>
<td>PGMDESC</td>
<td>LCL</td>
<td>Program descriptor name.</td>

<td>LDflt</td>
<td>DEFAULT</td>
<td>LCL</td>
<td>Default descriptor (Y) or not (N).</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>N</strong> The descriptor is not the default.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>Y</strong> The descriptor is the default. When a descriptor or resource is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type. IMS defines a program descriptor called DFSDSPG1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor.</td>
</tr>
<tr>
<td>DFNT</td>
<td>LDefnType</td>
<td>DEFNTYPE</td>
<td>LCL</td>
<td>Definition type, which can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>CREATE</strong> Defined by a CREATE command. The DEFNTYPE is not changed if the descriptor is updated with an UPDATE command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>IMPORT</strong> Defined by an IMPORT command. The DEFNTYPE is not changed if the descriptor is updated with an UPDATE command.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>IMS</strong> Defined by IMS. DFSDSPG1 is an IMS-defined program descriptor containing the default program values.</td>
</tr>
</tbody>

</tbody>
</table>

### Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 177. Return and reason codes for the QUERY PGMDESC command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each descriptor, accompanied by its completion code. See the completion code table for details.</td>
</tr>
</tbody>
</table>
| X'00000004'   | X'00001010'   | No resources were found to be returned. The resource names specified might be invalid, or:  
|               |               | • There were no resources that match the filter specified.           |
|               |               | • If SHOW(EXPORTNEEDED) was specified, no resources needed to be exported to the IMSRSC repository. |
| X'00000008'   | X'00002004'   | Invalid command keyword or invalid command keyword combination.         |
| X'00000008'   | X'00002040'   | Invalid filter or filter combination. An invalid filter might be an invalid parameter specified with the DEFAULT keyword. |
| X'0000000C'   | X'00003000'   | Command was successful for some descriptors but failed for others. The command output contains a line for each descriptor, accompanied by its completion code. See the completion code table for details. |
| X'0000000C'   | X'00003004'   | Command was successful for none of the descriptors. The command output contains a line for each descriptor, accompanied by its completion code. See the completion code table for details. |
| X'00000010'   | X'00004004'   | No CQS address space.                                                   |
| X'00000010'   | X'00004014'   | Command is not valid on the RSR tracker.                                |
| X'00000010'   | X'00004018'   | No resource structure exists, or resource structure is not available.  |
| X'00000010'   | X'00004100'   | Resource structure is full.                                             |
| X'00000010'   | X'00004104'   | No RM address space.                                                    |
| X'00000010'   | X'00004108'   | No SCI address space.                                                   |
| X'00000010'   | X'00004300'   | Command is not allowed because online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). |
| X'00000010'   | X'00004500'   | IMS is not enabled to use the repository.                               |
| X'00000010'   | X'00004501'   | RM is not enabled with the repository.                                  |
| X'00000010'   | X'00004502'   | Repository is not available.                                            |
| X'00000010'   | X'00004503'   | Repository is stopped.                                                  |
| X'00000010'   | X'00004504'   | Repository spare recovery is in progress.                              |
| X'00000010'   | X'00004505'   | No IMS resource list exists, or no resources for the resource type exist in the IMS resource list. |
| X'00000010'   | X'00004507'   | Repository access is denied.                                            |
| X'00000010'   | X'00004508'   | Repository maximum put length exceeded.                                |
| X'00000010'   | X'00004509'   | RM data version is lower than the IMS data version.                     |
| X'00000010'   | X'0000450A'   | Repository Server is being shut down.                                   |

<input>QRY PGMDESC SHOW(ALL)</input>
</cmd>
</cmdrsphdr>
```
Example 2 for QUERY PGMDESC command

TSO SPOC input:

QUERY PGMDESC NAME(*) SHOW(DFNT,DOPT,GPSB,FP)

TSO SPOC output:

DescName MbrName CC Repo IMSid Lrgntype FP LFP DOPT LDOPt GPSB LGPSB
DFSDDSPG1 IMS1 0 IMS1 MPP N N N
DFSDDSPG1 IMS2 0 IMS2 MPP N N N

Explanation: All program descriptors are returned with all output fields. All of the program descriptor output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The program descriptor name, the member name that built the line of output, and the region type in which the program can run are displayed on every screen. The fields that are blank are not applicable to the specified program descriptor.
OM API input:

```
CMD(QUERY PGMDESC NAME(*) SHOW(DEFN,DOPT,GPSB,FP))
```

OM API output:

```
<imsout>
<ctl>
<omname>OM1OM</omname>

</cmd>
</cmdrsphdr>
```

Chapter 5. QUERY commands  507
The stored resource definitions and the runtime resource definitions for the specified resources are returned. Only the FP, DOPT, and GPSB definitions are returned because the SHOW options are specified. The Dflt (default) column, which identifies the default descriptor, is returned because the local IMS runtime definitions are returned. DFSDSPG1 is the default descriptor and is only at each IMS system. The IMS generated system descriptor definitions are not in the repository.

Example 3 for QUERY PGMDESC command

TSO SPOC input:
QUERY PGMDESC NAME(PGMD0001,PGMD0002) SHOW(EXPORTNEEDED)

TSO SPOC output:
DescName MbrName CC LRgnType ExportNeeded
PGMD0001 IMS1 0 MPP N
PGMD0002 IMS1 0 MPP Y

OM API input:
CMD(QUERY PGMDESC SHOW(EXPORTNEEDED))
**Explanation:** Program descriptor PGMD0001 has been exported to the IMSRSC repository, but program descriptor PGMD0002 has not been exported to the IMSRSC repository.

**Related concepts:**
- How to interpret CSL request return and reason codes (System Programming APIs)

**Related reference:**
- Command keywords and their synonyms (Commands)

---

**QUERY POOL command**

Use the QUERY POOL command to display information about the current usage of the buffers that are managed by the Fast Path 64-bit buffer manager, processor storage utilization statistics for the pool type specified, and full-function database (OSAM or VSAM) buffer pools.

If you modify buffer pool definitions in the DFSDFxxx member and run the UPDATE POOL TYPE(DBAS) command, and an emergency restart occurs, you can issue a QUERY POOL TYPE(DBAS) command to determine whether the updates were successful.

**Subsections:**
- “Environment”
- “Syntax”
- “Keywords” on page 510
- “Usage notes” on page 512
- “Output fields” on page 512
- “Return, reason, and completion codes” on page 519
- “Examples” on page 520

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY POOL</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TYPE</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SHOW</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>POOLID</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SIZE</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SUBTYPE</td>
<td></td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Restriction:** The dynamic database buffer pools function is not supported in a DBCTL warm standby environment.

**Syntax**
Keywords

The following keywords are valid for the QUERY POOL command:

**TYPE()**
Required keyword that specifies the type of pool that you want the information to display for. The pool types are mutually exclusive. The command is rejected with a syntax error if multiple types are specified.

**FPBP64**
Returns information about the Fast Path 64-bit buffer pool.

**ACBIN64**
Returns information about the 64-bit cache pools. The 64-bit ACB storage pool is ACBIN64.

**GURIN64**
Returns information about the 64-bit cache pools. The 64-bit cache for XML documents created as responses to GUR calls is GURIN64.
DBAS
Returns information about full-function database (OSAM or VSAM) buffer pools.

POOLID()
Specifies the user-defined identifier assigned to a specific OSAM subpool or VSAM shared resource pool. The identifier is a 1- to 4-character alphanumeric field that filters which subpools are displayed in the QUERY command output. This keyword is optional.

SIZE()
Specifies the size of the buffers in the subpool to be filtered on. The size value acts filters which subpools are displayed in the QUERY command output. The size value can be from 512 to 32768 bytes. The command rounds up the size value to 512, 1024, 2048, and thereafter to multiples of 2048 bytes. You can code specifications of 1024 and greater as 1KB, 2KB, 4KB, and thereafter round up values to multiples of 2KB to a maximum of 32KB.

SUBTYPE()
Specifies the subpool types that are returned to the issuer of the command. The following subpool types can be specified with this keyword:

OSAM
Specifies that OSAM subpool information is displayed.

VSAM
Specifies that VSAM subpool information is displayed.

OSAM,VSAM
Specifies that OSAM subpool information and VSAM subpool information is displayed.

SHOW()
Specifies the pool output fields to be returned. There is no default.

ALL
Returns all information for the pool type that you specified.

FREE
Returns the percentage of the pool that was not reserved for buffers or control data. The SHOW(FREE) keyword is valid only with the TYPE(ACBIN64) keyword.

INUSE
Returns the percentage of the pool that is used. The SHOW(INUSE) keyword is valid only with the TYPE(ACBIN64) keyword.

OVERFLOW
Returns the total number of overflow buffers in use in the pool. Overflow buffers are used to store the members that are too large to store in standard 64-bit cache buffers. The SHOW(OVERFLOW) keyword is valid only with the TYPE(ACBIN64) keyword.

SIZE
Returns the size of the 64-bit storage pool as specified by the user. The SHOW(SIZE) keyword is valid only with the TYPE(ACBIN64) keyword.

MEMBER
Lists the subpools and shows the active members of the IMS PROCLIB data set where full-function database buffer pool definitions are obtained.
STATISTICS

Returns specific point-in-time statistics information for the specified pool type.

If TYPE(DBAS) is specified, this option is equivalent to the information that is displayed when the /DIS POOL DBAS type-1 command is issued.

Usage notes

The QUERY POOL command can be specified only through the OM API.

Output fields

The following table shows the QUERY POOL output fields. The columns in the table are:

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTBUF</td>
<td>ACTBUF</td>
<td>TYPE(ACBIN64)</td>
<td>The total number of active buffers in the 64-bit storage pool, that is, buffers that contain valid ACBLIB data in binary format or whole catalog DBD or PSB records in XML format.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TYPE(GURIN64)</td>
<td></td>
</tr>
<tr>
<td>ADDS</td>
<td>Isrt</td>
<td>TYPE(ACBIN64)</td>
<td>For TYPE(ACBIN64), the number of times IMS inserted an ACB member into the 64-bit storage pool. For TYPE(GURIN64), the number of times IMS inserted a catalog record into the 64-bit storage pool. This count is initialized at IMS startup.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>TYPE(GURIN64)</td>
<td></td>
</tr>
<tr>
<td>ALTREQ</td>
<td>AltReq</td>
<td>TYPE(DBAS) SHOW(STA TISTICS)</td>
<td>For OSAM subpools, it is the number of buffer alter calls for this subpool. This count includes NEW BLOCK and BYTALT calls. For VSAM subpools, it is the number of logical records altered.</td>
</tr>
<tr>
<td></td>
<td>BiAlt</td>
<td></td>
<td></td>
</tr>
<tr>
<td>B64BT</td>
<td>64b_Buf</td>
<td>TYPE(FPBP64) SHOW(ALL)</td>
<td>The 64 bit storage used for the buffers for each subpool and extent.</td>
</tr>
<tr>
<td>B64BTOT</td>
<td>64b_Tot</td>
<td>TYPE(FPBP64)</td>
<td>The total amount of 64-bit storage used for each subpool and extents, and the overall 64-bit storage total.</td>
</tr>
<tr>
<td>BFSRCH</td>
<td>BfSrch</td>
<td>TYPE(DBAS) SHOW(STA TISTICS)</td>
<td>For OSAM subpools, it is the number of buffers searched by all LOCATE-type calls for this subpool. For VSAM subpools, it is the number of VSAM control interval reads.</td>
</tr>
<tr>
<td></td>
<td>VRds</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Table 180. Output fields for the QUERY POOL command (continued).

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BFSTLW</td>
<td>BfStlW</td>
<td>TYPE(DBAS) SHOW(STATISTICS)</td>
<td>For OSAM subpools, it is the number of single block writes initiated by buffer steal routine for this subpool. For VSAM subpools, it is the number of VSAM control interval writes.</td>
</tr>
<tr>
<td>BUFSIZE</td>
<td>Buf_Size</td>
<td>TYPE(FPB64) SHOW(STATISTICS)</td>
<td>The buffer size being displayed.</td>
</tr>
<tr>
<td>BUFAVL</td>
<td>Buf_Avl</td>
<td>TYPE(FPB64)</td>
<td>The number of buffers available for use from this subpool or extents, or the total for the entire buffer pool or the entire system. The system total is found in row DBF_TOTB.</td>
</tr>
<tr>
<td>BUFS</td>
<td>BufSize</td>
<td>TYPE(DBAS)</td>
<td>The buffer size.</td>
</tr>
<tr>
<td>BUFUSE</td>
<td>Buf_Use</td>
<td>TYPE(FPB64)</td>
<td>The number of buffers being used by a process (IMS, dependent region, or external thread (such as ODBM)) from this subpool or extents, or the grand total for the entire buffer pool or the entire system. The system total is found in row DBF_TOTB.</td>
</tr>
<tr>
<td>BUFA</td>
<td>Buf_A</td>
<td>TYPE(FPB64) SHOW(ALL)</td>
<td>The number of available buffers in the subpool base section or extent. This column does not contain the total number of available buffers for the entire subpool.</td>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY POOL command. The OM return and reason codes that might be returned as a result of the QUERY POOL command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 181. Return and reason codes for the QUERY POOL command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The command completed successfully. The command output contains a line for each resource, accompanied by its completion code. See Table 182 on page 520 for details.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X00001010</td>
<td>The command found that no resources exist that match the specified filter.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002004'</td>
<td>Invalid command keyword or invalid command keyword combination.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003000'</td>
<td>Command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code. See the completion code table for details.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>Command was not successful for any of the resources. The command output contains a line for each resource, accompanied by its completion code. See the completion code table for details.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004014'</td>
<td>The command failed because it is not valid on the RSR tracker.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004016'</td>
<td>The command failed because it is not valid in a DCCTL environment.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004024'</td>
<td>Fast Path is not enabled for this IMS system, so there is no data to display.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004040'</td>
<td>The Fast Path 64-bit buffer manager is not enabled, so there is no data to display.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005000'</td>
<td>IMODULE GETSTOR error.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005004'</td>
<td>DFSOCMD response buffer could not be obtained.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005010'</td>
<td>Unable to obtain latch.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005FFF'</td>
<td>The QUERY POOL command could not be processed because an internal error occurred.</td>
</tr>
</tbody>
</table>
The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 182. Completion codes for the QUERY POOL command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 X'00000000'</td>
<td></td>
<td>The QUERY POOL command completed successfully.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>Either the specified pool does not exist, or the specified wildcard name does not match any existing pool names.</td>
</tr>
</tbody>
</table>

Completion codes are not issued as part of this QUERY POOL command. The expected output will show available pool or subpool information.

Examples

528 Commands, Volume 2: IMS Commands N - V
**Explanation:** In this example, there is a successful invocation of the QUERY POOL command for statistical information about OSAM and VSAM subpools filtered by buffer sizes of 1KB.

*Example 8 for QUERY POOL command*

TSO SPOC input:
```
QUERY POOL TYPE(DBAS) SUBTYPE(OSAM,VSAM) SHOW(STATISTICS) POOLID(OSM2)
```

TSO SPOC output:
```
<table>
<thead>
<tr>
<th>Subpool</th>
<th>MbrName</th>
<th>CC</th>
<th>BufSize</th>
<th>PoolId</th>
<th>NBuf</th>
<th>FixOpt</th>
<th>LctReq/RRba</th>
<th>NewBlk/RKey</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSAM</td>
<td>IMS1</td>
<td>0</td>
<td>2048</td>
<td>OSM2</td>
<td>7832</td>
<td>Y/N</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>OSAM</td>
<td>IMS1</td>
<td>0</td>
<td>32768</td>
<td>OSM4</td>
<td>10</td>
<td>Y/N</td>
<td>0</td>
<td>0</td>
</tr>
</tbody>
</table>
```

*Explanation:* In this example, there is a successful invocation of the QUERY POOL command for statistical information about OSAM and VSAM subpools filtered by pool IDs of OSM2.

*Example 9 for QUERY POOL command*

TSO SPOC input:
```
QUERY POOL TYPE(DBAS) SUBTYPE(OSAM,VSAM) SHOW(MEMBER)
```

TSO SPOC output:
```
<table>

**Explanation:** In this example, there is a successful invocation of the QUERY POOL command for both OSAM and VSAM pool information when TYPE(DBAS) and SHOW(ALL) are specified.
QUERY RM command

Use the QUERY RM command to view status and attributes information about a Resource Manager (RM) address space. This command returns information about IMSRSC repositories managed by RM.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 532
- “Output fields” on page 532
- “Return, reason, and completion codes” on page 534
- “Examples” on page 534

Environment

The QUERY RM command is processed by the Common Service Layer (CSL) Resource Manager (RM) address space.

Syntax

```
QUERY RM TYPE(REPO) SHOW(ATTRIB STATUS) ALL
```

Keywords

The following keywords are valid for the QUERY RM command:

**TYPE**

Specifies the type of data or information to be processed.

**REPO**

Specifies that information about all IMSRSC repositories defined to RM is to be returned.

**SHOW**

Specifies the information to be returned on the QUERY command.
**ALL**

Specifies that all the status and attribute information is to be returned.

**ATTRIB**

Specifies that the repository attributes in RM is to be returned. The attributes that are returned are AUDITACCESS settings in RM.

**STATUS**

Specifies that the status information in RM is to be returned. For possible status values that can be returned, see [Table 183](#).

**Usage notes**

This command can be specified only through the Operations Manager (OM) API.

The QUERY RM command is defined to OM as ROUTE=ALL. The command is processed by each RM that receives the command.

The command syntax for this command is defined in XML and is available to automation programs that communicate with OM.

**Output fields**

The following table shows the QUERY RM output fields. The columns in the table are as follows:

- **Short label**: Contains the short label generated in the XML output.
- **Long label**: Contains the long label generated in the XML output.
- **Keyword**: Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.
- **Meaning**: Provides a brief description of the output field.

*Table 183. Output fields for QUERY RM command*

<td>Status. Valid status values that can be returned are:</td>
</tr>
</tbody>
</table>
|             |            |          | **CONNECT**
|             |            |          | Indicates that RM is connected to the IMSRSC repository and that the repository is available for use. |
|             |            |          | **CONNECT-INCOMPLETE**
|             |            |          | Indicates that RM successfully connected to the repository, but RM failed to correctly update the repository global entry in the resource structure. In addition, other RM systems in the IMSplex might not have been notified with the directive to connect to the repository. |
|             |            |          | The operator must issue the UPDATE RM TYPE(REPO)
|             |            |          | SET(REPO(Y)) command to complete the connect processing. |
|             |            |          | **DISCONNECT-INCOMPLETE**
|             |            |          | Indicates that RM successfully disconnected from the repository, but RM failed to correctly update the repository global entry in the resource structure. In addition, other RM systems in the IMSplex might not have been notified to disconnect from the repository. |
|             |            |          | The operator must issue the UPDATE RM TYPE(REPO)
|             |            |          | SET(REPO(N)) command to complete the disconnect processing. |
|             |            |          | **NOTAVAIL**
|             |            |          | Indicates that the repository is not available. RM reconnects to the repository when the Repository Server indicates to RM that the repository is available. |
|             |            |          | **RS-NOTAVAIL**
|             |            |          | Indicates that there is no master Repository Server that is available. This status is displayed only when RM has successfully registered with the Repository Server, but the master Repository Server is down and there are no subordinate Repository Servers available to take over. The repository is not available for use until a Repository Server is available. |
|             |            |          | **SPARERECOV**
|             |            |          | Indicates that the repository spare recovery process is in progress. The repository is not available during this process. |
|             |            |          | **SPARERCVERR**
|             |            |          | Indicates that the repository spare recovery process resulted in an error and that the repository is not available for use. See the FRP messages issued by the Repository Server during the spare recovery process, and fix the error. The repository must be started after the error is fixed to make it available for use. |
|             |            |          | **UPDATE-AUDACC-INCOMPLETE**
|             |            |          | Indicates that RM successfully updated the audit access setting in the repository, but RM failed to correctly update the repository global entry in the resource structure. In addition, other RM systems in the IMSplex might not have been notified to update the audit access value from the repository global entry. |
|             |            |          | The operator must issue the UPDATE RM TYPE(REPO)
|             |            |          | SET(REPO(AUDITACCESS)) command to complete the update of the audit access setting. |
Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY RM command. The OM return and reason codes that might be returned as a result of the QUERY RM command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 184. Return and reason codes for the QUERY RM command

<table>
<thead>
<tr>
<th>Return code</th>

---

**QUERY RTC command**

Use the QUERY RTC command to query Fast Path routing codes. A routing code can be used by the Fast Path Input Edit/Routing Exit Routine (DBFHAGU0) to route a transaction to a different application program within the same load balancing group.

**Subsections:**

- "Environment"
- "Syntax" on page 539
- "Keywords" on page 539
- "Usage notes" on page 543
- "Output fields" on page 544
- "Return, reason, and completion codes" on page 547
- "Examples" on page 549

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

**Table 186. Valid environments for the QUERY RTC command and keywords**

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>

SHOW(LOCAL),
SHOW(MODEL),
SHOW(PGM),
SHOW(TIMESTAMP),
SHOW(STATUS),
SHOW(REGION),
SHOW(WORK),
SHOW(IMPORTNEEDED),
```

Keywords

The following keywords are valid for the QUERY RTC command:

**NAME**

Specifies the 1-8 character name of the routing code. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*), which returns all routing code resources.

**SHOW**

Specifies the routing code output fields to be returned. The routing code is always returned, along with the name of the IMS that created the output and the completion code. The filters that are supported with the SHOW keyword are:

**ALL**

Returns all information about the routing code itself. Other SHOW keywords can be specified to return information about resources that are related to the routing code.
Restriction: The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

DEFN
Specifies that the resource definitions are to be returned.

The routing code attributes that can be returned are: INQ, PGM, the repository create and update time stamps, and the IMS runtime create, update, import, and access time stamps.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS.

SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository. If the command master IMS is not enabled to use the repository, SHOW(DEFN,GLOBAL) results in an error return and reason code.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:
• SHOW(DEFN) cannot be specified with DEFNTYPE, MODEL, STATUS, REGION, or WORK.
• The LclStat, LModelName, LModelType, and LDefnType columns, which are returned on the QRY RTC SHOW(ALL) command, are not returned with SHOW(DEFN).
• The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).
• When querying route code information from the repository, the SHOW(DEFN) filter is not supported when used with the STATUS filter. The runtime filter of STATUS is not valid with SHOW(DEFN), SHOW(DEFN,GLOBAL), SHOW(DEFN,LOCAL), SHOW(DEFN,IMSID), SHOW(DEFN,IMSID,GLOBAL) or SHOW(DEFN,IMSID,LOCAL).

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is
returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

The repository information for SHOW(DEFN) or SHOW(DEFN, IMSID) is processed only by the command master IMS and is valid only when the command master IMS is enabled to use the repository.

**DEFNTYPE**
Definition type that the resource was defined with.

**EXPORTNEEDED**
Specifies that only the routing code resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the routing codes that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each routing code name specified on the command. If the specified routing code does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY RTC SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

**Tip:** For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

**GLOBAL**
Specifies that the stored resource definitions from the repository are to be returned. If SHOW(GLOBAL, DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL, DEFN) is valid only when the command master IMS is enabled to use the repository.

**IMSID**
Specifies that the IMS IDs of the IMS systems whose resource lists contain the specified resource name are to be returned. SHOW(IMSID) is processed only by the command master IMS and is valid only when the command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.
SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

INQ
Inquiry option for transaction messages associated with this routing code.

LOCAL
Specifies that the runtime resource definitions from the IMS system are to be returned.
SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

MODEL
The model name and model type used to create this resource. If the resource is created with all of the attributes defined and no model specified, the model name and model type are blank. The CREATE command specified without the LIKE keyword creates a resource using the default descriptor as a model. The default descriptor is either the IMS descriptor DBFDSRT1 or user-defined. The CREATE command specified with the LIKE keyword creates a resource using a model. The resource is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The resource attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource.

PGM
Program associated with this routing code.

REGION
Regions where the routing code is active.

Note: You cannot specify this filter with other SHOW filters; you must specify SHOW(REGION) individually.

STATUS
Local routing code status. For a description of the possible routing code status returned, see the STATUS keyword in the "Output fields for the QUERY RTC command" under "Output fields" on page 544.

TIMESTAMP
The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS), and last import time (TIMECREATE) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:
- YYYY is the year.
- JJJ is the Julian day (001 - 365).
- HH is the hour (01 - 24).
- MM is the minute (00 - 59).
- SS is the seconds (00 - 59).
• TH is the tenths and hundredths of a second (00 - 99).

WORK

Work in progress for the routing code specified on NAME parameter and its associated resources. The QRY RTC SHOW(WORK) command can be issued before a DELETE, IMPORT or UPDATE command to check for any work in progress for the specified routing code and any of its associated resources. Any work in progress might cause the subsequent DELETE, IMPORT or UPDATE commands to fail. The QRY RTC SHOW(WORK) command returns the resource name, resource type, and work status for the work in progress for the routing code specified on the NAME parameter or work in progress for an associated resource. If no work is in progress for the specified resource as response line is returned with a work status of blanks.

SHOW(WORK) specified with NAME(*) might take a long time.

Notes:
1. You cannot specify this filter with other SHOW filters; you must specify SHOW(WORK) individually.
2. The QRY RTC SHOW(WORK) command is not valid on an XRF alternate.

STATUS()

Selects routing codes for display that match the NAME parameter and possess at least one of the specified routing code status values.

ACTIVE
Sets the STATUS() filter to return information about active routing codes.

NOTINIT
Sets the STATUS() filter to return information about routing codes that are not initialized and cannot be used.

NOTSCHD
Sets the STATUS() filter to return information about routing codes that are not scheduled.

STOQ
Sets the STATUS() filter to return information about routing codes that are stopped. Transactions that are associated with this routing code are not processed.

Usage notes

This command can be issued only through the Operations Manager API. Fast Path must be installed on the system. This command applies to DB/DC and DCCTL systems. This command is allowed on XRF alternate and RSR tracker systems.

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).
Output fields

The following table shows the QUERY RTC output fields. The columns in the table are as follows:

Short label  
Contains the short label generated in the XML output.

Long label  
Contains the long label generated in the XML output.

Keyword  
Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

Scope  
Identifies the scope of the output field.

Meaning  
Provides a brief description of the output field.

<td>DEFN</td>
<td>GBL</td>
<td>Update time from the repository. This is the time the resource was last updated in the repository.</td>
</tr>
</tbody>
</table>
| TMAC        | LTimeAccess| TIMESTAMP| LCL   | The time that the resource was last accessed. The last access time is retained across warm start, emergency restart, EXPORT and IMPORT. The updating of the last access time is not logged. After a restart, the last access time reflects the time recorded in the restart checkpoint log records. The value is returned from the local IMS. For a routing code resource, the following actions update the last access time:  
  • When a message is queued to the balancing group using the specified routing code.  
  • CREATE command references the resource as a model. |
| TMCR        | LTimeCreate| TIMESTAMP| LCL   | The time that the routing code was created. This is the result of a CREATE RTC command, IMPORT command that creates the routing code, or IMS initialization. The create time is retained across warm start, emergency restart, EXPORT and IMPORT. The value is returned from the local IMS. |
| TMIM        | LTimeImport| TIMESTAMP| LCL   | The time that the resource was last imported, if applicable. The import time is retained across warm start and emergency restart. The value is returned from the local IMS. |
| TMUP        | LTimeUpdate| TIMESTAMP| LCL   | The last time the attributes of the runtime resource definition were updated as a result of the UPDATE RTC command or the IMPORT command. The update time is retained across warm start and emergency restart. The output value is obtained from the local IMS. |
Table 187. Output fields for the QUERY RTC command (continued)

<table>
<thead>
<tr>
<th>Reason</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOPGM</td>
<td>The program that this routing code references is not defined. No program PDIR control block exists. Action: 2.</td>
</tr>
<tr>
<td>REPOCHGLIST</td>
<td>The routing code name exists in the change list in the IMSRSC repository for this IMS, and the change list is being processed or the change list processing failed because of an error. This routing code cannot be used, scheduled, updated, exported, or referenced as a model until it is successfully imported so that the runtime routing code definition and the stored definition in the repository are synchronized. Action: 3.</td>
</tr>
</tbody>
</table>

**Note:** Actions that can be taken to initialize the routing code are:

1. Call IBM Software Support.
2. Issue the CREATE PGM command to create the program. Issue the UPDATE RTC START(Q) command to complete routing code initialization.
3. If IMS change list processing failed and message DFS4411E was issued, correct the problem and take one of the following actions:
   - Shut down IMS and restart it in order to try processing the change list again.
   - Issue the IMPORT DEFN SOURCE(REPO) NAME(rtcname) TYPE(RTC) command to import the routing code, where rtcname is the routing code name.

Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 189. Return and reason codes for the QUERY RTC command

**Explanation:** The QUERY RTC command is specified with SHOW(ALL), so all output fields are returned for the specified routing codes. All of the routing code output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The routing code name, the member name that built the line of output, and the completion code are displayed on every screen. Routing code wildcard parameter %%%% causes all routing codes with 4-character names to be displayed. The routing codes that were generated in stage 1 MODBLKS generation are created when IMS cold starts and defined with a definition type of MODBLKS. Routing codes RTC00001 and RTC00002 were created dynamically using CREATE RTC commands and display a definition type of CREATE. RTC00001 was created using routing code GFP2 as the model and RTC00002 was created using default descriptor DBFDSRT1. Routing code GFP2 displays the last access time stamp, from when it was referred to by the CREATE RTC command that created routing code RTC00001, using routing code GFP2 as the model. Routing code RTC00002 shows the last update time, because its program was changed by an UPDATE RTC command since it was created.

**Example 2 for QUERY RTC command**

TSO SPOC input:
 QUERY RTC NAME(RTC00001) SHOW(DEFN,PGM,INQ)

TSO SPOC output:

<table>
<thead>
<tr>
<th>Rtcode</th>
<th>MbrName</th>
<th>CC</th>
<th>Repo</th>
<th>IMSid</th>
<th>PgmName</th>
<th>LpgmName</th>
<th>Inq</th>
<th>Linq</th>

Chapter 5. QUERY commands 553
Example 4 for QUERoreach r

The command master IMS. Thesource repository definition ar
defined and the repository information is returned by
the command master IMS. There are no IMS-specific sections in the repository for
each resource name that matches the wildcard name.

Example 4 for QUERY RTC command
QUERY RTC NAME(RTC00001) SHOW(EXPORTNEEDED)

TSO SPOC output:
Rtcode MbrName CC ExportNeeded
RTC00001 IMS1 0 N

CMD(QUERY RTC SHOW(EXPORTNEEDED))

Command keywords and their synonyms (Commands)

QUERY RTCDESC command

Use the QUERY RTCDESC command to query Fast Path routing descriptors. A descriptor is a model that can be used to create descriptors.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 556
- “Usage notes” on page 559
- “Output fields” on page 560
- “Return, reason, and completion codes” on page 562
- “Example” on page 564

Environment

The following table lists the environments (DB/BC, DBCTL and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY RTCDESC</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NAME</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SHOW</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>DEFAULT</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>
Keywords

The following keywords are valid for the QUERY RTCDESC command:

**NAME**

Specifies the 1-8 character name of the routing code descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*), which returns all routing code descriptor resources.

**DEFAULT**

Selects routing code descriptors for display that possess the default value specified. DEFAULT(Y) displays the one and only default descriptor. DEFAULT(N) displays all the other descriptors that are not the default.

**SHOW**

Specifies the routing code descriptor output fields to be returned. The routing code descriptor name is always returned, along with the name of the IMS that created the output and the completion code. The filters supported with the SHOW keyword are:

**ALL**

Returns all information about the routing code descriptor itself. Other SHOW keywords can be specified to return information about resources related to the routing code descriptor.

**Restriction:** The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

**DEFAULT**

Default descriptor option.

**DEFN**

Specifies that the resource definitions are to be returned.
The routing code descriptor attributes that can be returned are: INQ, PGM, DEFAULT, the repository create and update time stamps, and the IMS runtime create, update, import and access time stamps.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified only the time stamps are returned.

Restrictions:
- SHOW(DEFN) cannot be specified with DEFNTYPE or MODEL.
- The LModelName, LModelType, and LDefnType columns, which are returned on the QRY RTCDESC SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

When querying route code descriptor information from the repository, resource definitions stored in the repository are used to determine the response lines with the repository information, and the runtime resource definitions are used to determine the response lines with the IMS runtime resource information. The response lines are returned for each stored resource or runtime resource definition that matches the specified filter. If SHOW(DEFN,GLOBAL) is specified, only the stored resource definitions that match the specified filter are returned. If SHOW(DEFN,LOCAL) is specified, only the runtime resource definitions that match the specified filter are returned.

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.
DEFNTYPE
Definition type that the descriptor was defined with.

EXPORTNEEDED
Specifies that only the routing code descriptor resources that match the
NAME parameter and have not been exported to the IMSRSC repository
since they were created or last updated are to be returned on the QUERY
command.

If the NAME keyword is omitted or NAME(*) is specified, only the names
of the routing code descriptors that need to be exported to the repository
are returned.

If a specific name or a generic name that is not NAME(*) is specified on
the NAME keyword, a response line is returned for each routing code
descriptor name specified on the command. If the specified routing code
descriptor does not need to be exported to the repository, an N is returned
in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW
parameters or other keywords and is valid only when IMS is enabled with the
IMSRSC repository.

The QUERY RTCDESC SHOW(EXPORTNEEDED) command is not valid
on an XRF alternate or the RSR tracker.

Tip: For resources and descriptors that have not been exported to the
IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO)
OPTION(CHANGESONLY) command to write the resource and descriptor
definitions to the repository so that they are available for the next IMS cold
start.

GLOBAL
Specifies that the stored resource definitions from repository are to be
returned. If SHOW(GLOBAL,DEFN) is specified, the global resource
definitions from the repository are returned by the command master IMS.
SHOW(GLOBAL,DEFN) is valid only when the command master IMS is
enabled to use the repository.

IMSID
Specifies that the IMS IDs of the IMS systems whose resource lists contain
the specified resource name are to be returned. SHOW(IMSID) is processed
only by the command master IMS and is valid only if the command master
IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is
returned for each IMS that has the resource defined, along with the stored
resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line
is returned for each IMS that has the resource defined, along with the
resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than
DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is
ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID).
SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

INQ
Inquiry option for transaction messages that are associated with this
routing code descriptor.
**LOCAL**

Specifies that the runtime resource definitions from the IMS system are to be returned.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

**MODEL**

The model name and model type used to create this descriptor. If the descriptor is created with all of the attributes defined and no model specified, the model name and model type are blank. The CREATE command specified without the LIKE keyword creates a descriptor using the default descriptor as a model. The default descriptor is either the IMS descriptor DBFDSRT1 or user-defined. The CREATE command specified with the LIKE keyword creates a descriptor by using a model. The descriptor is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The descriptor attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource.

**PGM**

Program that is associated with this routing code.

**TIMESTAMP**

The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS), and last import time (TIMECREATE) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:

- YYYY is the year.
- JJJ is the Julian day (001 - 365).
- HH is the hour (01 - 24).
- MM is the minute (00 - 59).
- SS is the seconds (00 - 59).
- TH is the tenths and hundredths of a second (00 - 99).

**Usage notes**

This command can be issued only through the Operations Manager API. Fast Path must be installed on the system. This command applies to DB/DC and DCCTL systems. This command is allowed on XRF alternate and RSR tracker systems. The QUERY RTCDESC command is not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined).

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).
Output fields

The following table shows the QUERY RTCDESC output fields. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. 
N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Scope**
Identifies the scope of the output field.

**Meaning**
Provides a brief description of the output field.

<table>

<td>NO RESOURCES FOUND</td>
<td>Routing code or routing code descriptor name is invalid, or the wildcard parameter specified does not match any resource names.</td>
</tr>
</tbody>
</table>

**Example**

The following is an example of the QUERY RTCDESC command:

**Example 1 for QUERY RTCDESC command**

TSO SPOC input:
QRY RTCDESC SHOW(ALL)

TSO SPOC output:

```
(screen 1)
DescName  MbrName  CC  LPgmName  LInq  LModelName  LModelType  LDflt
DBFDSRT1  IMS1  0  N

(scrolled to the right screen 2)
DescName  MbrName  CC  LTimeCreate  LTimeUpdate
DBFDSRT1  IMS1  0  2011.180  12:37:38.07

(scrolled to the right screen 3)
DescName  MbrName  CC  LTimeAccess  LTimeImport  LDefnType
DBFDSRT1  IMS1  0  2011.180  13:18:55.75  IMS
```

OM API input:

```
CMD(QUERY RTCDESC SHOW(ALL))
```

OM API output:

```
<imsout>
<ctl>
<omname>OM1OM </omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20 </xmlvsn>
<staseq>C7FF0A28EBF54657</staseq>
<stoseq>C7FF0A28EC276557</stoseq>
<rqsttkn1>USRT005 10142016</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</cmd>
```

```
<master>IMS1 </master>
<userid>USRT005 </userid>
<verb>QRY </verb>
<kwd>RTCDESC </kwd>
<input>QRY RTCDESC SHOW(ALL) </input>
</cmd>
```

```
<cmdrsphdr>
<hdr slbl="DESC" llbl="DescName" scope="LCL" sort="a" key="1"
```
Explanation: All routing code descriptors are returned with all output fields. All of the routing code descriptor output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The routing code descriptor name, the member name that built the line of output, and the completion code are displayed on every screen. IMS-defined descriptor DBFDSRT1 contains the IMS default routing code values.

Example 2 for QUERY RTCDESC command

TSO SPOC input:
QUERY RTCDESC NAME(*) SHOW(DEFN,PGM,INQ))

- Command keywords and their synonyms (Commands)

QUERY STRUCTURE command

Use the QUERY STRUCTURE command to display information about IMS coupling facility structures used by members of an IMSplex.

Subsections:
- “Environment” on page 568
- “Syntax” on page 568
- “Keywords” on page 568
- “Usage notes” on page 568
- “Output fields” on page 568
- “Return, reason, and completion codes” on page 569
- “Examples” on page 571

Environment

There are no environment indicators for the QUERY STRUCTURE command itself, because it does not run in the address space of any IMS control or dependent region. QUERY STRUCTURE is processed in an RM command processing environment.
Syntax

```
 Query Structure
    Query(Qry)
        NAME(*)
            ,
                NAME(structurename)
                structurename*
                    
            SHOW(*)
                ALL
                STATISTICS
                TYPE
```

Keywords

The following keywords are valid for the QUERY STRUCTURE command:

**NAME()**
Specifies the names of the structures for which information is to be returned. The structure name can be a generic parameter, to enable easy specification of a group of structures whose names match a generic parameter mask.

**SHOW()**
Specifies the output fields to be returned. If SHOW is not specified, only the structure names, IMSplex member that builds the output line, and completion codes are returned. This provides a method for a system management application to obtain a list of all structure names. This can be used to determine the resource structure that is managed by RM. The parameters supported with the SHOW keyword are as follows:

- **ALL**
  Returns all the output fields.

- **STATISTICS**
  Displays statistics information for the structures that match the specification in the NAME() parameter.

- **TYPE**
  Returns the type of the specified structure. For example, the type might be RSRC, which identifies a resource structure.

Usage notes

This command is supported only by Resource Manager (RM) to return information about a resource structure.

The command syntax for this command is defined in Extensible Markup Language (XML) and is available to automation programs which communicate with Operations Manager (OM).

Output fields

The following table contains information about the output fields for QUERY STRUCTURE. The columns in the table are as follows:
Short label
Contains the short label generated in the XML output.

Long label
Contains the long label generated in the XML output.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Table 195. Output fields for the QUERY STRUCTURE command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRNM</td>

</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY STRUCTURE command are standard for all commands entered through the OM API.

The following table contains the return and reason codes that can be returned to OM from a QUERY STRUCTURE command.

Table 196. Return and reason codes for the QUERY STRUCTURE command

<table>
<thead>
<tr>

<tr>
<td>X'03000014'</td>
<td>X'00005200'</td>
<td>The QUERY STRUCTURE command processing terminated because of an unexpected Common Queue Server (CQS) error.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

The following table contains the completion codes that can be returned on a QUERY STRUCTURE command.

Table 197. Completion codes for the QUERY STRUCTURE command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY STRUCTURE command completed successfully for the resource.</td>
</tr>
<tr>
<td>4</td>
<td>NO RESOURCES FOUND</td>
<td>The structure name is unknown to the client that is processing the request. The structure name might have been typed in error, or the structure might not be defined or allocated at this time. If this is a wildcard request there were no matches for the name. Confirm the correct spelling of the structure name is specified on the command.</td>
</tr>
<tr>
<td>30</td>
<td>INVALID CHARACTER, RESOURCE NAME</td>
<td>Incorrect or unsupported characters are included in the structure name.</td>
</tr>
<tr>
<td>38</td>
<td>CQS UNEXPECTED ERROR</td>
<td>Command failed because of a CQS error.</td>
</tr>
</tbody>
</table>
Examples

The following is an example of the QUERY STRUCTURE command:

Example 1 for QUERY STRUCTURE command

This command displays all of the resource structures in the IMSplex and their statistics. Only one resource structure is defined, IMSRSRC01. The number of list entries allocated on the resource structure is 3577, the number of list entries in use on the structure is 676. The number of data elements allocated is 3574, the number of data elements in use is 24. The list entry to data element ratio on the resource structure is one to one. Not many list entries or data elements are in use on the resource structure, so the resource structure is not approaching full.

TSO SPOC input:
QRY STRUCTURE SHOW(STATISTICS)

TSO SPOC output:
StructureName MbrName CC LeAlloc LeInuse ElmAlloc ElmInuse LE/EL
IMSRSRC01 RM1RM 0 3577 676 3574 24 0001/0001

Chapter 5. QUERY commands 571
QUERY TRAN command

Use the QUERY TRAN command to display information about transactions (for example, class, status, queue count, and others) across the IMSplex. This command can be specified only through the OM API and is valid on an XRF alternate.

Subsections:
- "Environment"
- "Syntax" on page 573
- "Keywords" on page 574
- "Usage notes" on page 585
- "Equivalent IMS type-1 commands" on page 586
- "Output fields" on page 586
- "Return, reason, and completion codes" on page 606
- "Examples" on page 609

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the QUERY TRAN command and keywords can be issued.

<table>

```
Keywords

The following keywords are valid for the QUERY TRAN command:

CLASS()

     Displays transactions that possess at least one of the specified classes. This
keyword allows for additional filtering by CLASS value. If no filter is specified (such as STATUS, CLASS or QCNT), all the transactions matching the transaction name are returned.

The output returned when the CLASS filter is specified includes the class value of the transaction that caused the transaction name to be displayed even if the SHOW(CLASS) option is not specified.

CONV()
Selects transactions for display that possess the conversational attributes specified.

FP()
Selects transactions for display that possess the Fast Path option specified. If more than one FP option is specified, selects transactions for display that possess at least one of the Fast Path options specified.

NAME()
Specifies the 1-8 character name of the transaction. Wildcards can be specified in the name. The name is a repeatable parameter. The default is NAME(*), which returns all transactions. If no filter is specified (such as STATUS, CLASS or QCNT), all the transactions matching the transaction name are returned.

QCNT()
Selects transactions that have a queue count less than (LT), less than or equal to (LE), greater than (GT), greater than or equal to (GE), equal to (EQ), or not equal to (NE) the specified numbers. The specified number cannot be a 1 when LT is specified. This keyword allows for additional filtering by QCNT value. Transactions with a queue count of 0 are not returned when the QCNT filter is specified. When a filter of QCNT(LT,n) is specified, transactions with a queue count greater than 0 and less than n are returned. If no filter is specified (such as STATUS, CLASS or QCNT), all the transactions matching the transaction name are returned.

The QCNT filter is valid in both a shared-queues environment and a non-shared-queues environment.

In a shared-queues environment, if QCNT is specified, the performance implication is that the shared queues are read. In this environment, the QUERY TRAN QCNT command is processed only by the master IMS as the queues are global. The command master returns all the transactions on the shared queues that match the queue count filter specified. If QCNT is specified with a wildcard transaction name, the performance implication is that all the shared-queues transaction messages on the Coupling Facility must be read.

In a non-shared-queues environment, the local queue count values are used to determine the transactions to be displayed. In this environment, the QUERY TRAN QCNT command is processed by each IMS the command is routed to as the queues are local. Each IMS returns all the transactions it found locally that match the queue count filter specified.

The output returned when the QCNT filter is specified includes the queue count of the transaction that caused the transaction name to be displayed even if the SHOW(QCNT) option is not specified.

REMOTE()
Selects transactions for display that possess the remote option specified.

RESP()
Selects transactions for display that possess the response mode option specified.
SHOW()

Specifies the transaction output fields to be returned. The transaction name is always returned along with the name of the IMS that created the output and the completion code. If SHOW is not specified, only the transaction names are returned if the QCNT, CLASS, or STATUS filter is not specified. This keyword provides a method for a system management application to obtain a list of transactions that match the transaction names that are currently known in the IMSplex.

Important: The only SHOW option supported when the QCNT() filter is specified is the AFFIN option. No other SHOW options are supported with the QCNT() filter because of performance reasons.

AFFIN

IMS affinity of the messages on the shared queues.

If the AFFIN option is used as a status filter, IMS shows all the transactions that have affinity status.

If the SHOW(ALL) or SHOW(STATUS) keyword is specified, and if a transaction has affinity status, AFFIN is displayed in the LclStat column.

If the SHOW(AFFIN) keyword is used with the QCNT filter, messages on the shared queue are displayed with their AFFIN value.

The affinity that is shown when the SHOW(AFFIN) keyword is specified is valid only with the QCNT filter and is ignored for the other variations of the QUERY TRAN command.

The AFFIN option is valid only in a shared-queues environment and is ignored in a non-shared-queues environment.

ALL

Returns all information about the transaction itself. Other SHOW keywords can be specified to return information about resources that are related to the transaction.

Global values are returned only for those status fields and attributes for which global information is kept for the IMSplex.

Restriction: The ExportNeeded column, which is returned when SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

AOCMD

Specifies that you want the AOI option returned which indicates whether the transaction can issue the type-1 AOI CMD call or the type-2 AOI ICMD call.

CLASS

Scheduling class used to determine which message regions can process the transaction locally on a particular IMS.

CMTMODE

Specifies when database updates and non-express output messages are committed. This operand affects emergency restart.

CONV

Conversation option.

CPRI

The current priority. The current priority is the normal priority, when the
transaction queue count is less than the limit count. The current priority is raised to the limit priority if the transaction queue count is equal to, or exceeds, the limit count.

**DCLWA**
Log write-ahead option.

**DEFN**
Specifies that the resource definitions are to be returned.

The transaction attributes that can be returned are: AOCMD, CLASS, CMASMODE, CONV, DCLWA, DIRET, EDITUC, EDITRUN, EMHBSZ, EXPRTIME, FP, INQ, LCT, LPRI, MAXRGN, MSGTYPE, NPRI, PLCT, PLCTTIME, PARM, PGM, RECOVER, REMOTE, RESP, SERIAL, SIDR, SIDL, SEGNO, SEGSZ, SPASZ, SPATRUNC, TRANSTAT, WFI, the repository create and update time stamps, the IMS runtime create, update, import and access time stamps, and the IMS runtime MSNAME.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition that is obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

**Restrictions:**
- SHOW(DEFN) cannot be specified with DEFNTYPE, MODEL, QCNT, STATUS, or WORK.
- The LclStat, LModelName, LModelType, and LDefnType columns, which are returned on the QRY TRAN SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).
- When querying transaction information from the repository, the SHOW(DEFN) filter is not supported when used with either the QCNT
or STATUS filter. The runtime filters of QCNT and STATUS are not valid with SHOW(DEFN), SHOW(DEFN,GLOBAL), SHOW(DEFN,LOCAL), SHOW(DEFN,IMSID), SHOW(DEFN,IMSID,GLOBAL) or SHOW(DEFN,IMSID,LOCAL).

Resource definitions that are stored in the repository are used to determine the response lines with the repository information, and the runtime resource definitions are used to determine the response lines with the IMS runtime resource information. The response lines are returned for each stored resource or runtime resource definition that matches the specified filter. If SHOW(DEFN,GLOBAL) is specified, only the stored resource definitions that match the specified filter are returned. If SHOW(DEFN,LOCAL) is specified, only the runtime resource definitions that match the specified filter are returned.

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

**DEFNTYPE**
Definition type, which describes how the resource was defined.

**DIRROUTE**
MSC directed routing option.

**EDITRTN**
Input edit routine that edits messages before the program receives the message.

**EDITUC**
Uppercase translation option of the input data.

**EMHBSZ**
EMH buffer size that is required to run the Fast Path transaction.

**EXPORTNEEDED**
Specifies that only the transaction resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the transactions that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each transaction name specified on the command. If the specified transaction does not need to be exported to the repository, an N is returned in the ExportNeeded column.

**Restrictions:**
1. SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords.
2. SHOW(EXPORTNEEDED) is valid only when IMS is enabled with the IMSRSC repository.
3. The QUERY TRAN SHOW(EXITPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.
For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.

**EXPTIME**
Transaction expiration time in seconds.

**FP** Fast Path option.

**GLOBAL**
For output fields that have both local and global values, this option returns only the global values. If used with another SHOW keyword to request a specific output field, this OPTION requests that only the global value of the specified output field is returned. IMS retrieves global information from the source that maintains the data. For example, RM maintains some global information, and CQS maintains other global information. Global output is returned only by the command master. The QUERY TRAN command can return global information from the RM resource structure if global status is maintained for transactions.

The QUERY TRAN command returns global information if you specified that the IMSplex maintain global transaction status in RM. You can specify this during IMS initialization in either the DFSDFxxx or DFSCGxxx PROC LIB member with PLEXPARM(GSTSTRAN(Y)). You can also change it dynamically using the UPD IMS SET(PLEXPARM(GSTSTRAN(Y)) command. If you do not specify that global database status is to be maintained, the GLOBAL keyword is processed, and the global status is not updated.

If SHOW(GLOBAL) is specified without SHOW(DEFN), the repository information is not returned. SHOW(GLOBAL) returns any global status information from the resource structure if GSTSTRAN=Y is enabled. It also returns the global queue count from IMS shared queues. If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

**IMSID**
Specifies that the IMS IDs of the IMS systems whose resource lists contain the specified resource name are to be returned. SHOW(IMSID) is processed only by the command master IMS and is valid only when the command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

**INQ**
Inquiry option.
LCT
Limit count. Specifies the number that, when compared to the number of input transactions queued and waiting to be processed, determines whether the normal or limit priority value is assigned to this transaction. The limit count value can range from 1 through 65 535.

The limit count value is ignored for a transaction that is processed by a BMP.

The limit count value is ignored in a shared-queues environment.

LOCAL
For output fields that have both local and global values, this option returns only the local values. If used with another SHOW keyword to request a specific output field, this option requests that only the local value of the specified output field is returned. Local output is returned by each IMS that processes the command.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

LPRI
Limit priority. The scheduling priority to which this transaction is raised when the numbers of input transactions enqueued and waiting to be processed is equal to or greater than the limit count value. The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class.

The limit priority value is ignored for a transaction that is processed by a BMP.

MAXRGN
Maximum region count. This limits the number of message processing program (MPP) regions that can be concurrently schedule to process a transaction. When the number of MPP regions is not limited, one transaction might monopolize all available regions. MAXRGN(0) means that no limit is imposed.

MODEL
The model name and model type used to create this resource. The model name and model type are blank for IMS-defined resources and descriptors and queue-only transactions created by the DFSINSX0 exit. The CREATE command specified without the LIKE keyword creates a resource using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSTR1 or user-defined. The CREATE command specified with the LIKE keyword creates a resource using a model. The resource is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The resource attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource. The model name is blank if the resource is IMS-defined.

MSGTYPE
Message segment type (single or multiple segment). It specifies the time at which an incoming message is considered complete and available to be routed to an application program for subsequent processing.

If MSC-directed routing is used in a multiple IMS system configuration, IMS does not ensure that both the message and the transaction destined to process that message are either single segment or multiple segments.

**MSNAME**

The logical link path name, remote system ID, and local system ID are returned.

Logical link path name in a multiple IMS system configuration (MSC). A logical link path is a path between any two IMS systems. The IMS systems are identified by the remote system ID and the local system ID associated with the logical link path. The remote system ID identifies the system in which messages using this path are to be processed. The local system ID identifies this system.

The remote system ID (SIDR) identifies the IMS system on which the application program runs. A value of 0 means MSC is not enabled on this system. The local system ID and remote system ID are the same for local transactions.

The local system ID (SIDL) identifies the originating system to which responses are returned. A value of 0 means MSC is not enabled on this system. The local system ID and remote system ID are the same for local transactions.

**NPRI**

Normal scheduling priority. The scheduling priority is an attribute that is used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class. The normal priority is assigned to the transaction as the scheduling priority when the number of input transactions that are enqueued and waiting to be processed is less than the limit count value.

The normal priority value is ignored for a transaction that is processed by a BMP.

**PARLIM**

Parallel processing limit count. This value is the maximum number of messages that can currently be queued, but not yet processed, by each active message region that is currently scheduled for this transaction. This value is the threshold value to be used when the associated program is defined with a scheduling type of parallel. An additional region is scheduled whenever the current transaction enqueue count exceeds the PARLIM value multiplied by the number of regions that are currently scheduled for this transaction.

PARLIM(0) indicates that any input message can cause a new region to be scheduled. PARLIM(65535) indicates that parallel processing is disabled and IMS allows the transaction to be scheduled in only one region at a time.

**PGM**

The name of the program that is associated with this transaction. This name matches the PSB name in ACBLIB. SHOW(PSB) is an alias of SHOW(PGM).
**PLCT**

Processing limit count. This value is the maximum number of messages that are sent to the application program by the IMS for processing without reloading the application program.

PLCT(0) means that a maximum of one message is sent to the application program at a single program load.

PLCT(65535) means that no limit is placed on the number of messages that are processed at a single program load.

**PLCTTIME**

Processing limit count time. This value is the amount of time (in hundredths of seconds) allowable to process a single transaction (or message). The number specifies the maximum CPU time allowed for each message to be processed in the message processing region.

For the Fast Path potential transactions that are defined in the system definition TRANSACT macro, the value shown is the CPU-time-per-transaction number, which is specified on the PROCLIM keyword, multiplied by 100.

PLCTTIME(6553500) means that no time limit is placed on the application program.

**PSB**

The name of the program that is associated with this transaction. This name matches the PSB name in ACBLIB. SHOW(PSB) is an alias of SHOW(PGM).

**QCNT**

Transaction message queue count.

In a non-shared-queues environment, the local transaction message queue count is returned. This count represents the number of messages on the IMS system where the command is issued.

In a shared-queues environment, both the local transaction message queue count and the global transaction message queue count are returned.

- The local queue counts value that is returned in this environment represents the messages being processed by the IMS system where this command is issued. Do not use local queue counts for queue evaluation purposes.
- The global transaction message queue count represents the current message queue count on the shared queues structure. This count represents the number of messages that can be processed by the IMS system where the command is issued. This count includes messages that can be processed by any IMS system (messages with no affinity), plus messages that can be processed by the IMS system where the command is issued (messages with an affinity to the IMS system that issued the command).

**RECOVER**

Recovery option.

**REMOTE**

Remote option.

**RESP**

Response option.
RGC
Number of regions the transaction is currently scheduled in the local IMS.

SECON
Segment number. This value is the maximum number of application
program output segments that are allowed into the message queues per
Get Unique (GU) call from the application program.
SECON(0) means that the number of segments is not checked by the
online system at the execution time.

SEGSZ
Segment size. This value is the maximum number of bytes allowed in any
one output segment.
SEGSZ(0) means that the segment size is not checked by the online system
at execution time.

SERIAL
Serial option.

SPASZ
Scratchpad area size for a conversational transaction.

SPATRUNC
The SPA data truncation option indicates whether the SPA data should be
truncated or preserved across a program switch to a transaction that is
defined with a smaller SPA.
When a conversation initially starts, and when a program is switched, the
SPATRUNC option is checked and set or reset as specified. When the
option is set, it remains set for the life of the conversation, or until a
program switch occurs to a transaction that specifies the option is to be
reset.
When a program switch occurs, the truncated data option for the new
transaction is first checked, and that specification is set for the conversation
and is used for the SPA inserted into the output message. If the option is
not specified for the new transaction, the option currently in effect for the
conversation is used.

STATUS
Local transaction status. For a description of the possible transaction status
returned, see the STATUS keyword in the "Output fields for the QUERY
TRAN command" table under "Output fields on page 586.

TIMESTAMP
The creation time (TIMECREATE), last update time (TIMEUPDATE), last
access time (TIMEACCESS), and last import time (TIMEIMPORT) time
stamps are returned. The time is returned in local time in the format
YYYY.JJJ HH:MM:SS.TH, where:
• YYYY is the year.
• JJJ is the Julian day (001 - 365).
• HH is the hour (01 - 24).
• MM is the minute (00 - 59).
• SS is the seconds (00 - 59).
• TH is the tenths and hundredths of a second (00 - 99).

TRANSTAT
Transaction level statistics option.
WAIT-FOR-INPUT OPTION.

WORK
Work in progress for the transaction specified on the NAME parameter and its associated resources. The QUERY TRAN SHOW(WORK) command can be issued before a DELETE, IMPORT or UPDATE command to check for any work in progress for the specified transaction and any of its associated resources. Any work in progress might cause the subsequent DELETE, IMPORT or UPDATE commands to fail. If no work is in progress for the specified resource, a response line is returned with a work status of blanks.

Notes:
1. SHOW(WORK) specified with NAME(*) might have a performance impact on the processing of the command.
2. You cannot specify this filter with other SHOW filters; you must specify SHOW(WORK) individually.
3. The QRY TRAN SHOW(WORK) command is not valid on an XRF alternate.

STATUS()
Selects transactions for display that possess at least one of the specified transaction statuses. This keyword allows for additional filtering by transaction status. If a STATUS, CLASS, or QCNT filter is not specified, all the transactions matching the transaction name are returned.

The output returned when the STATUS filter is specified includes the status of the transaction that caused the transaction name to be displayed even if the SHOW(STATUS) option is not specified.

Filtering is based only on local status, even if RM maintains global status.

AFFIN
Transaction is registered with local affinity with IMS.

BAL
Transaction is eligible for load balancing (for example, with parallel limits specified).

CPIC
This CPI-C transaction was built dynamically on this IMS system and can process only on this IMS system.

DYN
Transaction was built in a shared-queues environment, is not defined to this IMS, and therefore, cannot be scheduled in this IMS subsystem.

IOPREV
Indicates that a BMP program containing GSAM cannot complete scheduling because I/O prevention has not completed. Further I/O requests to data sets are inhibited.

LCK
Transaction is locked by a /LOCK TRAN command.

NOTINIT
Transaction is not initialized and cannot be used.

QERR
I/O error has occurred on this queue for this MSC remote transaction.
QSTP
Transaction queuing is stopped by online change because the transaction is affected by the online change. Online change might be changing or deleting the transaction, or changing or deleting a program, PSB, database, or DMB referenced by the transaction. Transaction queuing is stopped until the online change is committed or aborted.

SUSPEND
Transaction has messages on the suspend queue.

STOQ
Transaction is stopped for queuing and can no longer be queued globally. This status might be caused by a previous UPDATE TRAN, /PURGE TRAN or /STO TRAN command.

STOSCHD
Transaction is stopped for scheduling and can no longer be scheduled globally. This status might be caused by a previous UPDATE TRAN, /PSTOP TRAN or /STO TRAN command or an application abend.

TRACE
Transaction is being traced.

USTO
Transaction scheduling stopped because of unavailable data.

Usage notes

The transaction information displayed depends on whether the IMS issuing the QUERY TRAN command is running with RM services. If the QUERY TRAN command is issued by an IMS command master running without RM, all transaction information local to that IMS is returned. If the QUERY TRAN command is issued by an IMS command master running with RM, the IMS command master retrieves global information from CQS or RM as specified.

If the QUERY TRAN command is routed for global information to all IMS systems in an environment where some IMS systems use RM services and other IMS systems do not, the command results will vary because any of the IMS systems can be the command master. The RM environment of the IMS command master affects the type of transaction information that is displayed. You might want to route QUERY TRAN to specific IMS systems if some IMS systems are using RM. Here are two examples of why you might receive different command results:

1. The IMSplex has non-cloned systems and the transaction is only defined by an IMS that has RMENV=N. The IMS command master is running with RM services, but because the transaction is not defined to RM, no global information is obtained. The results are two response lines:
   • The IMS command master returns the transaction name as invalid.
   • The IMS with RMENV=N returns its local information.

2. The IMSplex has non-cloned systems. If global queue counts are requested, and the IMS command master does not have RM running, no global queue counts are returned for transactions that are not defined locally at the command master. All other IMS systems return only their local information.

In a shared-queues environment, a QUERY TRAN NAME(tranname) QCNT(GT,0) command returns the total count of messages on the shared queue structure for transaction tranname. This count includes messages that can be processed by any IMS (messages with no affinity), plus messages with affinity to an IMS. A QUERY
TRAN NAME(*TRANNAME*) QCNT(GT,0) SHOW(AFFIN) command returns one line for the transaction name with messages that can be processed by any IMS (messages with no affinity). Another line is returned for the transaction that has messages queued with affinity to an IMS. This line shows the number of messages that are queued with affinity, as well as the IMSID of the IMS to which they have affinity. A QUERY TRAN NAME(*TRANNAME*) QCNT(GT,0) or QUERY TRAN NAME(*TRANNAME*) QCNT(GT,0) SHOW(AFFIN) command is processed only by the command master IMS because the command master IMS can obtain information for all IMS subsystems in the IMSplex environment.

If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

### Equivalent IMS type-1 commands

The following table shows variations of the QUERY TRAN command and the type-1 IMS commands that display similar information.

<table>
<thead>
<tr>
<th>QUERY TRAN command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY TRAN NAME(<em>TRANNAME</em>) SHOW(ALL)</td>
<td>/DISPLAY TRAN <em>TRANNAME</em></td>
</tr>
<tr>
<td>QUERY TRAN SHOW(ALL)</td>

### Output fields

The following table shows the output fields for the QUERY TRAN command. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that can appear for a nonzero completion code.

**Scope**
Identifies the scope of the output field.

**Meaning**
Provides a brief description of the output field.
<table>

<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AFIN</td>
<td>Affinity</td>
<td>AFFIN</td>
<td>GBL</td>
<td>Affinity of the transaction messages on the shared queues, or affinity registration of the transactions for this IMS. For a transaction message on the shared queues (that is, the QCNT option), AFFIN displays the IMS ID or the recoverable service element (RSE) name of the IMS system that the message can be processed on. For a transaction registration, AFFIN displays the IMS ID or the RSE name appended to the transaction that was registered to CQS with local affinity.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AOCMD</td>
<td>LAOCMD</td>
<td>AOCMD</td>
<td>LCL</td>
<td>Transaction supports AOI CMD calls (CMD, TRAN, or Y) or not (N). The output value is obtained from the local IMS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>N Indicates that the transaction is not permitted to issue AOI type-1 CMD calls. The transaction is permitted to issue AOI type-2 ICMD calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>CMD Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI execute parameter is defined as C, R, or A, authorization checking is based on which transactions can issue a particular command. In this case, the commands (or first three characters of the commands) need to be defined to RACF or equivalent product as a user. The type-1 AOI transactions must be defined as profiles under the TIMS class, and for each transaction, the commands it can issue must be specified. Defining AOCMD(CMD) requires you to create fewer user IDs than you need to create for the AOCMD(TRAN) definition. However, defining AOCMD(CMD) requires you to create or modify a larger number of resource profiles.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>TRAN Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI execute parameter is defined as C, R, or A, the transaction code is used for authorization. The first authorization check results in the accessor environment element (ACEE) being built. This environment is kept for use by future authorization checks. The type-1 AOI transaction must be defined to RACF or equivalent product as a user. The transactions will then be specified on RACF PERMIT statements for each command they are allowed to issue from a type-1 AOI transaction. Specifying AOI transactions as users to RACF might conflict with the name of a user already defined to RACF. If this conflict occurs, then either the transaction name or the existing user name needs to be changed.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Y Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI execute parameter is defined as C, R, or A, the user ID or program name is used for authorization. For some environments, if a Get Unique call has not yet occurred, the program name is used for authorization.</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>N/A</td>
<td>Completion code. The completion code indicates whether IMS was able to process the command for the specified resource. The completion code is always returned. Refer to Table 204 on page 609 for more information.</td>
</tr>

<td>LCmtMode</td>
<td>CMTMODE</td>
<td>LCL</td>
<td>Commit mode for the transaction: commit after a single message (SNGL) or multiple messages (MULT). The output value is obtained from the local IMS.</td>
</tr>
</tbody>
</table>

**MULT**

Database updates and non-express output messages are committed only when the application program terminates normally, when the processing limit count has been reached, or, in the case of a pseudo-WFI dependent region, when there are no more messages on the queue. For example, if five transactions are processed during a single schedule of a program, all five are committed only when the fifth one is completed and the program terminates. Until a transaction has been committed, locks for updated database records are not released and non-express output messages are not queued for output. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing.

**SNGL**

Database updates and non-express output messages are committed when the application program completes processing each transaction. IMS invokes commit processing either when the application program requests the next message (issues a GU to the IO-PCB), or when the application program terminates. If an application ends abnormally before committing its message, emergency restart requeues the message that was in process before the abend and makes it available for reprocessing.

<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>P</td>
</tr>
</tbody>
</table>

Restriction: The method to filter on a Fast Path transaction has changed between IMS Version 9 and IMS Version 10. In Version 9, the command is QUERY TRAN STATUS(FPE), QUERY TRAN STATUS(FPP) or QUERY TRAN STATUS(FPE,FPP). In IMS Version 10 or later, the command is QUERY TRAN FP(E), QUERY TRAN FP(P), or QUERY TRAN FP(E,P). If IMS is running in an IMSplex with IMS Version 10 or later and either IMS Version 8 or IMS Version 9 systems, and the command is to be processed on all systems, the command must be issued as QUERY TRAN STATUS(FPE) FP(E), QUERY TRAN STATUS(FPP) FP(P), or QUERY TRAN STATUS(FPE,FPP) FP(E,P). The IMS Version 10 system or later processes the FP() filter, while the IMS Version 8 and IMS Version 9 systems process the STATUS() filter. If a command is issued to an IMS Version 10 system or later with STATUS(FPE), STATUS(FPP), or STATUS(FPE,FPP) without FP(), the command is rejected.

</tbody>
</table>

- **S** is shown on the QRY TRAN command for a conversational transaction in one of the following conditions:
  - If the transaction is defined with SPATRUNC=S on the CREATE TRAN or CREATE TRANDESC command
  - If SPA=SRTUNC is specified on the TRANSACT macro
  - If the system-wide truncated data option is set as TRUNC=Y in the DFSDCxxx member

- **R** is shown on the QRY TRAN command for a conversational transaction in one of the following conditions:
  - If the transaction is defined with SPATRUNC=R on the CREATE TRAN or CREATE TRANDESC command
  - If SPA=RTRUNC is specified on the TRANSACT macro
  - If the system-wide truncated data option is not set as TRUNC=N in the DFSDCxxx member.

- **null** A null value indicates that the transaction does not have the SPATRUNC value defined and that the value is overridden with the system-wide truncated data option defined with the TRUNC= option on the DFSDCxxx member.

<tr>
<td>REPOCHGLIST</td>
<td>The transaction name exists in the change list in the IMSRSC repository for this IMS, and the change list is being processed or the change list processing failed because of an error. This transaction cannot be used, scheduled, updated, exported, or referenced as a model until it is successfully imported so that the runtime transaction definition and the stored definition in the repository are synchronized. Action: 4.</td>
</tr>
</tbody>
</table>

**Note:** Actions that can be taken to initialize the transaction are:

1. Call IBM.
2. Issue a CREATE PGM command to create the program. Issue an UPDATE TRAN START(Q,SCHD) command to complete transaction initialization.
3. Issue a CREATE RTC command to create the routing code. Issue an UPDATE TRAN START(Q,SCHD) command to complete transaction initialization.
4. If IMS change list processing failed and message DFS4411E was issued, correct the problem and take one of the following actions:
   - Shut down IMS and restart it in order to try processing the change list again.
   - Issue the IMPORT DEFIN SOURCE(REPO) NAME(transname) TYPE(TRAN) command to import the transaction, where transname is the transaction name.

---

**How the SHOW keyword on QUERY TRAN determines the type of output**

The following table provides some examples of how the SHOW keyword determines the type of output returned on the QUERY TRAN command.

Table 202. How the SHOW keyword on QUERY TRAN determines the type of output

<table>
<thead>
<tr>
<th>Form of SHOW keyword used</th>
<th>Type of output returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW(LOCAL)</td>
<td>Only those output fields that are local to an IMS system. SHOW(ALL,LOCAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM or CQS. SHOW(ALL,GLOBAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(ALL)</td>
<td>All the output fields for those fields that have both local and global data. Both values are returned in the output.</td>
</tr>
<tr>
<td>SHOW(QCNT,GLOBAL)</td>
<td>Only global QCNT values.</td>
</tr>
<tr>
<td>SHOW(QCNT,LOCAL)</td>
<td>Only local QCNT values.</td>
</tr>
<tr>
<td>SHOW(QCNT)</td>
<td>Both local and global QCNT values, because there is no LOCAL or GLOBAL qualifier.</td>
</tr>
</tbody>
</table>

Chapter 5. QUERY commands 605
Table 202. How the SHOW keyword on QUERY TRAN determines the type of output (continued)

<table>
<thead>
<tr>
<th>Form of SHOW keyword used</th>
<th>Type of output returned</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW(ALL,GLOBAL)</td>
<td>Only those output fields that are globally maintained, such as data maintained by RM or CQS. SHOW(GLOBAL) provides the same output.</td>
</tr>
<tr>
<td>SHOW(ALL,LOCAL)</td>
<td>Only those output fields that are local to an IMS system. SHOW(LOCAL) provides the same output.</td>
</tr>
</tbody>
</table>

If specific output fields are listed in the SHOW keyword, you can specify them as either local or global; however, you cannot combine a list of SHOW keywords in which some are global and some are local.

**Return, reason, and completion codes**

The return and reason codes that can be returned as a result of the QUERY TRAN command are standard for all commands entered through the OM API.

The following table contains the return and reason codes that can be returned to OM from a QUERY TRAN command.

Table 203. Return and reason codes for the QUERY TRAN command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>

</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

The following table contains completion codes that can be returned on a QUERY TRAN command.
Table 204. Completion codes for the QUERY TRAN command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Command completed successfully for transaction.</td>
<td></td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>Transaction name is invalid, or the wildcard parameter specified does not match any resource names.</td>
</tr>
<tr>
<td>50</td>
<td>CQS IS UNAVAILABLE</td>
<td>The QUERY TRAN command could not be completed for the resource as CQS is not available. Make sure CQS is available before issuing the command again.</td>
</tr>
<tr>
<td>51</td>
<td>NO RESOURCE STRUCTURE</td>
<td>The QUERY TRAN command could not be completed for the resource as there is no resource structure or it is unavailable.</td>
</tr>
<tr>
<td>52</td>
<td>RESOURCE STRUCTURE FULL</td>
<td>The QUERY TRAN command could not be completed for the resource as the resource structure is full.</td>
</tr>
<tr>
<td>90</td>
<td>INTERNAL ERROR</td>
<td>The QUERY TRAN command could not be completed for the resource because of an IMS internal error.</td>
</tr>
<tr>
<td>94</td>
<td>RM REQUEST ERROR</td>
<td>The QUERY TRAN command could not be completed for the resource because of an RM error.</td>

Explanation: The QUERY TRAN command is specified with SHOW(ALL) to display all the output fields for the specified transactions. All the transaction output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The transaction name and the member name that built the line of output are displayed on every screen. Transaction PART has a status of stopped for scheduling and queuing. Transactions CDEBTRN4 and CONV13V0 are conversational. Transaction FPACP is Fast Path potential. Transaction CONV13V0 is remote. Transactions TRAN0001 and TRAN0002 are dynamic, they display the LModelName and LModelType used to create them, and they have a definition type of CREATE.

Example 2 for QUERY TRAN command

TSO SPOC input:
QUERY TRAN STATUS(AFFIN)

TSO SPOC output:
Trancode MbrName CC LclsStat
APOL12 IMS1 0 AFFIN

Explanation: This example shows the use of the AFFIN option as a filter to query transactions that have affinity status.

Example 3 for QUERY TRAN command

TSO SPOC input:
QUERY TRAN NAME(APOL11 APOL12) SHOW(STATUS)

TSO SPOC output:
Trancode MbrName CC LclsStat
APOL11 IMS1 0
APOL12 IMS1 0 AFFIN

Chapter 5. QUERY commands 613
Explanation: This example queries transaction status for transactions APOL11 and APOL12. The output shows that transaction APOL12 has affinity status.

Example 4 for QUERY TRAN command

TSO SPOC input:

```
QUERY TRAN QCNT(GT,0) SHOW(AFFIN)
```

TSO SPOC output:

```
Trancode  MbrName  CC  QCnt  Affinity
APOL12    IMS1     0   1
APOL12    IMS1     0   1  IMS1
```

Explanation: This example queries transaction messages on the shared queue and shows which messages have affinity status.

Example 5 for QUERY TRAN command

TSO SPOC input:

```
QRY TRAN NAME(PART) SHOW(DEFN,CLASS)
```

TSO SPOC output:

```
Trancode  MbrName  CC  Repo  IMSId  Cls  LCls
PART      IMS1     0   Y    1
PART      IMS1     0   Y    IMS3   5
PART      IMS1     0   IMS1  1
PART      IMS2     0   IMS2  99
PART      IMS3     0   IMS3  5
```

OM API input:

```
CMD(QRY TRAN NAME(PART) SHOW(DEFN,CLASS))
```

OM API output:

```
<imsout>
<ctl>
<omname>OM1OM </omname>
<omvsn>1.5.0 </omvsn>
<xmlvsn>20 </xmlvsn>
<statime>2011.182 21:12:56.087584</statime>
<stotime>2011.182 21:12:56.099946</stotime>
<staseq>C8018C3FABC2038C</staseq>
<stoseq>C8018C3FAEC6A010</stoseq>
<rqsttkn1>USRRT005 10141256</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
</cmd>
```
**Explanation:** The stored resource definitions and the runtime resource definitions for the specified resources are returned. PART has the generic definition in the repository and also a specific section for IMS3 in the repository.

**Example 6 for QUERY TRAN command**

**TSO SPOC input:**

```
QRY TRAN NAME(PART*) SHOW(DEFN)
```

**TSO SPOC output:**

**Explanation:** A line is returned for each resource that matches the wildcard name. The resource definitions from each IMS that has the resource defined and the global repository definition are returned. The repository information is returned by the command master IMS. There are no IMS specific sections in the repository for each resource name that matches the wildcard name.

**Example 7 for QUERY TRAN command**

**TSO SPOC input:**

QUERY TRAN NAME(*) SHOW(EXPORTNEEDED)

**TSO SPOC output:**

Trancode MbrName    CC     ExportNeeded
TRN000002 IMS1       0       Y

**OM API input:**

CMD(QUERY TRAN SHOW(EXPORTNEEDED)

**Related concepts:**

- How to interpret CSL request return and reason codes (System Programming APIs)

**Related reference:**

- DISPLAY MODIFY command (Commands)
QUERY TRANDESC command

Use the QUERY TRANDESC command to query information about transaction descriptors.

A descriptor is a model that can be used to create descriptors or resources.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 622
- “Usage notes” on page 629
- “Output fields” on page 630
- “Return, reason, and completion codes” on page 643
- “Examples” on page 644

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 205. Valid environments for the QUERY TRANDESC command and keywords

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Syntax
**Keywords**

The following keywords are valid for the QUERY TRANDESC command:

**DEFAULT**

Selects transaction descriptors for display that possess the default value specified. DEFAULT(Y) displays the only default descriptor. DEFAULT(N) displays all the other descriptors that are not the default.

**NAME**

Specifies the 1-8 character name of the transaction descriptor. Wildcards can be
specified in the name. The name is a repeatable parameter. The default is
NAME(‘), which returns all transaction descriptors.

SHOW
Specifies the transaction descriptor output fields to be returned. The
transaction descriptor name is always returned along with the name of the IMS
that created the output and the completion code. The filters that are supported
with the SHOW keyword are:

ALL
Returns all information about the transaction descriptor itself.

Restriction: The ExportNeeded column, which is returned when
SHOW(EXPORTNEEDED) is specified, is not returned with SHOW(ALL).

AOCMD
Specifies that you want the AOI option returned which indicates whether
the transaction can issue the type-1 AOI CMD call or the type-2 AOI ICMD
call. If AOCMD is defined as CMD, TRAN, or Y, and the AOI1 execution
parameter is defined as AOI1=N, no authorization checking is done and
the transaction is permitted to issue CMD and ICMD calls.

CLASS
Scheduling class used to select a transaction for scheduling. A transaction
can be scheduled if there is a message processing region available for that
class.

CMTMODE
Specifies when database updates and non-expr output messages are
committed. This operand affects emergency restart.

CONV
Conversation option indicates whether the transaction is conversational.

CPRI
The current priority. The current priority is the normal priority, when the
transaction queue count is less than the limit count. The current priority is
raised to the limit priority if the transaction queue count is equal to, or
exceeds, the limit count. The current priority for transaction descriptors is
always 0 because the current priority is a runtime scheduling value that
does not apply to transaction descriptors, which are never scheduled.

DCLWA
Log write-ahead option.

DEFAULT
Default descriptor option.

N  The descriptor is not the default.

Y  The descriptor is the default. When a descriptor or resource is created
without the LIKE keyword, any attribute not specified on the CREATE
command takes the value defined in the default descriptor. Only one
descriptor can be defined as the default for a resource type. IMS
defines a default transaction descriptor called DFSDSTR1, where all
attributes are defined with the default value. Defining a user-defined
descriptor to be the default overrides the current default descriptor.

DEFN
Specifies that the resource definitions are to be returned.
The transaction descriptor attributes that can be returned are: AOCMD, CLASS, CMTMODE, CONV, DCLWA, DEFAULT, DIRROUTE, EDITUC, EDITRTN, EMHBSZ, EXPRTIME, FP, INQ, LCT, LPRI, MAXRGN, MSGTYPE, NPRI, PLCT, PLCTTIME, PARLIM, PGM, RECOVER, REMOTE, RESP, SERIAL, SIDR, SIDL, SEGNO, SEGSZ, SPASZ, SPATRUNC, TRANSTAT, WFI, the repository create and update time stamps, the IMS runtime create, update, import and access time stamps, and the IMS runtime MSNAME.

If SHOW(DEFN) is specified without any other SHOW filters or with the IMSID filter, all the definitional attributes, including those defined globally in the repository and those defined locally in the IMS system, are returned. The runtime resource definitions from the IMS system are returned by each IMS that receives the command. The stored resource definitions in the IMSRSC repository are returned by the command master IMS if the command master IMS is enabled to use the repository.

The command master IMS returns a response line for each generic stored resource definition obtained from the repository. This response line displays the attributes of the generic resource definition. When SHOW(DEFN) is specified without the IMSID filter and all the IMS systems have the same attribute values defined, only the response line for the generic definition is returned. The IMS IDs of the IMS systems that have the stored resource definition defined are not returned. If an IMS system has a stored resource definition with one or more attribute values that differ from the generic stored resource definition, an additional response line is returned for each IMS that has different attribute values.

If SHOW(DEFN,LOCAL) is specified, the runtime resource definitions from the IMS system are returned by each IMS that received the command.

If SHOW(DEFN,GLOBAL) is specified, the stored resource definitions from the repository are returned by the command master IMS. SHOW(DEFN,GLOBAL) is valid only when the command master IMS is enabled to use the repository.

If SHOW(DEFN) is specified with other parameters, only the requested definitional attributes are returned. For example, if SHOW(DEFN,TIMESTAMP) is specified, only the time stamps are returned.

Restrictions:

- SHOW(DEFN) cannot be specified with DEFNTYPE or MODEL.
- The LModelName, LModelType, and LDefnType columns, which are returned on the QRY TRANDESC SHOW(ALL) command, are not returned with SHOW(DEFN).
- The Repo and IMSid columns, which are returned with SHOW(DEFN), are not returned with SHOW(ALL).

If SHOW(DEFN,IMSID) is specified, a response line is returned for the generic stored resource definition, and an additional response line is returned for each IMS that has the resource defined in the repository, regardless of whether their stored resource definitions are the same as the generic resource definition.

When querying transaction descriptor information from the repository, resource definitions that are stored in the repository are used to determine the response lines with the repository information, and the runtime resource definitions are used to determine the response lines with the IMS.
runtime resource information. The response lines are returned for each stored resource or runtime resource definition that matches the specified filter. If SHOW(DEFN,GLOBAL) is specified, only the stored resource definitions that match the specified filter are returned. If SHOW(DEFN,LOCAL) is specified, only the runtime resource definitions that match the specified filter are returned.

**DEFNTYPE**
Definition type. This is how the descriptor or resource was defined.

**DIRROUTE**
MSC directed routing option.

**EDITRTN**
Input edit routine that edits messages before the program receives the message.

**EDITUC**
The uppercase translation of input data.

**EMHBSZ**
EMH buffer size required to run the Fast Path transaction.

**EXPORTNEEDED**
Specifies that only the transaction descriptor resources that match the NAME parameter and have not been exported to the IMSRSC repository since they were created or last updated are to be returned on the QUERY command.

If the NAME keyword is omitted or NAME(*) is specified, only the names of the transaction descriptors that need to be exported to the repository are returned.

If a specific name or a generic name that is not NAME(*) is specified on the NAME keyword, a response line is returned for each transaction descriptor name specified on the command. If the specified transaction descriptor does not need to be exported to the repository, an N is returned in the ExportNeeded column.

SHOW(EXPORTNEEDED) cannot be specified with any other SHOW parameters or other keywords and is valid only when IMS is enabled with the IMSRSC repository.

The QUERY TRANDESC SHOW(EXPORTNEEDED) command is not valid on an XRF alternate or the RSR tracker.

**EXPRTIME**
Transaction expiration time in seconds.

**FP** Fast Path option.

**GLOBAL**
Specifies that the stored resource definitions from the repository are to be returned.

Tip: For resources and descriptors that have not been exported to the IMSRSC repository, you can issue the EXPORT DEFN TARGET(REPO) OPTION(CHANGESONLY) command to write the resource and descriptor definitions to the repository so that they are available for the next IMS cold start.
If SHOW(GLOBAL,DEFN) is specified, the global resource definitions from the repository are returned by the command master IMS. SHOW(GLOBAL,DEFN) is valid only when the command master IMS is enabled to use the repository.

**IMSID**

Specifies that the IMS IDs of the IMS systems whose resource lists contain the specified resource name are to be returned. SHOW(IMSID) is processed only by the command master IMS and is valid only if the command master IMS is enabled to use the repository.

When SHOW(IMSID) is specified with the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the stored resource definitions.

When SHOW(IMSID) is specified without the DEFN filter, a separate line is returned for each IMS that has the resource defined, along with the resource name. No resource definitions are returned.

SHOW(IMSID) cannot be specified with any other SHOW filters other than DEFN and GLOBAL. If SHOW(IMSID,GLOBAL) is specified, GLOBAL is ignored; that is, SHOW(IMSID,GLOBAL) is treated as SHOW(IMSID). SHOW(DEFN,IMSID,LOCAL) is treated as SHOW(DEFN,LOCAL).

**INQ**

Inquiry option.

**LCT**

Limit count. Specifies the number that, when compared to the number of input transactions queued and waiting to be processed, determines whether the normal or limit priority value is assigned to this transaction. The limit count value can range from 1 through 65 535.

The limit count value is ignored for a transaction processed by a BMP.

The limit count value is ignored in a shared-queues environment.

**LOCAL**

Specifies that the runtime resource definitions from the IMS system are to be returned.

SHOW(DEFN,LOCAL) returns only the local definitional attributes from the IMS system that processes the command.

**LPRI**

Limit priority. The scheduling priority to which this transaction is raised when the number of input transactions enqueued and waiting to be processed is equal to or greater than the limit count value. The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class.

The limit priority value is ignored for a transaction processed by a BMP.

**MAXRGN**

Maximum region count. This limits the number of message processing program (MPP) regions that can be concurrently scheduled to process a transaction. When the number of MPP regions is not limited, one transaction might monopolize all available regions. MAXRGN(0) means that no limit is imposed.
MODEL
The model name and model type used to create this resource or descriptor. If the descriptor or resource is created with one or more attributes defined and no model specified, the model name and model type is the default descriptor. The model name and model type are blank for the IMS-defined transaction descriptor DFSDSTR1. The CREATE command specified without the LIKE keyword creates a descriptor or resource using the default descriptor as a model. The default descriptor is either the IMS descriptor DFSDSTR1 or user-defined. The CREATE command specified with the LIKE keyword creates a descriptor or resource using a model. The descriptor or resource is created with all the same attributes as the model. Attributes set explicitly by the CREATE command override the model attributes. The model type can either be a descriptor (DESC) or a resource (RSC). The model name and model type are for reference only. The descriptor or resource attributes might not match the model, if attributes are overridden by CREATE or UPDATE command values, or the model is updated later. The model name and model type can be used to identify resources that were created with the same model. The model name and model type of a resource are exported and imported. The IMPORT command does not use the model name and model type when creating a resource.

MSGTYPE
Message segment type (single or multiple segment). It specifies the time at which an incoming message is considered complete and available to be routed to an application program for subsequent processing.

If MSC-directed routing is used in a multiple IMS system configuration, IMS does not ensure that both the message and the transaction destined to process that message are either single segment or multiple segments.

MSNAME
The logical link path name, remote system ID, and local system ID are returned.

Logical link path name in a multiple IMS system configuration (MSC). A logical link path is a path between any two IMS systems. The IMS systems are identified by the remote system ID and the local system ID associated with the logical link path. The remote system ID identifies the system in which messages using this path are to be processed. The local system ID identifies this system.

The remote system ID (SIDR) identifies the IMS system on which the application program runs. A value of 0 means MSC is not enabled on this system. The local system ID and remote system ID are the same for local transactions.

The local system ID (SIDL) identifies the originating system to which responses are returned. A value of 0 means MSC is not enabled on this system. The local system ID and remote system ID are the same for local transactions.

NPRI
Normal scheduling priority. The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class. The normal priority is assigned to the transaction as the scheduling
priority when the number of input transactions enqueued and waiting to be processed is less than the limit count value.

The normal priority value is ignored for a transaction processed by a BMP.

**PARLIM**

Parallel processing limit count. This is the maximum number of messages that can currently be queued, but not yet processed, by each active message region currently scheduled for this transaction. This is the threshold value to be used when the associated program is defined with a scheduling type of parallel. An additional region is scheduled whenever the current transaction enqueue count exceeds the PARLIM value multiplied by the number of regions currently scheduled for this transaction.

PARLIM(0) indicates that any input message can cause a new region to be scheduled. PARLIM(65535) indicates that parallel processing is disabled and IMS allows the transaction to be scheduled in only one region at a time.

**PGM**

The name of the program associated with this transaction. This name matches the PSB name in ACBLIB.

**PLCT**

Processing limit count. This is the maximum number of messages sent to the application program by the IMS for processing without reloading the application program.

- PLCT(0) means that a maximum of one message is sent to the application program at a single program load.
- PLCT(65535) means that no limit is placed on the number of messages processed at a single program load.

**PLCTTIME**

Processing limit count time. This is the amount of time (in hundredths of seconds) allowable to process a single transaction (or message). The number specifies the maximum CPU time allowed for each message to be processed in the message processing region.

PLCTTIME(6553500) means that no time limit is placed on the application program.

**PSB**

The name of the program associated with this transaction. This name matches the PSB name in ACBLIB.

**RECOVER**

Recovery option.

**REMOTE**

Remote option.

**RESP**

Response-mode option.

**SEGNO**

Segment number. This is the maximum number of application program output segments that are allowed into the message queues per Get Unique (GU) call from the application program.
SEGNO(0) means that the number of segments is not checked by the online system at execution time.

**SEGSZ**

Segment size. This is the maximum number of bytes allowed in any one output segment.

SEGSZ(0) means that the segment size is not checked by the online system at execution time.

**SERIAL**

Serial option.

**SPASZ**

Scratchpad area size for a conversational transaction.

**SPATRUNC**

The SPA data truncation option indicates whether the SPA data should be truncated or preserved across a program switch to a transaction that is defined with a smaller SPA.

When a conversation initially starts and a program switch occurs, the SPATRUNC option is checked and set or reset as specified. When the option is set, it remains set for the life of the conversation, or until a program switch occurs to a transaction that specifies the option is to be reset.

When a program switch occurs, the truncated data option for the new transaction is first checked, and that specification is set for the conversation and is used for the SPA inserted into the output message. If the option is not specified for the new transaction, the option currently in effect for the conversation is used.

**TIMESTAMP**

The creation time (TIMECREATE), last update time (TIMEUPDATE), last access time (TIMEACCESS), and last import time (TIMEIMPORT) time stamps are returned. The time is returned in local time in the format YYYY.JJJ HH:MM:SS.TH, where:

- YYYY is the year.
- JJJ is the Julian day (001 - 365).
- HH is the hour (01 - 24).
- MM is the minute (00 - 59).
- SS is the seconds (00 - 59).
- TH is the tenths and hundredths of a second (00 - 99).

**TRANSTAT**

Transaction level statistics option.

**WFI**

Wait-for-input option.

**Usage notes**

This command can be issued only through the Operations Manager API. This command applies to DB/DC and DCCTL systems. This command is allowed on XRF alternate and RSR tracker systems. The QUERY TRANDESC command is not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined).
If you want to display information about resource definitions, specify SHOW(DEFN). If you want to know which IMS systems have the resource defined and also know the attributes or resource definitions at each IMS system, specify SHOW(DEFN,IMSID). If you want to know which IMS systems have the resource defined, specify SHOW(IMSID).

**Output fields**

The following table shows the QUERY TRANDESC output fields. The columns in the table are as follows:

- **Short label**: Contains the short label generated in the XML output.
- **Long label**: Contains the long label generated in the XML output.
- **Keyword**: Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.
- **Scope**: Identifies the scope of the output field.
- **Meaning**: Provides a brief description of the output field.
<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AOCMD</td>
<td>LAOCMD</td>
<td>AOCMD</td>
<td>LCL</td>
<td>Indicates whether the transaction can issue the type-1 AOI CMD call or the type-2 AOI ICMD call. The output value is obtained from the local IMS.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>CMD</strong> Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execution parameter is defined as C, R, or A, authorization checking is based on which transactions can issue a particular command. In this case, the commands (or the first three characters of the commands) need to be defined to RACF or an equivalent product as a user. The type-1 AOI transactions must be defined as profiles under the TIMS class, and for each transaction, the commands it can issue must be specified.</td>
</tr>
<tr>
<td>N</td>
<td></td>
<td></td>
<td></td>
<td>Indicates that the transaction is not permitted to issue type-1 AOI CMD calls. The transaction is permitted to issue type-2 AOI ICMD calls.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>TRAN</strong> Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execution parameter is defined as C, R, or A, the transaction code is used for authorization. The first authorization check results in the accessor environment element (ACEE) being built. This environment is kept for use by future authorization checks. The type-1 AOI transaction needs to be defined to RACF or an equivalent product as a user. The transactions will then be specified on RACF PERMIT statements for each command they are allowed to issue from a type-1 AOI transaction. Specifying AOI transactions as users to RACF might conflict with the name of a user already defined to RACF. If this conflict occurs, then either the transaction name or the existing user name needs to be changed.</td>
</tr>
<tr>
<td>Y</td>
<td></td>
<td></td>
<td></td>
<td>Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, the user ID or the program name is used for authorization. For some environments, if a Get Unique call has not yet occurred, the program name is used for authorization.</td>

<td>LCmtMode</td>
<td>CMTMODE</td>
<td>LCL</td>
<td>Commit mode for the transaction: commit after a single message (SNGL) or multiple messages (MULT). The output value is obtained from the local IMS.</td>
</tr>
</tbody>
</table>

**MULT**

Database updates and non-express output messages are committed only when the application program terminates normally, when the processing limit count has been reached, or, in the case of a pseudo-WFI dependent region, when there are no more messages on the queue. For example, if five transactions are processed during a single schedule of a program, all five are committed only when the fifth one is completed and the program terminates. Until a transaction has been committed, locks for updated database records are not released and non-express output messages are not queued for output. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing.

**SNGL**

Database updates and non-express output messages are committed when the application program completes processing each transaction. IMS invokes commit processing either when the application program requests the next message (issues a GU to the IO-PCB), or when the application program terminates. If an application ends abnormally before committing its message, emergency restart requeues the message that was in process before the abend and makes it available for reprocessing.

<table>

</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>N</strong> IMS does not perform log write-ahead.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td><strong>Y</strong> IMS performs log write-ahead for recoverable, nonresponse input messages and transaction output messages. If not defined for the transaction, the default is the DCLWA parameter in the IMSCTRL macro. This ensures that a nonresponse input transaction is made recoverable across IMS failures, prior to IMS acknowledging receipt of the input. Database changes are made recoverable prior to IMS sending associated output reply messages. This ensures that information in the log buffers is written to the IMS log, before the associated input acknowledgment or output reply is sent to the terminal.</td>

</table>
Explanation: All transaction descriptors are returned with all output fields. All the transaction descriptor output fields do not fit on one screen, so the user must scroll to the right for additional output fields. The transaction descriptor name and the member name that built the line of output are displayed on every screen. The fields that are blank are not applicable to the specified transaction descriptor. IMS defines descriptor DFSDSTR1 at IMS cold start time to contain the IMS default values for transactions. A few other descriptors were created dynamically with CREATE TRANDESC commands, including CONVDESC for conversational transactions, FPEDESC for FP exclusive transactions, FPPDESC for FP potential transactions, and MSCDESC for remote MSC transactions. DFSDSTR1 shows the last access time for TimeAccess, which was updated by the last CREATE TRAN or CREATE TRANDESC command that referred to it as the default model.

</imsout>

**Explanation:** The stored resource definitions and the runtime resource definitions for the specified resources are returned. The Dflt (Default) column is returned because the local IMS runtime definitions are returned to identify the default descriptor. DFSDSTR1 is the default descriptor and is only at each IMS system. The default descriptor definitions are not in the repository. The TRANDESC descriptor exists only in the repository.

**Example 3 for QUER Y TRANDESC command**

TSO SPOC input:
QUERY TRANDESC NAME(TRND*,NOTFN*) SHOW(EXPORTNEEDED)

TSO SPOC output:

<table>
<thead>
<tr>
<th>DescName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
<th>ExportNeeded</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOTFN*</td>
<td>IMS1</td>

QUERY USER command

Use the QUERY USER command to display information about VTAM users across the IMSplex. A user is either a dynamic (ETO) user, or a static or dynamic (ETO) ISC subpool user. In this context, a user ID that is used for user or terminal security is not considered as a user, but rather as a user ID. This command can be specified only through the OM API and is valid on an XRF alternate.

Subsections:

   VERSION

Keywords

The following keywords are valid for the QUERY USER command:

NAME()

Specifies the names of one or more users (dynamic user or ISC subpool user) that are to be displayed. Valid names are 1-8 characters, and wildcards can be specified. To display all users, specify NAME(*). NAME(*) is the default.
SHOW()

Specifies the user output fields to be returned. The user name is always returned along with the name of the IMS that created the output and the completion code. If SHOW is not specified, only the user names are returned, provided that the STATUS filter is not specified. This provides a method for a system management application to obtain a list of all user names that are currently known in the IMSplex.

Two parameters, GLOBAL and LOCAL, are used to specify the location (global resources or local resources) where IMS should obtain the information that is to be displayed. The default is both GLOBAL and LOCAL. The rest of the parameters are used to specify what information is displayed.

The parameters supported with the SHOW keyword, which can be specified in any order, are:

**ALL**
- Returns all of the output fields, except for those fields displayed when the LTERM and CONV parameters are specified. To display lterm and conversation information with all other output, specify SHOW(ALL,LTERM,CONV).

**AUTOLOGON**
- Displays the current autologon information for the specified user. This includes the name of the node with which to establish a session, the VTAM mode table name, the name of the node descriptor to be used to build the node, and (if ISC) the identifier of the other system half-session qualifier.

**CONV**
- The conversation ID, transaction, and conversation status associated with the user. Each conversation is returned on a separate command response display line. Conversation status is not included when SHOW(ALL) is specified. To display conversation information with all other output, specify SHOW(ALL,CONV).

**EMHQ**
- Displays the user message queue count in the Expedited Message Handler (EMH) queues. The queue count is the sum of the queue counts for each lterm associated with the specified user.

EMHQ is valid only when the GLOBAL parameter is specified on the SHOW keyword. If GLOBAL is not specified, then the EMHQ parameter is ignored.

EMHQ is processed by the command master only. It is ignored by all other IMS systems.

EMHQ is valid only if shared EMH is used in a shared queues environment. Otherwise, this parameter is ignored.

If the user resource exists in the resource structure, then the lterms associated with the global user resource are used to obtain the queue counts from the EMH queues. Otherwise, the lterms associated with the local user resource are used, but if the user does not exist locally on the command master, then the queue count is 0.

**GLOBAL**
- When GLOBAL is specified, the command master displays global information, depending on the other SHOW parameters specified. This includes information from shared queues and the resource structure.
The GLOBAL parameter is processed by the command master only. All other IMS systems ignore this parameter. If LOCAL is not also specified, then all IMS systems other than the command master ignore the command.

GLOBAL is applicable only when the command master is using shared queues or sysplex terminal management (or both). GLOBAL is not applicable when the command master is not using shared queues or sysplex terminal management. In this environment, if LOCAL is also specified, then GLOBAL is ignored. Otherwise, the command master rejects the command.

If shared queues are enabled, and global queue counts are requested, then the command master will make requests to CQS to determine the appropriate queue counts. This includes both MSGQ and EMHQ.

If sysplex terminal management is enabled, then the command master will make requests to RM to determine the appropriate global status.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

ID Displays the other half-session qualifier name of the ISC node.

LOCAL
When LOCAL is specified, then all IMS systems including the command master display local information, depending on the other SHOW parameters specified. This includes information local to the IMS processing the command.

The LOCAL parameter is processed by all IMS systems, including the command master.

LOCAL is applicable in any environment, regardless of whether shared queues or sysplex terminal management are used.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line (or set of output lines), and local information is displayed as another output line (or set of output lines).

LTERM Displays the logical terminal (lterm) names, if any, associated with the user. A user might have zero or more logical terminals associated with it. Each lterm associated with the user is returned on a separate command response line.

The lterm status is not included when SHOW(ALL) is specified. To display lterm information with all other output, specify SHOW(ALL,LTERM).

NODE Displays the dynamic or ISC node that the user is associated with.

OWNER Displays the owner of the user resource in the resource structure. This applies only when sysplex terminal management is enabled, and is processed by the command master only. All other IMS systems ignore this parameter.
The owner is the IMSID (or RSENAME for XRF systems) of the IMS system that owns the user. An IMS system owns a user resource if the resource is active (the user is signed on), or an IMS system is maintaining significant status for that resource.

**PRESET**
Displays the preset destination name for a user. A user is in preset destination mode following a /SET command. The preset destination name is either a transaction name or a logical terminal (LTERM) name. All messages entered from this user are sent to the preset destination transaction or LTERM.

**QCNT**
Displays the user message queue count. The queue count is the sum of the queue counts for each lterm associated with the specified user.

The local queue counts value returned on this command represents the messages being processed by the IMS system where this command is issued. In a shared-queues environment, do not use the local queue counts for queue evaluation purposes. The global queue counts, which are returned on this command, represent the current message queue counts on the shared queues structure.

When the LOCAL parameter is also specified on the SHOW keyword, then all IMS systems that process the command, including the command master, display the local queue count. This is valid whether shared message queues are enabled.

When the GLOBAL parameter is also specified on the SHOW keyword, and shared message queues are enabled, then the command master displays the global queue count on the shared message queues (MSGQ). If the user resource exists in the resource structure, then the lterms associated with the global user resource are used to obtain the queue counts from shared queues. Otherwise, the lterms associated with the local user resource are used, but if the user does not exist locally on the command master, then the queue count is 0.

The local and global queue counts are displayed as separate output fields.

**RECOVERY**
Displays the status recovery mode (SRM) and level of recovery for the user. End-user significant status can be conversation, Fast Path, full-function response mode, or STSN (set-and-test-sequence-number) status.

SRM determines where end-user significant status, if any exists, is recovered following a user signoff, or session or IMS termination. The output displays the SRM for the user as either GLOBAL (sysplex terminal management recovers it in the resource structure), LOCAL (IMS recovers it locally, which indicates an affinity to a particular IMS), or NONE (status is discarded).

Level of recovery determines what end-user significant status, if any exists, is recovered (if SRM is GLOBAL or LOCAL). The output displays whether conversation status is recovered (RCVYCONV), Fast Path status is recovered (RCVYFP), full-function response mode is recovered (RCVYRESP), and STSN status is recovered (RCVYSTSN).

**STATUS**
Returns local or global status of the user. See "QUERY USER status" on page 661 for a list and meaning of possible status that might be returned.

**USERID**

The RACF user ID that was used to sign the user on to a node.

**VERSION**

Displays the RM version number of the user resource. This is the version number assigned to the user, which is assigned by MVS, and maintained by RM, when the resource is created or updated in the resource structure. VERSION applies only when sysplex terminal management is enabled. VERSION is ignored when sysplex terminal management is not enabled.

**STATUS()**

Selects users for display that possess at least one of the specified user statuses. The status might exist locally or globally if sysplex terminal management (STM) is enabled.

The STATUS filter is valid in both a sysplex terminal management environment and in a non-sysplex terminal management environment. In a sysplex terminal management environment, the status selected might exist locally, globally, or both. If sysplex terminal management is not enabled, then the status only exists locally.

If SHOW(LOCAL) is specified, then IMS will select only those users with the appropriate status in the local system. The command is processed by all IMS systems, including the command master.

If SHOW(GLOBAL) is specified, and sysplex terminal management is enabled, then IMS will select only those users with the appropriate status in the resource structure. The command is processed only by the command master. If SHOW(GLOBAL) is specified, but sysplex terminal management is not enabled, then the command is rejected.

If SHOW(GLOBAL,LOCAL) is specified (the default), then IMS will select those users with the appropriate status either locally or in the resource structure (if sysplex terminal management is enabled). The command is processed by all IMS systems. The command master processes both global and local information.

The output returned when the status filter is specified includes the status of the user, even if SHOW(STATUS) is not specified.

To determine which filters can be used to select users with corresponding status, see “QUERY USER status” on page 661.

**Usage notes**

The QUERY USER command can be specified only through the OM API.

The QUERY USER command can be issued on an XRF alternate system, but SHOW(GLOBAL) is not supported. Only local information can be displayed.

The processing of the QUERY USER command is different depending on whether IMS sysplex terminal management is enabled.

- If IMS sysplex terminal management is not enabled, processing is local for each system. The results of type-1 and type-2 commands are similar.
- If IMS sysplex terminal management is enabled, type-1 and type-2 command processing is similar when displaying local information. However, they differ in how global information is displayed.
- For type-1 /DISPLAY commands with IMS sysplex terminal management enabled, the command master displays information from either the resource...
structure or the local system, but not both. If the resource being displayed is not owned by any system or is owned by the command master, the command master displays the global resource. However, if the resource is owned by a system other than the command master, the command master displays only the local resource, and the owning system is responsible for displaying the global resource.

- For type-2 QUERY commands with IMS sysplex terminal management enabled, the command master is the only system that displays global resource information, regardless of whether the resource is owned. In addition, the command master displays local resource information. All other IMS systems that process the command display local resource information only. This approach allows more flexibility in displaying all information in an IMSplex.

The SHOW keyword determines which IMS systems process the command, and what information is displayed.

- If SHOW(GLOBAL) is specified, then the command master displays global information, which includes the global queue count if shared queues are enabled, and status from the resource structure if sysplex terminal management is enabled (STM=YES defined in DFSDCxxx PROCLIB member). This is true whether or not the user is active on any particular IMS system. All other IMS systems to which OM routes the command ignore the GLOBAL parameter with return code 'X'00000004' and reason code 'X'00001000'.

- If SHOW(LOCAL) is specified, then each IMS system to which OM routes the command (including the command master) processes the command, and displays information that is local to each system.

- If both GLOBAL and LOCAL are specified (which is the default), then the command master displays both global and local information, and all other IMS systems to which OM routes the command displays local information.

**Similar IMS type-1 commands**

The following table shows variations of the QUERY USER command and the type-1 IMS commands that perform similar functions.

*Table 210. Type-1 equivalents for the QUERY USER command*

<table>
<thead>
<tr>

### Output fields

The following table shows the QUERY USER output fields. The columns in the table are:

**Short label**
Contains the short label generated in the XML output.

**Long label**
Contains the column heading for the output field in the formatted output.

**SHOW parameter**
Identifies the parameter on the SHOW keyword that caused the field to be generated. *Error* appears for output fields that are returned for a non-zero completion code. *N/A* (not applicable) appears for output fields that are always returned.

**Scope**
Identifies the scope of the output field. *GBL* indicates that the field can be generated only by the command master when displaying global information for SHOW(GLOBAL). *LCL* indicates that the field can be generated by any IMS displaying local information for SHOW(LOCAL). *N/A* (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

</tbody>
</table>
| RCVY        | Rcvy       | RECOVERY       | GBL   | The level of recovery for end-user significant status in the resource structure, which indicates what type of status is recoverable. Any value presented here implies that the corresponding status is recoverable. If SRM is LOCAL, the status will be recovered locally. If SRM is GLOBAL, the status will be recovered globally. These values are not applicable if SRM is NONE or there is no SRM. The status values that can be returned (more than one are possible) are:  
  • CONV: IMS conversations are recoverable (RCVYCONV=YES).  
  • FP: Fast Path status is recoverable (RCVYFP=YES).  
  • STSN: STSN status is recoverable (RCVYSTSN=YES). |
| SRM         | SRM        | RECOVERY       | GBL   | The status recovery mode in the resource structure, which determines where the end-user significant status is maintained and recovered from. The output will be one of the following:  
  • GBL: Status is saved globally in the IMS resource structure.  
  • LCL: Status is saved in local control blocks and log records.  
  • NONE: Status is not saved in the IMS resource structure or log records.  
  • Blank: SRM is not yet established, or the user is not signed on and there is no end-user significant status. |
| STT         | Status     | STATUS         | GBL   | Global user status. See "QUERY USER status" on page 661 for a list and explanation of the possible node status. |
| UID         | Userid     | USERID         | GBL   | Identifies the RACF user ID signed on to the user. |

**QUERY USER status**

The following table shows the possible user status that can be displayed. The columns in the table are:

**Status**  The user status that is displayed.

**STATUS parameter**  The STATUS() filter that will select users with the specified status.

**Scope**  The scope of the status. GBL indicates that the status can be global (it exists in the resource structure when STM is enabled), and is returned with the STT short label. LCL indicates that the status can be local, and is returned with the LSTT short label.

**Meaning**  Provides a brief description of the status.

</tbody>
</table>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY USER command. The OM return and reason codes that may be returned as a result of the QUERY USER command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the QUERY USER command.

Table 213. Return and reason codes for the QUERY USER command

<table>
<thead>
<tr>
<th>Return code</th>

<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If this is a wildcard request there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
<tr>
<td>98</td>
<td>CQS REQUEST ERROR</td>
<td>Global queue counts could not be obtained because of a CQS error.</td>
</tr>
<tr>
<td>1A2</td>
<td>User Resource is in error</td>
<td>The user resource was found in the resource structure, and an associated resource was needed, but it was either not found or appeared to be in error. This is normally an error condition. However, it could be a temporary condition caused by terminal or command activity. The command should be retried.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERY USER command:

Example 1 for QUERY USER command

TSO SPOC input:
QRY USER NAME(USER2*,XYZ) SHOW(LOCAL)

TSO SPOC output:

<table>
<thead>
<tr>
<th>User</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER23</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>USER23</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>USER24A</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>USER24B</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>USER24C</td>
<td>IMS2</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>XYZ</td>
<td>IMS1</td>
<td>10</td>
<td>NO RESOURCES FOUND</td>
</tr>
<tr>
<td>XYZ</td>
<td>IMS2</td>
<td>10</td>
<td>NO RESOURCES FOUND</td>
</tr>
</tbody>
</table>

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. STM and shared queues are irrelevant because only LOCAL information is requested. IMS1, the command master, displays only local information because no global information is requested. IMS2 displays local information only.

• USER23 exists on IMS1 and IMS2.
• USER24A exists on IMS2.
• USER24B exists on IMS2.
• USER24C exists on IMS2.
• XYZ does not exist on any system.

Example 2 for QUERY USER command

TSO SPOC input:
QRY USER NAME(USER2*)
TSO SPOC output:

```
User  MbrName CC Gbl
USER23 IMS1 0 Y
USER23 IMS1 0
USER23 IMS2 0
USER24A IMS1 0 Y
USER24A IMS2 0
USER24B IMS1 0 Y
USER24B IMS2 0
USER24C IMS2 0
USER25 IMS1 0 Y
USER26 IMS1 0 Y
```

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global and local information. IMS2 displays local information only.

- USER23 exists on IMS1, IMS2 and in the resource structure.
- USER24A exists on IMS1 and IMS2 and in the resource structure.
- USER24B exists on IMS2 and in the resource structure.
- USER24C exists on IMS2 only.
- USER25 exists in the resource structure only.
- USER26 exists in the resource structure only.

**Example 3 for QUERY USER command**

TSO SPOC input:

```
QRY USER NAME(USER2*) STATUS(STATIC) SHOW(LOCAL)
```

TSO SPOC output:

```
User  MbrName CC CCText LclStat
USER24A IMS2 0 ALLOC,STATIC
USER24B IMS2 0 ALLOC,STATIC
USER24C IMS2 0 STATIC
USER2* IMS1 10 NO RESOURCES FOUND
```

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM and shared queues are irrelevant because no global information is requested. IMS1, the command master, displays local information only because SHOW(LOCAL) is specified. IMS2 displays local information only. All static users are displayed, and status is displayed because the STATUS filter was specified. IMS1 did not find any static users that matched the name specified.

- USER24A exists on IMS2, and is allocated to a node.
- USER24B exists on IMS2, and is allocated to a node.
- USER24C exists on IMS2, but is not allocated.

**Example 4 for QUERY USER command**

TSO SPOC input:

```
QRY USER NAME(USER25) SHOW(GLOBAL,CONV,LTERM,STATUS)
```

TSO SPOC output:

```
(screen 1)
User  MbrName CC Gbl Lterm ConvID ConvTran ConvStat
USER25 IMS1 0 Y
USER25 IMS1 0 Y LTERM25A
USER25 IMS1 0 Y LTERM25B
USER25 IMS1 0 Y 1 TRAN1A CONVHELD
```

Chapter 5. QUERY commands 665
USER25  IMS1  0  Y  2  TRAN1A  CONVHELD
USER25  IMS1  0  Y  3  TRAN1A  CONVACTV

(rolled right to screen 2)
User  MbrName  Gbl  Status
USER25  IMS1  Y  CONVACT,RM
USER25  IMS1  Y
USER25  IMS1  Y
USER25  IMS1  Y
USER25  IMS1  Y
USER25  IMS1  Y

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global information only. IMS2 ignores the command (RC=4, RSN=x1000) because only global information is requested.

USER25 exists in the resource structure. IMS1 displays a global line that shows that the user is not active (not signed on) in the IMSplex, and has a conversation active. There are two lterms assigned to the user, and are displayed on separate output lines. There are three conversations associated with the user, and are displayed on separate output lines.

Example 5 for QUERY USER command

TSO SPOC input:
QRY USER NAME(USER23) SHOW(CONV,STATUS,OWNER,RECOVERY)

TSO SPOC output:

(rolled right to screen 2)
User  MbrName  ConvID ConvTran ConvStat Status
USER23  IMS2  LCL  CONV,FP

(rolled right to screen 3)
User  MbrName  LSRM LRcvy  LConvID LConvTran LConvStat LClStat
USER23  IMS2
USER23  IMS1  LCL  CONV,FP
USER23  IMS2  LCL  CONV,FP
USER23  IMS2

Explanation: There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are irrelevant because queue counts are not requested. IMS1, the command master, displays global and local information. IMS2 displays local information.

USER23 exists on IMS1, IMS2 and in the resource structure. IMS1 displays a global line that shows the user is active and owned on IMS2, and its status recovery
mode is LOCAL, which means conversation information is not known globally. IMS1 also displays a local line showing that USER23 exists locally, but has no local status. IMS2 displays the local information for the active user, which includes one status line that shows that an active conversation exists, and an additional output line for each conversation active or held locally.

**Example 6 for QUERY USER command**

TSO SPOC input:

QRY USER NAME(USER23) SHOW(ALL)

TSO SPOC output:

(screenshot)

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Shared queues are active. IMS1, the command master, displays global and local information. IMS2 displays local information.

USER23 exists in IMS1, IMS2, and in the resource structure. IMS1 displays a global line that shows global queue counts and global status from the resource structure. Global status indicates that the user is active on IMS2, and its status recovery mode is LOCAL, which means conversation information is not known globally. IMS1 also displays a local line showing that USER23 exists locally, but has no local status. IMS2 displays the local information for the active user, which shows that conversation status exists locally.

QUERY USEREXIT command

Use the type-2 QUERY USEREXIT command to display information about the user exits that are defined in the USER_EXITS section of the DFSDFxxx member of the IMS PROCLIB data set. Information about user exits that are not specified in the USER_EXITS section of the DFSDFxxx member is not displayed in the output of the QUERY USEREXIT command.

</tr>
</tbody>
</table>

Syntax

```
QUERY USEREXIT TYPE(exittype) SHOW(ALL, ACTIVE, CALLS, ENCRYPT, ETIME, LOADPT, RTIME, SIZE, TEXT)
```
**Keywords**

The following keywords are valid for the QUERY USEREXIT command:

**TYPE()**

Specifies the user exit type or types for which you want information displayed. You can specify a single user exit type or a list of user exit types separated by commas. If the SHOW keyword is not specified, only the names of the exit routines for the specified types are returned. The valid user exit types are:

- **AOIE**
  Type-2 Automated Operator User Exit

- **BSEX**
  Build Security Environment user exit

- **ICQSEVENT**
  IMS CQS Event user exit

- **ICQSSTEV**
  IMS CQS Structure Event user exit

- **IMSMON**
  IMS Monitor user exit

- **INITTERM**
  Initialization/Termination user exit

- **LOGEDIT**
  Log Edit user exit

- **LOGWRT**
  Logger user exit

- **NDMX**
  Non-Discardable Messages user exit

- **OTMAIOED**
  OTMA Input/Output Edit user exit

- **OTMAYPRX**
  OTMA Destination Resolution user exit

- **OTMARTUX**
  OTMA Resume TPIPE Security user exit

- **PPUE**
  Partner Product user exit

- **RASE**
  Resource Access Security user exit

- **RESTART**
  Restart user exit

**SHOW()**

Specifies the information about the user exit routines to be returned in the output fields of the command response. The exit type and module name fields are always returned along with the name of the IMS that created the output for the user exit type and the completion code. The valid fields that can be specified are the following:

- **ALL**
  All possible output fields are returned.
ACTIVE
The number of currently active instances of the user exit routine. This is a point-in-time number that represents the number of calls to the user exit that are still in progress and have not returned to IMS.

CALLS
The number of calls to the user exit since the last user exit routine refresh. For performance reasons serialization is not obtained when IMS collects this number. For an exit type that can run multiple instances in parallel, this number is an approximation. The maximum value that this field can contain is 4,294,967,295 (2^32-1). When the call count exceeds this value, the field rolls over and starts again from zero.

ENTRYPT
The entry point address of the user exit routine.

ETIME
The total (cumulative) elapsed time in milliseconds spent in the exit module since it was last refreshed. For performance reasons serialization is not obtained when IMS collects this number. For an exit type that can run multiple instances in parallel, this number is an approximation. The maximum value that can be displayed in this field is 2,147,483,647 (2^31-1). If the elapsed time exceeds this value, 2147483647 is displayed.

LOADPT
The address at which the user exit routine was loaded.

RTIME
The local date and time that the user exit routine was last refreshed (or initially loaded, if no refreshes have occurred). The format of the output field is:
yyyy-mm-dd hh:mm:ss.th

SIZE
The size in bytes of the user exit load routine. This value is displayed in hexadecimal.

TEXT
The 32 bytes starting from offset +04 from the entry point of the exit module, translated to EBCDIC with non-printable characters replaced by periods (.). This is a common location for module identification information. If your user exit routines contain printable identification data at this point in the module, you can use the TEXT option to display that information.

Usage notes
You can issue the QRY USEREXIT command only through the Operations Manager (OM) API.

The output contains an entry for each user exit module within each user exit type specified in the QUERY USEREXIT command. The output of this command is defined in XML and is available to automation programs that communicate with OM.

The QRY USEREXIT command is routed to all IMS systems in the IMSplex as its default routine.
Output fields

The following table shows the QUERY USEREXIT output fields. The columns in the table are:

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the long label generated in the XML output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned.

**Scope**
Identifies the scope of the output field.

**Meaning**
Provides a brief description of the output field.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the QUERY USEREXIT command are standard for all commands entered through the OM API.

The following table contains the return, reason, and completion codes for the QUERY USEREXIT command. Included in the tables is a brief explanation of the codes.

Table 217. Return and reason codes for the QUERY USEREXIT command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The QUERY USEREXIT command completed successfully.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001010'</td>
<td>The QUERY USEREXIT command is not processed because no user exit routines were found that matched the TYPE parameter.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003000'</td>
<td>The QUERY USEREXIT command was successful for at least one user exit type. The QUERY USEREXIT command was not successful for one or more user exit types. The completion code indicates the reason for the error with the user exit type. The completion codes that can be returned by the QUERY USEREXIT command are listed in Table 218.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>The QUERY USEREXIT command was not successful for any of the user exit types specified. The completion code indicates the reason for the error with the user exit type. The completion codes that can be returned by the QUERY USEREXIT command are listed in Table 218.</td>
</tr>
<tr>

  </cmd>
</imsout>
```
Example 2 for QUERY USEREXIT command

TSO SPOC input:
QRY USEREXIT TYPE(AOIE) SHOW(CALLS,RTIME)

TSO SPOC output:
Response for: QRY USEREXIT TYPE(INITTERM) SHOW(CALLS,RTIME)
ExitType ModName MbrName CC Calls RefreshTime
AOIE DFSAOE00 SYS3 0 1 2013-04-22 10:20:41.12
AOIE USREXIT2 SYS3 0 1 2013-04-22 10:20:41.12

OM API input:
CMD(QRY USEREXIT TYPE(AOIE) SHOW(CALLS,RTIME))

OM API output:

674  Commands, Volume 2: IMS Commands N - V
**QUERY USERID command**

Use the QUERY USERID command to display information about user IDs across the IMSplex. In this context, a user ID is used for user or terminal security. A user ID is not the same as a user, which is either a dynamic (ETO) user, or a static or dynamic (ETO) ISC subpool user. This command can be specified only through the OM API. It is not valid on an XRF alternate.

Subsections:
- “Environment”
- “Syntax” on page 676
- “Keywords” on page 676
- “Usage notes” on page 678
- “Similar IMS type-1 commands” on page 679
- “Output fields” on page 679
- “QUERY USERID status” on page 680
- “Return, reason, and completion codes” on page 681
- “Examples” on page 682

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUERY USERID</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NAME</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>SHOW</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```
QUERY USERID
   NAME(*)
   ,
   NAME(useridname)
   ,
   SHOW(GLOBAL, LOCAL)
   ,
   SHOW(A)
   ,
   SHOW(GLOBAL)
   ,
   A:
   ALL
   | NODE
   | OWNER
   | STATUS
   | USER
   | VERSION
```

Keywords

The following keywords are valid for the QUERY USERID command:

**NAME()**
Specifies the names of one or more user IDs that are to be displayed. Valid names are 1-8 characters, and wildcards can be specified. To display all user IDs, specify NAME(*). NAME(*) is the default.

**SHOW()**
Specifies the user ID output fields to be returned. The user ID is always returned along with the name of the IMS that created the output and the completion code. If SHOW is not specified, only the user IDs are returned. This provides a method for a system management application to obtain a list of all user IDs that are currently known in the IMSplex.

Two parameters, GLOBAL and LOCAL, are used to specify the location (global resources, or local resources) where IMS should obtain the information that is to be displayed. The default is both GLOBAL and LOCAL.

The rest of the parameters are used to specify what information is displayed.

The parameters supported with the SHOW keyword, which can be specified in any order, are:

**ALL**
Returns all the output fields.

**GLOBAL**
When GLOBAL is specified, the command master displays global
information, depending on the other SHOW parameters specified. This includes information from the resource structure.

The GLOBAL parameter is processed by the command master only. All other IMS systems ignore this parameter. If LOCAL is not also specified, then all IMS systems other than the command master ignore the command.

GLOBAL is applicable only if the command master is using sysplex terminal management.

GLOBAL is not applicable if the command master is not using sysplex terminal management. In this environment, if LOCAL is also specified, then GLOBAL is ignored. Otherwise, the command master rejects the command.

If sysplex terminal management is enabled, then the command master will make requests to RM to determine the appropriate global status.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line, and local information is displayed as another output line.

LOCAL
Specifies that all IMS systems, including the command master, display local information, depending on the other SHOW parameters specified. This includes information local to the IMS processing the command.

The LOCAL parameter is processed by all IMS systems, including the command master.

LOCAL is applicable in any environment, regardless of whether sysplex terminal management is used.

If both GLOBAL and LOCAL are specified (which is the default), then the command master builds global and local information separately. Global information is displayed as one output line, and local information is displayed as another output line.

NODE
Displays the node that the user ID is signed on to. This can be a static node or a dynamic node.

OWNER
Displays the owner of the user ID resource in the resource structure. This applies only when sysplex terminal management is enabled, and is processed by the command master only. All other IMS systems ignore this parameter.

The owner is the IMSID (or RSENAME for XRF systems) of the IMS system that owns the user ID. An IMS system owns a user ID resource if the resource is active (the user ID is signed on).

STATUS
Returns local or global status of the user ID. See “QUERY USERID status” on page 680 for a list and meaning of possible status that might be returned.

USER
Displays the dynamic or ISC user associated with the user ID.

VERSION
Displays the RM version number of the user ID resource. This is the
version number assigned to the user ID, which is assigned by MVS, and maintained by RM, when the resource is created or updated in the resource structure. VERSION applies only when sysplex terminal management is enabled. VERSION is ignored when sysplex terminal management is not enabled. Only the global version number is displayed. IMS does not maintain the version number in the local system.

Usage notes

The QUERY USERID command can be specified only through the OM API.

The QUERY USERID command is not supported on an XRF alternate system.

The processing of the QUERY USERID command is different depending on whether IMS sysplex terminal management is enabled.

- If IMS sysplex terminal management is not enabled, processing is local for each system. The results of type-1 and type-2 commands are similar.
- If IMS sysplex terminal management is enabled, type-1 and type-2 command processing is similar when displaying local information. However, they differ in how global information is displayed.
- For type-1 /DISPLAY commands with IMS sysplex terminal management enabled, the command master displays information from either the resource structure or the local system, but not both. If the resource being displayed is not owned by any system or is owned by the command master, the command master displays the global resource. However, if the resource is owned by a system other than the command master, the command master displays only the local resource, and the owning system is responsible for displaying the global resource.
- For type-2 QUERY commands with IMS sysplex terminal management enabled, the command master is the only system that displays global resource information, regardless of whether the resource is owned. In addition, the command master displays local resource information. All other IMS systems that process the command display local resource information only. This approach allows more flexibility in displaying all information in an IMSplex.

The SHOW keyword determines which IMS systems process the command, and what information is displayed.

- If SHOW(GLOBAL) is specified, then the command master displays global information, which includes status from the resource structure if sysplex terminal management is enabled (STM=YES defined in DFSDCxxx PROCLIB member). This is true whether or not the user ID is active on any particular IMS system. All other IMS systems to which OM routes the command ignore the GLOBAL parameter with return code X'00000004' and reason code X'00001000'. However, user ID resources are not maintained in the resource structure if multiple signons are allowed (the same user ID is allowed to sign on to multiple terminals simultaneously). The first IMS that joins the IMSplex determines whether multiple signons are allowed in the IMSplex by specifying SGN=G, M, or Z in the IMS startup parameters.
- If SHOW(LOCAL) is specified, then each IMS system to which OM routes the command (including the command master) processes the command, and displays information that is local to each system.
- If both GLOBAL and LOCAL are specified (which is the default), then the command master displays both global and local information, and all other IMS systems to which OM routes the command display local information.
Similar IMS type-1 commands

The following table shows variations of the QUERY USERID command and the type-1 IMS commands that perform similar functions.

Output fields

The following table shows the QUERY USERID output fields. The columns in the table are:

Short label
Contains the short label generated in the XML output.

Long label
Contains the column heading for the output field in the formatted output.

SHOW parameter
Identifies the parameter on the SHOW keyword that caused the field to be generated. Error appears for output fields that are returned for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

Scope
Identifies the scope of the output field. GBL indicates that the field can be generated only by the command master when displaying global information for SHOW(GLOBAL). LCL indicates that the field can be generated by any IMS displaying local information for SHOW(LOCAL). N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

**QUERY USERID status**

The following table shows the possible user ID status that can be displayed. The columns in the table are:

- **Status**: The user ID status that is displayed.
- **Scope**: The scope of the status. GBL indicates that the status can be global (it exists in the resource structure when STM is enabled), and is returned with the STT short label. LCL indicates that the status can be local, and is returned with the LSTT short label.
- **Meaning**: Provides a brief description of the status.

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the QUERY USERID command. The OM return and reason codes that may be returned as a result of the QUERY USERID command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the QUERY USERID command.

Table 223. Return and reason codes for the QUERY USERID command

</table>

The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 224. Completion codes for the QUERY USERID command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td></td>
<td>The QUERY USERID command completed successfully for the resource.</td>
</tr>
<tr>
<td>10</td>
<td>NO RESOURCES FOUND</td>
<td>The resource name is unknown to the client that is processing the request. The resource name might have been typed in error or the resource might not be active at this time. If this is a wildcard request there were no matches for the name. Confirm that the correct spelling of the resource name is specified on the command.</td>
</tr>
<tr>
<td>1A3</td>
<td>Userid resource is in error</td>
<td>The user ID resource was found in the resource structure, and an associated resource was needed, but it was either not found or appeared to be in error. This is normally an error condition. However, it could be a temporary condition caused by terminal or command activity. The command should be retried.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the QUERY USERID command:

Example 1 for QUERY USERID command

TSO SPOC input:
QRY USERID NAME(USERID*,XYZ) SHOW(ALL)

TSO SPOC output:

```
(screen 1)
UserID MbrName CC CCText Gbl Owner Node User Version#
USERID01 IMS1 0 Y IMS1 NODE01 USER01 1
USERID01 IMS1 0 Y IMS1 NODE01 USER01 1
USERID02 IMS1 0 Y IMS2 NODE02 USER02 1
USERID02 IMS2 0 Y IMS2 NODE02 USER02 1
USERID03 IMS1 0 Y IMS1 NODE03 1
USERID03 IMS1 0 Y IMS1 NODE03 1
XYZ IMS1 10 NO RESOURCES FOUND Y
```
### Explanation:

There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Single-signon for user IDs is enforced. IMS1, the command master, displays global and local information. IMS2 displays local information only.

- **USERID01** is signed on to dynamic or ISC node NODE01, user USER01 on IMS1.
- **USERID02** is signed on to dynamic or ISC node NODE02, user USER02 on IMS2.
- **USERID03** is signed on to static node NODE03 on IMS1.
- **XYZ** does not exist.

#### Example 2 for QUERY USERID command

TSO SPOC input:

```
QRY USERID NAME(USERID*) SHOW(ALL)
```

TSO SPOC output:

<table>
<thead>
<tr>
<th>UserID</th>
<th>MbrName</th>
<th>CC</th>
<th>LNode</th>
<th>LUser</th>
</tr>
</thead>
<tbody>
<tr>
<td>USERID11</td>
<td>IMS1</td>
<td>0</td>
<td>NODE11</td>
<td>USER11</td>
</tr>
<tr>
<td>USERID12</td>
<td>IMS1</td>
<td>0</td>
<td>NODE12A</td>
<td>USER12A</td>
</tr>
<tr>
<td>USERID12</td>
<td>IMS1</td>
<td>0</td>
<td>NODE12B</td>
<td>USER12B</td>
</tr>
<tr>
<td>USERID12</td>
<td>IMS2</td>
<td>0</td>
<td>NODE12C</td>
<td>USER12C</td>
</tr>
<tr>
<td>USERID13</td>
<td>IMS2</td>
<td>0</td>
<td>NODE12D</td>
<td>USER12D</td>
</tr>
<tr>
<td>USERID13</td>
<td>IMS2</td>
<td>0</td>
<td>NODE13</td>
<td>USER13</td>
</tr>
</tbody>
</table>

**Explanation:** There are two IMS systems in the IMSplex: IMS1 and IMS2. RM is maintaining status (STM=YES). Multiple-signons for user IDs are enabled, so user ID resources are not maintained in RM. IMS1 displays local information only because user IDs are not maintained in RM. IMS2 displays local information only.

- **USERID11** is signed on to dynamic or ISC node NODE11, user USER11 on IMS1.
- **USERID12** is signed on to multiple terminals simultaneously: dynamic or ISC nodes NODE12A and NODE12B on IMS1, dynamic or ISC node NODE12C on IMS2, and static node NODE12D on IMS2.
- **USERID13** is signed on to static node NODE13.

Chapter 6. QUEUE commands

Use the IMS QUEUE commands to queue or dequeue LTERMs and transactions. These commands can be issued to an IMSplex using the Batch SPOC utility.

Subsections:
- “QUEUE LTERM command”
- “QUEUE TRAN command” on page 690

**QUEUE LTERM command**

Use the QUEUE LTERM command to enqueue a message to the specified LTERM or to dequeue and discard messages currently enqueued to the LTERM.

When IMS uses local queue manager data sets, all IMS systems that receive this command process it.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 686
- “Usage notes” on page 687
- “Output fields” on page 687
- “Return, reason, and completion codes” on page 688
- “Examples” on page 689

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>QUEUE LTERM</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>DATA</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>OPTION</td>
<td></td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**

```
QUEUE LTERM NAME(ltermname)
```
Keywords

The following keywords are valid for the QUEUE LTERM command:

**NAME(\textit{lterm})**

Specifies the 1- to 8-character name of the LTERM.

**DATA(\textit{message data})**

Specifies the message data to enqueue to the LTERM. The data is variable in length. This parameter is valid only for OPTION(ENQ). If the COMM macro is defined with OPTION=NOBLANK, DATA is an optional parameter. If the COMM macro is defined with OPTION=BLKREQD (the default), at least one character, even if it is a blank, must be specified in the message data area.

The message data specified can be in mixed case. If the LTERM is defined as EDIT=ULC, the data is enqueued as specified on the command without any uppercase translation. If the LTERM is defined as EDIT=UC, the data is translated to uppercase before the message is enqueued. No EDIT routine is called before the data is enqueued.

The data is enqueued as a single segment message. The maximum length of data that can be enqueued is 32,763.

**OPTION()**

Specifies the option parameters.

**DEQALL**

Indicates that all of the messages currently enqueued to the LTERM should be dequeued and discarded. The dequeue function is similar to a /DEQUEUE LTERM command. The node and user must be stopped before messages can be dequeued. To use the DEQALL option, the LTERM must be defined locally on the IMS system, and the node (if the LTERM is associated to a static node) or the user (if the LTERM is associated to dynamic node) must be stopped.

**DEQ1**

Indicates the first (oldest) message on the queue for the LTERM should be dequeued and discarded. The dequeue function is similar to a /DEQUEUE LTERM command. The node and user must be stopped before a message can be dequeued. To use the DEQ1 option, the LTERM must be defined locally on the IMS system, and the node (if the LTERM is associated to a static node) or the user (if the LTERM is associated to dynamic node) must be stopped.

**ENQ**

Indicates that a message is to be enqueued to the specified LTERM. The enqueue function is similar to a /BROADCAST command. If the LTERM is stopped, no message can be enqueued to it.

The QUEUE LTERM OPTION(ENQ) command is not supported for remote LTERMs.
Usage notes

If you use the ENQ option when IMS is using shared message queues, with or without STM=YES, only the command master IMS system processes the command. Messages are enqueued to the shared queues. The LTERM does not need to be defined in the IMS system that processes the command. If the LTERM does not exist, the command master IMS attempts to create the LTERM and associated user structure if ETO is active. If the LTERM is stopped, no message can be enqueued to it. If you use the ENQ option and the LTERM name specified is a remote LTERM, the message is placed on the shared queues using the MSNAME associated with the remote LTERM. The command is not processed if the MSNAME associated with the remote LTERM is stopped.

If you use the DEQALL or DEQ1 option when IMS is using shared message queues and STM=NO, only the command master processes the command. When IMS is using shared message queues and STM=YES, the command is processed by the command master IMS if the user or node is not owned, and by the owning system if the user or node is owned. Messages are dequeued from the shared queues. The node (if LTERM associated to a static node) or the user (if LTERM associated to dynamic node) must be stopped. The LTERM does not need to be defined in the IMS processing the command. If the LTERM does not exist, the IMS processing the command first attempts to create the LTERM and its associated user structure if ETO is active, and then processes the command.

The maximum length of the data that can be enqueued is 32 763 bytes. The data is enqueued to the LTERM as a single segment.

The QUEUE LTERM command includes completion code text with the non-zero completion code. The text can be up to 32 bytes and provides the meaning for the returned completion code:

Note: Before dequeuing one or all messages from shared message queues, stop the user (for ETO terminals) or NODE (or static terminals) for all IMS systems sharing the queues. The LTERM should not be in conversation mode.

Output fields

Output from QUEUE LTERM is returned encapsulated in `<cmdrsphdr>` and `<cmdrspdata>` XML tags. The short label is generated in the XML output. The SHOW keyword listed is the keyword on the command that causes the field to be generated. A value of “n/a” indicates that the output field is always returned. The following table shows the output fields for the QUEUE LTERM command.

<table>
<thead>
<tr>
<th>Short label</th>
<th>SHOW keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>n/a</td>
<td>The completion code for the output line. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>LCL</td>
<td>The completion code text that briefly explains the meaning of the completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>n/a</td>
<td>The IMSplex member that built the output line. The member name is always returned.</td>
</tr>
<tr>
<td>LTERM</td>
<td>n/a</td>
<td>The name of the LTERM resource. The LTERM name is always returned.</td>
</tr>
</tbody>
</table>

Note: Before dequeuing one or all messages from shared message queues, stop the user (for ETO terminals) or NODE (or static terminals) for all IMS systems sharing the queues. The LTERM should not be in conversation mode.

<td>The number of messages dequeued from the shared message queue.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

Commands that are issued through the OM API, including QUEUE LTERM, produce a standard set of OM return and reason codes, which are defined in the CSLORR request.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 227. QUEUE LTERM return and reason codes

<td>The QUEUE LTERM OPTION(ENQ) command is not supported for remote LTERMs.</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the QUEUE LTERM command:

**Example 1 for QUEUE LTERM command**

**TSO Input:**

```
QUEUE LTERM NAME(LTERM1) OPTION(ENQ) DATA(MESSAGE1)
```

**TSO Output:**

```
Lterm MbrName CC
LTERM1 SYS3 0
```

**Explanation:** The QUEUE LTERM command completed successfully and was processed by the command master IMS.

**Example 2 for QUEUE LTERM command**

**TSO Input:**

```
QUEUE LTERM NAME(IMSUS01) OPTION(DEQALL)
```

**TSO Output:**

```
Lterm MbrName CC Qcnt
IMSUS01 IMS2 0 4
```
**Explanation:** Dequeues all messages on the LTERM queue. The QUEUE LTERM command completed successfully and processed by the command master IMS.

**Example 3 for QUEUE LTERM command**

TSO Input:
QUEUE LTERM NAME(IMSUS01) OPTION(DEQALL)

TSO Output:

```
Lterm  MbrName  CC  LQcnt
IMSUS01 IMS2  0   3
IMSUS01 IMS3  0   0
```

**Explanation:** Dequeues all messages on the LTERM queue. The QUEUE LTERM command completed successfully and is processed by all IMS systems that receive the command.

**Related concepts:**

---

**QUEUE TRAN command**

Use the QUEUE TRAN command to enqueue a message to the specified transaction or to dequeue and discard messages currently enqueued to the transaction.

The QUEUE TRAN command is defined to OM as ROUTE=ALL. When this command is issued, OM routes the command to all IMS systems that have registered for the command. Depending on the environment, either only the command master IMS processes the command or all IMS process the command. If only the command master processes the command, all other IMS systems that receive the command return with a return and reason code indicating that they are not the IMS command master.

<td>X</td>
<td></td>
</tr>
<tr>
<td>OPTION</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
QUEUE TRAN NAME(tranname) OPTION(ENQ) DATA(message_data)
```

Keywords

The following keywords are valid for the QUEUE TRAN command:

**NAME(tranname)**

Specifies the 1- to 8-character name of the transaction.

**DATA(message_data)**

Specifies the message data to enqueue to the transaction. The data is variable in length. This parameter is only valid for OPTION(ENQ). If the COMM macro is defined with OPTION=NOBLANK, DATA is an optional parameter. If the COMM macro is defined with OPTION=BLKREQD (the default), at least one character, even if it is a blank, must be specified in the message data area.

The data can be specified in mixed case. If the transaction is defined as EDIT=ULC, the data is enqueued as it was specified on the command, without any uppercase translation. If the transaction is defined as EDIT=UC, the data is translated to uppercase before the message is enqueued. No EDIT routine is called before the data is enqueued.

The data is enqueued as a single segment message. The maximum length of data that can be enqueued is 32 763.

**OPTION()**

Specifies the option parameters:

**ENQ**

This is the default. Indicates that a message is to be enqueued to the specified transaction. The ENQ function is processed only by the command master IMS in both the local queues and shared-queues environment. Any output generated by the transaction is sent as an unsolicited output message to the OM that originated the command. Any MFS formatting associated with the output message is not returned.

The transaction specified for the ENQ cannot be full-function response mode or a Fast Path transaction. The initiated transaction can be conversational, but it cannot be in conversational mode with OM.

**DEQALL**

Indicates that all messages currently enqueued to the transaction should be dequeued and discarded. The transaction must be stopped before messages can be dequeued.
DEQALL is valid in both local queues environment and the shared-queues environment. If IMS is in the local queues environment, all IMS systems that receive the command process the QUEUE TRAN OPTION(DEQALL) command. If IMS is in the shared-queues environment, only the command master IMS processes the QUEUE TRAN OPTION(DEQALL) command.

A QUEUE TRAN OPTION(DEQALL) command can dequeue transaction messages queued to a transaction from APPC or OTMA Clients. The command only dequeues the transaction messages. The APPC or OTMA transaction instance blocks (TIB) created at the IMS system are not deleted and the storage may remain allocated until the next IMS restart. For APPC, the TIB is not released and the APPC conversation (the client) hangs if there is no timeout value specified. The APPCITO=(x,Y) timeout value for APPC would deallocate the APPC conversation and release the TIB after the timeout limit has been reached.

**DEQ1**

Indicates that the first (oldest) message on the queue for the transaction should be dequeued and discarded. The transaction must be stopped before the message can be dequeued.

A QUEUE TRAN OPTION(DEQ1) command can dequeue transaction messages queued to a transaction from APPC or OTMA Clients. The command only dequeues the transaction messages. The APPC or OTMA transaction instance blocks (TIB) created at the IMS system are not deleted and the storage may remain allocated until the next IMS restart. For APPC, the TIB is not released and the APPC conversation (the client) hangs if there is no timeout value specified. The APPCITO=(x,Y) timeout value for APPC would deallocate the APPC conversation and release the TIB after the timeout limit has been reached.

**Usage notes**

This command is processed if the transaction is defined locally at the IMS system. If the transaction is not defined at the IMS system, the Destination Creation exit routine, DFSINSX0, is called. If the exit routine successfully creates a transaction, the command is processed. If the exit does not create a transaction, a response line is returned with an error completion code indicating that the transaction is not found.

The effect of this command differs depending on whether the IMS processing it uses RM's resource structure. If it does use the resource structure, a message can be enqueued even if the transaction is stopped locally if the transaction does not have a global status of STOQ. To dequeue one or all messages, however, the transaction must be stopped globally and locally for scheduling (STOSCHD). If the IMS does not use the resource structure, no messages can be enqueued if the transaction is stopped for queuing (STOQ). To dequeue one or all messages, the transaction must be stopped for scheduling (STOSCHD).

The QUEUE TRAN OPTION(ENQ) command is not supported for conversational, response mode, Fast Path, and remote transactions. This form of the command performs security checking on the transaction name and on the user ID that issued the command. For OPTION(ENQ), workload management (WLM) CLASSIFY calls are issued using information passed to the OM from the command. The information passed includes LUNAME=DFSOMAPI and the user ID. Also for OPTION(ENQ), if the transaction name specified is a remote transaction, the message is placed on the shared queues (on the transaction ready queue) using the remote transaction name.
The command is not processed if the MSNAME associated with the remote transaction is stopped. The TM and MSC Message Routing and Control user exit routine, DFSMSCE0, is not called for a QUEUE TRAN command.

The maximum length of the data that can be enqueued is 32 763 bytes. The data is enqueued to the transaction as a single segment.

If the transaction is processed by an IMS Version 10 or higher system, any generated output to the input destination is sent as an unsolicited output message to the OM that originated the command. The transaction name and IMS ID that processed the transaction are included in the output as follows:

8 byte transactionname + 8 byte IMSID + output message

If the transaction is processed by an IMS Version 9 or earlier, any generated output to the input destination is not queued. The application program receives a status code of AD.

**Output fields**

Output from the QUEUE TRAN command is returned encapsulated in `<cmdrsphdr>` and `<cmdrspdata>` XML tags. The short label is generated in the XML output. The keyword listed is the keyword on the command that causes the field to be generated. A value of “n/a” indicates that the output field is always returned. A value of error indicates that the output field is returned if there is an error (for example, a nonzero completion code).

</table>

### Examples

The following are examples of the QUEUE TRAN command:

**Example 1 for QUEUE TRAN command**

TSO Input:

```
QUEUE TRAN NAME(PART) OPTION(DEQALL)
```

TSO Output:

```
Trancode MbrName CC LQcnt
--------------------------
PART IMS1 0 5
PART IMS2 0 2
```

**Explanation:** The command was processed by all the IMS systems that received the command. IMS1 had five messages dequeued from its local queue, and IMS2 had two messages dequeued from its local queue.

**Example 2 for QUEUE TRAN command**

TSO SPOC input:

```
QUEUE TRAN NAME(PART) DATA(message1)
```

Chapter 6. QUEUE commands 695
TSO SPOC output:
Trancode MbrName CC
PART IMS2 0

**Explanation:** The QUEUE TRAN command completed successfully and was processed by the command master.

**Example 3 for QUEUE TRAN command**

TSO SPOC input:
QUEUE TRAN NAME(PART) OPTION(DEQALL)

TSO SPOC output:
Trancode MbrName CC Qcnt
PART IMS3 0 2

**Explanation:** This example shows the QUEUE TRAN OPTION(DEQALL) in a shared-queues environment. Two messages are dequeued by the command master IMS.

**Example 4 for QUEUE TRAN command**

TSO SPOC input:
QUEUE TRAN NAME(PART) OPTION(DEQALL)

TSO SPOC output:
Trancode MbrName CC LQcnt
PART IMS2 0 2
PART IMS3 0 0
PART SYS3 0 1

**Explanation:** This example shows the QUEUE TRAN OPTION(DEQALL) in a Local Queues environment. Each IMS processes the command.

Chapter 7. /QUIESCE command

The /QUIESCE command initiates the shutdown and deallocates the user for the specified ISC node.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 698
- “Example” on page 698

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/QUIESCE</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NODE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/QUIESCE        /QUI
               NODE nodename
               USER username
               ALL
```

Keywords

The following keywords are valid for the /QUIESCE command:

**NODE**
Specifies the VTAM node for the user to be shut down and deallocated.

**USER**
If the USER keyword is omitted, all half-sessions of an ISC node are affected. The half-sessions must be connected.

Restrictions for using NODE and USER parameters together:
- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- /QUIESCE NODE USER commands are valid for ISC nodes only.
Usage notes

This command can be issued to an IMSplex using the Batch SPOC utility.

The /QUIESCE NODE command is valid for ISC nodes only.

/QUIESCE resets preset mode, test mode, lock node, lock lterm, pstop lterm, and purge lterm because these statuses are not significant and are not kept after a logon or restart. /QUIESCE also takes other actions depending on the recovery settings for the node:

RCVYCONV=NO
/QUIESCE causes any IMS conversations (active and held) to be terminated. Any conversational message that is queued or being processed has its output response message delivered asynchronously.

RCVYFP=NO
/QUIESCE causes Fast Path status and messages to be discarded

RCVYRESP=NO
/QUIESCE resets full-function response mode.

If global resource information is not kept in Resource Manager, /QUIESCE deallocates the user and resets status locally. If global resource information is kept in Resource Manager, /QUIESCE deallocates the user and resets status globally. If the user has no significant status, /QUIESCE deletes the user in Resource Manager. If the node has no significant status, and there are no other half-sessions for the node, /QUIESCE deletes the node in Resource Manager.

If ROUTE is specified, it should be specified with ROUTE(*). The command fails if not routed to the IMS where the node is active.

Example

Entry ET:

/QUIESCE NODE CAL USER LAX

Response ET:

/DFS058I QUIESCE COMMAND COMPLETED

Explanation: The half-session of node CAL using user LAX is shut down.

“UPDATE IMSCON TYPE(ISC) command” on page 1077
“UPDATE IMSCON TYPE(ISCUSER) command” on page 1083
Chapter 8. /RCLSDST command

The /RCLSDST (remote close destination) command causes IMS to disconnect the VTAM terminal from which the command is entered.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Example” on page 700

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command can be issued.

Table 234. Valid environments for the /RCLSDST command

<table>
<thead>
<tr>
<th>Command</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RCLSDST</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
►►/RCLSDST
```

Usage notes

If you are in an active conversational mode, /EXIT or /HOLD must be entered before /RCLSDST is executed. If this command is issued by a signed on user, the user is signed off.

This command does not reset preset mode.

/RCLSDST resets preset mode, test mode, lock node, lock lterm, pstop lterm, and purge lterm because these statuses are not significant and, therefore, are not kept after logons and restart. /RCLSDST also takes other actions depending on the recovery settings for the node:

RCVYSTSN=NO
/RCLSDST acts like a /CHANGE NODE COLDSESS command for FINANCE and SLUP nodes by setting the session status to 'cold'. /RCLSDST acts like a /QUIESCE NODE command for ISC (LU6.1) nodes by initiating the shutdown and deallocating the user for the specified node. This action changes the session status to 'cold'. With these actions taken by the /RCLSDST command, the next session initiation request for this node is allowed to again attempt a session cold start. For ETO nodes, the control block structure could be deleted, if no significant status exists.

RCVYCONV=NO
/RCLSDST causes any held IMS conversations to be terminated. Any
conversational message that is queued or being processed has its output response message delivered asynchronously.

**RCVYFP=NO**

/RCLSDST causes Fast Path status and messages to be discarded.

**RCVYRESP=NO**

/RCLSDST resets full-function response mode.

If global resource information is not kept in Resource Manager, /RCLSDST logs a node off and resets status locally. If global resource information is kept in Resource Manager, /RCLSDST logs a node off and resets status globally. If the node has no status, /RCLSDST deletes the node in Resource Manager.

**Example**

**Entry ET:**
/RCLSDST

**Response ET:**

DF5058I  RCLSDST COMMAND COMPLETED

**Explanation:** The entering terminal is logged off IMS.
Chapter 9. /RCOMPT command

The /RCOMPT command sets a particular VTAM terminal component to a ready/not ready state.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes” on page 702
- “Example” on page 702

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 235. Valid environments for the /RCOMPT command and keywords

</tr>
<tr>
<td>UDS</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>VID</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax
Usage notes

Output messages queued for a particular component will not be sent unless the component is ready. Depending on terminal type, output operations for other components can continue.

Note: Defaults are READY and 1.

The ready/not ready state set by the /RCOMPT command can be altered by the following:
- Another /RCOMPT command
- A /COMPT, /START, or /RSTART command
- An I/O error on the terminal component

The command format takes one of the following forms:
- A keyword is used.
  A search is made of the components (as defined in the TERMINAL macro during IMS system definition or logon descriptor) for the component defined that corresponds to the specified keyword. When a match is found, that component type is made ready or not ready as specified by the command.
- A keyword is used with a number other than 1 following the keyword.
  The corresponding occurrence of that component type is made ready or not ready, as specified by the command.
- Number 1 through 4 is used instead of a keyword.
  The component affected is the one defined in that position during system definition or logon descriptor independent of component type.

When using ISC, only parameters 1, 2, 3, and 4 are valid.

Example

Entry ET:
/RCOMPT VID 2 READY

Response ET:
  DFS058I  RCOMPT COMMAND COMPLETED

Explanation: The second display component is declared operable to IMS.

Entry ET:
/RCOMPT 4 READY

Response ET:
  DFS058I  RCOMPT COMMAND COMPLETED

Explanation: The fourth component defined is declared ready to IMS.

<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RDISPLAY</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>MASTER</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/RDISPLAY MASTER
```

Keywords

The following keyword is valid for the /RDISPLAY command:

MASTER

  Specifies the identity of the terminal designated as the master terminal.

Usage notes

If the 3270 master terminal capability was generated during IMS system definition, the logical terminal name, line, and physical terminal number of the secondary master terminal are also displayed.

This command can be issued to an IMSplex using the Batch SPOC utility.

Equivalent IMS type-2 commands

The following table shows variations of the /RDISPLAY command and the IMS type-2 commands that perform similar functions.
Table 237. Type-2 equivalents for the /RDISPLAY command

<table>
<thead>
<tr>
<th>Task</th>
<th>/RDISPLAY command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displays the primary and secondary master terminal.</td>
<td>/RDISPLAY MASTER</td>
<td>QUERY LTERM STATUS(MTO,SMTO)</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the /RDISPLAY command:

*Example 1 for /RDISPLAY command*

Entry ET:
/RDISPLAY MASTER

Response ET:
LTERM CNTRL
PTERM 3-1
*91010/123704*

Explanation: CNTRL is the master terminal logical terminal and is assigned to LINE 3 PTERM 1.

*Example 2 for /RDISPLAY command*

Entry ET:
/RDISPLAY MASTER

Response ET:
LTERM CTRL1
PTERM 4-2
LTERM CTRL2
PTERM 4-4
*91010/12370*

Explanation: CTRL1 is the primary master terminal logical terminal and is assigned to LINE 4 PTERM 2. CTRL2 is the secondary master terminal logical terminal and is assigned to LINE 4 PTERM 4.

**Related reference:**

“QUERY LTERM command” on page 293
Chapter 11. /RECOVER commands

The /RECOVER commands are used with the recovery list of database data sets and areas.

In an IMSplex, the /RECOVER command initiates the operation of the Database Recovery facility. OM sends the /RECOVER command to one IMS.

These commands can be issued to an IMSplex using the Batch SPOC utility.

/RECOVER commands are:

- “/RECOVER ADD command”
- “/RECOVER REMOVE command” on page 710
- “/RECOVER START command” on page 714
- “/RECOVER STOP command” on page 719
- “/RECOVER TERMINATE command” on page 722

/RECOVER ADD command

Use the /RECOVER ADD command to add database data sets and areas to a list (recovery list) of database data sets and areas to be recovered using the Database Recovery Facility.

The database data sets and areas can be specified as database data sets, areas, databases, or groups.

Subsections:
- “Environment”
- “Syntax” on page 706
- “Keywords” on page 706
- “Usage notes” on page 709
- “Examples” on page 709

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

</tr>
<tr>
<td>USEAREA</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>USEDBDS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

### Syntax

```
/RECOVER ADD RCVTOKEN recoveryname OFFLINE STAGLOBAL STALOCAL
```

```
USEDBDS USEAREA SMSOPTS
```

### Keywords

The following keywords are valid for the /RECOVER ADD command:

**OFFLINE**

With this option, the database remains offline from the IMS system at the completion of the recovery. This option is used to enable the database administrator to verify that the recovery has completed successfully and the databases are ready for use. This is the default if it is not specified on the /RECOVER START command.

The IMS system performing the recovery has exclusive authorization of the database to perform the recovery. The OFFLINE option allows the IMS system to deauthorize the databases at the completion of the recovery without issuing
a START command. This will leave the databases available for processing. If a PITR option has been used in a recovery, the database data set in the RECON is IMAGE COPY NEEDED.

STAGLOBAL
This option is used when the full-function database or databases and Fast Path areas are used in a sysplex data sharing environment. A /START DB command with the GLOBAL option is issued on the IMS system which ran the recovery for all full-function databases affected by recovery. A /START AREA command with the GLOBAL option is used on the IMS system which ran the recovery for all Fast Path areas recovered. This option makes the database or databases available to IMS transactions as soon as all the DBDSs in the recovery list have been recovered. Authorization to use the database is returned to IMS.

STALOCAL
This option is used when the DRF is being executed in the operational IMS system where the database or databases are used. A /START DB command is issued on the IMS system which ran the recovery for all full-function databases affected by recovery. A /START AREA is issued on the IMS system which ran the recovery for all Fast Path areas recovered. Fast Path databases are not started with the /START DB command. Only one option needs to be specified and it applies to all DBDSs and areas added to the recovery list.

USEDBDS | USEAREA
These options are for Fast Path areas, full-function, and HALDB DBDS. When specified, DRF does not need to restore the image copy before applying log updates. You can use this option when you restore image copies prior to recovery.

Note: You must restore non-standard image copies prior to recovery.

This parameter determines whether DRF will restore the image copy for a DBDS before applying log updates.

RCVTOKEN | RCK
Specifies the unique identifier associated with a recovery list that the /RECOVER ADD command operates against. RCVTOKEN is optional. If it is not specified, IMS generates a recovery name. However, if the command is intended to add entries to an existing recovery list, RCVTOKEN must be specified with the intended recovery list token recoveryname. When RCVTOKEN is specified in a command, it must come before any keywords that identify the names of database data sets, areas, or groups.

recoveryname
Specifies the unique recovery token associated with the recovery list that the /RECOVER ADD command operates against. This token can be up to eight characters in length.

SMSOPTS
Specifies that the DFSMSdss options are to be associated with the entries being added to the recovery list. The options are only used when restoring image copies created by the Image Copy 2 utility.

doptionname
Specifies a unique SMS option.

DELCAT
Specifies that the data set is to be restored using the DFSMSdss optional keyword, DELETECATALOGENTRY.
Attention: This option is to be used with extreme care. DELCAT is required if SMSOPTS is supplied. This option allows you to recover from a scenario where entire volumes are lost but the catalog entries remain. When this option is specified, SMS deletes the prior catalog entries for the database data sets and areas being restored as part of recovery. Before using this option, read the caution under DELETECATALOGENTRY option of the RESTORE command.

AREA
Specifies that one or more Fast Path areas are to be added to a recovery list.

areaname
Specifies a unique Fast Path area.

CAGROUP
Specifies that one or more change accumulation groups, as defined in the RECON data sets, are to have their database data sets and areas added to a recovery list.

grouppname
Specifies that the database data sets and areas belonging to the named CA group are to be added to the recovery list.

DB
Specifies that all the areas or full-function database data sets for one or more databases are to be added to a recovery list.

dbname
 Specifies the database and the associated database data sets or areas that are to be added to a recovery list.

DBDS
Specifies that one or more full-function database data sets are to be added to a recovery list.

dbname ddname
Specifies a full-function database data set is to be added to a recovery list. Full-function database data sets are specified with the /RECOVER ADD DBDS command as an ordered pair. The first member of the pair is the database name. The second member is the DD name. If more than one full-function database data set is specified, the complete ordered pair must be specified for each database data set. All parameters must be separated by at least one blank space.

DBDSGRP
Specifies that one or more DBDS groups as defined in the RECON data sets will have their database data sets and areas added to a recovery list.

grouppname
Specifies that the database data sets and areas belonging to the named DBDS group are to be added to the recovery list.

RECOVGRP
Specifies that the listed groups are recovery groups. A recovery group is a group of full-function databases, DEDB areas, or both that the user defines to IMS as related. All DBDSs that make up the full-function databases and all the DEDB areas making up the recover groups specified in the command are added to a recovery list.

grouppname
Specifies the unique name of the group whose database data sets and areas are to be added to a recovery list.
Usage notes

Successful completion of a /RECOVER ADD command results in the specified database data sets and areas being added to a recovery list. Database data sets and areas can be added to a recovery list by specifying one or more database data sets, databases, change accumulation groups (CAGROUP), database data set groups (DBDSGRP), or recovery groups (RECOVGRP). If a database or group is specified, all database data sets and areas making up the database or group are added to a recovery list. If the specified database is a master database for a partitioned HALDB, all database data sets from all partitions that make up the HALDB are added to a recovery list. All groups (including databases) are defined in DBRC.

Database data sets and areas must be registered with DBRC to be recovered with the IMS Recovery Services. If the database data set, area, or group name is not known to DBRC, it is not added to a recovery list and a message is issued.

If a database data set or area specified in a /RECOVER ADD command (individually or as part of a group) is already on a recovery list, processing for the duplicate is ignored and a message is issued. Other database data sets and areas that are not duplicates are processed normally.

This command can be issued in IMS DBCTL and IMS DB/DC environments.

Examples

The COMMAND IN PROGRESS message is issued for /RECOVER ADD commands but is not shown in the following examples.

Example 1 for /RECOVER ADD command

In this example, a /RECOVER ADD STALOcal command is issued for full-function database data sets. Following a successful recovery of the database data sets, the database is started on the IMS that runs the recovery.

/RECOVER ADD STALOCAL DBDS DBNAME1 DDNAME1 DBNAME2 DDNAME2
DFS42991 FRD6001W THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS42991 FRD6003I DBNAME1 DDNAME1
DFS42991 FRD6003I DBNAME2 DDNAME2

Example 2 for /RECOVER ADD command

In this example, a /RECOVER ADD command is issued for full-function database data sets. One of the database data sets is not registered in RECON and is rejected.

/RECOVER ADD DBDS DBNAME1 DDNAME1 DBNAME1 DDNAME2
DFS42991 FRD6001W THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS42991 FRD6003I DBNAME1 DDNAME1
DFS42991 FRD6010W UNABLE TO ADD TO RECOVERY LIST, NOT FOUND IN RECON, DBNAME2 DDNAME2

Example 3 for /RECOVER ADD command

In this example, a /RECOVER ADD command is issued for full-function database data set. The database that database data set belongs to is still authorized to two IMS systems.

/RECOVER ADD DBDS DBNAME1 DDNAME1
DFS42991 FRD6001W THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS42991 FRD6003I DBNAME1 DDNAME1
DFS42991 FRD6003I DBNAME1 DDNAME1 AUTHORIZED BY IMS1
DFS42991 FRD6003I DBNAME1 DDNAME1 AUTHORIZED BY IMS2
Example 4 for /RECOVER ADD command

Databases can be specified as a whole with the /RECOVER ADD DB command. In this example, a full-function database and a Fast Path database have all their database data sets and areas, respectively, added to the recovery list.

/RECOVER ADD DB FFDDB1 FFDDB2
DFS4299I FRD60031 THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS4299I FRD60031 FFDDB1 DDNAME1
DFS4299I FRD60031 FFDDB1 DDNAME2
DFS4299I FRD60031 DBAREA3 DBAREA3
DFS4299I FRD60031 DBAREA4 DBAREA4

Example 5 for /RECOVER ADD command

If more than one DATAGROUP is specified, the group names must be separated by at least one blank space. In this example, a /RECOVER ADD command is issued for two database groups.

/RECOVER ADD DATAGROUP GRPNAME1 GRPNAME2
DFS4299I FRD60031 THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS4299I FRD60031 DBNAME3 DDNAME3
DFS4299I FRD60031 DBNAME4 DDNAME4
DFS4299I FRD60031 DBNAME5 DDNAME5
DFS4299I FRD60031 DBNAME6 DDNAME6
DFS4299I FRD60031 DBNAME7 DDNAME7
DFS4299I FRD60031 DBNAME8 DDNAME8

Example 6 for /RECOVER ADD command

If one or more RECOVGRP is specified, the group names must be separated by at least one blank. In this example, a /RECOVER ADD command is issued for two recovery groups.

/RECOVER ADD RECOVGRP GRPNAME1 GRPNAME2
DFS4299I FRD60031 THE FOLLOWING ENTRIES ARE ADDED TO THE RECOVERY LIST:
DFS4299I FRD60031 DBNAMEA DDNAMEA
DFS4299I FRD60031 DBNAMEB DDNAMEB
DFS4299I FRD60031 DBNAMEC DDNAMEC
DFS4299I FRD60031 DBNAMED DDNAMED
DFS4299I FRD60031 DBNAMEE DDNAMEE
DFS4299I FRD60031 DBNAMEF DDNAMEF

/RECOVER REMOVE command

Use the /RECOVER REMOVE command to remove some or all database data sets and areas from the recovery list.

It can only be issued prior to issuing the /RECOVER START command.

**Syntax**

```
►►/RECOVER REMOVE RCVTOKEN recoveryname

►►ALLENTRIES

►AREA areaname

►CAGRP groupname

►DB dbname

►DBDSDRAG groupname

►DBDS dbname ddname

►RECOVGRP groupname
```

**Keywords**

The following keywords are valid for the /RECOVER REMOVE command:

- **RCVTOKEN | RCK**
  Specifies the unique identifier associated with the recovery list that the /RECOVER REMOVE command operates against. The RCVTOKEN keyword must come before any keywords that identify the names of database data sets, areas, or groups.

- **recoveryname**
  Specifies the unique recovery token associated with the recovery list that the /RECOVER REMOVE command operates against. This token can be up to eight characters in length.
**ALLENTRIES**

Specifies that the recovery list is to be eliminated.

**AREA**

Specifies that one or more Fast Path areas are to be removed from the recovery list.

*areaname*

Specifies a unique Fast Path area.

**CAGROUP**

Specifies that the database data sets and areas of one or more change accumulation groups as defined in the RECON data sets are to be removed from the recovery list.

*groupname*

Specifies that the database data sets and areas belonging to a specific CA group are to be removed from the recovery list.

**DATAGROUP**

Specifies that the database data sets and areas of one or more database groups (as defined in the RECON data sets) are to be removed from the recovery list.

*groupname*

Specifies the database data sets and areas of the unique group name that are to be removed from the recovery list.

**DB**

Specifies that the full-function database data sets or Fast Path areas making up one or more databases are to be removed from the recovery list.

*dbname*

Specifies database data sets or areas of the database that are to be added to a recovery list.

**DBDS**

Specifies that one or more full-function database data sets are to be removed from the recovery list.

*dbname*

Specifies the database data sets or areas of the database that are to be removed from the recovery list.

*ddname*

Specifies the DD name of the database data set. If DBDS is specified on the /RECOVER REMOVE command, *dbname* and *ddname* must be specified together.

**DBDSGRP**

Specifies that the database data sets and areas of one or more DBDS groups as defined in the RECON data sets are to be removed from the recovery list.

*groupname*

Specifies the database data sets and areas of the group that are to be removed from the recovery list.

**RECOVGRP**

Specifies that this group is a recovery group. All DBDSs that make up the full-function databases and all the DEDB areas are removed from the recovery list.

*groupname*

Specifies the database data sets and areas of the database that are to be removed from the recovery list.
Usage notes

Use the /RECOVER STOP command to remove entries after recovery has started.

- If /RECOVER REMOVE is issued before the /RECOVER START command, database data sets and areas specified on the /RECOVER REMOVE command individually or as part of databases or groups are removed from the recovery list. A subsequent /RECOVER START command initiates recovery for the remaining members in the recovery list.
- If a /RECOVER REMOVE ALLENTRIES command is issued before the /RECOVER START command, all elements in the list are removed, and the recovery list is eliminated.
- If the /RECOVER REMOVE command is issued after the /RECOVER START command, the /RECOVER REMOVE command is rejected.

If /RECOVER REMOVE is issued with one or more databases or groups, all database data sets and areas that are part of the database or group specified are removed from the recovery list. If a /RECOVER REMOVE command results in the removal of every data set or area entry from the recovery list, the recovery list is eliminated.

This command executes in IMS DBCTL and IMS DB/DC environments.

Examples

The command IN PROGRESS message is issued for /RECOVER commands but is not shown in these examples.

Example 1 for /RECOVER REMOVE command

As with the /RECOVER ADD command, full-function database data sets and Fast Path areas are specified with the /RECOVER REMOVE DBDS command. With the DBDS option, each full-function database data set must be specified as an ordered pair. Each element must be separated by at least one blank space. The first element of the pair is the database name. The second element is the DDNAME. In this example, a /RECOVER REMOVE command is issued for a single full-function database data set.

/RECOVER REMOVE RCVTOKEN DFS00001 DBDS DBNAME1 DDNAME1

DFS4299I FRD6016I THE FOLLOWING ENTRIES WERE REMOVED FROM THE RECOVERY LIST:

DFS4299I FRD6003I DBNAME1 DDNAME1

DFS4299I FRD6016I THE FOLLOWING ENTRIES WERE REMOVED FROM THE RECOVERY LIST:

DFS4299I FRD6003I DBNAME1 DDNAME1

If more than one full-function database data set is specified in a /RECOVER REMOVE DBDS command, each dbname/ddname ordered pair must be separated by at least one blank space.

/RECOVER REMOVE RCVTOKEN DFS00001 DBDS DBNAME1 DDNAME1 DBNAME3 DDNAME3

DFS4299I FRD6016I THE FOLLOWING ENTRIES WERE REMOVED FROM THE RECOVERY LIST:

DFS4299I FRD6003I DBNAME1 DDNAME1

DFS4299I FRD6003I DBNAME3 DDNAME3

Example 2 for /RECOVER REMOVE command

In this example, a /RECOVER REMOVE command is issued for a single Fast Path area that was not added to the recovery list.
Example 3 for /RECOVER REMOVE command

In this example, a /RECOVER REMOVE command is issued for a full-function database and Fast Path database. All full-function database data sets and Fast Path areas making up the two databases are removed from the recovery list.

/REC REMOVE RCVTOK DFS00001 AREA DDAREA1

DFS4299I FRD6018W UNABLE TO REMOVE AREA DDAREA1: NOT IN RECOVERY LIST

Example 4 for /RECOVER REMOVE command

In this example, a /RECOVER REMOVE command is issued to stop recovery for the entire recovery list.

/REC REMOVE RCVTOK DFS00001 ALLENT

DFS4299I FRD6016I THE FOLLOWING ENTRIES WERE REMOVED FROM THE RECOVERY LIST:
DFS4299I FRD6003I DBNAME1 DDNAME1
DFS4299I FRD6003I DBNAME2 DDNAME2
DFS4299I FRD6003I DBAREA1 DDAREA1
DFS4299I FRD6003I DBAREA2 DDAREA2
DFS4299I FRD6003I DBAREA3 DDAREA3
DFS4299I FRD6003I DBAREA4 DDAREA4

Related reference:
"/RECOVER START command"

/RECOVER START command

Use the /RECOVER START command to start the recovery process for all the members of a recovery list.

The recovery process includes performing the following tasks:
• Image copies are restored to the database data sets and areas in the recovery list.
• Change accumulation data is applied to the database data sets and areas in the recovery list.
• The database data sets and areas are brought up to date by applying data changes from log data sets (or up to the recovery time).
• Log data sets cached to a VTS are staged to DASD as a user option.

**Syntax**

```
/RECOVER START RCVTOKEN recoveryname ERRORABORT ERRORCONT

READNUM VERIFY

OFFLINE

STAGLOBAL STALOCAL RCVTIME time-stamp PITR NOCHECK
```

**Keywords**

The following keywords are valid for the /RECOVER START command:

**RCVTOKEN | RCK**

Specifies the token of the recovery list that will be processed. When RCVTOKEN is specified in a command, it must come before any keywords that identify the names of database data sets, areas, or groups.

**recoveryname**

Specifies the unique recovery token associated with the recovery list to be processed. This token can be up to eight characters in length.
ERRORABORT
Specifies that recovery stops for all entries in the recovery list if recovery of any database data set can not be completed. ERRORABORT is the default.

ERRORCONT
Specifies that recovery is to continue if recovery is able to complete processing for any database data set.

READNUM n
Specifies the number of input devices used in parallel during recovery. Image copies are restored using the number of input devices specified by n. When image copies are restored, log data sets are read using the number of input devices specified by n.

VERIFY
Specifies the report only execution and obtains a list of the log, change accumulation, and image copy data sets required to process recovery for the associated recovery list. This option allows users to perform set up procedures before invoking the recovery process.

OFFLINE
This option leaves all the databases offline after the recovery is complete. When the recovery is complete, DRF will deauthorize the databases. This leaves the databases in a state that allows normal DBRC processing.

STAGLOBAL
This option is used in a sysplex data sharing environment or with two IMS systems sharing data on the same central processing complex (CPC). A /START DB command with the GLOBAL option is issued internally for DL/I databases and a /START AREA command with the GLOBAL option is issued for the Fast Path areas. OFFLINE, STALOCAL, or STAGLOBAL options specified on the /RECOVER START command are used only for database data sets and areas that were added and did not have any of those options specified.

STALOCAL
This option is used to start the databases on the IMS system that ran the DRF recovery. A /START DB command with the LOCAL option is issued internally.

RCVTIME
Specifies the time stamp to which a point in time or time stamp recovery is to be performed.

time-stamp
The time stamp must have a format that is recognizable to IMS. Note that the UTC offset portion of a time stamp cannot be specified using a symbolic value in this command.

Additionally, the time stamp must by surrounded by single quotation marks ('). For example:

/RECOVER START RCVTOKEN R1 RCVTIME '022671213156'

PITR
Specifies that a time stamp recovery (TSR) will be performed to the time specified with the RCVTIME parameter regardless if there are any active database allocations for the specified database data sets.

NOCHECK
If a portion of the database data sets making up a database are in the recovery list being started, NOCHECK specifies that the Database Recovery Facility will
not stop a time stamp recovery or a time stamp recovery to any prior point in
time (PITR) if one of the following situations occurs:

- All members of the recovery group are not in the same recovery list.
- All members of the recovery group are not being recovered to an equivalent
  point in time.

**Usage notes**

Only one /RECOVER START command is allowed to execute in one IMS at a time.
If DRF is to run in conjunction with multiple IMS systems simultaneously, ensure
that log contention situations do not occur. To avoid log contention situations,
ensure that recovery instances that would read the same log data sets do not
execute simultaneously in multiple IMS systems.

You can choose to automatically /START any or all members of the recovery list
after successful completion of recovery, either on all IMS systems on which they
are defined or just the one where the recovery is executed.

If ERRORABORT is in effect, the recovery list will not start until all the DBDSs in
the list can be authorized for recovery. This is not true if the ERRORCONT
parameter is specified on the /RECOVER START command. Instead, the recovery
will continue.

If coordinated online change removes from the system any database data set or
area that has been previously added to a recovery list, message DFS4266I with
reason code NOT FOUND will be issued after the /RECOVER START command
for that recovery list is entered.

**Examples**

The command IN PROGRESS message is issued for /RECOVER commands but is not
shown in the following examples.

**Example 1 for /RECOVER START command**

In this example, /RECOVER START initiates recovery for the database data sets
and areas from previous examples. Recovery continues until it completes or until
one of the database data sets or areas is operable.

```
/REC START RCVTOKEN RCVTN1 ERRORCONT
DFS4299I FRD6021I RECOVERY STARTED FOR:
  DFS4299I FRD6003I DBNAME1 DDNAME1
  DFS4299I FRD6003I DBNAME2 DDNAME2
  DFS4299I FRD6003I DBAREA1 DDAREA1
  DFS4299I FRD6003I DBNAME3 DDNAME3
  DFS4299I FRD6003I DBAREA4 DDAREA4
  DFS4299I FRD6003I DBAREA5 DDAREA5
  DFS4299I FRD6003I DBAREA6 DDAREA6
  DFS4299I FRD6003I DBNAME7 DDNAME7
  DFS4299I FRD6003I DBAREA8 DDAREA8
```

**Example 2 for /RECOVER START command**

In this example, /RECOVER START RCVTOKEN initiates recovery for the
database data sets and areas owned by the recovery token RCVTN2.

```
/REC START RCVTOKEN RCVTN2
DFS4299I FRD6021I RECOVERY STARTED FOR:
  DFS4299I FRD6003I DBNAME1 DDNAME1
```
Example 3 for /RECOVER START command

In this example, /RECOVER START RCVTOKEN OFFLINE READNUM 6 initiates recovery for the database data sets and areas from previous examples. Recovery will not continue if any error is detected for any member of the recovery list. The database data sets and areas remain offline after recovery completes.

/RECOVER START RCVTOKEN RCVTKN2 OFFLINE READNUM 6

Example 4 for /RECOVER START command

In this example, /RECOVER START RCVTOKEN ERRORCONT RCVTIME time-stamp is issued. TSR continues until it completes or until one of the database data sets or areas undergoing recovery encounters an error. After recovery completes, a message is issued listing each database data set and area successfully recovered.

Example 5 for /RECOVER START command

In this example, /RECOVER START RCVTOKEN RCVTIME time-stamp PITR is issued. Point-in-time recovery will continue until it completes or until one of the
database data sets encounters an error. A message is issued listing the database data sets and areas that were not in the recovery list, but might need recovery using point-in-time recovery.

```
/REC START RCVTOKEN RCVTKN2 RCVTIME '020011015257' PITR
DFS4299I FRD6021I RECOVERY STARTED FOR RCVTKN2, ERRORCONT, PITR
DFS4299I FRD6003I DBNAME1 DDNAME1

- "/RECOVER STOP command"

Examples for the DFSURDB0 utility (Database Utilities)

/RECOVER STOP command

Use the /RECOVER STOP command to stop recovery for all database data sets and areas on the recovery list.

Subsections:

- “Environment”
- “Syntax” on page 720
- “Keywords” on page 720
- “Usage notes” on page 721
- “Examples” on page 721

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RECOVER</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>STOP</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/RECOVER STOP
  ALLENTRIES
  ALLENT
  SAVE
  AREA area
  CAGRP group
  DB dbname
  DBDS dbname ddname
  DBDSGRP group
  RECOVGRP group
```

Keywords

The following keywords are valid for the /RECOVER STOP command:

**ALLENTRIES**

Specifies that recovery is to be aborted for all database data sets and areas (all entries) in the recovery list.

**SAVE**

Specifies that the recovery list is not to be deleted when recovery is stopped. This parameter is only allowed with the ALLENT parameter after recovery has been initiated with the /RECOVER START command.

**AREA**

Specifies that recovery processing is to be stopped for the specified Fast Path areas.

```
area
```

**CAGROUP**

Specifies that recovery processing is to be stopped for the database data sets and areas making up the specified change accumulation groups as defined in the RECON data sets.

```
group
```

**DB**

Specifies that recovery processing is to be stopped for the full-function database data sets or Fast Path areas that make up the specified databases.

```
db
```

**DBDS**

Specifies the database data sets or areas are to be added to a recovery list.
DBDS
Specifies that recovery processing is to be stopped for the specified full-function database data sets.

dbname
Specifies the database whose database data sets or areas are to be added to a recovery list.

ddname
The 8 character identifier associated with the data set name and data set characteristics. dbname and ddname must be specified together if DBDS is specified on the /RECOVER REMOVE command.

DBDSGRP
Specifies that recovery processing is to be stopped for the database data sets and areas making up the specified DBDS groups as defined in the RECON data sets.

groupname
Specifies the unique name of the group whose database data sets and areas are to have recovery processing be stopped.

RECOVGRP
Specifies that this group is a recovery group. A recovery group is a group of full-function databases or DEDB areas that are considered to be related. All DBDSs that make up the full-function databases and all the DEDB areas are removed from the recovery list.

groupname
Specifies the unique name of the group whose database data sets and areas are to have recovery processing be stopped.

Usage notes
The command can only be issued for a recovery list that has had /RECOVER START issued against it. If the /RECOVER STOP is issued before the /RECOVER START command, it is rejected. If it is issued after the /RECOVER START command, recovery is stopped for all database data sets in the recovery list. After a /RECOVER STOP command successfully processes, subsequent /RECOVER STOP commands are rejected.

If /RECOVER STOP ALLENT is issued, all recovery processing for the affected recovery list halts, and the existing recovery list is deleted.

Examples
The COMMAND IN PROGRESS message is issued for /RECOVER commands but is not shown in the following examples.

Example 1 for /RECOVER STOP command
In this example, a /RECOVER STOP command is issued to stop recovery for the entire recovery list.

/REC STOP ALLENT
DF54299I FRD6003I THE FOLLOWING ENTRIES WILL HAVE RECOVERY STOPPED:
DF54299I FRD6003I DBNAME1 DNAME1
DF54299I FRD6003I DBNAME2 DNAME2
DF54299I FRD6003I DBAREA1 DDAREA1
DF54299I FRD6003I DBNAME3 DNAME3
DF54299I FRD6003I DBAREA4 DDAREA4
Example 2 for /RECOVER STOP command

In this example, a /RECOVER STOP ALLENT SAVE is issued after a /RECOVER START command.

/REC STOP ALLENT SAVE
DFS4299I FRD6032I THE FOLLOWING ENTRIES WILL HAVE RECOVERY STOPPED:
DFS4299I FRD6031I DBNAME1 DDNAME1

Example 3 for /RECOVER STOP command

In this example, a /RECOVER STOP ALLENT command is issued with no recovery in progress.

/REC STOP ALLENT
DFS4299I FRD6031E UNABLE TO STOP ALLENT: RECOVERY NOT IN PROGRESS

Related reference:
"/RECOVER START command" on page 714
"/RECOVER TERMINATE command"

/RECOVER TERMINATE command

Use the RECOVER TERMINATE command to delete all lists in BEING BUILT status and to terminate the DRS address space.

Subsections:
- "Environment"
- "Syntax"
- "Usage notes" on page 723
- "Example" on page 723

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RECOVER</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>TERMINATE</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/RECOVER TERMINATE
```
Usage notes

If a recovery is in progress, the recovery will ignore the /RECOVER TERMINATE command and continue to process. When it completes, another /RECOVER TERMINATE command is required. It will not take effect automatically. If you would like to force DRF down while a recovery is running, you must issue the /RECOVER STOP ALLENT command first. This will stop the recovery, and then you can enter the /RECOVER TERMINATE command to terminate the DRF address space.

Example

In this example, a /RECOVER TERMINATE command is issued with no recovery in progress.

/RECOVER TERMINATE
DFS4299I FRD4202I DATABASE RECOVERY DATA MANAGER TERMINATION COMPLETE

"/RECOVER STOP command" on page 719
Chapter 12. REFRESH USEREXIT command

Use the type-2 REFRESH USEREXIT command to refresh the user exit modules that are defined in the USER_EXITS section of the DFSDFx member. When the command is processed, IMS rereads the DFSDFx member and processes the USER_EXITS section.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 727
- “Output fields” on page 728
- “Return, reason, and completion codes” on page 728
- “Examples” on page 730

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the REFRESH command and keywords can be issued.

<table>
<thead>
<tr>
<th>Command / keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>REFRESH USEREXIT</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TYPE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>MEMBER</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
  REFRESH USEREXIT TYPE(exit_type)
        MEMBER(suffix)
```

Keywords

The following keyword is valid for the REFRESH USEREXIT command:

**TYPE(exit_type)**

Specifies the user exit type or types that you want to be refreshed. You can specify a single user exit type or a list of user exit types separated by commas. The valid user exit types are the following:

- **AOIE**
  - Type-2 Automated Operator User Exit
- **BSEX**
  - Build Security Environment user exit
ICQSEVNT
IMS CQS Event user exit

ICQSTEV
IMS CQS Structure Event user exit

IMSMON
IMS Monitor user exit

INITTERM
Initialization/Termination user exit

LOGEDIT
Log Edit user exit

LOGWRT
Logger user exit

NDMX
Non-Discardable Messages user exit

OTMAIOED
OTMA Input/Output Edit user exit

OTMAYPRX
OTMA Destination Resolution user exit

OTMARTUX
OTMA Resume TPIPE Security user exit

PPUE
Partner Product user exit

RASE
Resource Access Security user exit

RESTART
Restart user exit

If an exit type is specified more than once, it is refreshed only once and no error message is issued.

MEMBER(suffix)
Specifies a 1- to 3-alphanumeric character value that represents the suffix to a DFSDFxxx member name. The identified DFSDFxxx member is read in and parsed for the EXITDEF statements for the requested user exit types. If the keyword is not specified, the DFSDFxxx member specified for system initialization is used as the default. The DFSDFxxx member specified on system initialization can be determined from message DFS1929I on the system console or log. The command fails if the MEMBER keyword is specified with an invalid xxx value or if the DFSDFxxx member is not found.

This keyword is optional. Normally, the DFSDFxxx member specified on system initialization should be the only one available. The purpose of this keyword is to provide the capability of having the command point to an alternate DFSDFxxx member (different from the system default) for test purposes. Outside of testing, IMS expects the MEMBER keyword to be omitted.

Note: These changes are not saved across a restart. If you refresh your user exits from a DFSDFxxx member that is not the member specified on IMS initialization and you do not update your initialization DFSDFxxx member, the user exit changes will be lost when IMS restarts.
If the MEMBER parameter is specified without any value (MEMBER()), it is treated as if MEMBER is not specified. The DFSDFxxx member specified for initialization will be used.

**Usage notes**

You can issue this command only through the Operations Manager (OM) API.

The output of this command is defined in XML and is available to automation programs that communicate with OM.

When the REFRESH USEREXIT command is entered, IMS performs the following steps:

1. Reads the DFSDFxxx member and process the USER_EXITS section of the DFSDFxxx member.
2. Loads the user exit modules specified in the USER_EXITS section for the exit types specified in the command.
3. Updates the internal IMS control block with pointers to the new user exit modules. Any subsequent calls to the user exit modules will now call the new modules.
4. When the processing has completed in the old exit modules, the old modules will be deleted.

IMS loads the new user exit modules before deleting the old modules. If an error occurs during this process (for example, a module could not be loaded), IMS fails the command for the particular user exit type and leaves the current modules of the user exit type in effect. All modules of the specified user exit type must be loaded successfully for the command to complete successfully.

If your IMSplex has multiple IMS systems, you can refresh the user exit modules in all of the IMS systems in the IMSplex by using the default routing for the command. This sends the REFRESH USEREXIT command to all of the IMS systems in the IMSplex and the user exit modules are refreshed in each of the IMS systems. If the refresh fails on one or more IMS systems, you must resolve the problem that caused the command to fail and reenter the command.

You can use the REFRESH USEREXIT command to add a user exit type to IMS, delete a user exit type, or migrate an existing user exit to be dynamically refreshable:

- To add a user exit type, insert EXITDEF statements into the USER_EXITS section of the DFSDFxxx member for the user exit type you want to add and then enter the REFRESH USEREXIT command for that exit type. If the user exit has an initialization function, the user exit is called with the initialization function before the user exit is made available to IMS.
- To delete a user exit type, remove the EXITDEF statements from the USER_EXITS section of the DFSDFxxx member for the user exit type you want to delete and then enter the REFRESH USEREXIT command for that exit type.
- To migrate an existing user exit, specify the exit routines on the EXITDEF parameter in the USER_EXITS section of the DFSDFxxx member and then enter the REFRESH USEREXIT command for that exit type.

Refreshes are performed at the exit type level, so when an exit routine of a certain exit type is modified, every exit routine of that exit type is refreshed.
Certain messages contain the short form of the command to which the message refers. Because the REFRESH USEREXIT command does not have a short form, the first four characters of the command (REFR) are specified in the message. These four characters are also used to define the command security.

**Output fields**

The following table shows the REFRESH USEREXIT output fields. The columns in the table are:

- **Short label**
  - Contains the short label that is generated in the XML output.

- **Long label**
  - Contains the long label generated in the XML output.

- **Keyword**
  - Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned.

- **Scope**
  - Identifies the scope of the output field.

- **Meaning**
  - Provides a brief description of the output field.

**Table 244. Output fields for the REFRESH command**

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Scope</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>N/A</td>
<td>Completion code for the line of output. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>N/A</td>
<td>N/A</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>N/A</td>
<td>IMSplex member that built the output line. Member name is always returned.</td>
</tr>
<tr>
<td>TYPE</td>
<td>ExitType</td>
<td>TYPE</td>
<td>LCL</td>
<td>User exit type requested by the REFRESH USEREXIT command. User exit type is always returned.</td>
</tr>
<tr>
<td>NAME</td>
<td>ModName</td>
<td>N/A</td>
<td>LCL</td>
<td>Exit routine name that was loaded by this REFRESH USEREXIT command.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

The return and reason codes that can be returned as a result of the REFRESH USEREXIT command are standard for all commands entered through the OM API. For a list of the codes and their meaning, see **CSLOMCMDD: command request** ([System Programming APIs](#)).

The following table contains the return, reason, and completion codes for the REFRESH USEREXIT command. Included in the tables is a brief explanation of the codes.
Table 245. Return and reason codes for the REFRESH USEREXIT command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The REFRESH USEREXIT command completed successfully.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'00001024'</td>
<td>The REFRESH USEREXIT command completed successfully and a message was issued.</td>
</tr>
<tr>
<td>X'00000008'</td>
<td>X'00002014'</td>
<td>The DFSDFxxx suffix specified in the MEMBER parameter contains an invalid character.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003000'</td>
<td>The REFRESH USEREXIT command was successful for at least one user exit type. The REFRESH command was not successful for one or more user exit types. The completion code indicates the reason for the error with the user exit type. The completion codes that can be returned by the REFRESH command are listed in Table 246.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>The REFRESH USEREXIT command was not successful for any of the user exit types specified. The completion code indicates the reason for the error with the user exit type. The completion codes that can be returned by the REFRESH command are listed in Table 246.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005004'</td>
<td>The REFRESH USEREXIT command processing terminated, because a DFSOCMD response buffer could not be obtained.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005FFF'</td>
<td>The REFRESH USEREXIT command processing terminated because of an internal error.</td>
</tr>
</tbody>
</table>

Errors that are unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

The following table contains completion codes that can be returned on a REFRESH USEREXIT command.

Table 246. Completion codes for the REFRESH USEREXIT command

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The REFRESH USEREXIT command completed successfully for the user exit type.</td>
</tr>
<tr>
<td>92</td>
<td>An Error was encountered while processing the REFRESH USEREXIT command. Check the messages that are returned with the command output for additional information about the error.</td>
</tr>
<tr>
<td>148</td>
<td>The specified user exit type was successfully deleted and a message was issued.</td>
</tr>
<tr>
<td>14E</td>
<td>The specified user exit type is deleted and will no longer be called.</td>
</tr>
</tbody>
</table>
Table 246. Completion codes for the REFRESH USEREXIT command (continued)

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>14F</td>
<td>The specified user exit type could not be added because there was no EXITDEF for the user exit type in the DFSDFxxx member or because no log record types existed in the DFSVSMxx member (message DFS4586E).</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the REFRESH USEREXIT command:

**Example 1 for REFRESH command**

TSO SPOC input:

```
REFRESH USEREXIT TYPE(ICQSEVNT)
```

TSO SPOC output:

```
ExitType  ModName  MbrName  CC
ICQSEVNT  DFSCQEX0  SYS3  0
ICQSEVNT  DFSCQEX1  SYS3  0
ICQSEVNT  DFSCQEX2  SYS3  0
```

OM API input:

```

- [USER_EXIT section of the DFSDFxxx member (System Definition)](#)
Chapter 13. /RELEASE command

The /RELEASE command resumes a conversation that was previously saved by means of the /HOLD command.

Subsections:
- “Environment”
- “Syntax”
- "Keywords"
- “Usage notes”
- “Example” on page 734

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command and keyword can be issued.

Table 247. Valid environments for the /RELEASE command and keyword

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RELEASE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>CONVERSATION</td>
<td></td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

![/RELEASE CONVERSATION-conv#]

Keywords

The following keywords are valid for the /RELEASE command:

CONVERSATION  
Specifies the 4-digit identification (including leading zeros) of the conversation to be resumed; CONVERSATION conv# is the 4-digit identification conv# that was provided when the conversation was previously held.

Usage notes

The last message sent to the terminal before /HOLD was entered is sent to the terminal again.

/RELEASE is not valid from an LU 6.2 device. LU 6.2 communications cannot release a conversation, whether started by itself or by another communications protocol.

If global resource information is kept in Resource Manager, /RELEASE updates the conversation globally in Resource Manager. If global resource information is not kept in Resource Manager, /RELEASE updates the conversation locally.
Example

Entry ET:

/RELEASE CONVERSATION 0001

Response ET:

IMS does not respond to this command except to resend the last message.

Explanation: Conversation 0001 has been released and can be resumed by the terminal operator.
Chapter 14. /RESET command

The /RESET command eliminates the preset mode established by the /SET command.

Subsections:
- "Environment"
- "Syntax"
- "Example"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command can be issued.

<table>
<thead>
<tr>
<th>Command</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RESET</td>
<td>X</td>
<td>DBCTL</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Syntax:

```
/RESET
```

Example

Entry ET:

```
/RESET
```

Response ET:

```
DFS058I  RESET COMMAND COMPLETED
```

Explanation: The preset mode is no longer in effect.
Chapter 15. /RMxxxxxxx commands

The /RMxxxxxxx commands are multisegment commands that call functions of IMS Database Recovery Control (DBRC). Each /RMxxxxxxx command is an online version of the corresponding batch DBRC command.

The following table lists the DBRC commands that are supported online and describes the utility function of each command:

<table>
<thead>
<tr>
<th>Command</th>
<th>Utility function</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RMCHANGE</td>
<td>Changes or modifies information in the RECON data set</td>
</tr>
<tr>
<td>/RMDELETE</td>
<td>Deletes information in the RECON data set</td>
</tr>
<tr>
<td>/RMGENJCL</td>
<td>Generates JCL for:</td>
</tr>
<tr>
<td></td>
<td>• IMS Change Accumulation utility</td>
</tr>
<tr>
<td></td>
<td>• IMS Log Archive utility</td>
</tr>
<tr>
<td></td>
<td>• IMS Log Recovery utility</td>
</tr>
<tr>
<td></td>
<td>• IMS Database Image Copy utility</td>
</tr>
<tr>
<td></td>
<td>• Database Image Copy 2</td>
</tr>
<tr>
<td></td>
<td>• IMS Online Database Image Copy utility</td>
</tr>
<tr>
<td></td>
<td>• Database Recovery utility</td>
</tr>
<tr>
<td></td>
<td>• User-defined output</td>
</tr>
<tr>
<td>/RMINIT</td>
<td>Creates records in the DBRC RECON data set</td>
</tr>
<tr>
<td>/RMLIST</td>
<td>Lists information contained in the RECON data set</td>
</tr>
<tr>
<td>/RMNOTIFY</td>
<td>Notifies DBRC about additional information, which gets</td>
</tr>
<tr>
<td></td>
<td>recorded in the RECON data set.</td>
</tr>
</tbody>
</table>

These commands enable the IMS master terminal operator or an authorized terminal operator to run certain DBRC utility functions online. For any /RMxxxxxxx commands other than /RMLIST, output is limited to what can be put in a 4 KB buffer. For the /RMLIST command that is issued from non-OM API (for example, IMS terminals or master terminals), output is limited to 32 KB. There is no limit to the output generated and returned by the /RMLIST command issued from OM API.

Subsections:
- “Environment”
- “Syntax” on page 738
- “Keywords” on page 738
- “Usage notes” on page 740
- “Examples” on page 740

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command and keyword can be issued.
Table 250. Valid environments for the /RMxxxxxx command and keyword

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RMxxxxxx</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LTERM</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/LTERM ltermname  DBRC='modifier parameter_set'
```

Keywords

The following keywords are valid for the /RMxxxxxx command:

**LTERM ltermname**

Specifies the logical terminal designated for output. If you omit the LTERM keyword, the output destination is the input terminal.

**Recommendation:** Because some of the DBRC commands generate a large amount of output, especially the /RMGENJCL and /RMLIST commands, direct the output to a printer.

**DBRC='modifier parameter_set'**

Specifies the DBRC modifier for the function specified and the parameters that will be passed to DBRC. The DBRC= parameter is required on all /RMxxxxxx commands.

- **modifier**
  The DBRC modifier for the function specified. The following table lists the DBRC modifiers and the /RMxxxxxx commands with which the modifiers can be issued.

Table 251. DBRC modifiers for the /RMxxxxxx commands

<table>
<thead>
<tr>
<th>Modifier</th>
<th>CHANGE</th>

</tr>
<tr>
<td>USER</td>
<td></td>
</tr>
</tbody>
</table>

*parameter_set*

Represents the required and optional parameters that will be passed to DBRC. For an explanation of the values that can be specified, see the corresponding command. For example, if you specify `/RMLIST LTERM(termname) DBRC='DBDS parameter_set'`, see the description of the LIST.DBDS command to understand what parameters can be used in place of *parameter_set*.

### Table 252. /RMxxxxx commands and corresponding DBRC commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Corresponding DBRC command</th>
</tr>
</thead>
<tbody>
<tr>
<td>/RMCHANGE</td>

</tr>
<tr>
<td>/RMLIST</td>
<td>For the parameters that can be issued with the /RMLIST command, see <a href="Commands">LIST commands</a></td>
</tr>
<tr>
<td>/RMNOTIFY</td>
<td>For the parameters that can be issued with the /RMNOTIFY command, see <a href="Commands">NOTIFY commands</a></td>
</tr>
</tbody>
</table>
**Usage notes**

All /RMxxxxxx formats require an EOM indication to denote end-of-message. An EOS indication must be included for all segments, if any, that precede the last segment. If comments are included with the /RMxxxxxx commands, they must be enclosed in asterisks.

If a failure other than the loss of both RECON data sets occurs while DBRC is processing an online command, DBRC makes the command unavailable for the remaining time the IMS online region is running. After determining and correcting the cause of the original failure, the command can be made available again by resubmitting the online command with the RESET parameter specified in the parameter set. It is the verb, rather than the modifier, level of the command that DBRC makes unavailable. That is, if a DBRC INIT.DB command fails, DBRC makes all INIT commands unavailable. DBRC sends an error message to the originating terminal when the command fails. You can still issue the failing command from other IMS online regions.

**Note:** DBRC does not make GENJCL commands unavailable, because the GENJCL.ARCHIVE command is needed for automatic archiving.

These commands can be issued to an IMSplex using the Batch SPOC utility.

DBRC does not remember command failures across IMS restarts because it assumes that you will correct the error before restarting IMS.

**Examples**

The following are examples of the /RMxxxxxx commands:

**Examples for /RMCHANGE command**

Entry ET (with comments):

```
/RMCHANGE DBRC='DB DBD(DIVNTZ04) SHARELVL(3)' . *COMMENT*.
```

Response ET:

```
CHANGE.DB DBD(DIVNTZ04) SHARELVL(3)

Chapter 16. /RSTART command

The /RSTART command starts lines, lines and physical terminals, logical links, nodes, and users when you do not want to reset all associated conditions such as a conversation or special operating mode.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 750
- “Usage notes” on page 752
- “Equivalent IMS type-2 commands” on page 752
- “Examples” on page 752

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>

</tbody>
</table>

Syntax
Keywords

The following keywords are valid for the /RSTART command:

**LINE**

Specifies the line or line/physical terminal to be started with all terminals on the line in the same mode of operation they were in when they were stopped. The /RSTART LINE command allows all input, output, and queuing to start on the line and take the line out of response mode if the line was in this mode. The /RSTART LINE PTERM command does not reset line response mode, but does reset the non-VTAM-attached 3270 terminal response mode and looptest mode.

**LOPEN**

LOPEN enables stopped and idle remote non-VTAM lines. Enter the /RSTART LINE LOPEN command before any /RSTART LINE PTERM command to avoid having a line that is stopped and idle reset before it can be enabled again. If the line is not stopped or process stopped, and idle, or if enabling is not applicable, the LOPEN keyword is ignored and processing continues.

/RSTART LINE and /RSTART NODE cannot reset terminal response mode if Fast Path is active for a specified physical terminal or node. The /DEQUEUE command must be entered to discard Fast Path output before using the /RSTART command.

**LINK**

Specifies the logical links to be started, either individually or all at once.
For TCP/IP and VTAM links, the /RSTART LINK command can be issued in either one of the two partner systems to start communication. For CTC or MTM links, communication does not begin until the /RSTART LINK command is entered in both partner IMS systems. The /RSTART LINK command is rejected unless the link is in a stopped and idled status and the assigned physical link is open, as shown in the /DISPLAY command.

**MODE**

The MODE keyword allows you to specify mode table entries to be used when activating an IMS VTAM MSC session. Use of the MODE keyword with non-VTAM links is invalid. If non-VTAM links are referred to specifically in the /RSTART LINK command with the MODE keyword, they will be marked in error.

**MSPLINK**

Resets the PSTOPPED status of MSC TCP/IP or VTAM links to enable logons. If the TCP/IP link is used with TCP/IP generic resources, this keyword also resets the PSTOPGEN status.

**NODE**

Specifies the VTAM node for which input, output, and queuing will start. The /RSTART NODE nodename USER username command restarts the ISC half-session allocated to *username for nodename*. The USER keyword is valid only with the NODE keyword and restarts the specified half-session. If the USER keyword is omitted, all half-sessions of the specified node are affected.

**Restrictions for using NODE and USER parameters together:**

- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- The /RSTART NODE USER commands are valid for ISC, LUP, and 3600 nodes only.

The NODE parameter can be generic if the USER keyword is not specified. The generic parameter specifies nodes that already exist. If the node was created temporarily to retain status data and the status conditions have been reset, then the node is deleted at the next simple checkpoint.

If global resource information is not kept in Resource Manager, the /RSTART NODE command allows a node to logon to the local IMS, without resetting local status. If global resource information is kept in Resource Manager, the /RSTART NODE command allows a node to logon to any IMS in the IMSplex, without resetting global node status kept in Resource Manager. If the node no longer has significant status, it is deleted by Resource Manager.

**USER**

Specifies the USER for which input, output, and queuing are to start. This command starts the USER without resetting conditions such as conversation mode, exclusive mode, and test mode. The /RSTART USER command applies only to dynamic users.

The USER parameter can be generic where the generic parameter specifies already existing users.

If the user structure is temporary and was created solely to retain status that is now reset, the temporary user is deleted at the next simple checkpoint.
If global resource information is not kept in Resource Manager, the /RSTART USER command allows a user to sign on to the local IMS. If global resource information is kept in Resource Manager, the /RSTART USER command allows a user to sign on to any IMS in the IMSplex. If the user no longer has significant status in Resource Manager, it is deleted.

Usage notes

The /RSTART command checks the validity of all parameters entered by the terminal operator. If an error is detected on parameters that are independent of one another, only the invalid parameters are flagged as being in error and the /RSTART command processes the rest of the parameters.

The /RSTART command can be used to reset conditions previously established by the /START, /STOP, /PSTOP, /PURGE, /MONITOR, /COMPT, or /RCOMPT command.

This command can be issued to an IMSplex using the Batch SPOC utility.

Equivalent IMS type-2 commands

The following table shows variations of the /RSTART command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/RSTART command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resets MSC TCP/IP or VTAM links to enable logons.</td>
<td>/RSTART MSPLINK msplinkname</td>
<td>UPDATE MSPLINK NAME(msplinkname</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the /RSTART command:

Example 1 for /RSTART command

Entry ET:

/RSTART LINE 4,5,6,7,8,9,10,11

Response ET:

DFS058I RSTART COMMAND COMPLETED

Response RT:

DFS059I TERMINAL RSTARTED

Explanation: LINES 4,5,6,7,8,9,10, and 11 are started.

Example 2 for /RSTART command

Entry ET:

/RSTART LINE 4 5 6 700

Response ET:

DFS058I RSTART COMMAND COMPLETED EXCEPT LINE 700
Example 3 for /RSTART command

Entry ET:
/RSTART LINE 4 PTERM 1, 2

Response ET:
DFS058I RSTART COMMAND COMPLETED

Response RT:
DFS059I TERMINAL RSTARTED

Explanation: LINE 4 PTERM 1 and 2 are started.

Example 4 for /RSTART command

Entry ET:
/RSTART LINK ALL

Response ET:
DFS058I RSTART COMMAND COMPLETED

Explanation: All of the logical links are started. For CTC and MTM links, communication across the link does not begin until the partner in the remote system is started with the /RSTART LINK command.

Response ET:
DFS2168I CONNECTION ESTABLISHED ON LINK 2

Explanation: The connection for communication between two IMS systems is established. The partner link is started with a /RSTART LINK command. After each connection, the message DFS2168 is returned.

Example 5 for /RSTART command

Entry ET:
/RSTART LINK 2

Response ET:
DFS058I RSTART COMMAND COMPLETED

Explanation: Logical link 2 is started.

Response ET:
DFS2168I CONNECTION ESTABLISHED ON LINK 2

Explanation: The two IMS systems are connected.

Example 6 for /RSTART command and a TCP/IP link

Entry ET:
/RSTART LINK 23

Response ET:
DFS2168I 17:37:39 CONNECTION ESTABLISHED ON LINK 0023
Response ET at the partner system:

DFS2160I 17:37:39 LINK 028 STARTED BY PARTNER TB NODE IMS1
DFS2168I 17:37:39 CONNECTION ESTABLISHED ON LINK 0028

Explanation: In the Response ET at the partner system, IMS1 is the IMS ID of the partner system in which the /RSTART command was issued.

Example 7 for /RSTART command and a VTAM link

Entry ET:

/RSTART LINK 10

Response ET:

DFS058I 17:34:36 RSTART COMMAND COMPLETED
DFS2168I 17:34:36 CONNECTION ESTABLISHED ON LINK 0010

Response ET at the partner system:

DFS2160I 17:34:36 LINK 013 STARTED BY PARTNER AK NODE L6APPL3
DFS2168I 17:34:36 CONNECTION ESTABLISHED ON LINK 0013

Explanation: In the Response ET at the partner system, L6APPL3 is the APPLID of the partner system in which the /RSTART command was issued.

Example 8 for /RSTART command

Entry ET:

/RSTART NODE EAST

Response ET:

DFS058I  RSTART COMMAND COMPLETED

Explanation: The node named EAST is started.
Chapter 17. /RTAKEOVER command

The /RTAKEOVER command requests a remote takeover of an active IMS subsystem by a tracking subsystem at a secondary site.

The remote takeover causes the tracking subsystem to finish processing and shut down.

Subsections:
• “Environment”
• “Syntax”
• “Usage notes”
• “Examples” on page 757

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 255. Valid environments for the /RTAKEOVER command and keywords

</tr>
<tr>
<td>NOREVERSE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>UNPLAN</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

/RTAKEOVER for an active subsystem

/RTAKEOVER

/RTAKEOVER for a tracking subsystem

/RTAKEOVER

Usage notes

If entered on an active subsystem, /RTAKEOVER also causes the active subsystem to shut down. Once the remote tracking subsystem has shut down and remote takeover has successfully completed, one or more subsystems may be brought up in an active role at the secondary site and started with standard IMS restart commands.

© Copyright IBM Corp. 1974, 2016
Unless you specify the NOREVERSE keyword, a remote takeover can be reversed, even after the /RTAKEOVER command has been issued. The NORTA parameter on the CHANGE.SG command can be used to reverse a remote takeover.

This command can be issued to an IMSplex using the Batch SPOC utility.

/RTAKEOVER for an active subsystem

/RTAKEOVER is issued on the active IMS subsystem to initiate a planned remote takeover and must be specified with either the FREEZE keyword or the DUMPQ keyword.

/RTAKEOVER FREEZE indicates that a /CHECKPOINT FREEZE type of shutdown is performed before the planned takeover occurs.

/RTAKEOVER DUMPQ indicates that a /CHECKPOINT DUMPQ type of shutdown is performed before the planned takeover occurs. This form of takeover provides that all relevant log records reach the tracking subsystem such that no data is lost. This form of takeover allows the capability to rebuild the message queues during the new active start.

/RTAKEOVER must be entered for at least one IMS subsystem in the global service group (GSG) at the active site for which takeover is to occur. The other IMS subsystems at the active site must also be shut down, either with the /RTAKEOVER command, or some form of the /CHECKPOINT command that shuts the system down.

Once the active sends all of its log data sets, the active IMS subsystem shuts down. When all of the active subsystems in the global service group have shut down, the tracking subsystem then completes tracking work, stops online forward recovery (OFR), changes the role of the service group (tracking to active) in the RECON data set, and shuts down.

/RTAKEOVER for a tracking subsystem

/RTAKEOVER UNPLAN is issued on the tracking IMS subsystem to initiate an unplanned remote takeover after the active site fails unexpectedly. /RTAKEOVER UNPLAN causes the tracking subsystem to complete tracking work, stops online forward recovery (OFR), changes the role of the service group (tracking to active) in the RECON data set, and shuts down.

Recommendation: Specify the NOREVERSE keyword to enable the tracking IMS subsystem to save and process all data it has received from the active site, regardless of whether that data was committed on the active IMS subsystem.

Although you can still reverse a remote takeover even if you specify NOREVERSE, you should not reverse it; in this case, you receive message DFS4122A when you restart the tracking subsystem.

If you do not specify NOREVERSE, the tracking IMS subsystem discards any uncommitted data it has received from the active subsystem.
Examples

The following are examples of the /RTAKEOVER command:

Example for /RTAKEOVER command at active site

Entry ET:
/RTA FREEZE

Response ET:

Explanation: An unplanned takeover is successfully initiated for a tracking subsystem that was tracking 2 active subsystems (SYS3 and IMS2).
Chapter 18. /SECURE command

The /SECURE command is used to control the RACF security level. It is used for administrative control of the IMS environment and as an emergency operations control command to throttle RACF activity without requiring an IMS shutdown.

This command can be issued to an IMSplex using the Batch SPOC utility.

Subsections:
  • “Environment”
  • “Syntax”
  • “Keywords” on page 760
  • “Examples” on page 761

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 256. Valid environments for the /SECURE command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SECURE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>APPC</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>OTMA</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Note: You can use the SECURE OTMA command in non-OTMA environments to specify the security settings for the DFSYICAL member. The DFSYICAL member is an internal member that is used to process DL/I ICAL calls for synchronous program switch, even when OTMA is not enabled. If the DFSYICAL member does not exist when the SECURE OTMA command is issued, it is created automatically and the specified security configuration is applied to it.

Syntax
Keywords

The following keywords are valid for the /SECURE command:

**APPC**
When used with the CHECK, FULL, NONE, or PROFILE parameters. APPC controls the RACF security level for input from LU 6.2 devices. The /DISPLAY APPC command can be used to show the security level that is currently in effect. At IMS startup, the security default is FULL.

**CHECK**
Causes existing RACF calls to be made. IMS commands are checked using the RACF resource class of CIMS. IMS transactions are checked using TIMS. Disables z/OS System Authorization Facility security for IMS allocate PSBs (APSBs).

**FULL**
Causes the same processing as the CHECK parameter but uses additional RACF calls to create the security environment for dependent regions and enables z/OS System Authorization Facility security for IMS APSBs for all CPI Communications driven application programs.

**NONE**
Does not call RACF within IMS for security verification. RACF security verification in APPC/MVS is not affected. Disables z/OS System Authorization Facility security for IMS APSBs.

**PROFILE**
Causes the values in the TP profile for each transaction to be used. If the TP profile is not defined for a transaction, or if the TP profile does not specify a RACF security level, then the default security is CHECK.

**OTMA**
Is used with the CHECK, FULL, NONE, or PROFILE parameters to control the RACF security level for input from IMS Open Transaction Manager Access (OTMA) clients. The /DISPLAY OTMA command can be used to show the security level that is currently in effect. After an IMS cold start, the security default is FULL if the IMS startup parameter OTMASE= is not used.

**CHECK TMEMBER** *tmembername*
Causes existing RACF calls to be made for input from the specified OTMA client.

**FULL TMEMBER** *tmembername*
Causes the same processing as the CHECK parameter for input from the
specified OTMA client, but uses additional RACF calls to create the
security environment for dependent regions.

**JOIN TMEMBER** *tmemberrname*
Causes existing RACF calls to be made on only the OTMA client bid
requests from OTMA clients. No transaction or command security checking
is performed on individual messages.

**NONE TMEMBER** *tmemberrname*
Specifies that there is no RACF security checking within IMS for the input
from the specified OTMA client.

**PROFILE TMEMBER** *tmemberrname*
Specifies that the values in the Security Data section of the OTMA message
prefix of each transaction are used to check security for input from the
specified OTMA client.

**REFRESH**
OTMA caches the ACEE for a user ID to reduce the amount of RACF I/O.
As a result, a refresh for the cached ACEE is needed after the RACF
database is updated. Issuing the /SEC OTMA REFRESH command without
the TMEMBER option performs the ACEE refresh for all user IDs for all
the OTMA clients. However, the actual ACEE refresh occurs when the next
OTMA message for the user ID is received. This is designed to prevent all
the RACF ACEE refreshes from happening at one time.

When USER is specified, OTMA refreshes across all TMEMBERs only
ACEEs that include the specified user profile.

**USER userid**
An option to refresh only the specified user ID for all OTMA
TMEMBERS. *userid* is the 1-8 character name of RACF User Profile to
be refreshed.

### Examples

The following are examples of the /SECURE command:

**Example 1 for /SECURE command**

Entry ET:

```
/DIS APPC
```

Response ET:

```
IMSLU  #APPC-CONV SECURITY STATUS DESIRED
IMSLUMME 0 PROFILE ENABLED ENABLED
*91242/163820*
```

Explanation: Enter /DISPLAY APPC to see which security checking option is in
effect.

Entry ET:

```
/SECURE APPC FULL
```

Response ET:

```
DFS058I SECURE COMMAND COMPLETED
```

Parameter descriptions for IMS procedures (System Definition)
Chapter 19. /SET command

The /SET command establishes the destination of all messages entered into this terminal to another terminal or to a particular transaction code.

If the terminal is in conversation, the /SET command also sets the destination of only the next message to the specified transaction.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 764
- “Examples” on page 765

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 257. Valid environments for the /SET command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SET</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>CONVERSATION</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>LTERM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>TRANSACTION</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/>SET CONVERSATION tranname (password)

/>SET LTERM ltermname (password)

/>SET TRANSACTION tranname (password)
```

Keywords

The following keywords are valid for the /SET command:

CONVERSATION

Directs the next input message to a selected transaction. The terminal being used must be in a conversation that is waiting for an input message. For example, the response message must have been received.

In an IMSplex, if global resource information is kept in Resource Manager, the /SET command sets a transaction for the next input message both globally and locally. If global resource information is not kept in Resource Manager, the /SET command sets the transaction just locally.
**LTERM**

Specifies the logical terminal that is the destination of all messages entered into this terminal.

The mode established by /SET LTERM is called preset mode. If the preset mode is established from a 3270 and user-defined formats are not being used, input message must be entered from a cleared screen. Preset mode can be reset by:

```plaintext
/CLSDST NODE
/SIGN
/STOP LINE PTERM
/STOP NODE command
/STOP USER command
/RESET
/STOP NODE
/STOP LINE
/STOP USER
```

Once a destination is preset, the terminal operator cannot enter the destination (logical terminal name) as the first part of the message.

In a multiple systems configuration, the name of a remote logical terminal can be specified. If the preset destination is to be deleted (/RESET) or changed (/SET), the command must be entered from some other valid component.

**TRANSACTION**

Specifies the transaction code that is the destination of all messages entered into this terminal. The mode established by /SET TRANSACTION is called preset mode. If the preset mode is established from a 3270 and user-defined formats are not being used, input messages must be entered from a cleared screen. Preset mode can be reset by:

```plaintext
/CLSDST NODE
/SIGN
/START LINE PTERM
/RESET
/STOP NODE
/STOP LINE
/STOP USER
```

Once a destination is preset, the terminal operator cannot enter the destination (transaction code) as the first part of the message. In a multiple systems configuration, the name of a remote transaction can be specified. The terminal cannot be in conversation.

**Usage notes**

The status fields of /DISPLAY LINE PTERM, /DISPLAY NODE, or /DISPLAY USER indicate if a physical terminal, node, or user is in preset destination mode (PRST), and display the destination transaction code or logical terminal name.

A transaction name can be defined with password protection in SAF for the CONVERSATION and TRANSACTION keywords. If the resource is not defined to SAF, or is defined and is authorized to the user, the command is processed. If the resource is defined to SAF but not authorized for use, the command is rejected with a DFS2469W message.

A period that is specified in the password brackets is not treated as a delimiter.
Examples

The following are examples of the /SET command:

Example 1 for /SET command

Entry ET:
   /SET CONVERSATION CONVTRAN(password)

Response ET:
   DFS058I  SET COMMAND COMPLETED

Explanation: Any message entered from this terminal is sent to conversation CONVTRAN.

Example 2 for /SET command

Entry ET:
   /SET LTERM CNTRL

Response ET:
   DFS058I  SET COMMAND COMPLETED

Explanation: Any message entered from this terminal is sent to LTERM CNTRL.

Example 3 for /SET command

Entry ET:
   /SET TRANSACTION IMS(password)

Response ET:
   DFS058I  SET COMMAND COMPLETED

Explanation: Any message entered from this terminal is sent to transaction IMS.
Chapter 20. /SIGN command

The /SIGN command is used to sign on and sign off at terminals attached to IMS.

This command enables IMS to identify who is using the terminal and to determine if you are authorized to enter the transaction or command.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 771
- “Examples” on page 772

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command can be issued.

Table 258. Valid environments for the /SIGN command

<table>
<thead>
<tr>
<th>Command</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SIGN</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

A:

Keywords

The following keywords are valid for the /SIGN command:
/SIGN ON must be issued for any physical terminal or user ID requiring a signon, or the transaction entered is rejected.

From terminals that require signon, commands other than /SIGN or /RCLSDST are rejected if transaction authorization is requested. Static terminals requiring a signon also have enhanced command authorization with RACF or an equivalent product if RCF=S or RCF=A is specified at system startup.

At terminals not requiring signon, transactions are passed to RACF, an equivalent security product, or a user exit for authorization checking. If /SIGN ON is entered at a terminal not requiring a signon, the signon is processed as if the terminal required a signon. That is, the terminal is placed in a signed on status with the user ID until a /SIGN OFF or another /SIGN ON command is entered.

After any IMS restart or terminal disconnect, the remote terminal operator is required to sign on again using the /SIGN ON command. A terminal can be disconnected by:

- A switched line disconnect
- A VTAM CLSDST
- A line shutdown
- The /IDLE command
- Auto logoff

Signon status is also reset by the /START LINE, /START LINE PTERM, and /START NODE commands and auto signoff.

The remote terminal operator must wait at a static physical terminal for confidential responses, because responses queued for a given physical terminal are sent even if the physical terminal is signed off. If the remote terminal operator must be absent, the /LOCK command can be used to prevent output from being received. Confidential output sent to a dynamic user is queued to the user instead of to the physical terminal when the user has signed off. A successful signon of an existing user turns off the DEADQ status for the user, if that status exists.

For the user exit routine DFSCSGN0, the user ID and userdata parameter values are defined by the installation.

**PASSPHRASE**

The /SIGN PASSPHRASE command is equivalent to the /SIGN ON command except that it uses RACF password phrases instead of passwords for a signon. A RACF password phrase can be up to 100 bytes. IMS uses 100 bytes as the password phrase and removes leading and trailing blanks, if any, before passing it to RACF.

RACF password phrases are used for password, NEWPW, and VERIFY. RACF does not allow a mixture of passwords and password phrases. For example, if PASSPHRASE is specified on the /SIGN command, you must specify password phrases for all the other keywords such as NEWPW and VERIFY.

A blank is necessary after PASSPHRASE. There must be a blank between the 100-character password phrase and the next keyword. A period within the 100 character does not end the /SIGN command. If there is no additional keyword after the password phrase, the password phrase does not need to have trailing blanks. If a password phrase is less than 9 bytes, IMS will pass the password phrase as a password to RACF. The PASSPHRASE keyword is most likely used on MFS panels, which fill the password phrase with trailing blanks.
RACF password phrases are always mixed case. It is not necessary to turn on mixed-case password for password phrases. The IMS system's default MFS panels do not support password phrases.

**PASSPHRASEQ**

The `/SIGN PASSPHRASEQ` command is equivalent to the `/SIGN ON` command except that it uses RACF password phrases instead of passwords for a signon. A password phrase must start with a single quotation mark (') and end with a single quotation mark. If you want to include a single quotation mark in a password phrase, you must specify two single quotation marks ("'). For example,

'This is "my" passphrase.'

IMS removes the single quotation mark at the beginning and ending of the password phrase and also removes one single quotation mark if there are two single quotation marks following each other. PASSPHRASEQ must have at least one blank before the beginning single quotation mark. A password phrase can be up to 100 characters. If a password phrase is less than 9 characters, IMS will pass it as a password to RACF. RACF does not allow a mixture of passwords and password phrases. For example, if PASSPHRASEQ is specified on the `/SIGN` command, you must specify password phrases for all the other keywords such as NEWPW and VERIFY.

RACF password phrases are always mixed case. It is not necessary to turn on mixed-case password for password phrases. The IMS system's default MFS panels do not support password phrases.

**OFF**

The `/SIGN OFF` command is used to complete a session on a terminal that required a signon. Static terminals in conversational mode cannot be signed off without first issuing an `/EXIT` or `/HOLD` command.

Another method of signing off a terminal is to reenter the `/SIGN ON` command. This method initiates a new signon at the terminal without having to enter the `/SIGN OFF` command.

The `/SIGN OFF` command resets status that is not significant such as preset mode, test mode, lock lterm, pstop lterm, and purge lterm.

/SIGN OFF for ETO users will also take other actions depending on the recovery settings for the user:

**RCVYCONV=NO**

/SIGN OFF causes any IMS conversations (active and held) for an ETO user to be terminated. Any conversational message that is queued or being processed has its output response message delivered asynchronously.

**RCVYFP=NO**

/SIGN OFF causes Fast Path status and messages for an ETO user to be discarded.

**RCVYRESP=NO**

/SIGN OFF resets full-function response mode.

If global resource information is kept in Resource Manager, /SIGN OFF deletes the user ID from Resource Manager (if single user signon enforced) and resets status globally. If the user has no status, /SIGN OFF deletes the user and associated lterms from Resource Manager.
You can specify the following keywords and parameters with the ON, PASSPHRASE, or PASSPHRASEQ keyword:

**APPL**

A keyword that notifies IMS that the following character string should be the application name used by IMS when IMS makes the SAF call to verify the user. The default application name used by IMS is the IMSID. The IMSID can be overridden by the SAPPILD= parameter in the IMS PROCLIB member DFSDCxxx. If the signon specifies a PassTicket instead of a password, the APPL parameter should specify the application name used when the PassTicket was created. The creator of the PassTicket can specify any value to identify an IMS subsystem.

If RACF is used, APPL= should specify the name of the RACF PTKTDATA profile for IMS as defined to RACF by the creator of the PassTicket. If the name of the PTKTDATA profile is the same as the IMSID, the APPL keyword is not needed.

**GROUP**

Is an optional keyword indicating a group name of 8 characters or fewer that is associated with the user ID.

**NEWPW**

Is an optional keyword that indicates a new user password or a new password phrase that replaces the current user password or password phrase specified in userpw. Passwords can be mixed case or uppercase depending on what is specified on the PSWDC keyword in the DFSPBxxx IMS.PROCLIB member. RACF password phrases are always mixed case.

**nuserpw**

Is a new password of 8 characters or fewer that is associated with the user identification.

**npassphr**

Is a 9- to 100-character password phrase that is associated with the user identification. If PASSPHRASE is specified, the password phrase must be up to 100 characters. If PASSPHRASEQ is specified, the password phrase must be enclosed in single quotation marks. If a password phrase contains one or more single quotation marks, two single quotation marks must be specified for each single quotation mark.

**USERD**

Is a user descriptor name. This user descriptor name is used in the signon. The userdesc parameter must be a user ID, node name, or DFSUSER.

**userdata**

Is user identification information that has been defined to IMS with the (RACF), equivalent security product or the user exit routine, DFSCSGN0. For RACF, this information consists of the following:

```
userpw GROUP groupname NEWPW nuserpw
```

**userid**

Is a user identification of 8 characters or fewer.

**userpw | PassTicket | passphr**

Specifies user identification in one of the following formats:

**userpw**

Is a password of 8 characters or fewer that is associated with the user identification. Passwords can be mixed case or uppercase depending on what is specified on the PSWDC keyword in the DFSPBxxx IMS.PROCLIB
member. If support for special characters is enabled in RACF, IMS supports
RACF passwords that contain special characters.

**PassTicket**
A one-time password that is generated by a requesting product or function. The PassTicket is an alternative to the RACF password. Using a PassTicket removes the need to send RACF passwords across the network in clear text.

**passphr**
Is a 9- to 100-character password phrase that is associated with the user identification. If PASSPHRASE is specified, the password phrase must be up to 100 characters. If PASSPHRASEQ is specified, the password phrase must be enclosed in single quotation marks. If a password phrase contains one or more quotation marks, two single quotation marks must be specified for each single quotation mark.

**VERIFY**
Is an optional keyword that requests IMS to verify the new password entered. IMS verifies the new password before passing it to RACF or to the IMS signon exit routines. This keyword can also be used as an alternative to reentering the password on the DFS3656 panel.

**Restriction:** You can use this keyword only when responding to an IMS DFS3656A message and as an alternative to reentering the password on the DFS3656 panel.

**nuserpw**
Is a new password of 8 characters or fewer that is associated with the user identification.

**npassphr**
Is a 9- to 100-character password phrase that is associated with the user identification. If PASSPHRASE is specified, the password phrase must be up to 100 characters. If PASSPHRASEQ is specified, the password phrase must be enclosed in single quotation marks. If a password phrase contains one or more single quotation marks, two single quotation marks must be specified for each single quotation mark.

**Usage notes**
When SGN=G, Z, or M is specified, the user can sign on multiple times to both STATIC and ETO terminals when the structure name is different from the user ID.

For a static terminal, or a dynamic terminal that has the same SPQBname as the node name, a user will not be allowed to sign on unless all conversations are held, or the user is authorized to use the transaction for the active conversation.

If there is an active conversation for a static terminal, and the user is not authorized to use its transaction, the user can enter a /HOLD command prior to signing on to put all of the conversations in a held state. The user will then be allowed to sign on.

If there is an active conversation for a dynamic terminal that has the SPQBname the same as the node name, only a user that is authorized to use the transaction of the active conversation will be allowed to sign on. The /HOLD command is not allowed prior to signing on for a dynamic terminal.
If there is an active conversation for a dynamic terminal that has the SPQBname the same as the USERID, the conversation will be associated with that user at signoff. That same user can sign on to any dynamic terminal and continue the conversation if they are still authorized to use the conversational transaction. Any new user that signs on to the dynamic terminal will not be in a conversation unless they are continuing a conversation from a previous signon or starting a new conversation by entering an authorized conversational transaction.

The status fields of /DISPLAY NODE and /DISPLAY LINE PTERM indicate whether a terminal is signed on with the word SIGN.

You can use password phrases for user identification.

A period is normally used as the delimiter at the end of IMS commands. When support for special characters is enabled in RACF, a period becomes a valid character in the RACF password. Therefore, when a password is specified at the end of the /SIGN command, you must insert a space before the period that you are using as the end-of-command delimiter. If a space is not added before the period that you are using as the end-of-command delimiter and support for special characters is enabled in RACF, the period is treated as part of the password and not as a delimiter.

For IMS 14 to support special characters in RACF passwords when special characters is also enabled in RACF, install APAR/PTFs PI48111/UI34376/UI34377. Also, ensure that all IMS systems that require support for RACF special characters are migrated to IMS 14.

Examples

The following are examples of the /SIGN command:

**Example 1 for /SIGN command**

Entry ET:

```
DFS3649A /SIGN COMMAND REQUIRED FOR IMS
DATE: 11/03/92  TIME: 14:39:33
NODE NAME: DT327001
USERID: IMSUS01
PASSWORD: IMSPW01
USER DESCRIPTOR: GROUP NAME:
NEW PASSWORD:
    OUTPUT SECURITY AVAILABLE
```

Response ET:

```
DFS3650I SESSION STATUS FOR IMS
DATE: 11/03/92  TIME: 14:41:48
NODE NAME: DT327001
USERID: IMSUS01
PRESET DESTINATION:
```
CURRENT SESSION STATUS:
OUTPUT SECURITY AVAILABLE

Explanation: The user with user ID IMSUS01 and password IMSPW01 has successfully signed on to a dynamic terminal. The signon is done with the panel (DFS3649A).

Example 2 for /SIGN command

Entry ET:
/SIGN IMSUS02 IMSPW02

Response ET:
DFS3650I SESSION STATUS FOR IMS
DATE: 11/03/92  TIME: 14:41:48
NODE NAME: DT327001
USERID: IMSUS02
PRESET DESTINATION:
CURRENT SESSION STATUS:
OUTPUT SECURITY AVAILABLE

Explanation: The user with user ID IMSUS02 and password IMSPW02 has successfully signed on to a dynamic terminal. The signon is done with the /SIGN command.

Example 3 for /SIGN command

Entry ET:
/SIGN IMSUS03 IMSPW03

Response ET:
DFS3650I SESSION STATUS FOR IMS
DATE: 11/03/92  TIME: 14:45:53
NODE NAME: L3270A
USERID: IMSUS03
PRESET DESTINATION:
CURRENT SESSION STATUS:
NO OUTPUT SECURITY AVAILABLE

Explanation: The user with user ID IMSUS03 and password IMSPW03 has successfully signed on to a static terminal.

Example 4 for /SIGN command

Entry ET:
/SIGN PASSPHRASEQ IMSUS03 'this is my 'password'' now'

Response ET:
DFS3650I SESSION STATUS FOR IMS
DATE: 06/07/13  TIME: 15:26:42
Explanation: The user with user ID IMSUS03 and password phrase this is my 'password' now has successfully signed on to a static terminal.

**Example 5 for /SIGN command**

Entry ET:
/SIGN PASSPHRASE IMSUS03 this is my 'password' now.

Response ET:
DFS3650I SESSION STATUS FOR IMS

DATE: 06/07/13     TIME: 15:36:42
NODE NAME:        L3270A
USERID:           IMSUS03

Explanation: The user with user ID IMSUS03 and password phrase this is my 'password' now. has successfully signed on to a static terminal. Note that the period is part of the password phrase and that no trailing blanks have been added.

Chapter 21. /SMCOPY command

The /SMCOPY command is used by the master terminal operator to control the printing of certain output to the secondary master terminal.

This command can be issued to an IMSplex using the Batch SPOC utility.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 776
- “Example” on page 776

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 259. Valid environments for the /SMCOPY command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SMCOPY</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>MASTER</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>MSG</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>TERMINAL</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the /SMCOPY command:

MASTER

Turns ON or OFF the printing of the above subset of IMS commands and command responses when issued from the master terminal.
TERMINAL

Turns ON or OFF the printing of the above subset of IMS commands and command responses when issued from terminals other than the master terminal.

Input coming through Operations Manager is not reflected in the secondary master. This also applies to input coming from MCS/E-MCS terminals.

MSG

ON All system messages will be logged to the secondary master. This is the default.

Before logging a message to the secondary master, if the installation type-2 exit routine indicated it needs to be called for messages, the exit routine is called first. The exit routine then determines if the message is logged to the secondary master.

OFF IMS does not send system messages to the secondary master.

Usage notes

System definition establishes whether the commands and their responses will be printed on the secondary master and the origin of the printed command (master terminal, remote terminal, or both). /SMCOPY provides online control of the printing established by system definition.

Example

A system definition has established that copies of the above subset of commands and command responses, when issued from any terminal, will be printed on the secondary master terminal (operand COPYLOG=ALL was specified on the COMM macro).

Entry ET:

/SMCOPY TERMINAL OFF

Response ET:

DFS058I  SMCOPY COMMAND COMPLETED

Explanation: The secondary master terminal does not receive copies of IMS commands and command responses issued from remote terminals. Commands and responses issued from the master terminal are still received.

Related reference:

[IMS type-1 commands logged to the secondary master terminal (Commands)]
Chapter 22. /SSR command

The /SSR command is a multisegment command that allows the IMS operator to enter an external subsystem command as part of the command input. (The external system is not a CCTL subsystem.)

Subsection:
- “Environment”
- “Syntax”
- “Usage notes”
- “Example”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command can be issued.

<table>
<thead>
<tr>
<th>Command</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/SSR</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/SSR text
```

Usage notes

Routing is the only function IMS performs. The command is processed by the external subsystem and the response (from the external subsystem, not CCTL) is routed back to the entering terminal.

All /SSR formats require an EOM indication to denote end-of-message. An EOS indication must be included for all segments that precede the last segment.

text is the alphanumeric external subsystem command.

Example

Entry ET:
```
/SSR ;START DATABASE (DSN8D22P)
```

Response ET:
```
DFS058I SSR COMMAND COMPLETED
DSN9022I ; DSNTDIS 'START DATABASE' NORMAL COMPLETION
```

Explanation: The START DATABASE command is successfully routed to the DB2 subsystem for processing.
Chapter 23. /START commands

The /START commands make IMS resources available for reference and use.

/START also checks the validity of all parameters entered by the terminal operator. If an error is detected on parameters that are independent of one another, only the invalid parameters are indicated as being in error and the /START command processes the rest of the parameters. For example,

```
/START LINE 4 6 200
DF5058 START COMMAND COMPLETED EXCEPT LINE 200
```

signifies parameter value 200 is not a valid line number.

When a resource becomes available, the system parameters used for this initialization of IMS are displayed in message DFS1929I. The system parameters are also written to the job log.

These commands can be issued to an IMSplex using the Batch SPOC utility.

/START commands are:

- “/START APPC command” on page 780
- “/START AREA command” on page 780
- “/START AUTOARCH command” on page 784
- “/START CLASS command” on page 785

- “/START USER command” on page 827
- “/START VGR command” on page 828
- “/START WADS command” on page 829
- “/START XRCTRACK command” on page 830
/START APPC command

Use the /START APPC command to instruct IMS to activate the connection to APPC/z/OS and to start accepting transaction schedule requests from APPC/z/OS.

This command reverses the effect of a /PURGE APPC command or a /STOP APPC(CANCEL) command.

The /START APPC command sets the desired status to ENABLED. The current status is initially set to STARTING. When APPC/z/OS responds to the start request, the status changes to either ENABLED or FAILED.

Subsections:
- “Environment”
- “Syntax”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START APPC</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

►►/START APPC

/START AREA command

Use the /START AREA command to specify the specific areas of DEDBs to be allocated. For z/OS, you can use the /START AREA command to reallocate DEDB areas.

Subsections:
- “Environment”
- “Syntax” on page 781
- “Keywords” on page 781

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.
Table 262. Valid environments for the /START AREA command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START AREA</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>/START GLOBAL</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>/START LOCAL</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>/START ALL</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/START AREA areaname
```

Keywords

The following keywords are valid for the /START AREA command:

GLOBAL

The GLOBAL keyword applies when an IRLM is active. GLOBAL specifies that the command applies to all subsystems sharing the area. The GLOBAL keyword and the ALL parameter are mutually exclusive. The /START command is rejected if both ALL and GLOBAL are specified. The GLOBAL keyword requires that IRLM be active. The command will be rejected if IRLM is not active.

If the area is registered in the RECON data set, the /STA AREA GLOBAL command will reset the prohibit authorization flag to off (PROHIBIT AUTH = OFF).

The GLOBAL command is processed by the IMS system where the command was initiated. This system will process the command locally and then request IRLM NOTIFY to route and process the command on sharing IMS systems.

If global DB or AREA status is maintained, the global status maintained in RM is also updated. The global status is set to STOA.

If the command is entered from OM API, the global status is updated by the command master IMS. If the command is not entered from OM API, the IMS that initiated the GLOBAL command updates the global status in RM.

You must specify if the global area status must be maintained in RM. You can specify this during IMS initialization in either the DFSDFxxx or DFSCGxxx PROCLIB member with PLEXPARM(GSTSAREA(Y)). You can also change it dynamically using the UPDATE IMS SET(PLEXPARM(GSTSAREA(Y))) command. If you do not specify that global database status is to be maintained, the GLOBAL keyword is processed as in prior releases, and the global status is not updated.

If global status in RM is successfully updated, message DFS0988I for RSRCTYPE=AREA is issued. If global status is not successfully updated, message DFS3308I is issued, indicating RM failure, and no command response
lines are generated. Any RM error is traced to the OCMD trace table. Users can issue a QRY AREA STATUS(GLOBAL) command to obtain the global status of the resources in RM.

The X'594C' log record for databases is updated to include both global status and global command time stamp.

The GLOBAL keyword is not supported on an RSR tracking subsystem.

If the GLOBAL keyword on a command is entered from an OM API, the command is processed only by the command master IMS. The command master IMS will make DBRC calls to update the RECON with GLOBAL status. It will also request IRLM NOTIFY to route and process the command on sharing IMS systems, and then process the command locally. All other non-master IMS systems ignore the /START command with the GLOBAL keyword.

Messages produced on the NOTIFIED systems will appear only on the system console and will not be routed back to the OM API which originally entered the command.

If multiple IMS systems have been explicitly specified in the route list, the master IMS system will process the command as described previously. However, the non-master IMS systems, to which OM routes the command, will reject the command with the following return and reason code listed in the following table:

Table 263. Return and reason code for GLOBAL keyword issued from the OM API

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000004'</td>
<td>X'00001000'</td>
<td>The command contained the GLOBAL keyword and was routed to more than one IMS system in the IMSPLEX. The non-master IMS systems will reject this command when OM routes the command to them. The master IMS system will process this command and use IRLM NOTIFY to route and process the command on the non-master IMS systems. See the discussion under the GLOBAL keyword.</td>
</tr>
</tbody>
</table>

LOCAL

Specifies that the command only applies to the IMS subsystem in which the command is entered. This command does not affect any other subsystem sharing the area.

LOCAL is the default.

Usage notes

For areas on an RSR tracking subsystem, /START AREA is used to resume tracking for those areas that were stopped by a previous /DBRECOVERY command or by errors found during tracking subsystem processing. /START AREA also starts online forward recovery (OFR) for those areas that are not current with mainline tracking.

For virtual storage option (VSO) areas that have been defined with the PREOPEN option, /START AREA causes the areas to be preopened. If the VSO area is defined with the PRELOAD option, /START AREA causes the area to be opened and loaded into the z/OS data space.
Restriction: This command only applies to the IMS subsystem on which it is entered; it does not preload or preopen areas on other IMS subsystems in the sysplex that share the area.

The /START AREA command has no effect on VSO areas that are in virtual storage when the command is issued.

The output of the /START AREA command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. For commands that specify GLOBAL, only the command master returns the asynchronous messages to OM. When a command is processed with the LOCAL keyword, all IMS systems are able to return the asynchronous messages to OM. The command response returned to OM contains one or more of the following messages as appropriate.

Fast Path messages: DFS0011I, DFS140I, DFS0488I, DFS0666I, DFS1407I, DFS2980E, DFS2981E, DFS3320I, DFS3325I, DFS3342I, DFS3720I, DFS3824I

/START AREA ALL causes message DFS0488 to be issued for every area that is not started successfully, but you do not see a DFS0488 message for every area that does start successfully. You do see a final DFS0488 message which indicates the end of command processing.

While the database is being quiesced, this command cannot be processed successfully.

Equivalent IMS type-2 commands

The following table shows variations of the /START AREA command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/START AREA command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts the area.</td>
<td>/START AREA areaname</td>
<td>UPDATE AREA NAME(areaame)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>START(ACCESS)</td>
</tr>
</tbody>
</table>

Examples

The following is an example of the /START AREA command:

Entry ET:

/START AREA DB1AREA0 DB1AREA1

Response ET:

DFS058I  START COMMAND IN PROGRESS
DFS0488I  START COMMAND COMPLETED. AREA=DB1AREA0
DFS0488I  START COMMAND COMPLETED. AREA=DB1AREA1

Explanation: DEDB areas DB1AREA0 and DB1AREA1 are started.

Related concepts:

Maintaining global information for databases, DEDB areas, and transactions (System Administration)

# START AUTOARCH command

Use the /START AUTOARCH command to set the value to change the automatic archiving option selected at system initialization or to set the value to start automatic archiving after a previous /STOP AUTOARCH command.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Examples”

## Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START AUTOARCH</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>AUTOARCH</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

## Syntax

```
/START AUTOARCH Xolds
```

## Keywords

The following keywords are valid for the /START AUTOARCH command:

- `Xolds`

  Specifies the number of OLDSs that are to be filled before the /DBRC GENJCL ARCHIVE command is generated. It is optional and defaults to either the value specified at system initialization or to one. If /DBR NOFEOV or /DBD NOFEOV is issued before `nn` OLDSs are filled, the number of OLDSs currently filled will be archived.

## Examples

The following is an example of the /START AUTOARCH command:

Entry ET:
```
/START AUTOARCH 4
```

Response ET:
```
DFS058I  START COMMAND COMPLETED
```

Explanation: Automatic archiving will be initiated after 4 OLDS data sets are filled.
/START CLASS command

Use the /START CLASS command to specify transaction class, allowing scheduling of application programs to begin.

Message regions must have appropriate classes assigned to them before scheduling will proceed.

Subsections:
- "Environment"
- "Syntax"
- "Examples"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 266. Valid environments for the /START CLASS command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>CLASS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/START CLASS cls# ALL
```

Examples

The following is an example of the /START CLASS command:

Entry ET:
```
/START CLASS ALL
```

Response ET:
```
DFS058I  START COMMAND COMPLETED
```

Explanation: All classes of transactions are made available for scheduling into message processing regions.

/START DATAGRP command

Use the /START DATAGRP command to specify groups of DL/I databases and Fast Path DEDBs to be allocated.

Data groups are logical groupings of databases and areas; they enable simplified command processing for databases. You define a data group in the RECON data set by using the INIT.DBDSGRP command with parameters GRPNAME and DBGRP. DATAGRP is valid on active and RSR tracking subsystems.
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 267. Valid environments for the /START DATAGRP command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>ACCESS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>DATAGRP</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>LOCAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/START DATAGRP datagroupname LOCAL
```

A:

```
ACCESS= RO
```

B:

```
NODBALLOC
```

Keywords

The following keywords are valid for the /START DATAGRP command:

ACCESS

Overrides the access intent for a database. The original database access is specified during IMS system definition.

Changing the access intent for a DEDB is allowed only when no PSBs are scheduled that access any areas in the DEDB. You might have to stop PSBs and regions that have wait-for-input (WFI) transactions scheduled before you can change a DEDB's access intent.

Changing the access intent of a database with the /START DB ACCESS= command causes any VSO areas of the database to be removed from virtual
storage. Because the access intent of a DEDB cannot be changed while any of its areas are authorized to an IMS subsystem, IMS closes any open areas before processing the command. If a VSO area is closed as a result of the command, it is also removed from the data space.

The /START AREA command must be used to reactivate the VSO options (VSO and PREOPEN) and PRELOAD option for the area. If an area is opened as a result of an access request rather than by the /START AREA command, it is opened as a non-VSO area.

Non-VSO areas with the PREOPEN option are closed as a result of the /START DB ACCESS= command. These areas are reopened either at the next access request for the area or by the /START AREA command.

The GLOBAL and ACCESS keywords are mutually exclusive. The /START command is rejected if both keywords are specified.

The meanings of the ACCESS parameter values are:

- **RO** Specifies that the named database is available for read-only processing on this IMS subsystem.

  The only programs which can use the database on this subsystem are those which have a PCB processing option of GO (PROCPT=GO). Programs which access the data using the GO processing option might see uncommitted data, since a sharing IMS subsystem could be updating the database, which is opened for input only.

- **RD** Specifies that the named database is available for read-only processing on this IMS subsystem.

  Programs with update intent can be scheduled, but cannot update the database. ACCESS=RD differs from ACCESS=RO in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The database is opened for read-only processing.

- **UP** Specifies that the named database is for update as well as read processing in the IMS subsystem.

- **EX** Specifies that the named database is to be used exclusively by this IMS subsystem.

  This exclusive access is guaranteed only when the database is registered to DBRC.

**NODBALLOC | DBALLOC**

Indicates whether the databases within the data group are to be allocated.

NODBALLOC is the default.

**NODBALLOC**

Indicates that the databases within the data group are not to be allocated. The databases will be allocated when they are scheduled. This command does not affect any other subsystem sharing the database.

**DBALLOC**

Indicates that the databases within the data group are to be allocated.

**LOCAL**

Specifies that the /START command applies only to the IMS subsystem in which the command is entered.
Usage notes

For databases and areas on an RSR tracking subsystem, /START DATAGRP is used to resume tracking for those areas that were stopped by a previous /DBRECOVERY command or by errors found during tracking subsystem processing. /START DATAGRP also starts online forward recovery (OFR) for those databases and areas that are not current with mainline tracking.

After processing for a /START DATAGRP completes, a DFS0488 message is issued indicating the end of processing. A DFS0488 message is also issued for every database or area that does not start successfully.

If the data group contains both full function and Fast Path databases, a DFS0488 message might be issued indicating the /START DATAGRP command completed successfully before any messages are issued that indicate a Fast Path area did not start successfully. This situation is caused by the asynchronous processing of Fast Path databases.

For virtual storage option (VSO) areas that have been defined with the PREOPEN option, /START AREA causes the areas to be preopened. If the VSO area is defined with the PRELOAD option, /START AREA causes the area to be opened and loaded into the z/OS data space.

A data group is defined in the RECON data set using the INIT.DBDSGRP command with the parameters GRPNAME and DBGROUP or DBDSGRP. The DATAGRP keyword on the /START command can specify either a DBDS group or a database group name.

If the ACCESS keyword is specified on the /START DATAGRP command along with the DBDS group name, the ACCESS keyword is not applied to the Fast Path DEDB databases associated with the Fast Path DEDB areas in the DBDS group. If the intent is to use the ACCESS keyword for Fast Path DEDB databases, the DATAGRP parameter must be a database group name that does not contain area names.

Recommendation: Although you can use DBDS groups as well as database groups for this command, you should use database groups whenever possible to eliminate the overhead of converting the DBDS group to a database group.

Equivalent IMS type-2 commands

The following table shows variations of the /START DATAGRP command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/START DATAGRP command</th>
<th>Similar IMS type-2 command</th>

**Syntax**

```
/START DB dbname
```

Chapter 23. /START commands 789
Keywords

The following keywords are valid for the /START DB command:

ACCESS

Specifies the type of access that is intended for the named database. This keyword overrides the database access that is specified at system definition. Changing the ACCESS parameter of a DEDB is allowed only when all the AREAS in the DEDB are not authorized by the subsystem.

Changing the access intent of a database with the /START DB ACCESS= command causes any VSO areas of the database to be removed from virtual storage. Because the access intent of a DEDB cannot be changed while any of its areas are authorized to an IMS subsystem, IMS closes any open areas before it processes the command. If a VSO area is closed as a result of the command, it is also removed from the data space.

The /START AREA command must be used to reactivate the VSO options (VSO and PREOPEN) and PRELOAD option for the area. If an area is opened as a result of an access request rather than by the /START AREA command, it is opened as a non-VSO area.

Non-VSO areas with the PREOPEN option are closed as a result of the /START DB ACCESS= command. These areas are reopened either at the next access request for the area or by the /START AREA command.

The GLOBAL and ACCESS keywords are mutually exclusive. The /START command is rejected if both keywords are specified.

Issuing a /START DB command with the ACCESS parameter is not valid for an MSBD.

The meanings of the ACCESS parameter values are:

RO  Specifies that the named database is available for read-only processing on this IMS subsystem. The only programs that can use the database on this subsystem are those that have a PCB processing option of GO (PROCOPT=GO). Programs that access the data by using the GO
processing option might see uncommitted data, because a sharing IMS subsystem could be updating the database, which is opened for input only.

**RD** Specifies that the named database is available for read-only processing in this IMS subsystem. Programs with update intent can be scheduled, but cannot update the database. ACCESS of RD differs from ACCESS of RO in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The database is opened for read-only processing.

**UP** Specifies that the named database is for update and read processing in the IMS subsystem.

**EX** Specifies that the named database is to be used exclusively by this IMS subsystem. This exclusive access is guaranteed only when the database is registered to DBRC.

**DBALLOC**
Indicates that the specified databases are to be allocated. DBALLOC is the default except for /START DB ALL commands.

**NODBALLOC**
Indicates that the specified databases are not to be allocated. The databases will be allocated when they are scheduled. NODBALLOC is the default for /START DB ALL commands.

**GLOBAL**
Specifies that the command applies to all subsystems that are sharing the database. GLOBAL requires that IRLM be active. The command is rejected if IRLM is not active.

If the database is registered in the RECON data set, the /START DB GLOBAL command will reset the prohibit authorization flag to off (PROHIBIT AUTH = OFF).

The /START DB GLOBAL command is processed by the IMS system where the command was initiated. This system will process the command locally and then request IRLM NOTIFY to route and process the command on sharing IMS systems.

If global DB status is maintained, the global status that is maintained in RM is also updated. The global status is set to STA.

If the command is entered from OM API, the global status is updated by the command master IMS. If the command is not entered from OM API, the IMS that initiated the GLOBAL command updates the global status in RM.

You must specify whether the global database status must be maintained in RM. You can specify this during IMS initialization in the DFSDFxxx or DFSCGxxx PROCLIB member with PLEXPARM(GSTSDKB(Y)). You can also change it dynamically using the UPD IMS SET(PLEXPARM(GSTSDKB(Y)) command. If you do not specify that global database status is to be maintained, the GLOBAL keyword is processed as in prior releases, and the global status is not updated.

If global status in RM is successfully updated, message DFS0988I for RSRCTYPE=DB is issued. If global status is not successfully updated, message DFS3308I is issued, indicating RM failure, and no command response lines are generated. Any RM error is traced to the OCMD trace table. Users can issue a QRY DB STATUS(GLOBAL) command to obtain the global status of the resources in RM.
The X’4C’ log record for databases is updated to include both global status and global command time stamp. It includes the DEDB name for the area. The GLOBAL keyword and the ALL parameter are mutually exclusive. The /START command is rejected if both ALL and GLOBAL are specified.

The GLOBAL keyword is not supported on an RSR tracking subsystem.

If the GLOBAL keyword on a command is entered from an OM API, the command should only be routed to one IMS system in the IMSplex. The IMS that receives the command from OM will make DBRC calls to update the RECON with GLOBAL status. It will also request IRLM NOTIFY to route and process the command on sharing IMS systems, and then process the command locally.

Messages that are produced on the NOTIFIED systems will be displayed only on the system console and will not be routed back to the OM API that originally entered the command.

If multiple IMS systems have been explicitly specified in the route list, the master IMS system will process the command as described previously. However, the non-master IMS systems, to which OM routes the command, will reject the command with the following return and reason code listed in the following table:

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X’00000004’</td>
<td>X’00001000’</td>
<td>The command contained the GLOBAL keyword and was routed to more than one IMS system in the IMSplex. The non-master IMS systems will reject this command when OM routes the command to them. The master IMS system will process this command and use IRLM NOTIFY to route and process the command on the non-master IMS systems. See the discussion under the GLOBAL keyword.</td>
</tr>
</tbody>
</table>

LOCAL

Specifies that the command applies only to the IMS subsystem in which the command is entered. This command does not affect any other subsystem sharing the database.

LOCAL is the default.

NOBACKOUT

 Suppresses backout restart for a database not registered in DBRC. If there was a prior dynamic backout or emergency restart backout failure, then a /START, command will attempt to perform the backout again. However, if the log data required to perform the backout has been archived, the backout must be performed by executing the Batch Backout utility.

If the database is registered in DBRC and is using share control, then DBRC is informed when batch backout is successfully executed, and the failing backout will not be attempted again when the /START command is issued.

If the database is registered in DBRC and is using recovery control, DBRC is not informed when batch backout is successfully executed. You must specify the NOBACKOUT keyword to inform IMS that it does not have to attempt to execute the failed backout again.

NOBACKOUT is not valid with the ALL parameter.
OPEN | NOOPEN

Indicates that the named databases should be opened or should not be opened as part of the /START DB processing. NOOPEN is the default except when the database has EEQEs or the database was previously authorized but not allocated. If the database has EEQEs or was previously authorized but not allocated, then the database will be opened until the NOOPEN keyword is specified. Operators need to be aware of the results of issuing this command. Check the return code in message DFS0488I.

Specifying /START DB OPTION(OPEN) can cause the randomizer routine or the selection partition routine to load.

Restriction: The OPEN parameter is not supported:
- On a HALDB master. The command will result in message DFS0488I RC=57, but if only one HALDB master database was specified in the command, the online partition structures of the HALDB master database will be rebuilt if needed. No rebuild will be attempted if more than one database name is listed in the command.
- In an RSR environment.
- On an XRF alternate.
- With keywords ALL, GLOBAL, or NODBALLOC.

Usage notes

For a DEDB, the /START DB command also causes any unloaded randomizer, which is specified in the DBD source, to be reloaded.

You can use the UPD DB START(ACCESS) AREA(*) command to allocate the areas of a DEDB.

When you issue the CREATE DB command for a DEDB, you must specify RESIDENT(Y). DEDBs are always resident. The residency default for the CREATE DB command is non-resident.

After a DEDB is created, you must start it before you can use it in a similar manner as when you add a DEDB or change a DEDB using the online change (OLC) process. After an OLC process that either adds a DEDB or changes a DEDB, the DEDB and the areas must be started. The /START DB command or the UPD DB command will start the database and load the randomizer. The /START AREA command or the UPD AREA command will start the individual areas.

When the name that is specified is for a partition, the action that is taken to allocate data sets varies. The action varies depending on the status of the master database and whether the DMB for the master database is already loaded. If a partition has the /DBRECOVERY command called against it, then the partition cannot be allocated by the /START command even if the DBALLOC keyword is specified. The partition can be allocated by the /START command if the OPEN keyword is used or if the database has EEQEs. The partition will get allocated at first reference if the partition cannot be allocated by the /START command, the OPEN keyword is not used, and the database does not have EEQEs. This applies to partitioned PHDAM and PHIDAM database types.

PHDAM or PHIDAM partitions that had the /DBRECOVERY command issued against them, cannot be allocated with the /START DB DBALLOC command. However, if the partition databases have EEQEs, or the OPEN keyword is used with the /START DB command, or the databases were previously authorized but
not allocated, the partitions can be allocated. If you do not use the OPEN keyword, the PSINDEX partition is allocated and the PHDAM and PHIDAM partitions are not allocated until they are authorized.

When a /START DB command is issued for all transactions whose processing program has access to a successfully started database, the USTOPPED attribute will be reset and any messages on the suspend queue for that transaction will be transferred to the normal queue.

If one or more of the named databases requires backout or recovery, and the database is registered in DBRC, the database that require backout or recovery is dropped from the command and the remainder of the databases continue processing. If the database is not registered in DBRC, specify the NOBACKOUT keyword to inform IMS that it does not have to attempt to execute the failed backout again.

To start a HIDAM database, both the index and the data area DBD names must be specified. If a backout failure occurred for this database, the /START command causes the backout to be attempted again.

If a DL/I database is in use by a batch message processing (BMP) region when the /START DB command is issued, a DFS0565I message is returned to the master terminal, the command is ignored for the database indicated in the message, and processing continues for any other databases that are specified in the command. The master terminal operators must wait until the BMP program ends before they reissue the /START DB command to start the database indicated in the DFS0565I message. However, if allocation of a database fails during the scheduling or processing of a BMP region, the /START DB command for that database is processed while the BMP region is still active, and a DFS0565I message is not issued.

For databases on an RSR tracking subsystem, /START DB is used to resume tracking for those databases that were stopped by a tracking subsystem processing. The /START DB command also starts online forward recovery (OFR) for those databases that are not current with mainline tracking.

The /START DB ALL command causes message DFS0488I to be issued. All databases that were defined during the system definition process will be started if possible.

The output of the /START DB command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages as appropriate to the database type and the command completion.

- Full-function database messages: DFS030I, DFS132, DFS160, DFS216, DFS0402I, DFS0488I, DFS0740I, DFS1407, DFS2026, DFS3317I, DFS3318I, DFS3320I, DFS3325I, DFS3465I, DFS3466I
- Fast Path database messages: DFS140I, DFS666, DFS3062

When you enter this command, the database name can be an existing non-HALDB, a HALDB master, or a HALDB partition. A command against a HALDB partition operates exactly like a command against a non-HALDB except for the /START DB command and the UPDATE DB START(ACCESS) command. A HALDB partition is
not allocated during the command unless it was previously authorized but not allocated, the OPEN keyword was specified, or the partition has EEQEs. The partition is allocated at first reference.

The HALDB partition reflects conditions such as STOPPED (shown as STOACC or STOSCHD or STOUPDS on QUERY DB), LOCKED, or NOTOPEN. When a HALDB partition is stopped, it must be explicitly started again. The type-1 commands with the keyword ALL, type-2 commands with NAME(*), and commands against a HALDB master do not change the STOPPED (shown as STOACC, STOSCHD or STOUPDS on QUERY DB) and LOCKED indicators in each HALDB partition.

When the command target is a HALDB master, processing acts on all HALDB partitions. For example, if the IMS command is /DBR on the HALDB master, all of the HALDB partitions are closed, deallocated, and deauthorized. On a /DISPLAY DB command, only the HALDB master displays STOPPED (each HALDB partition does not display STOPPED unless it was itself stopped). If a /DBR command was issued against a HALDB master, the display output of a /DISPLAY DB command shows the HALDB master (as STOPPED), but does not display the status of the partitions.

Each partition inherits the access limitations of its HALDB master. If the /DBD command is issued against a HALDB master, all of its partitions close. A subsequent reference to any of the partitions results in the partition opening for input, although the partition's access might be UPDATE or EXCLUSIVE. The DBRC authorization state reflects the limited access.

Restrictions:

- The /START DB command cannot be processed against a HALDB partition on an IMS system while HALDB Online Reorganization (OLR) is running against that partition on the same IMS system.
- The /START DB ACCESS=UP command cannot be issued against a HALDB master while OLR is reorganizing any of its partitions.
- While the database is being quiesced, this command cannot be processed successfully.

The /START DB command is not allowed for a database that is marked bad with the NOTINIT-48-REP0CHGLIST reason code because the IMS change list processing is not complete for the database or the change list processing failed.

**Equivalent IMS type-2 commands**

The following table shows variations of the /START DB command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/START DB command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts a database and change access intent of the database.</td>
<td>/START DB ACCESS</td>
<td>UPDATE DB START(ACCESS) SET(ACCTYPE())</td>
</tr>
<tr>
<td>Starts a database.</td>
<td>/START DB dbname</td>
<td>UPDATE DB NAME(dbname) START(ACCESS)</td>
</tr>
</tbody>
</table>

Chapter 23. /START commands 795
Examples

The following are examples of the /START DB command:

Example 1

TSO SPOC input:

STA DB BANKATMS BANKTERM BANKLDGR BE3ORDER

TSO SPOC output:

SYS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKATMS RC=04
SYS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKTERM RC=04
SYS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKLDGR RC=04
IMS3 DFS0488I STA COMMAND COMPLETED. DBN= BE3ORDER RC=08
IMS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKATMS RC=04
IMS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKTERM RC=04
IMS3 DFS0488I STA COMMAND COMPLETED. DBN= BANKLDGR RC=04
IMS3 DFS0488I STA COMMAND COMPLETED. DBN= BE3ORDER RC=08

OM API input:

CMD (STA DB BANKATMS BANKTERM BANKLDGR BE3ORDER )

OM API output:

<msgdata>
<mbr name="SYS3">

Explanation: The START DB command is routed from OM to the two active IMS systems - SYS3 and IMS3. The response from both IMS systems is returned to OM. The databases BANKATMS, BANKTERM, BANKLDGR, and BE3ORDER are started at both IMS systems.

**Example 2**

Entry ET:

/START DB TREEFARM

Response ET:

DFS058I (time stamp) START COMMAND IN PROGRESS
DFS0488I START COMMAND COMPLETED. DBN=TREEFARM RC=0.

Explanation: Database TREEFARM is started.

/START DC command

Use the /START DC command to open the VTAM ACBs (if MNPS for XRF is used, then both the MNPS and APPLID ACBs are opened) if they are not already open, to enable logons to IMS, and to enable optional transaction manager functions such as IMS generic resource support and IMS persistent sessions support for RNR.

- IMS generic resource support: The defined VTAM generic resource group is joined with GRNAME in the IMS or DCC PROCLIB members.
- IMS persistent sessions support for RNR: Session activity that was suspended because of a major outage is resumed or terminated, as appropriate, if the RNR option was specified in the DFSDCxxx PROCLIB member.

If the /START DC command is issued on an XRF alternate system that is using MNPS, the command will only open the APPLID ACB. The MNPS ACB is not opened until XRF takeover processing.

Subsections:
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 272. Valid environments for the /START DC command and keywords

```

798  Commands, Volume 2: IMS Commands N - V
/START ISOLOG command

The /START ISOLOG command indicates that the RSR tracking subsystem is to initiate a request for isolated log data from the isolated log sender at the active site.

/START ISOLOG can only be entered on an RSR tracking subsystem.

/START ISOLOG may be needed when:

- The active system failed and was not restarted, and the OLDS at the time of failure was closed using the Log Recovery utility.
- Batch jobs or utilities running at the active were unable to send logs.
- Permanent error status is shown for gaps in the output of a /DISPLAY TRACKING STATUS command. If the log problem at the active has been corrected, use /START ISOLOG to initiate retry.

Successful completion of syntax checking of the /START ISOLOG command results in the DFS058 START COMMAND COMPLETED message, although processing of the command continues asynchronously.

Subsections:
- “Environment”
- “Syntax”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/START ISOLOG
```

/START LINE command

The /START LINE command makes communication lines that are idle and in a stopped or process stopped state available for use. It also terminates any conversations that are active on the line.

Subsections:
- “Environment” on page 800
- “Syntax” on page 800
- “Usage notes” on page 800
- “Examples” on page 801
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 275. Valid environments for the /START LINE command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LINE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>PTERM</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

All terminals are removed from looptest mode, MFSTEST mode, or exclusive mode, and any terminals in signon status are reset. The /START LINE command without the PTERM keyword enables the line again (resulting in a non-VTAM LOPEN macro).

If the line must be enabled again, /START LINE must be entered prior to any /START LINE PTERM command.

The /START LINE PTERM command makes one or more physical terminals available for use. The physical terminals are removed from response mode, test mode, looptest mode, MFSTEST mode, preset destination mode, or exclusive mode, and resets terminals in signon status. If IMS encounters a stopped and idle line when processing /START LINE PTERM, it restarts the line. Any inoperable components are marked as operable.

To activate I/O operations for a LINE, LINE PTERM, or NODE without altering the status of the associated/specified terminals, use /RSTART instead of /START.

If an error is detected on parameters that are independent of one another, only the invalid parameters are indicated as being in error and processing continues for the rest of the parameters. This happens for /START LINE if:

- The specified line is already started or is not idle.
- Any terminals on the line had conversations that could not be canceled (because an application program is scheduled).
- The specified line could not be started because of IMS internal processing.
- The DD statement is missing from the IMS execution JCL.

The /START LINE command no longer resets preset mode, test mode, and response mode since these statuses are no longer significant and therefore are not
kept after a /START LINE command or restart.

**Examples**

The following are examples of the /START LINE command:

*Example 1 for /START LINE command*

Entry ET:
/START LINE 4 PTERM 1, 2

Response ET:
DFS058I START COMMAND COMPLETED

Response RT:
DFS059I TERMINAL STARTED

Explanation: Physical terminals 1 and 2 on line 4 are started.

*Example 2 for /START LINE command*

Entry ET:
/START LINE 4,5,6,7,8,9,10,11

Response ET:
DFS058I START COMMAND COMPLETED

Response RT:
DFS059I TERMINAL STARTED

Explanation: Lines 4, 5, 6, 7, 8, 9, 10, and 11 are started.

*Example 3 for /START LINE command*

Entry ET:
/START LINE 4 5 6 700

Response ET:
DFS058I START COMMAND COMPLETED EXCEPT LINE 5 700

Response RT:
DFS059I TERMINAL STARTED

Explanation: Lines 4 and 6 are started. The /DISPLAY LINE command can be used to determine why line 5 did not start successfully. (700 is an invalid line number.)

**/START LTERM command**

Use the /START LTERM command to specify the logical terminals to be started and to reset the QLOCK state. (QLOCK indicates that the LTERM is locked from sending any further output or from receiving input that can create additional output for the same LTERM until the state is reset by a specific request received on the session.) /START LTERM is rejected for remote logical terminals.
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 276. Valid environments for the /START LTERM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LTERM</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

The LTERM keyword is only effective for existing LTERMs.

The LTERM parameter can be generic where the generic parameter specifies LTERMs that already exist.

If global resource information is kept in Resource Manager, the /START LTERM command allows messages to be queued to the LTERM from anywhere in the IMSplex and the change is reflected both in Resource Manager and in the local IMS system.

Examples

The following is an example of the /START LTERM command:

Entry ET:
/START LTERM APPLE, TREE, FRUIT

Response ET:
DFS058I  START COMMAND COMPLETED

Response RT:
DFS059I  TERMINAL STARTED

Explanation: Logical terminals APPLE, TREE, and FRUIT are started.
/START LUNAME command

Use the START LUNAME command to specify the LU name that is to be started.

Subsections:
- "Environment"
- "Syntax"
- "Keywords"
- "Usage notes"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 277. Valid environments for the START LUNAME command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START LUNAME</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>INPUT</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LUNAME</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>OUTPUT</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/START LUNAME luname
INPUT ALL
OUTPUT tpname
```

Keywords

The following keywords are valid for the /START LUNAME command:

**INPUT**

Specifying the keyword INPUT starts an luname for any input and synchronous outbound activities. Specifying the parameter ALL with the keyword INPUT causes all future LU 6.2 inbound and synchronous output activities to be started as well.

**OUTPUT**

Specifying the keyword OUTPUT starts an luname for asynchronous outbound activities. Specifying the parameter ALL with the keyword OUTPUT causes all future LU 6.2 outbound asynchronous activities to be started as well.

Usage notes

Specifying neither INPUT nor OUTPUT is the same as specifying both INPUT and OUTPUT. The LU name is started for any input and both synchronous and
asynchronous outbound activities. Specifying the parameter ALL in this case also causes the start of all future LU 6.2 inbound activities, outbound synchronous, and asynchronous activities.

A network-qualified LU name is optional for the LUNAME keyword. If the LU name is not network-qualified and no TP name is specified, all the network-qualified LU names whose LU name matches the LU name specified are also started.

/START LUNAME TPNAME starts a particular tpname of an luname. The keyword OUTPUT is the default for this command.

If the specified resource does not exist, a structure is created to retain the status.

Command keywords and their synonyms (Commands)

/START MADSIOT command

Use the /START MADSIOT command to specify the MADS I/O timing function.

Subsections:
- "Environment"
- "Syntax"
- "Usage notes"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 278. Valid environments for the /START MADSIOT command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START MADSIOT</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/START MADSIOT
```

Usage notes

The /START MADSIOT command is valid only after the long busy handling function is disabled for a link failure, a structure failure, or a rebuild failure. When the /START MADSIOT command completes normally, one of the two following messages is returned to the operator's console:

- DFS1728E START MADSIOT COMMAND FAILED RSN=rrr
- DFS1727I MADSIOT TIMING FUNCTION RESUMED SUCCESSFULLY

The purpose of this command is to enable MADS I/O Timing function. If MADS I/O Timing list structure is not defined in DFSVSMxx, the command will be
rejected. If MADS I/O Timing function is already enabled, the command will be ignored. If MADS I/O Timing function is not enabled and all sharing partners successfully connect to MADS I/O Timing list structure on the coupling facility, the command will complete successfully; if any sharing partners fails to connect to MASD I/O Timing list structure, the command will fail.

The output of the /STA MADSiot command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages as appropriate.

Fast Path messages: DFS0023I, DFS0007I, DFS1270I, DFS1727I, DFS1552A, DFS1728E

/START MSNAME command

Use the /START MSNAME command to specify the logical link path that is to be started. The MSNAME keyword can be generic.

Subsections:
- "Environment"
- "Syntax"
- "Examples"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 279. Valid environments for the /START MSNAME command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>MSNAME</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Examples

The following is an example of the /START MSNAME command:

Entry ET:
/START MSNAME CHICAGO

Response ET:
DFS058I START COMMAND COMPLETED

Explanation: A logical link path associated with the name CHICAGO is started.
/START NODE command

Use the /START NODE command to allow IMS to accept logons from, or initiate logons to, terminals attached to VTAM without actually initiating a session with the terminal. When a stopped node is started by using the /START NODE command, the terminal can log on to IMS or IMS can initiate a session with the terminal by using the /OPNDST NODE command.

The /START NODE command operates only if the node is disconnected, idle, and stopped. In addition to resetting the STOPPED status, the command resets MFSTEST mode, exclusive mode, DEACT status, and conversational mode by terminating the conversations.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Examples” on page 807

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>

<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

![Syntax Diagram]

Usage notes

The /START NODE command is valid for existing nodes only (including any temporary nodes present in the system).

There is no need to issue a /DEQUEUE command for Fast Path messages. When the response mode is reset for a NODE or USER destination of Fast Path messages
by either a /STOP NODE or a /STOP USER command, the Fast Path messages are discarded when the accompanying /START NODE or /START USER command is issued. In this case, IMS writes a X'67D0' Subtype 11 trace log record.

The /START NODE nodename USER username command applies to ISC sessions only, and it is used to start a half session allocated to USER username for NODE nodename. The USER keyword when used with the NODE keyword affects the specified half-session. When the USER keyword is omitted, all half-sessions of the specified node are affected.

Restrictions for using NODE and USER parameters together:

- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
  - /START NODE USER commands are valid for ISC, LUP, and 3600 nodes only.

The NODE parameter can be generic if the USER keyword is not present. The generic parameter specifies nodes that already exist.

The /START NODE command no longer resets test mode and preset mode, because these statuses are no longer significant and therefore no longer carried across logon or restart. MFSTEST mode (at the node level) and exclusive mode are still reset.

If global resource information is kept in Resource Manager, the /START NODE command allows a node to log on to any IMS in the IMSplex and resets MFSTEST mode and exclusive mode. If the node no longer has significant status, it is deleted from Resource Manager.

If a node in conversational mode receives the message, DFS058I START COMMAND COMPLETED EXCEPT when a /START NODE command is issued, it is possible that the conversation is INUSE by some other process. This is a temporary condition; you can reissue the /START NODE command.

Examples

The following is an example of the /START NODE command:

Entry ET:
/START NODE HARRY

Response ET:
DFS058I START COMMAND COMPLETED

Explanation: The physical terminal that is associated with the node HARRY is started.

/START OLDS command

The /START OLDS command indicates that either a previously stopped OLDS is to be started or that IMS is to add a new OLDS log data set.
If a new OLDS is being added, olds# is an OLDS identifier that is defined by the DFSMDA macro specification. If in dual mode, both primary and secondary OLDSs are started. olds# must be 00-99.

When using /START OLDS, an OLDS must be defined in the DFSMDA macro, even if it is allocated in JCL.

Subsections:

- “Syntax”
- “Examples”

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START OLDS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```plaintext
/START OLDS olds#
```

**Examples**

The following is an example of the /START OLDS command:

Entry ET:
/START OLDS 09

Response ET:
DFS058I START COMMAND IN PROGRESS

Explanation: OLDS data set DFSOLP09 (DFSOLS09) will be started for logging.

**/START OTMA command**

Use the /START OTMA command to cause IMS to join the z/OS cross-system coupling facility (XCF) group for the IMS Open Transaction Manager Access (OTMA).

Subsections:
- “Environment” on page 809
- “Syntax” on page 809
- “Usage notes” on page 809
- “Examples” on page 809
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 282. Valid environments for the /START OTMA command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>OTMA</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/START OTMA NOCHECK
```

Usage notes

/START OTMA command processing is as follows:
1. IMS joins the XCF group.
2. Following a successful Client-Bid, IMS sends an ACK message to the OTMA client.
3. IMS begins sending all Commit-then-Send (commit mode 0) output messages to the OTMA client.

The NOCHECK option specifies that the command is not recovered during emergency restart for OTMA.

Examples

The following is an example of the /START OTMA command:

Entry ET:

```
/STA OTMA
```

Response ET:

```
DFS2360I 14:02:53 XCF GROUP JOINED SUCCESSFULLY. SYS3
DFS058I 14:02:53 START COMMAND COMPLETED SYS3
DFS996I *IMS READY* SYS3
```

/START PGM command

Use the /START PGM command to specify the application program that is to be started.

This command also clears the indicator preventing a program from scheduling when I/O prevention has not completed. The integrity of a GSAM database residing on DASD can be affected if I/O prevention has not been done on a failing active system.

/START PGM does not start a CPI Communications driven transaction program.

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

*Table 283. Valid environments for the /START PGM command and keywords*

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>

/START REGION command

Use the /START REGION command to specify the set of message processing region JCL to be passed to z/OS. If no member name is specified, the default member name is used.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Examples” on page 812

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 285. Valid environments for the /START REGION command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LOCAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>REGION</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

![Diagram of /START REGION command syntax]

Usage notes

IMS dependent regions of the same type (MPP, BMP, or IFP) can share a PROCLIB member containing the startup JCL for the type of region. Use the JOBNAME or
LOCAL keywords of the /START REGION command to enable IMS to set (or override) the IMS ID for the dependent region to match the IMS ID of the IMS that processes the command.

Restriction: The JCL for the region to be started must include the IMSID= execution parameter.

Use the JOBNAME keyword to override the job name on the JOB statement of the default or specified JCL member for a dependent region.

If you specify the LOCAL keyword, IMS overrides the symbolic IMSID parameter in the JCL of the default or specified member. LOCAL is the default if you specify the JOBNAME keyword.

When the LOCAL or JOBNAME keywords are specified on the /START REGION command, the PROCLIB member must be a job that runs a procedure to start the dependent region. The procedure cannot be an instream procedure. For example, suppose that the /START REGION command is entered in one of the following formats:

/START REGION member_name LOCAL
/START REGION member_name JOBNAME job_name
/START REGION member_name JOBNAME job_name LOCAL

In these instances, member_name is a job that runs a procedure to start the dependent region and has the following format:

//job_name JOB ... (parameters)...
//   EXEC proc_name,
//     IMSID=xxxx

The operator can start more dependent regions than were specified in the IMS system definition or the EXEC parameter, up to 999. A request to start more regions than the system-definition value (but less than or equal to 999) might be rejected if resources are not available.

The /START REGION command is not mirrored on the XRF alternate subsystem. You must enter this command on the alternate subsystem if you want it to affect the alternate subsystem.

The /START REGION command allows the IMS catalog update task to be stopped. The IMS catalog update task is used to make changes to the IMS catalog and activate those changes in the online IMS system. When issuing the /START REGION command against the IMS catalog update task the results to the IMS catalog will be unpredictable when an update is in progress. The IMS catalog update task performs several operations that extend outside the scope of the IMS database, updating the RECONs, creating data sets, creating programs and databases. The /START REGION command prevents the task from executing the abnormal termination logic. It is your responsibility to cleanup.

Examples

The following are examples of the /START REGION command:

Example 1 for /START REGION command

Entry ET:
/START REGION
Response ET:
DFS058I  START COMMAND IN PROGRESS

Response ET:
DFS551I  IFP|MESSAGE|BATCH  REGION XXXXXXXX STARTED. ID=yy TIME=zzzz
CLASSES=xxx,xxx,xxx,xxx

Explanation: One message region or batch region (ID=yy) is started at TIME=zzzz. The transactions associated with the classes listed in the response can now be scheduled.

Example 2 for /START REGION command

Entry ET:
/START REGION IMSWT000

Response ET:
DFS058I  START COMMAND IN PROGRESS

Explanation: The JCL stored as member IMSWT000 is used to start the spool SYSOUT utility for the data sets associated with the spool line corresponding to the IMSWT000 procedure.

Example 3 for /START REGION command

Entry ET:
/START REGION MEMABC

Response ET:
DFS058I  START COMMAND IN PROGRESS

Response ET:
DFS551I  IFP|MESSAGE|BATCH  REGION XXXXXXXX STARTED. ID=yy TIME=zzzz
CLASSES=xxx,xxx,xxx,xxx

Explanation: The JCL stored as member XXXXXX is used to start a message processing region or batch message processing region with the classes specified by the EXEC statement parameters in MEMABC.

</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>RTC</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

/rstart rtcname

Usage notes

The /START RTC command is not allowed for a routing code that is marked bad with the NOTINIT-07-REPOCHGLIST reason code because the IMS change list processing is not complete for the routing code or the change list processing failed.

Equivalent IMS type-2 commands

The following table shows variations of the /START RTC command and the IMS type-2 commands that perform similar functions.

Table 287. Type-2 equivalents for the /START RTC command

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>Starts queuing to a Fast Path routing code.</td>
<td>/START RTC rtcname</td>
<td>UPDATE RTC NAME(rtcname) START(Q)</td>
</tr>
</tbody>
</table>

Examples

The following is an example of the /START RTC command:

Entry ET:
/START RTCODE ALL

Response ET:
DFS058I START COMMAND COMPLETED

Explanation: All the Fast Path routing codes are activated. Transactions associated with these routing codes can now be processed.

Related reference:
“UPDATE RTC command” on page 1250
/START SB command

Use the /START SB command to dynamically allow sequential buffering. This command does not affect sequential buffering applications scheduled before this command was issued.

Subsections:
- “Environment”
- “Syntax”
- “Examples”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 288. Valid environments for the /START SB command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>

DATABASE BUFFER POOL: BSIZE 356352
RRBA 0 RKEY 0 BFALT 0 NREC 0 SYN PTS 0
NMBUFS 29 VRDS 0 FOUND 0 WTS 0 ERRORS 00/00
+86253/104547*

Explanation: Sequential buffering is started.
**/START SERVGRP command**

Use the /START SERVGRP command to start communications between the entering service group and the service group at the other site in an Remote Site Recovery (RSR) complex.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START SERVGRP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
/START SERVGRP
```

**Usage notes**

If the subsystem is not currently identified to the Transport Manager Subsystem (TMS), an attempt to identify precedes an attempt to connect to the other subsystem. /START SERVGRP is supported on an active IMS subsystem and an RSR tracking subsystem.

The /START SERVGRP command is not normally needed for an active subsystem because the logger normally attempts to identify to TMS at each OLDS switch to establish connections with the other subsystem. However, the operator might want to trigger this process between OLDS switches; for instance, if a network outage between the active and tracking sites has been repaired and the operator does not want to wait until the next OLDS switch to re-establish communications.

Successful completion of the syntax checking of the /START SERVGRP command results in the DFS058 START COMMAND COMPLETED message, although processing of the command continues asynchronously.

**Examples**

The following is an example of the /START SERVGRP command:

Entry ET (at the active site):

```
/START SERVGRP
```

Response ET (to the active subsystem):
Explanation: Communications between the subsystem at the active site and the subsystem at the RSR tracking site are started.

/START SLDSREAD command

The /START SLDSREAD command indicates whether IMS is enabled to retrieve records from both a system log data set (SLDS) and OLDS or OLDS only. The default is that SLDSREAD is enabled.

Subsections:
- “Environment”
- “Syntax”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 290. Valid environments for the /START SLDSREAD command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SLDSREAD</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

/START SLDSREAD

/START SUBSYS command

Use the /START SUBSYS command to specify the external subsystem to which IMS is to connect.

Subsections:
- “Environment”
- “Syntax” on page 818
- “Keywords” on page 818
- “Usage notes” on page 818

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 291. Valid environments for the /START SUBSYS command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SSM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SUBSYS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```
/START SUBSYS subsysname

/START SUBSYS ALL

SSM ssname
```

Keywords

The following keywords are valid for the /START SUBSYS command:

- **SSM**
  
  Allows external subsystem connection processing to occur even though the option was not requested when IMS was started.

  The syntax and usage of the SSM keyword are the same as the SSM= EXEC parameter that can be specified on the IMS startup JCL. The SSM keyword is followed by a 1 to 4 character identifier. IMS concatenates the SSM identifier to the IMSID to create an SSM PROCLIB member name. The SSM PROCLIB member is then used for external subsystem processing.

  The SSM keyword is not valid if either of the following conditions apply:
  
  - The SSM= keyword is specified in the EXEC parameters of the startup JCL.
  - The /START SUBSYS SSM command has been previously issued.

Usage notes

This command can also be used to dynamically reconfigure existing subsystem definitions. The installation can start IMS with the subsystem PROCLIB member defining one subsystem. The PROCLIB member can then be changed or added to. The operator can then /STOP the existing subsystem connections or only the one that has changed. By issuing the /START SUBSYS command, IMS will pick up the new or changed definitions and attempt to connect to those subsystems.

The /START SUBSYS ALL command connects IMS to all external subsystems.

Also, the SSM keyword can be used with the /START SUBSYS command.

If the subsystem connection was abnormally terminated, IMS puts the connection in a stopped state. In this instance, the /START command must be used to reestablish the connection.

Examples

The following is an example of the /START SUBSYS command:

Entry ET:

```
/START SUBSYS ABC
```

Response ET:

```
DFS058I  START COMMAND COMPLETED
```

Explanation: IMS has established a connection to the requested subsystem. It is likely that an external subsystem (not CCTL) connection message will be received.
at this time. If this is not the case, the /DISPLAY command can be used.

/START SURV command

Use the /START SURV command in an XRF environment to start the operation of the IMS surveillance function.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 292. Valid environments for the /START SURV command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SURV</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

Usage notes

When surveillance is on for a function, potential failures of the active system are detected. Based on information from surveillance, the alternate system either requests a takeover or informs the operator of the potential failure. The following are the surveillance functions to be started:

- **ALL**  Same as specifying LNK, RDS, and LOG.
- **LNK**  ISC link.
- **LOG**  System log.
- **RDS**  Restart data set.

The surveillance function is generally started during IMS system definition by using the /START SURVEILLANCE control statement. ALL is the default.

/START THREAD command

Use the /START THREAD command to specify the set of message processing region JCL to be passed to z/OS. If no member name is specified, the default member name is used.

Subsections:
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

### Table 293. Valid environments for the /START THREAD command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>THREAD</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/START THREAD membername
```

Usage notes

The /START THREAD command is used only for DEDB utility regions. BMP regions are started by JCL. CCTL threads are started automatically at connection: first to the MINTHREAD value, and later (on demand) to MAXTHREAD value.

/START TMEM command

Use the /START TMEM command to cause IMS to send an Open Transaction Manager Access (OTMA) command to OTMA clients to request that input resume for the specified transaction membername. IMS then resumes sending output to the OTMA client.

Subsections:
- "Environment"
- "Syntax" on page 821
- "Keywords" on page 821
- "Examples" on page 823

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

### Table 294. Valid environments for the /START TMEM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TMEM</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>TPIPE</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
Syntax

```
/START
/STA
  TMEM
  tmembername
    A
    INPUT—yyyy
```

A:

```
TPIPE
  ALL
  tpipename
  120
  TIMEOUT—xx
  INPUT—yyyy
```

Keywords

The following keywords are valid for the /START TMEM command:

INPUT

Specifies the maximum number of concurrent input messages from the
OTMA member. OTMA monitors the growth of the input messages from
the member. A DFS1988W warning message is sent to the system console
to indicate that the input messages reached 80% of the limit and the
message is issued every 5% thereafter. When the maximum is reached, a
DFS1989E error message is sent to the console. Any subsequent OTMA
input message from this member will be rejected with the OTMA sense
code X’30’.

When the number of input messages (transaction instance blocks (YTIBs))
reaches the maximum, the /DISPLAY command shows FLOOD status
under the user-status column. FLOOD status is relieved when the input
messages are processed and recede to 50% or less of the maximum value
or a /START TMEMBER INPUT command is issued with a higher
maximum value specified.

The input value is a 1- to 5-digit decimal integer. Valid values are 200 -
65000 or 0. If the value is 1 - 200, it is treated as 200. If the value is over
65000, a value of 65000 is used. If the value is 0, OTMA deactivates the
message flood detection.

If this keyword is specified with the ALL keyword, the following is true:

- The value can be one- to five-digit decimal integer 0 - 99999. If the value
  is 1 - 99999, it indicates the maximum number of input messages from
  all the OTMA members that can be waiting at the same time to be
  processed. To avoid too many OTMA unprocessed or waiting messages
  or TIBs in the system, this value is used as a global flood threshold to
  protect IMS from getting storage-related abends. A non-zero value
  activates the global flood control for OTMA for the system. If you
  specify a value of 0, OTMA deactivates the global flood monitoring and
  control. If the value is 1 - 200, it is treated as 200.

- When a non-zero global flood limit is specified, it activates the global
  flood control. When the global flood limit is reached, OTMA rejects all
  the new input transactions from all the members, including synchronous
  program switch requests from the internal OTMA member DFSYICAL. A
DFS3429E error message is sent to the console and MTO. A protocol message with the command type set to X’3C’ is sent to all the OTMA members with “unavailable for work” status. When OTMA members receive this new status, they can choose to take corrective action when this degraded condition occurs. One example would be the rerouting of all the new transaction requests from one IMS system to another. The /DISPLAY OTMA command of this degraded system also shows “SERVER-FLOOD” in the user status of the OTMA server member.

• The DFS3428W warning message is issued to IMS MTO and system console along with OTMA protocol messages that reflect a warning status to all the OTMA member clients when the global flood limit has reached 80%. And this message is issued every 5% thereafter until the global message limit is reached. This global flood status is relieved when the input messages in the system are processed and the number of total transaction instance blocks (TIB) in the system is reduced to 50% of the global limit or less. A DFS0793I is sent to IMS MTO and system console along with OTMA protocol messages that reflect a good status to all the OTMA members.

• When this command is not issued and there is no global limit in OTMA client descriptor, the default global flood processing takes place in the system and the default global flood limit is set to 10000 to protect the system. The default action points of the OTMA global flood process issue:
  − Warning message DFS3428W starting at 80% of the flood limit and every 5% thereafter.
  − Warning message DFS4388W when 100% is reached.
  − Relief message DFS0793I when the flood is relieved and back to 50%.

Also, the OTMA protocol message that reflect a warning or good status is sent to all the OTMA members.

TPIPE

When it is used with the /START command, TPIPE causes IMS to send an OTMA command to its OTMA clients to request that the input resume for the specified transaction pipe. IMS then resumes sending output to the OTMA client. If the member specified is a super member, output is resumed for the super member’s transaction pipe, but no OTMA command is sent. If the member specified is a regular member whose hold queue output is managed by a super member, IMS resumes output for the specified member’s transaction pipe and it also resumes output for the super member’s transaction pipe. An OTMA command is sent to the regular member’s OTMA client. Output is only resumed on the IMS that processes the command. If output cannot be resumed for both the regular member’s transaction pipe and the super member’s transaction pipe, it is not resumed for either transaction pipe. The DFS058I COMMAND COMPLETED EXCEPT message is issued with the name of the regular member for which output could not be resumed.

Restriction: If a transaction pipe has a resynchronization pending status, IMS does not start the transaction pipe.

TIMEOUT

Sets the timeout interval for acknowledgments to commit-then-send (CM0) and send-then-commit (CM1) output messages.

After OTMA delivers a send-then-commit output message that used synclevel=confirm or synclevel=synct, OTMA expects an acknowledge
(ACK or NAK) message from the OTMA client, such as IMS Connect. If the acknowledge message is not received by IMS within the specified timeout value, OTMA will take the timeout action to abort the transaction. This prevents IMS dependent region from getting the WAITSYNPT or WAIT/RRS status for long time.

The TIMEOUT keyword also applies to acknowledgments for transaction messages sent to a remote IMS system by way of an IMS-to-IMS TCP/IP connection. When the timeout interval expires, the unacknowledged message is rerouted to the default timeout queue, DFS$$TOQ.

The timeout interval must be 0 - 255 seconds, with a default value of 120 seconds. When 0 is specified, the timeout function is disabled.

Examples

The following are examples of the /START TMEM command:

Example 1 for /START TMEM command

Entry ET:
/STAMEMBER CLIENT1 TPIPE TPIpesY

Response ET:
DFS058I 15:39:40 START COMMAND COMPLETED SYS3
DFS996I *IMS READY* SYS3

Example 2 for /START TMEM command

Entry ET:
/START TMEMBER HWS1 INPUT 2000

Response ET:
DFS058I START COMMAND COMPLETED

Explanation: The maximum concurrent input message count for the OTMA member HWS1 has been set to 2000. Based on the number specified, IMS OTMA will monitor the growth of the input messages to prevent a message flood condition.

/START TRAN command

Use the /START TRAN command to specify the transactions to be started.

Subsections:
- “Environment”
- “Syntax” on page 824
- “Usage notes” on page 824
- “Equivalent IMS type-2 commands” on page 825

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.
Table 295. Valid environments for the /START TRAN command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>AFFINITY</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>CLASS</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>TRAN</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/START TRAN tranname
/START TRAN tranname AFFINITY
/START TRAN tranname CLASS cls#
```

Usage notes

The /START TRAN ALL CLASS cls# command causes all transactions associated with the specified class to be started.

If a transaction that has messages on the suspend queue is started, the suspend queue associated with the transaction is automatically transferred to the normal queue.

The TRAN keyword can be generic where the generic parameter specifies transactions that already exist.

You can use the /START TRAN tranname AFFINITY command to start a local affinity transaction queue in a shared-queues environment. Starting a local affinity transaction queue in a shared-queues environment causes this IMS system to be notified when transaction messages that have an affinity name of this IMS system’s IMSID or RENAME (XRF) appended to the transaction name are on the shared queues for processing. This affinity registration is in addition to the normal transaction registration (registration with the transaction name appended with blanks).

When a transaction is started with affinity, the affinity registration status cannot be removed and the QUERY TRAN command always shows the affinity status. The following /STOP TRAN tranname command therefore stops both normal and affinity registration. The subsequent /START TRAN tranname command (with or without the AFFINITY keyword) always performs both normal and affinity registration.

The affinity status is lost across IMS cold starts. If the DFSMSCE0 user message routing exit is used to set local affinity for an input transaction message in a shared-queues environment and the IMS control region is stopped and
subsequently cold started, you must issue the /START TRAN AFFINITY command or the UPDATE TRAN NAME(\textit{tranname}) START(SCHD) OPTION(AFFIN) command. These commands register the transaction with affinity status so that the messages will be processed.

At the end of cold start processing, when shared-queues informs are done, the inform for the transaction is done without affinity to the local IMSID. Because local affinity is set by the exit and is not part of the transaction definition, it is not maintained across a cold start. As a result, the message with local affinity cannot be scheduled. The /START TRAN \textit{tranname} AFFINITY command issues an inform for the transaction with affinity to the local IMSID.

The /START TRAN \textit{tranname} AFFINITY command does not support generic transaction names of ALL in the parameter.

In a shared-queues environment, the /START TRAN command will result in IMS registering interest for the transaction, which indicates that the transaction can be scheduled at the IMS. A /START TRAN ALL command does not register transactions that are already registered to CQS.

The /START TRAN command is not allowed for a transaction that is marked bad with the NOTINIT-15-REPOCHGLIST reason code because the IMS change list processing is not complete for the transaction or the change list processing failed.

**Equivalent IMS type-2 commands**

The following table shows variations of the /START TRAN command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/START TRAN command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts a transaction.</td>
<td>/START TRAN</td>
<td>UPDATE TRAN NAME(\textit{tranname})</td>
</tr>
<tr>
<td></td>
<td></td>
<td>START(Q,SCHD,SUSPEND)</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the /START TRAN command:

**Example 1 for /START TRAN command**

Entry ET:

/START TRAN ALL CLASS 6

Response ET:

DFS058I START COMMAND COMPLETED

Explanation: All transactions associated with class 6 are started.

**Example 2 for /START TRAN command**

Entry ET:

/START TRAN PIT, SEED

Response ET:
DFS058I  START COMMAND COMPLETED

Explanation: Transactions PIT and SEED are started.

*Example 3 for /START TRAN command*

Entry ET:
/START TRAN APOL12 AFFINITY

Response ET:
DFS058I  START COMMAND COMPLETED

Explanation: Transaction APOL12 is started with affinity.

**Related reference:**
“UPDATE TRAN command” on page 1263

/START TRKARCH command

Use the /START TRKARCH command to indicate that the RSR tracking subsystem is to initiate a request to start the automatic archiving of the tracking log data sets.

This keyword allows the user to start automatic archive after it has been terminated following archive data set full conditions.

Successful completion of the syntax checking of the /START TRKARCH command results in the DFS058I START COMMAND COMPLETED message, although processing of the command continues asynchronously.

Subsections:
- **“Environment”**
- **“Syntax”**

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TRKARCH</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
/START TRKARCH
```
/START USER command

Without the NODE keyword, USER specifies the ISC user or the dynamic user to start. The USER parameter can be generic where the generic parameter specifies users that already exist.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 298. Valid environments for the /START USER command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td></td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

Usage notes

The /START USER command applies only to users that are stopped and signed off. The /START USER command also terminates any active conversations before starting the user.

The /START USER command removes the user from MFSTEST mode and exclusive mode. If the USER structure is temporary and the status conditions that caused the creation of the structure have been reset, the temporary user is deleted at the next simple checkpoint.

For ISC users, the user is started and made available for allocation.

For dynamic users, the user is started and made available for signon. If the dynamic user was in either Fast Path input or output response mode, and the Fast Path input or output response mode is reset by the /STOP USER and /START USER commands issued in sequence, IMS writes a X’67D0’ Subtype 11 trace log record.

The /START USER command no longer removes the user from test mode, and preset mode. MFSTEST mode can now be associated with the node and with the user. MFSTEST mode (at the user level) and exclusive mode are still reset. The other statuses are no longer significant and therefore not carried across signon or restart.
If global resource information is not kept in Resource Manager, the /START USER command allows a user to signon to the local IMS. If global resource information is kept in Resource Manager, the /START USER command allows a user to signon to any IMS in the IMSplex.

If a user in conversational mode receives the message, DFS058I START COMMAND COMPLETED EXCEPT when a /START USER command is issued, it is possible that the conversation is INUSE by some other process. This is a temporary condition; you can reissue the /START USER command.

**Examples**

The following is an example of the /START USER command:

**Entry ET:**
/DISPLAY USER IMSUS01 IMSUS02

**Response ET:**

<table>
<thead>
<tr>
<th>USER</th>
<th>ENQCT</th>
<th>DEQCT</th>
<th>QCT</th>
</tr>

<td>0</td>
<td>0</td>
</tr>
<tr>
<td>IMSUS02</td>
<td>0</td>
<td>0</td>
<td>STOPPED</td>
</tr>
</tbody>
</table>

*91091/113038*

**Entry ET:**
/START USER APPLE*

**Response ET:**

DFS3633 11:19:35 GENERIC PARAMETER RESOURCES NOT FOUND, NO ACTION TAKEN

**/START VGR command**

The /START VGR command causes the IMS subsystem to join a VTAM generic resource group. The command is rejected if the VTAM ACB is closed (usually the result of a /STOP DC command).

Subsections:
- **“Environment” on page 829**
- **“Syntax” on page 829**
- **“Keywords” on page 829**
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 299. Valid environments for the /START VGR command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>GRSNAME</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>VGR</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/START VGR
GRSNAME generic_resource_name
```

Keywords

The following keywords are valid for the /START VGR command:

The GRSNAME keyword allows you to specify the generic resource name if the IMS subsystem does not have one. The IMS subsystem already has a generic resource name if it has the GRSNAME= keyword specified on its EXEC statement.

The GRSNAME is ignored if GRSNAME= was specified on the EXEC statement, or if it was already specified on a previous /START VGRS command. If GRSNAME= was not specified on the EXEC statement or any previous /START VGRS command, then all VTAM sessions must be terminated prior to executing the /START command with GRSNAME specified.

/START WADS command

The /START WADS command indicates that either a previously stopped WADS is to be started or that IMS is to add a new WADS to the pool of available WADSs.

Subsections:
- "Environment"
- "Syntax" on page 830
- "Keywords" on page 830
- "Usage notes" on page 830

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 300. Valid environments for the /START WADS command and keywords

<table>

<td>X</td>
<td>X</td>
</tr>
<tr>
<td>WADS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```
/START WADS wads#
```

Keywords

The following keywords are valid for the /START WADS command:

- `wads#`
  
  If a new WADS is being added, `wads#` is a WADS identifier that is defined by the DFSMDA macro specification. `wads#` must be 0-9.

Usage notes

When using the /START WADS command, a WADS must be defined in the DFSMDA macro, even if it is allocated in JCL.

/START XRCTRACK command

The /START XRCTRACK command results in calls to the log router to initiate or terminate XRC tracking. It is only valid on a tracking IMS system.

Subsections:
- "Environment"
- "Syntax"

Environment

</tbody>
</table>

Syntax

```
/START XRCTRACK
```

830 Commands, Volume 2: IMS Commands N - V
Chapter 24. /STOP commands

The /STOP commands stop the sending, receiving, or queuing of output messages to a particular communication line, terminal, user, or logical path.

You can also use these commands to stop the scheduling or queuing of messages containing a specific transaction code, the execution of a specific program, or the use of a given database.

For VTAM nodes, the currently connected terminal is disconnected. All further logons are rejected until the node is the subject of a /START or /RSTART command.

The /STOP command validity checks all parameters entered by the terminal operator. If an error is detected on parameters that are independent of one another, only the invalid parameters are indicated as being in error and the /STOP command processes the rest of the parameters.

The /STOP command can be used to reset conditions previously established by the /START, /RSTART, /PSTOP, /PURGE, or /MONITOR commands.

These commands can be issued to an IMSplex using the Batch SPOC utility.

/STOP ADS command

The /STOP ADS command specifies the area data set to be closed and deallocated.
The AREA is not stopped as long as at least one data set in the AREA remains open. /STOP ADS is rejected if the specified ADS is the last data set available in the AREA.

Subsections:
- "Environment"
- "Syntax"
- "Usage notes"

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>ADS</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**

```
/STOP ADS ddbname
```

**Usage notes**

Although the /STOP ADS command has no option of LOCAL/GLOBAL, if the DE DB area is shared at the block level, the response is the same as if GLOBAL were specified.

The output of the /STOP ADS command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages as appropriate.

Fast Path messages: DFS140I, DFS0488I, DFS0666I, DFS1407I, DFS3720I, DFS3721I, DFS3771I

**/STOP APPC command**

The /STOP APPC command instructs IMS to stop scheduling transactions from LU 6.2 devices. The /STOP APPC command can be used in a transient stopped state. It causes remote LU 6.2 devices to receive a sense code of TP_Not Avai lable_No_Retry. This is likely to lead to further attempts to access IMS.

Subsections:
- “Environment” on page 833
- “Syntax” on page 833
- “Keywords” on page 833
- “Usage notes” on page 833
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<td>X</td>
</tr>
<tr>
<td>APPC</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>CANCEL</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

►►/STOP APPC◄◄

Keywords

The following keyword is valid for the /STOP APPC command:

CANCEL

Causes APPC/MVS to initiate a shutdown request when a long stopped period is anticipated, for example, at the end of the day's processing. All remote LU 6.2 devices receive a sense code of TP_Not_Available_No_Retry. The remote LU 6.2 devices stop trying to access this application.

The /STOP APPC CANCEL command sets the desired status to CANCEL according to responses from APPC/MVS. If the desired status is DISABLED, then IMS rejects /STOP APPC CANCEL when it is entered.

Note: The sense code returned to the LU 6.2 remote device for an incoming ATTACH to a stopped APPC/IMS system is determined by APPC/MVS, and it might differ from release to release. In general, the remote LU 6.2 application should wait for a period of time after rejection before any attempts to reestablish a session with IMS.

Usage notes

The /STOP APPC command sets the desired status to STOPPED. The current status is set to STOPPED or FAILED according to the response from APPC/MVS.

/STOP AREA command

The /STOP AREA command specifies that the data sets associated with this area are closed.

Subsections:
- “Environment” on page 834
- “Syntax” on page 834
- “Keywords” on page 834
- “Usage notes” on page 836
- “Equivalent IMS type-2 commands” on page 836
- “Examples” on page 836
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 304. Valid environments for the /STOP AREA command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>LOCAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NOPFA</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

The following keywords are valid for the /STOP AREA command:

GLOBAL

Specifies when an IRLM is active and that the command applies to all subsystems sharing the database or area.

The GLOBAL keyword and the ALL parameter are mutually exclusive. If both keywords are specified, the command is rejected. The GLOBAL keyword requires that IRLM be active. If IRLM is not active, the command is rejected. DBRC is informed that the database or area has been stopped and will update the RECON data set to indicate the stopped condition.

The GLOBAL command is processed by the IMS system where the command was initiated. This system will process the command locally and then request IRLM NOTIFY to route and process the command on sharing IMS systems.

If global DB or AREA status is maintained, the global status maintained in RM is also updated. The global status is set to STOPPED.

If the command is entered from OM API, the global status is updated by the command master IMS. If the command is not entered from OM API, the IMS that initiated the GLOBAL command updates the global status in RM.

You must specify if the global area status must be maintained in RM. You can specify this during IMS initialization in either the DFSDFxxx or DFSCGxxx PROCLIB member with PLEXPARM(GSTSAREA(Y)). You can also change it dynamically using the UPDATE IMS SET(PLEXPARM(GSTSAREA(Y))) command. If you do not specify that the global area status is to be maintained, then the GLOBAL keyword is processed as in prior releases, and the global status is not updated.
If global status in RM is successfully updated, message DFS0988I for
RSRCTYPE=AREA is issued. If global status is not successfully updated,
message DFS3308I is issued, indicating RM failure, and no command response
lines are generated. Any RM error is traced to the OCMD trace table. Users can
issue a QRY DB STATUS(GLOBAL) command to obtain the global status of the
resources in RM.

The X'594C' log record for DEDB areas includes both global status and global
command time stamp.

The GLOBAL keyword is not supported on an RSR tracking subsystem.

If the GLOBAL keyword on a command is entered from an OM API, the
command should only be routed to one IMS system in the IMSplex. The IMS
that receives the command from OM will make DBRC calls to update the
RECON with GLOBAL status. It will also request IRLM NOTIFY to route and
process the command on sharing IMS systems, and then process the command
locally.

Messages produced on the NOTIFIED systems will appear only on the system
console and will not be routed back to the OM API which originally entered
the command.

If multiple IMS systems have been explicitly specified in the route list, the
master IMS system will process the command as described previously.
However, the non-master IMS systems, to which OM routes the command, will
reject the command with the following return and reason code listed in the
following table:

Table 305. Return and reason code for GLOBAL keyword issued from the OM API

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000004'</td>
<td>X'00001000'</td>
<td>The command contained the GLOBAL keyword and was routed to more than one IMS system in the IMSPLEX. The non-master IMS systems will reject this command when OM routes the command to them. The master IMS system will process this command and use IRLM NOTIFY to route and process the command on the non-master IMS systems. See the discussion under the GLOBAL keyword.</td>
</tr>
</tbody>
</table>

LOCAL

Specifies that the command only applies to the subsystem in which the
command is entered. This command does not affect any other subsystem
sharing the database or area. LOCAL is the default.

NOPFA

Specifies that DBRC is not notified that the database or area has changed
status. You can use this keyword when you need to authorize the database for
use after it is offline, for example, for offline utilities. By using this keyword,
DBRC does not prevent further authorizations for the database or area. NOPFA
can be specified only with the GLOBAL keyword.

Recommendation: Before restarting the database or area, issue this command
without the NOPFA keyword to inform DBRC of the change in status for the
database or area.
Usage notes

Use the /DISPLAY AREA command to determine if the area is stopped or closed. If the area is stopped, the area must be made available using the /START AREA command. In z/OS, all the data sets are deallocated. If the system processes a /STOP AREA command during HSSP processing, the area will be released after the current commit processing completes. Any image copy option in effect at /STOP time can affect the continued system operation. All virtual storage option (VSO) DEDB areas that are being stopped and that are in a z/OS data space are removed from the data space and updates are written out to DASD.

The output of the /STOP AREA command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. For commands that specify GLOBAL, only the command master returns the asynchronous messages to OM. When a command is processed with the LOCAL keyword, all IMS systems are able to return the asynchronous messages to OM. The command response returned to OM contains one or more of the following messages as appropriate.

Fast Path messages: DFS140I, DFS170I, DFS0488I, DFS0666I, DFS1407I, DFS3062I, DFS3342I, DFS3720I, DFS3824I

/STOP AREA is not supported on an RSR tracking subsystem.

While the database is being quiesced, this command cannot be processed successfully.

Equivalent IMS type-2 commands

The following table shows variations of the /STOP AREA command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/STOP AREA command</th>

/STOP BACKUP

/STOP CLASS

/STOP CLASS command

The /STOP CLASS command prevents further scheduling of application programs for the designated class.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Examples” on page 839

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 309. Valid environments for the /STOP CLASS command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>CLASS</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

/STOP CLASS

Usage notes

All regions currently handling transactions assigned to the specific class are allowed to run until the limit count is reached (MPPs) or the input queue contains no more messages (BMPs and MPPs).
The region is not allowed to wait for the next message (wait-for-input mode). Instead a QC status code (no more messages) is returned to the application (MPPs).

If the region is already scheduled and waiting for the next message (wait-for-input mode) when the command is entered, the region is notified and a QC status code is returned to the application (MPPs).

A batch message processing region (BMP) scheduled against wait-for-input (WFI) transactions returns a QC status code (no more messages) for /PSTOP REGION, /DBD, /DBR, or /STA commands only.

**Examples**

The following is an example of the /STOP CLASS command:

Entry ET:
/STOP CLASS 3

Response ET:
DFS058I STOP COMMAND COMPLETED

Explanation: No further scheduling of application programs for class 3 transactions occurs. All message processing programs currently handling class 3 transactions are allowed to run until the processing limit count is reached or the input queue contains no more messages.

/STOP DATAGRP command

The /STOP DATAGRP command specifies groups of DL/I databases, Fast Path DEDBs, and Fast Path areas to be stopped.

Data groups are logical groupings of databases and areas; they enable simplified command processing for databases and areas. You define a data group in the RECON data set by using the INIT.DBDSSGRP command with parameters GRPNAME and DBGRP. DATAGRP is not valid on RSR tracking subsystems.

Subsections:
- “Environment”
- “Syntax” on page 840
- “Usage notes” on page 840
- “Equivalent IMS type-2 commands” on page 840

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>DATAGRP</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>LOCAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
Syntax

```
/STOP DATAGRPI datagroupname LOCAL
```

Usage notes

During /STOP DATAGRPI processing, all virtual storage option (VSO) DEDBs that are in a z/OS data space are removed from the data space and updates are written out to DASD.

Recommendation: Although you can use DBDS groups as well as DB groups for this command, you should use DB groups whenever possible to eliminate the overhead of converting the DBDS group to a DB group.

Equivalent IMS type-2 commands

The following table shows variations of the /STOP DATAGRPI command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/STOP DATAGRPI command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops a data group.</td>
<td>/STOP DATAGRPI datagrpname</td>
<td>UPDATE DATAGRPI NAME(datagrpname) STOP(SCHD)</td>
</tr>
</tbody>
</table>

Related reference:

“UPDATE DATAGRPI command” on page 971

/STOP DB command

The /STOP DB command prevents subsequently scheduled programs from accessing the database, without affecting currently scheduled programs or closing the database.

Subsections:

- “Environment”
- “Syntax” on page 841
- “Usage notes” on page 841
- “Equivalent IMS type-2 commands” on page 843
- “Examples” on page 843

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>

<tr>
<td>DB</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>GLOBAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
Table 312. Valid environments for the /STOP DB command and keywords  (continued)

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOCAL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NOPFA</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**

```
/STOP DB dbname
```

**Usage notes**

If the database is a DEDB or MSDB, programs using the database will not be scheduled. For other databases, the programs will still be scheduled but a call against the database will result in either a 3303 pseudoabend, or a BA status code, if the INIT call was issued.

The /STOP DB command deletes the randomizer routine from memory.

If the database is stopped after the region is scheduled, the region is not allowed to wait for the next message (wait-for-input mode). If there are no more messages available for the region to process, a QC status (no more messages) will be returned to the application (MPPs). If the region is already scheduled and waiting for the next message (wait-for-input mode) when the command is entered, the region is notified and a QC status code is returned to the application (MPPs).

A batch message processing region (BMP) scheduled against wait-for-input (WFI) transactions returns a QC status code (no more messages) for /PSTOP REGION, /DBD, /DBR, or /STA commands only.

In an IFP region, the /STOP command has no effect until the region is started again. Issuing a /STOP DB command with the ACCESS parameter is not valid for an MSBD.

The GLOBAL command is processed by the IMS system where the command was initiated. This system will process the command locally and then request IRLM NOTIFY to route and process the command on sharing IMS systems.

If global DB status is maintained, the global status maintained in RM is also updated. The global status is set to STOSCHD.

If the command is entered from OM API, the global status is updated by the command master IMS. If the command is not entered from OM API, the IMS that initiated the GLOBAL command updates the global status in RM.

If global status in RM is successfully updated, message DFS0988I for RSRCTYPE=DB is issued. If global status is not successfully updated, message DFS3308I is issued, indicating RM failure, and no command response lines are
Any RM error is traced to the OCMD trace table. Users can issue a QRY DB STATUS(GLOBAL) command to obtain the global status of the resources in RM.

The X'4C' log record for databases is updated to include both global status and global command time stamp.

For DBCTL, when CCTL schedules a PSB, the DBCTL thread SCHED request defines the thread as LONG or SHORT. If the database is currently scheduled to a LONG thread, the command is rejected; otherwise, the thread is allowed to complete before the database is acted upon. This results in either a commit point or transaction termination.

The output of the/STOP DB command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages as appropriate to the database type and the command completion.

- Full-function database messages: DFS132, DFS160, DFS216, DFS0488I, DFS1407, DFS2026, DFS3318I, DFS3466I
- Fast Path database messages: No unique messages are returned.

See the AREA keyword for a description of the LOCAL and NOPFA keywords.

When you enter this command, the database name can be an existing non-HALDB, a HALDB master, or a HALDB partition. A command against a HALDB partition operates exactly like a command against a non-HALDB except for the /START DB command and the UPDATE DB START(ACCESS) command. A HALDB partition is not allocated during the command unless it was previously authorized but not allocated, the OPEN keyword was specified, or the partition has EEQEs. The partition is allocated at first reference.

The HALDB partition reflects conditions such as STOPPED (shown as STOACC or STOSCHD or STOUPDS on QUERY DB), LOCKED, or NOTOPEN. When a HALDB partition is stopped, it must be explicitly started again. The type-1 commands with the keyword ALL, type-2 commands with NAME(*), and commands against a HALDB master do not change the STOPPED (shown as STOACC, STOSCHD or STOUPDS on QUERY DB) and LOCKED indicators in each HALDB partition.

When the command target is a HALDB master, processing acts on all HALDB partitions. For example, if the IMS command is /DBR on the HALDB master, all of the HALDB partitions are closed, deallocated, and deauthorized. On a /DISPLAY DB command, only the HALDB master displays STOPPED (each HALDB partition does not display STOPPED unless it was itself stopped). If a /DBR command was issued against a HALDB master, the display output of a /DISPLAY DB command shows the HALDB master (as STOPPED), but does not display the status of the partitions.

Each partition inherits the access limitations of its HALDB master. If the /DBD command is issued against a HALDB master, all of its partitions close. A subsequent reference to any of the partitions results in the partition opening for input, although the partition's access might be UPDATE or EXCLUSIVE. The DBRC authorization state reflects the limited access.

Restrictions:
1. The /STOP DB command is not supported on an RSR tracking subsystem.
2. The /STOP DB command cannot be processed against a HALDB partition on an IMS system while HALDB Online Reorganization (OLR) is running against that partition on the same IMS system.
3. While the database is being quiesced, this command cannot be processed successfully.

The /STOP DB command is not allowed for a database that is marked bad with the NOTINIT-48-REPOCHGLIST reason code because the IMS change list processing is not complete for the database or the change list processing failed.

**Equivalent IMS type-2 commands**

The following table shows variations of the /STOP DB command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/STOP DB command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops a database.</td>
<td>/STOP DB dbname</td>
<td>UPDATE DB NAME(dbname)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>STOP(SCHD)</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the /STOP DB command:

**Example 1 for /STOP DB command**

Entry ET:

/STOP DATABASE TREEFARM

Response ET:

DFS058I STOP COMMAND IN PROGRESS
DFS0488I STOP COMMAND COMPLETED. DBN=TREEFARM RC=0

Explanation: Database TREEFARM is stopped.

**Example 2 for /STOP DB command**

TSO SPOC input:

STO DB BANKATMS BANKTERM BANKLDGR BE3ORDER

TSO SPOC output:

SYS3  DFS0488I STOP COMMAND COMPLETED. DBN= BANKATMS RC= 0
SYS3  DFS0488I STOP COMMAND COMPLETED. DBN= BANKTERM RC= 0
SYS3  DFS0488I STOP COMMAND COMPLETED. DBN= BANKLDGR RC= 0
SYS3  DFS0488I STOP COMMAND COMPLETED. DBN= BE3ORDER RC= 0
IM33  DFS0488I STOP COMMAND COMPLETED. DBN= BANKATMS RC= 0
IM33  DFS0488I STOP COMMAND COMPLETED. DBN= BANKTERM RC= 0
IM33  DFS0488I STOP COMMAND COMPLETED. DBN= BANKLDGR RC= 0
IM33  DFS0488I STOP COMMAND COMPLETED. DBN= BE3ORDER RC= 0

OM API input:

CMD ( STO DB BANKATMS BANKTERM BANKLDGR BE3ORDER )

OM API output:
Explanation: The STOP command is routed from OM to the two active IMS systems - SYS3 and IMS3. The response from both IMS systems is returned to OM. The databases BANKATMS, BANKTERM, BANKLDGR, and BE3ORDER are stopped at both IMS systems.

- DFS2838I (Messages and Codes)

/STOP DC command

The /STOP DC command prohibits you from logging on to VTAM and ensures that all VTAM node sessions have terminated before IMS issues the DFS2111I message, which says the ACB is closed.

Subsections:

- "Environment" on page 845
- "Syntax" on page 845
• “Usage notes”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 314. Valid environments for the /STOP DC command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>DC</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

/STOP DC

Usage notes

There are two ACBs if MNPS for XRF is used. If you use XRF with MNPS, both the APPLID and MNPS ACB are closed. If you are not using XRF or using XRF without MNPS, there is only one ACB, the VTAM ACB, which is closed. APPLID ACB is the same as VTAM ACB.

The /STOP DC command can be used either before or after the /CLSDST NODE or /STOP NODE command, the only difference being that logons can still occur if the /STOP DC command is not entered. However, the command cannot start or complete processing if the VTAM ACBs (APPLID and MNPS) are not open or the VTAM nodes remain active. If the nodes are active, the /CLSDST NODE or /STOP NODE command must be issued to close the nodes; in some cases, a /IDLE NODE command can be issued to cause an OS VTAM VARY command to be issued against any nodes that remain connected.

/STOP DESC command

The /STOP DESC command defines the LU62 descriptors from DFS62DTx PROCLIB member to IMS.

Subsections:

• “Environment”
• “Syntax” on page 846

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 315. Valid environments for the /STOP DESC command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>DESC</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>
The /STOP LINE command stops message queuing for lines and stops the sending and receiving of messages over the lines. However, lines are not considered stopped unless they are stopped and idle. Use /DISPLAY LINE to verify line status.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Examples” on page 847

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP LINE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LINE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>PTERM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

The /STOP LINE PTERM command ensures that no input messages from any of the specified terminals assigned to the specified lines will be received by IMS after the command is issued.

The /STOP LINE command resets preset mode, test mode, response mode, lock pterm, lock lterm, pstop lterm, and purge lterm because these statuses are not significant and therefore are not kept after a /START LINE or restart.
Examples

The following are examples of the /STOP LINE command:

Example 1

Entry ET:
/STOP LINE 4,5,6,7,8,9,10,11

Response ET:
  DFS058I  STOP COMMAND COMPLETED

Response RT:
  DFS059I  TERMINAL STOPPED

Explanation: Lines 4, 5, 6, 7, 8, 9, 10, and 11 and their associated physical terminals are stopped.

Example 2

Entry ET:
/STOP LINE 4 8 900

Response ET:
  DFS058I  STOP COMMAND COMPLETED EXCEPT LINE 900

Response RT:
  DFS059I  TERMINAL STOPPED

Explanation: Lines 4 and 8 and their associated physical terminals are stopped. 900 is an invalid line number.

Example 3

Entry ET:
/STOP LINE 4 PTERM 1, 2

Response ET:
  DFS058I  STOP COMMAND COMPLETED

Response RT:
  DFS059I  TERMINAL STOPPED

Explanation: Physical terminals 1 and 2 on line 4 are stopped.

/STOP LTERM command

The /STOP LTERM command specifies the LTERM that is to be stopped. The /STOP LTERM command with a logical terminal that is in a QLOCKED state does not reset the QLOCK state, but puts the LTERM in a STOPPED and QLOCKED state.

Subsections:
  • “Environment” on page 848
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 317. Valid environments for the /STOP LTERM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LTERM</td>
<td>X</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/STOP LTERM
LTERM Itermname
LTERM Itermname*
ALL
```

Usage notes

If IMS internally resets the QLOCK condition, the LTERM remains in a STOPPED state. (QLOCK indicates that the LTERM is locked from sending any further output or from receiving input that can create additional output for the same LTERM until the state is reset by a specific request received on the session.)

The /STOP LTERM command is rejected for remote logical terminals.

The LTERM parameter can be generic where the generic parameter specifies LTERMs that already exist.

When a specific Iterm name is specified in the command, IMS creates the Iterm if it does not exist and ETO is enabled.

If global resource information is kept in Resource Manager, the /STOP LTERM command stops messages from being queued to the Iterm anywhere in the IMSplex and the change is reflected both in Resource Manager and in the local IMS system.

Examples

The following is an example of the /STOP LTERM command:

Entry ET:
/STOP LTERM APPLE, TREE, FRUIT

Response ET:
DFS058I STOP COMMAND COMPLETED

Response RT:
DFS059I TERMINAL STOPPED

Explanation: Logical terminals APPLE, TREE, and FRUIT are stopped.

/STOP LUNAME command

The /STOP LUNAME command specifies a particular LU name that is to be stopped.

Subsections:
- "Environment"
- "Syntax"
- "Usage notes"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 318. Valid environments for the /STOP LUNAME command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>INPUT</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>LUNAME</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>OUTPUT</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

Specifying the keyword INPUT with the LUNAME keyword stops an LU name for any input and synchronous outbound activities. Specifying the parameter ALL with INPUT causes all future LU 6.2 input and synchronous outbound activities to be stopped as well.

Specifying the keyword OUTPUT with the LUNAME keyword stops an LU name for any asynchronous outbound activities. Specifying the parameter ALL with OUTPUT causes all future LU 6.2 asynchronous outbound activities to be stopped as well.

Specifying neither INPUT nor OUTPUT is the same as specifying both INPUT and OUTPUT. The LU name is stopped for any input, and both synchronous and
asynchronous outbound activities. Specifying the parameter ALL in this case stops all future LU 6.2 inbound activities, synchronous and asynchronous outbound activities.

A network-qualified LU name is optional for the LUNAME keyword. If the LU name is not network-qualified and no TP name is specified, all network-qualified LU names whose LU names match the LU name specified are also stopped.

The /STOP LUNAME TPNAME command stops a particular TP name of the LU name specified. The keyword OUTPUT is the default for this command.

If the specified resource does not exist, a structure is created to retain the status.

Command keywords and their synonyms (Commands)

### /STOP MADSIOT command

The /STOP MADSIOT command allows users to disable the MADS I/O timing function in a MADS I/O timing enabled environment.

Subsections:

- "Environment"
- "Syntax"
- "Usage notes"

#### Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>MADSIOT</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

#### Syntax

```
/STOP MADSIOT
```

#### Usage notes

When /STOP MADSIOT completes normally, the following message is returned to the operator's console:

```
DFS12761 MADS I/O TIMING FUNCTION STOPPED SUCCESSFULLY
```

/START MADSIOT allows users to resume the MADS I/O timing function.

If MADS I/O Timing list structure is not defined in DFSVSMxx, the command will be rejected. If MADS I/O Timing function is already disabled, the command will be ignored. If MADS I/O Timing function is enabled and all sharing partners successfully disconnect from MADS I/O Timing list structure on the coupling
facility, the command will complete successfully; if any sharing partners fails to disconnect to MASD I/O Timing list structure, the command will fail.

The output of the /STOP MADSIOT command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages as appropriate.

Fast Path messages: DFS0023I, DFS0008I, DFS1271I, DFS1276I, DFS1275E, DFS1219E

/STOP MSNAME command

The /STOP MSNAME command stops the sending of all messages (primary requests) from a terminal except those continuing a conversation. This includes all messages destined for remote transactions with the SYSID of the MSNAME and for remote logical terminals associated with this MSNAME.

Subsections:
- “Environment”
- “Syntax”
- “Examples”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>MSNAME</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP MSNAME msname
```

Examples

The following is an example of the /STOP MSNAME command:

Entry ET:

/STOP MSNAME BOSTON

Response ET:

DFS058I STOP COMMAND COMPLETED

Explanation: The logical link path associated with the name BOSTON is stopped.
Related reference:

"UPDATE MSNAME command" on page 1153

/STOP NODE command

The /STOP NODE command specifies the VTAM node to be stopped and logged off. The NODE parameter can be generic if the USER keyword is not specified and applies to nodes that already exist.

Subsections:

- "Environment"
- "Syntax"
- "Usage notes"
- "Examples" on page 853

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>NODE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

The /STOP NODE command prevents future logons until a /START NODE command is issued.

/STOP NODE without the USER keyword is supported for nodes that do not yet exist. It causes the node to be created and stopped which prevents the dynamic node from logging on. /STOP NODE without the USER keyword affects all half-sessions of the specified node.

/STOP NODE USER is valid for ISC and non-ISC nodes and users; however the user must still be allocated or signed on to the node. /STOP NODE USER for ISC nodes stops the named half-session defined in USER username for NODE nodename.
Restrictions for using NODE and USER parameters together:

- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- /STOP NODE USER commands are valid for ISC and non-ISC nodes and users.

/STOP NODE resets preset mode, test mode, lock node, lock lterm, pstop lterm, and purge lterm, because these statuses are not significant and therefore are not kept after a logon or restart. For Fast Path input response mode, you must also issue the /START NODE command before the mode is reset. The /STOP NODE command also takes other actions depending on the recovery settings for the node:

RCVYSTSN=NO
/STOP NODE acts like a /CHANGE NODE COLDSESS command for FINANCE and SLUP nodes by setting the session status to 'cold'. /STOP NODE acts like a /QUIESCE NODE command for ISC (LU6.1) nodes by initiating the shutdown and deallocating the user for the specified node. This action changes the session status to 'cold'. With these actions taken by the /STOP NODE command, the next session initiation request for this node is allowed to again attempt a session cold start (after a /START NODE command has been entered).

RCVYCONV=NO
/STOP NODE causes any IMS conversations (active and held) to be terminated. Any conversational message that is queued or being processed will have its output response message delivered asynchronously.

RCVYFP=NO
/STOP NODE causes Fast Path status and messages to be discarded

RCVYRESP=NO
/STOP NODE resets full-function response mode.

If global resource information is kept in Resource Manager, the /STOP NODE command sets a global stop status for the node and prevents the node from logging on anywhere in the IMSplex. If global resource information is not kept in Resource Manager, /STOP NODE creates the node, if it does not exist in an ETO environment, and sets stop status for the local node. If the node does not exist in a non-ETO environment, the /STOP NODE command is rejected.

Examples

The following is an example of the /STOP NODE command:

Entry ET:
/STOP NODE HARRY

Response ET:
DFS058I STOP COMMAND COMPLETED

Explanation: The physical terminal associated with node HARRY is disconnected (/CLSDST) and further logons are prevented.
/STOP OLDS command

The /STOP OLDS command indicates that IMS is to stop using an OLDS log data set.

Subsections:
- "Environment"
- "Syntax"
- "Keywords"
- "Usage notes"
- "Examples"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP OLDS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP OLDS olds#
```

Keywords

The following keyword is valid for the /STOP OLDS command:

**olds#**

Identifies an OLDS that is defined by JCL or a DFSMDA macro and is currently started. olds# must be 00 through 99.

Usage notes

The stopped OLDS will be dynamically deallocated when it is no longer possible for it to be accessed for dynamic backout.

If in dual mode, both primary and secondary OLDSs are stopped. If there are only two OLDS data sets available, or if the specified OLDS is the one currently being used for output, the /STOP OLDS command will be rejected.

Examples

The following is an example of the /STOP OLDS command:

Entry ET:
/STOP OLDS 09

Response ET:
/STOP OTMA command

The /STOP OTMA command causes IMS to leave the z/OS cross-system coupling facility (XCF) group for IMS Open Transaction Manager Access (OTMA).

Subsections:
- "Environment"
- "Syntax"
- "Usage notes"
- "Examples"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 323. Valid environments for the /STOP OTMA command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP OTMA</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP OTMA
```

Usage notes

/STOP OTMA command processing is as follows:
1. IMS leaves the XCF group.
2. For any IMS OTMA output awaiting an ACK message, IMS aborts the message. For Commit-then-Send transactions, the output remains enqueued to the transaction pipe. For Send-then-Commit transactions, IMS aborts the transaction.

When the /STOP OTMA command is issued, it will clear or reject all the ICAL messages for all the transaction pipes. However, the /STOP OTMA command does not halt processing for the DFSYICAL tmember for synchronous program switching. To clear a wait state for a synchronous program switch request, use the /PSTOP or /STOP REGIN ABDUMP command.

Examples

The following is an example of the /STOP OTMA command:

Entry ET:
The /STOP PGM command specifies the application program that is to be stopped.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Equivalent IMS type-2 commands”
- “Examples” on page 857

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 324. Valid environments for the /STOP PGM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP PGM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>PGM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Example syntax diagram:

```
/STOP PGM pgmname

/STO ALL
```

Usage notes

The /STOP PGM command does not stop CPI Communications driven transaction programs.

The /STOP PGM command is not allowed for a program that is marked bad with the NOTINIT-57-REPOCHGLIST reason code because the IMS change list processing is not complete for the program or the change list processing failed.

Equivalent IMS type-2 commands

The following table shows variations of the /STOP PGM command and the IMS type-2 commands that perform similar functions.
Table 325. Type-2 equivalents for the /STOP PGM command

<table>
<thead>
<tr>
<th>Task</th>
<th>/STOP PGM command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops program scheduling.</td>
<td>/STOP PGM pgmname</td>
<td>UPDATE PGM NAME(pgmname) STOP(SCHD)</td>
</tr>
</tbody>
</table>

**Examples**

The following is an example of the /STOP PGM command:

Entry ET:
/STOP PROGRAM APPLETRE

Response ET:
DFS058I STOP COMMAND COMPLETED

Explanation: Application program APPLETRE is stopped.

Related reference:
“UPDATE PGM command” on page 1201

/STOP REGION command

Use the /STOP REGION command to stop IMS regions, application programs, or both. /STOP REGION is not mirrored on the XRF alternate system. You must enter this command on the alternate system if you want it to affect the alternate system.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 858
- “Examples” on page 859

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

</tr>
<tr>
<td>TRANSACTION</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**
Keywords

The following keywords are valid for the /STOP REGION command:

REGION reg#

Is used to terminate one or more message processing regions at the conclusion of processing the current transaction. The region identifier is reg#.

/STOP REGION reg# can also be used to terminate Fast Path regions. /STOP REGION reg# cannot be used to terminate batch regions.

A Fast Path utility region is terminated at the next system checkpoint of the utility.

REGION reg#–reg#

Is used to terminate a range of message processing regions at the conclusion of processing the current transaction.

REGION reg# ABDUMP tranname

Causes abnormal termination of an application program.

The region identifier is reg# and the transaction code is tranname.

If the transaction indicated by tranname is currently running in REGION reg#, an error message is received at the master terminal, indicating an application program abend. The region will remain active, but the transaction will be stopped. The command is ignored if the transaction is not currently scheduled in region reg#.

/STOP REGION reg# ABDUMP should be used only for a region that appears to be looping or in a wait state. If this command does not abnormally terminate the application running in a region, the /STOP REGION reg# CANCEL command can be used. This might cause the control region to terminate with abend 113 if parallel DL/I is being used. See /STOP REGION reg# CANCEL for further warnings.

If the /CHECKPOINT command cannot shut down IMS because a message processing region appears to be active, but the region is no longer active in the system (a condition commonly referred to as a phantom region), the /STOP REGION reg# ABDUMP command can be used to correct the situation. In this case, the /STOP REGION reg# ABDUMP command detects that the region is no longer active and cleans the internal IMS entries for the nonexistent region, which allows the shut down process to proceed normally.

If a message processing region experiences a catastrophic failure and abnormally terminates and a /DISPLAY ACTIVE REGION shows the region is still defined to IMS, the /STOP REGION reg# ABDUMP command can be used...
to correct the situation. In this case, the /STOP REGION reg# ABDUMP command detects the region is no longer active and cleans the internal IMS entries for the nonexistent region.

The tranname variable is not valid for batch, IFP, or Fast Path utility regions.

**REGION reg# TRANSACTION tranname**

Stops a message processing program in wait-for-input (WFI) mode from processing within the specified region.

The region identifier is reg# and the transaction code is tranname.

If the transaction indicated by tranname is currently running in region reg#, the IMS message DFS0569I is received at the master terminal, indicating that a QC status code (no more messages) was returned to the application program (MPPs). The region that contained the application is still active and the transaction is not stopped. A batch message processing program in WFI mode must be stopped using the /PSTOP command.

A batch message processing region (BMP) scheduled against wait-for-input (WFI) transactions returns a QC status code (no more messages) for, /PSTOP REGION, /DBD, /DBR, or /STA commands only.

**REGION reg# CANCEL**

Is used if the region cannot be stopped with a /STOP REGION ABDUMP command and must be preceded by a /STOP REGION ABDUMP command.

The region identifier is reg#.

Using the /STOP REGION CANCEL command can cause the IMS control region to terminate with user abend 113 if parallel DL/I is being used. A z/OS CANCEL command will be rejected.

**REGION JOBNAME**

Identifies regions to be stopped by their job names. The job name must be 1-8 alphanumeric or national ($,#,@) characters. The first character of the job name must be either alphabetic or national.

**Examples**

The following are examples of the /STOP REGION command:

**Example 1 for /STOP REGION command**

/STOP RTC command

Use the /STOP RTC command to specify that transactions associated with this routing code are not processed.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Equivalent IMS type-2 commands”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 327. Valid environments for the /STOP RTC command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP RTC</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP/RTC
```

Usage notes

The /STOP RTC command is not allowed for a routing code that is marked bad with the NOTINIT-07-REP0CHGLIST reason code because the IMS change list processing is not complete for the routing code or the change list processing failed.

Equivalent IMS type-2 commands

The following table shows variations of the /STOP RTC command and the IMS type-2 commands that perform similar functions.

Table 328. Type-2 equivalents for the /STOP RTC command

“UPDATE RTC command” on page 1250

/STOP SB command

Use the /STOP SB command to disallow further use of sequential buffering. /STOP SB does not affect sequential buffering applications scheduled before this command was issued.

Subsections:
• “Environment”
• “Syntax”
• “Examples”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 329. Valid environments for the /STOP SB command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP SB</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP SB
```

Examples

The following is an example of the /STOP SB command:

Entry ET:
/STOP SB

Response ET:
DFS058 STOP COMMAND COMPLETED

Entry ET:
/DISPLAY POOL DBAS

Response ET:

```
SEQUENTIAL BUFFERING: STATUS = STOPPED
MAX N.A. FREE N.A. CURR 0K HIGH 320K
DATABASE BUFFER POOL: SIZE 67584
  REQ1 0 REQ2 0 READ 0 BISAM 0 WRITES 0
  KEYC 0 LCYL 0 PURG 0 OWNRR 0 ERRORS 00/00
DATABASE BUFFER POOL: BSIZE 12288
  RRBA 0 RXEY 0 BFALT 0 NREC 0 SYN PTS 0
  NDBUF 29 WRDS 0 FOUND 0 VWTS 0 ERRORS 00/00
```
/STOP SERVGRP command

Use the /STOP SERVGRP command to stop communications between the service group in an RSR complex at which the command was entered and the service group at the other site. /STOP SERVGRP also severs the relationship between the IMS subsystem and the TMS subsystem.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP SERVGRP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP SERVGRP
```

Usage notes

Once communications are stopped, the logger stops sending log data to the RSR tracking subsystem. No more attempts to re-establish failed conversations are made at OLDS switch. The /STOP SERVGRP command is normally not needed. The /STOP SERVGRP command is valid from an active subsystem and a tracking subsystem.

Successful completion of the syntax checking of the /STOP SERVGRP command results in the DFS058 STOP COMMAND COMPLETED message, although processing of the command continues asynchronously.

/STOP SLDSREAD command

The /STOP SLDSREAD command indicates whether IMS is enabled to retrieve records from both a system log data set (SLDS) and OLDS or OLDS only. The default is that SLDSREAD is enabled.

Subsections:
- “Environment” on page 868
- “Syntax” on page 868
**Usage notes**

If the SLDSREAD process is active, issuing the /STOP SLDSREAD command causes a U4095 symptom dump to be taken, and the SLDSREAD processing is stopped. This abend is not fatal, and IMS continues to function normally. Any backout processes that were active have to be backed out manually by using the batch backout utilities.

If the SLDSREAD process is not active, issuing the /STOP SLDSREAD command prevents any SLDSREAD processes from being started if an SLDS should be needed for backout processing. Use the batch backout utilities to back out any application programs that failed.

**/STOP SUBSYS command**

Use the /STOP SUBSYS command to specify the name of the external subsystem whose connection is to be terminated.

Subsections:
- “Environment”
- “Syntax” on page 869
- “Usage notes” on page 869
- “Examples” on page 869

**Environment**

<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SUBSYS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```
/STOP SUBSYS subsysname
```

Usage notes

The /STOP SUBSYS command does enable application programs currently accessing external resources to complete normally. When those applications have terminated, the connection to the subsystem will also terminate. The application must complete all message processing before actual connection termination. The next occurrence of an external subsystem call will receive a nonzero return code, indicating the connection is not available. A /START command is then necessary to reestablish the connection.

The /STOP SUBSYS command can also be used to dynamically reconfigure existing subsystem definitions. The operator can issue the /STOP SUBSYS command, change or add to the PROCLIB member, and then issue the /START SUBSYS command. IMS attempts to connect those subsystems defined in the PROCLIB member.

If system failure occurs after the /STOP SUBSYS command is processed, the stopped status is still set.

Examples

The following are examples of the /STOP SUBSYS command:

**Example 1**

Entry ET:

```
/STOP SUBSYS ALL
```

Response ET:

```
DFS058I  STOP COMMAND IN PROGRESS
```

Explanation: IMS has initiated the termination of the connection. When all dependent regions have terminated their connections, IMS will complete the termination. It is likely that an external subsystem message indicating connection termination will be received at this time.

**Example 2**

Entry ET:

```
/STOP SUBSYS XXX1 XXX3
```

Response ET:

```
DFS058I  STOP COMMAND IN PROGRESS
```

Explanation: IMS has initiated the termination of the connection. When all dependent regions have terminated their connections, IMS will complete the
termination. It is likely that an external subsystem message indicating connection termination will be received at this time

/STOP SURV command

Use the /STOP SURV command in an XRF environment to stop the operation of the IMS surveillance function.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 333. Valid environments for the /STOP SURV command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP SURV</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
[STOP SURV

ALL

LNK

LOG

RDS
```

Keywords

The following keywords are valid for the /STOP SURV command:

ALL

The same as specifying LNK, LOG, and RDS. This is the default.

LNK

ISC link.

LOG

System log.

RDS

Restart data set.

/STOP THREAD command

Use the /STOP THREAD command to stop an inactive CCTL thread. The DEDB utility region is terminated at the next system checkpoint.

Subsections:

- “Environment” on page 871
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 334. Valid environments for the /STOP THREAD command and keywords

<td>X</td>
</tr>
<tr>
<td>THREAD</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>TRANSACTION</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP
/STO THREAD reg#

ABDUMP tranname
TRANSACTION tranname
CANCEL
```

Keywords

For information about the keywords that are valid for the /STOP THREAD command, see the description about the same keywords under the /STOP REGION command.

Usage notes

The /STOP THREAD command is not valid for:

- Active CCTL threads
- BMPs

The THREAD ABDUMP command abnormally ends BMPs and DEDB utilities. If this command is used with CCTL threads, a U0474 abend results.

Examples

The following are examples of the /STOP THREAD command:

Example 1

Entry ET:

/DISPLAY A REGION
Response ET:

REGID JOBNAME TYPE TRAN/STEP PROGRAM STATUS CLASS
  BATCHREG  BMP  NONE

“/STOP REGION command” on page 857

/STOP TMEM command

Use the /STOP TMEM command to cause IMS to send an Open Transaction Manager Access (OTMA) command to OTMA clients to request that input be suspended for the specified transaction pipe name.

Subsections:

- “Environment”
- “Syntax” on page 874
- “Keywords” on page 874
- “Usage notes” on page 875
- “Examples” on page 875

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Table 335. Valid environments for the /STOP TMEM command and keywords (continued)

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>TMEM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>TPIPE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
/STOP
/STO
TMEM

Tmembername

TPIPE

ALL

TPipe

Tmembername

ALL

```

**Keywords**

The following keyword is valid for the /STOP TMEM command:

**TPIPE**

When used with the /STOP command, TPIPE causes IMS to send an OTMA command to its OTMA clients to request that the input be suspended for the specified transaction pipe. IMS then stops sending output to the OTMA client. If the member specified is a super member, output is suspended for the super member’s transaction pipe, but no OTMA command is sent. If the member specified is a regular member whose hold queue output is managed by a super member, IMS suspends output from the specified member’s transaction pipe and it also suspends output from the super member’s transaction pipe. An OTMA command is sent to the regular member's OTMA client. Output is only suspended on the IMS that processes the command. If output cannot be suspended for both the regular member’s transaction pipe and the super member’s transaction pipe, it is not suspended for either transaction pipe. The DFS058I COMMAND COMPLETED EXCEPT message is issued with the name of the regular member for which output could not be suspended.

While processing the /STOP TMEMBER TPIPE command, IMS creates a temporary transaction pipe (if one does not already exist) with the stopped status. IMS sets the synchronization status for this transaction pipe when it sends or receives the first message for the transaction pipe.

While processing the /STOP TMEMBER TPIPE command, OTMA checks for wait status (WAIT_A, WAIT_H, WAIT_R, and WAIT-SYNCPPOINT) for the messages using the tpipe. If a wait status is found, OTMA clears the wait status by generating an internal NAK message. This NAK message for a send-then-commit (CM1) response will cause a U0119 pseudoabend for the transaction. However, the NAK message for a commit-then-send (CM0) response will wash back the response to the tpiper queue. The message in the tpiper queue can be retrieved again later.

After a /STOP TMEMBER xxx TPIPE ALL command is issued, newly created tpipes will not be stopped for either input or output.

The /STOP TMEMBER xxx TPIPE xxx command will not create a temporary tpiper if the tmember does not exist (DFS058I STOP COMMAND COMPLETED EXCEPT TPIPE xxx will be issued).
Usage notes

You can stop any number of individual tmembers or all tmembers. IMS then stops sending output to the OTMA client and prevents any further output from being sent to the client.

When the /STOP TMEM TPIPE command is issued, it will clear the wait states of all messages for the transaction pipe.

You can issue the /STOP TMEM command to the DFSYICAL OTMA member to halt synchronous program switch processing. After the DFSYICAL tmember is stopped, all subsequent DL/ICAL calls made to initiate a synchronous program switch are rejected. The requesting application will receive the AIB return code X'00000100' with the reason code X'00000110' and the extended reason code X'00000005'.

Examples

The following is an example of the /STOP TMEM command:

Entry ET:
/STO TMEMBER CLIENT1 TPIPE TPIPESY

Response ET:
DFS058I 15:38:03 STOP COMMAND COMPLETED SYS3
DFS996I *IMS READY* SYS3

/STOP TRAN command

Use the /STOP TRAN command to stop the queuing and scheduling of messages destined for a transaction or class of transactions, or to stop transaction scheduling by class. However, output can still be queued if it originates from the application program.

The /STOP TRAN command stops the scheduling of transactions; however, the transactions will continue to be processed until the limit count is reached. If the limit count is large, the processing interval will be long.

Subsections:

</thead>
<tbody>
<tr>
<td>CLASS</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>TRAN</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

If the region is already scheduled and waiting for the next message (wait-for-input mode) when the command is entered, a QC status (no more messages) is returned to the application (MPPs). If there are no more messages available for the region to process, the region is not allowed to wait for the next message. Instead, a QC status is returned to the application (MPPs).

A batch message processing region (BMP) scheduled against wait-for-input (WFI) transactions returns a QC status code (no more messages) for /PSTOP REGION, /DBD, /DBR, or /STA commands only.

In a shared-queues environment, if you issue a /STOP TRAN command for a transaction that is not defined on that IMS subsystem, IMS creates an SMB if the Output Creation user exit routine indicates the destination is a valid transaction. The SMB is marked as “dynamic”.

A dynamic SMB created by a /STOP TRAN command can only be used to queue messages for the transaction and place the messages on the shared queues. The transaction cannot be scheduled or assigned. IMS does process checkpoints for the transaction, but does not save them across an IMS restart if they do not have a valid status.

In a shared-queues environment, the /STOP TRAN command will result in IMS deregistering interest for the transaction, which indicates that the transaction cannot be scheduled at that IMS.

The /STOP TRAN command is not allowed for a transaction that is marked bad with the NOTINIT-15-REPOCHGLIST reason code because the IMS change list processing is not complete for the transaction or the change list processing failed.

Equivalent IMS type-2 commands

The following table shows variations of the /STOP TRAN command and the IMS type-2 commands that perform similar functions.
Table 337. Type-2 equivalents for the /STOP TRAN command

<table>
<thead>
<tr>
<th>Task</th>
<th>/STOP TRAN command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stops the queuing and scheduling of</td>
<td>/STOP TRAN tranname</td>
<td>UPDATE TRAN NAME(tranname)</td>
</tr>
<tr>
<td>messages destined for a transaction.</td>
<td>STOP Q, SCHD</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following are examples of the /STOP TRAN command:

Example 1 for /STOP TRAN command

Entry ET:
/STOP TRANSACTION ALL CLASS 6

Response ET:
DFS058I STOP COMMAND COMPLETED

Explanation: All transactions associated with class 6 will be marked as stopped and all class 6 transactions are no longer available for scheduling. All message processing regions currently processing class 6 transactions are allowed to run until the processing limit count is reached or the input queue contains no more messages.

Example 2 for /STOP TRAN command

Entry ET:
/STOP TRANSACTION PIT, SEED

Response ET:
DFS058I STOP COMMAND COMPLETED

Explanation: Transaction codes PIT and SEED are stopped.

Related reference:
“UPDATE TRAN command” on page 1263

/STOP USER command

The /STOP USER command requires the ISC user to stop or the signed on user to stop and sign off. The USER parameter can be generic and applies only to users that already exist.

Subsections:
- “Environment”
- “Syntax” on page 878
- “Usage notes” on page 878
- “Examples” on page 879

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.
Table 338. Valid environments for the /STOP USER command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/STOP USER</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**

```
/STOP USER
```

**Usage notes**

For ISC users, the /STOP USER command specifies the ISC user that is to be made unavailable for allocation until a /START USER command is issued.

For signed on users, the /STOP USER command should specify the user structure name to prevent future signons until a /START USER command is issued.

The /STOP USER command is supported for users that do not yet exist. It causes the user to be created and stopped, which prevents the dynamic user from signing on.

The /STOP USER command will not cause the user to be signed off if the associated node is not active or the associated node is not in session.

The /STOP USER command for an ETO user session resets status that is not significant such as preset mode, test mode, lock lterm, pstop lterm, and purge lterm. For Fast Path input response mode, you must also issue the /START USER command before the mode is reset.

The /STOP USER command for ETO users also takes other actions depending on the recovery settings for the user:

- **RCVYCONV=NO**
  
  /STOP USER causes any IMS conversations (active and held) for an ETO user to be terminated. Any conversational message that is queued or being processed will have its output response message delivered asynchronously.

- **RCVYFP=NO**
  
  /STOP USER causes Fast Path status and messages for an ETO user to be discarded.

- **RCVYRESP=NO**
  
  /STOP USER resets full-function response mode.

If global resource information is kept in Resource Manager, the /STOP USER command sets a global stop signon status for the user and prevents the user from signing on anywhere in the IMSplex. If global resource information is not kept in Resource Manager, /STOP USER creates the user, if it does not exist in an ETO environment, and sets stop status for the local user. If the user does not exist in a non-ETO environment, the /STOP USER command is rejected.
Examples

The following is an example of the /STOP USER command:

Entry ET:
/DISPLAY USER IMS*

Response ET:

<table>
<thead>
<tr>
<th>USER</th>
<th>ENQCT</th>
<th>DEQCT</th>
<th>QCT</th>

<tbody>
<tr>
<td>/STOP VGR</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>VGR</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/STOP VGR
```

Usage notes

While this command prevents VTAM from routing new sessions using a generic resource name to the IMS subsystem, it does not affect existing sessions, and affinities remain (until terminated through normal processing).

/STOP WADS command

Use the /STOP WADS command to indicate that a WADS is to be removed from the pool of available WADS. IMS does not enable the active WADS (if WADS mode is single), or the active WADS pair (if WADS mode is dual), to be stopped. wads# must be 0 through 9.

Subsections:
- “Environment”
- “Syntax”

Environment

<tr>
<td>SYSTEM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>WADS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

/SWITCH for an active XRF subsystem

/SWITCH for an alternate XRF subsystem
Keywords

The following keywords are valid for the /SWITCH command:

**SYSTEM**
Requests a takeover by the alternate system from the current active system in an XRF environment.

/SWITCH SYSTEM without the FORCE keyword causes the active system to attempt to gracefully quiesce before the alternate system becomes active. System activity currently in progress is allowed to complete. New activity is queued. This disables surveillance on the active system, but not the alternate. Therefore, surveillance (if enabled) will eventually trigger a takeover if it does not eventually quiesce.

Unless the optional FORCE keyword is specified, the command is only operable when entered on the active system.

**FORCE**
Causes an immediate termination of the active system, forcing the alternate system to become the active.

**ABDUMP**
Results in a diagnostic dump of the active system when entered from either the active system or the alternate system (if it is on the same processor as the active system).

**ACTIVE, BACKUP**
Indicates the system on which the command is being entered. The keyword ACTIVE is required when the command is entered on an active system. The keyword BACKUP is optional when the command is entered on an alternate system. /SWITCH SYSTEM FORCE, without the ACTIVE keyword, can only be entered on an alternate system. This prevents the inadvertent abend of a newly created active system that is mistakenly assumed to still be the alternate system.

**OLDS, CHECKPOINT**
Causes switching of the active log data set. This log switch capability is identical to that provided with /DBDUMP and /DBRECOVERY commands. You can specify the CHECKPOINT keyword to take a simple checkpoint after the active log data set has been switched to the next OLDS. The /SWITCH OLDS CHECKPOINT command operates in all IMS environments.

**WADS**
Causes switching of the active write-ahead log data set. If you are using dual logging for the WADS, this command causes IMS to use the next available WADS pair.

This command is rejected if no unused WADS is available, or for dual logging, if no unused pair of WADS is available.
Examples

The following are examples of the /SWITCH command:

Example 1 for /SWITCH command

Entry ET:
/SWITCH OLDS

Response ET:
DFS3257I ONLINE LOG NOW SWITCHED
DFS058I 17:10:51 SWITCH COMMAND COMPLETED

Entry ET:
/SWITCH OLDS CHECKPOINT

Response ET:
DFS3257I ONLINE LOG NOW SWITCHED - FROM DFSOLP01 TO DFSOLP02
DFS058I 17:12:53 SWITCH COMMAND COMPLETED

DFS2719I MSDB CHECKPOINT WRITTEN TO MSDBCP2
DFS994I *CHKPT 91057/171254**SIMPLE*
DFS3499I ACTIVE DDNAME: MODBLKSA IMSACBA FORMATA MODSTAT ID: 1
DFS3804I LATEST RESTART CHKPT: 91057/132000, LATEST BUILDQ CHKPT: 91057/132414

Example 2 for /SWITCH command

Entry ET (Master Terminal for active system IMSA):
/SWITCH SYSTEM FORCE

Response ET:
A response message is not returned for the /SWITCH SYSTEM FORCE command. Any further input to the master terminal of the active system is inhibited.

Response RT (z/OS console for active system IMSA):

The z/OS console for the active system will show a user 0604 abend in progress for IMSA. If the ABDUMP keyword had been included on the /SWITCH command, the 0604 abend would be accompanied by a diagnostic dump of the active system.

Response RT (master terminal for alternate system IMSB):

The following figure is a screen that shows some of the messages associated with the beginning of takeover on the alternate system.
Intermediate screens are not shown. They would indicate such takeover functions as:

- Enabling of dependent region processing
- IRLM takeover
- Backout processing
- Draining of suspend queue
- Session switching

The following figure is a screen that show takeover is complete.

**Figure 1. Alternate system at start of takeover**

Takeover is complete and the alternate system is now an active system. The XRF environment status line indicates that the newly created active system is running in I/O toleration mode (awaiting I/O prevention).

**Figure 2. Newly created active system after takeover**

**Related concepts:**
Takeover phase of the XRF process (System Administration)
Chapter 26. TERMINATE commands

Use the TERMINATE commands to terminate a global online change or to stop one or more HALDB OLRs that are in progress.

- “TERMINATE OLC command”
- “TERMINATE OLREORG command” on page 901

TERMINATE OLC command

When the TERMINATE OLC (stop online change) command is issued by an IMS command master that is running with RM services (RMENV=Y), the command terminates a global online change and coordinates with all of the IMS systems in the IMSPlex.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “TERMINATE OLC error handling” on page 890
- “Output fields” on page 892
- “Return, reason, and completion codes” on page 893
- “Examples” on page 899

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the TERMINATE OLC command can be issued.

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>TERMINATE OLC</td>
<td>x</td>
<td>x</td>
<td>x</td>
</tr>
</tbody>
</table>

Syntax

```plaintext
TERMINATE OLC
```

Usage notes

If an IMS is not running with RM services (RMENV=N), the TERMINATE OLC command terminates an online change for that IMS only. If an IMS system is not running with RM, each IMS must have a unique OLCSTAT data set which cannot be shared. If the OLCSTAT data set contains the name of an IMS other than the one that is processing the online change, TERMINATE OLC is rejected because the OLCSTAT data set is invalid for the environment. To determine which IMS member names are invalid, issue the QUERY OLC command to display the contents of the OLCSTAT data set. You can use the OLC utility, DFSUOLC0, to correct the data set.
Each IMS system that does not have RM services and participates in global online change, must separately issue the TERMINATE OLC command. In a non-RM environment, if more than one IMS is specified in the route list for the TERMINATE OLC command or the default of route all is specified, online change is only performed for the IMS command master. To determine which IMS systems are defined with RMENVNO, issue a QUERY MEMBER SHOW(ATTRIB) command.

This command can be specified only through the OM API. OM sends the TERMINATE OLC command to an IMS in the IMSplex.

This command can be issued to an IMSplex using the Batch SPOC utility.

The TERMINATE OLC command can be used to abort an IMSplex-wide global online change initiated by a INITIATE OLC PHASE(PREPARE) command, before the online change is successfully committed with a INITIATE OLC PHASE(COMMIT) command.

The TERMINATE OLC command can be used to abort an online change after an INITIATE OLC PHASE(COMMIT) failure that occurs before the OLCSTAT data set is updated. Once the commit process has updated the OLCSTAT data set, the online change is considered to be successful and cannot be aborted.

A TERMINATE OLC command that aborts a global online change is similar to the /MODIFY ABORT command, except that it applies to all of the IMS systems in an IMSplex that are participating in the global online change. The TERMINATE OLC command can be used to terminate an INIT OLC TYPE(ACBMBR) command in progress. If the updated members have not been committed, the TERM OLC command will delete the new versions of the updated members in the active ACBLIB. The TERM OLC command for a TYPE(ACBLIB) will log a X'7010' log record indicating that the member OLC has been terminated.

The TERMINATE OLC command is not supported if local online change is enabled. The TERMINATE OLC command is rejected if the IMS to which the command is routed does not support global online change. If this occurs and there is an IMS that supports global online change, the user must route the command to a specific IMS that supports global online change.

The TERMINATE OLC command is invalid on the XRF alternate, RSR tracker, and FDBR system.

The OM command timeout default of 300 seconds (5 minutes) might not be enough time for the online change phase to complete. You might need to specify a timeout value on the command based on the needs of the installation. To change the timeout value, use the TIMEOUT parameter of the CSLOMCMCD command request or specify a Wait (timeout) value when you issue the TERMINATE OLC command from TSO SPOC.

The command syntax for this command is defined in XML and is available to automation programs which communicate with OM.

**TERMINATE OLC error handling**

Errors unique to the processing of this command are returned as a completion code. A completion code is returned for each action against an individual resource.
The TERMINATE OLC command might result in an error that leaves IMS systems in various online change states. Correct the error. Issue the QUERY MEMBER TYPE(IMS) SHOW(STATUS) command to display the online change state of all the IMS systems in the IMSplex. Evaluate the QUERY MEMBER TYPE(IMS) output to help you determine what to do:

- None of the IMS systems in an online change state
  The TERMINATE OLC command succeeded or was not applicable. No further action needs to be taken.

- Some of the IMS systems in a prepare complete state
  The online change is not committed. Correct the problem that caused TERMINATE OLC to fail, then try the TERMINATE OLC command again.
  The IMS systems that are in an online change state remain in an online change state until you abort the online change.

- All IMS systems in a prepare complete state
  The online change is not committed. Correct the problem that caused TERMINATE OLC to fail, then try the TERMINATE OLC command again.
  The IMS systems that are in an online change state remain in an online change state until you abort the online change.

- Some IMS systems in prepare complete and commit phase 1 complete state
  The commit phase failed before the master updated the OLCSTAT data set, so the online change is not committed. Correct the problem that caused TERMINATE OLC to fail and try the TERMINATE OLC command again.
  The IMS systems that are in an online change state remain in an online change state until you abort the online change.

- All IMS systems in commit phase 1 complete state
  If the commit phase failed before the master updated the OLCSTAT data set, the online change is not committed. Correct the problem that caused TERMINATE OLC to fail and try the TERMINATE OLC command again.
  If the commit phase failed after the master updated the OLCSTAT data set, the online change is committed. The TERMINATE OLC command is not permitted. You must correct the problem that caused the commit command to fail and try the INITIATE OLC PHASE(COMMIT) command again.
  The IMS systems that are in an online change state remain in an online change state until you abort the online change or commit the online change.

  You can determine whether the OLCSTAT data set has been updated by the modify ID. Issue the QUERY OLC LIBRARY(OLCSTAT) SHOW(MODID) command. Check if the modify ID returned is different from the modify ID returned by the INITIATE OLC PHASE(PREPARE) command, or the modify ID returned by a QUERY OLC LIBRARY(OLCSTAT) SHOW(MODID) command issued before the INITIATE OLC PHASE(COMMIT) command.

- Some IMS systems in commit phase 1 complete state and some in commit phase 2 complete state
  The online change is committed. The TERMINATE OLC command is not permitted. You must correct the problem that caused the commit command to fail and try INITIATE OLC PHASE(COMMIT) again.
  The IMS systems that are in an online change state remain in an online change state until you finish the online change with an INITIATE OLC PHASE(COMMIT) command.

- All IMS systems in commit phase 2 complete state
The online change is committed. The TERMINATE OLC command is not permitted. You must correct the problem that caused the commit command to fail and try INITIATE OLC PHASE(COMMIT) again.

The IMS systems that are in an online change state remain in an online change state until you finish the online change with an INITIATE OLC PHASE(COMMIT) command.

- Some IMS systems in commit phase 2 complete state and some not in online change state

The online change is committed. The TERMINATE OLC command is not permitted. You must correct the problem that caused the commit command to fail and try INITIATE OLC PHASE(COMMIT) again.

The IMS systems that are in an online change state remain in an online change state until you finish the online change with an INITIATE OLC PHASE(COMMIT) command.

Errors unique to the processing of this command are returned as a completion code. A completion code is returned for an IMS participating in the online change phase.

## Output fields

The following table shows the output fields for a TERMINATE OLC command. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Keyword**
Identifies keywords on the command that caused the field to be generated. N/A appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>IMSplex member that built the line of output. IMS identifier of the IMS that was master of the abort phase. IMS identifier is always returned.</td>
</tr>
<tr>
<td>IMSMBR</td>
<td>N/A</td>
<td>IMS member that performed the global online change phase. The IMS member name is always returned.</td>
</tr>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code from the IMS member that performed the online change phase. Completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code.</td>
</tr>
<tr>
<td>ERRT</td>
<td>N/A</td>
<td>Error text associated with a nonzero completion code returned by the IMS member that performed the online change phase. Error text might be returned if the completion code is nonzero.</td>
</tr>
</tbody>
</table>
Return, reason, and completion codes

The OM return and reason codes that might be returned as a result of this command are standard for all commands entered through the OM API. Refer to the OM CSLOMCMD Return and Reason code section for the list of codes and their meanings.

An IMS return and reason code is returned to OM by the TERMINATE OLC command.

Some reason codes are accompanied by a complete list of IMS systems and completion codes. The reason code meaning indicates whether a list is returned. A partial list of IMS systems and completion codes might be returned with any TERMINATE OLC error reason code, if any output was built before the error was detected.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The TERMINATE OLC command completed successfully. The TERMINATE OLC command is applied to all of the IMS systems listed in the OLCSTAT data set. All of the IMS systems in the IMSplex are no longer in an online change state. An output line is built for each IMS listed in the OLCSTAT data set. Each output line contains the IMS member name and a completion code of zero.</td>
</tr>
<tr>
<td>X'00000004'</td>
<td>X'0000100C'</td>
<td>The TERMINATE OLC command completed successfully, but was not applicable to one or more IMS systems for acceptable reasons. The TERMINATE OLC command applies to all of the IMS systems listed in the OLCSTAT data set. An output line is built for each IMS listed in the OLCSTAT data set. Each output line contains the IMS member name and a completion code. A nonzero completion code may be accompanied by error text. One or more of the IMS systems contain a completion code that indicates that the terminate online change did not apply to this IMS, such as the IMS state is abended, the IMS state is shutdown, or this IMS is already in the correct online change state. The TERMINATE OLC completion code table contains the list of completion codes and error text that can be returned by the TERMINATE OLC command.</td>
</tr>

Command keywords and their synonyms (Commands)

TERMINATE OLREORG command

The TERMINATE OLREORG command is used to stop one or more HALDB online reorganizations (OLRs) that are in progress.

The command stops OLR processing at a unit of reorganization boundary, unless the OPTION keyword is specified.

This command supports the type-1 command format and the type-2 command format. The type-1 command format is /TERMINATE OLREORG. The type-1 command response is returned as a DFS0725I pre-edit message. The type-2 command format is TERMINATE OLREORG. The type-2 command response is returned as XML and is available to automation programs.

<td></td>
</tr>
<tr>
<td>NAME</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>OPTION</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

Type-1 command syntax

```
/TERMINATE OLREORG NAME(partname) OPTION(ABORT FORCE)
```
Type-2 command syntax

```
TERMINATE OLREORG NAME( partname )

OPTION( ABORT | FORCE )
```

Keywords

The following keywords are valid for the TERMINATE OLREORG command:

**NAME()**
Specifies the names or name of a HALDB partition for which the OLR is to be stopped. You can specify only PHDAM or PHIDAM HALDB partition names. A parameter with the wildcard character (*) is not allowed, except as NAME(*) for all defined HALDB partitions.

For the type-2 version of this command, you can specify one or more HALDB partition names.

For the type-1 version of the command, you can specify only one partition name.

**OPTION()**
Allows you to specify the FORCE or ABORT options.

**ABORT**
Causes the HALDB OLR to be stopped immediately, possibly with a completion code of abend U0474, without waiting for the current unit-of-reorganization to complete. Backout may be required depending on the state of the online reorganization at termination.

**FORCE**
Specifies that the HALDB OLR for the named *part name* is to be stopped when the next record boundary is encountered. All of the moved data up to that point is committed to DASD and no backout is required.

**Attention:** If the HALDB OLR is stopped prior to completion, the OPTION(NODEL) is not retained and must be specified on the INITIATE OLREORG command that is issued to resume the stopped online reorganization or on the UPDATE OLREORG command.

Usage notes

If /TERMINATE OLREORG or TERMINATE OLREORG is issued from OM API, it is treated as a type-2 command. Therefore, if you issue TERM OLREORG as a type-2 command from an OM API, the only valid command verb form is TERM or TERMINATE. Similarly, if /TERMINATE OLREORG is issued from a terminal, it is treated as a type-1 command. Therefore, you can issue /TERMINATE OLREORG using the first three command characters, such as /TER OLREORG.

If an online reorganization is started with the ALTER option to modify the structure of the database, IMS reorganizes all of the partitions in the database. In

902 Commands, Volume 2: IMS Commands N - V
In this case, if you need to stop the reorganization of all of the partitions in the database, specify an asterisk in the NAME keyword, for example TERMINATE OLREORG NAME(*). You cannot specify the name of the HALDB master database. You can use either the type-1 or type-2 format of the TERMINATE OLREORG command to stop alter processing; however, if the altered database is shared, only the type-2 command can be routed to all of the IMS systems that share the database.

This command can be issued to an IMSplex using the Batch SPOC utility.

The TERMINATE OLREORG command causes HALDB OLR to be stopped for the specified HALDB partitions. After a HALDB OLR is terminated, it is no longer active and it does not have an owning IMS. The partitions remain in cursor-active status until the online reorganization is resumed with an INITIATE OLREORG command and completes, or until you run an offline reorganization.

**Command responses for /TERMINATE OLREORG**

When you issue the /TERMINATE OLREORG command as a type-1 command, the command response is returned in a message format.

When the command completes successfully, the message, DFS0725I, is returned to the system console and to the master terminal with a completion code of 0. If the command results in an error, a non-zero completion code or an error message is returned to the master terminal and system console.

DFS0725I INITIATE|UPDATE|TERMINATE OLREORG COMMAND FOR DB dbnamexx COMPLETE.
CC= nn

where: dbnamexx is the HALDB partition name entered on the command

nn is the completion code

**Output fields**

This section describes the responses from the OM API for the TERMINATE OLREORG command. The following table shows the TERMINATE OLREORG output fields. The columns in the table are as follows:

**Short label**
Contains the short label that is generated in the XML output. This field does not apply to the /TERMINATE command.

**Show Keyword**
Identifies the command keyword that caused the field to be generated.
N/A appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

<table>

</tbody>
</table>
Return, reason, and completion codes

The OM return and reason codes that might be returned as a result of the TERMINATE OLREORG command are standard for all commands that are entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 349. Return and reason codes for the TERMINATE OLREORG command

<table>
<thead>
<tr>

Examples

The following are examples of the TERMINATE OLREORG command:

Example 1 for /TERMINATE OLREORG command

Entry ET:
/TERM OLREORG NAME(PDHDOKA)

Response ET:
DFS0725I TERMINATE OLREORG COMMAND FOR DB PDHDOKA COMPLETE. CC= 24

Explanation: The TERM OLREORG command is issued for partition PDHDOKA to stop the OLR that is in progress. The command is not successful because OLR is not in progress for the partition.
Example 2 for TERMINATE OLREORG command

TSO SPOC input:
TERM OLREORG NAME(PDHDOKA,PDHDOKC)

TSO SPOC output:
Partition MbrName CC
PDHDOKA IMSA 0
PDHDOKA IMS1 24
PDHDOKC IMSA 24
PDHDOKC IMS1 24

OM API input:
CMD ( TERM OLREORG NAME(PDHDOKA,PDHDOKC))

OM API output:

<cmdrspdata>
<rsp> PART(PDHDOKA ) MBR(IMSA ) CC( 0 ) </rsp>
<rsp> PART(PDHDOKC ) MBR(IMSA ) CC( 24 ) </rsp>
Explaination: The TERM OLRORG command is issued to stop the OLR for partitions PDHDOKA and PDHDOKC. The command is routed to IMSA and IMS1. The command is successful for partition PDHDOKA at IMSA, where OLR is in progress. The command is not successful for PDHDOKC at IMSA because OLR is not in progress for PDHDOKC on IMSA. The command is not successful for either of the two partitions at IMS1, because OLR is not in progress for PDHDOKA and PDHDOKC on IMS1.

Chapter 27. /TEST command

Use the /TEST command to place a terminal or a user into either test mode or MFSTEST mode.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 908
- “Examples” on page 909

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 351. Valid environments for the /TEST command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/TEST</td>

<td></td>
</tr>
<tr>
<td>NODE</td>
<td></td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>PTERM</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>USER</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/TEST  /TEST
      MFS
     LINE line# PTERM pterm#
     NODE nodename
     USER username
```

Keywords

The following keywords are valid for the /TEST command:

MFS

Specifies MFS test mode for the terminal or user. The MFS parameter is valid only for terminals supported by Message Format Service (MFS). When the /TEST MFS USER command is issued for a dynamic user, it is not possible to determine if the MFSTEST mode is valid until the user signs on to a terminal. Once the user signs on to a terminal, a check is made to determine whether that terminal supports MFSTEST mode. If the terminal does not support MFSTEST mode, the mode is not propagated to the terminal and is removed from the USER unless another /TEST MFS USER command is issued.
LINE, PTERM
Specifies the non-VTAM line and pterm to place into MFSTEST mode.

NODE
Specifies the VTAM node to place into MFSTEST mode.

The /TEST MFS NODE form of the command is valid only for statically defined nodes.

Restrictions for using NODE and USER parameters together:
- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- /TEST MFS NODE USER commands are valid for ISC, LUP, and 3600 nodes only. For ISC, the /TEST MFS NODE nodename USER username form of the command is supported for ISC nodes and applies to the half-session allocated to the USER username.

USER
When specified without the NODE keyword, USER specifies the dynamic user to place into MFSTEST mode. MFSTEST mode status is kept from one signon to another. For example, if a user issues a /TEST MFS command, signs off, and then signs on again at another terminal, the MFSTEST mode is still in effect. If the user does not exist, it is created and MFSTEST mode is set.

Usage notes

This command can be issued to an IMSplex using the Batch SPOC utility.

In test or echo mode, any input from the terminal is sent back. Input and output errors are not checked, and IMS error notification procedures are bypassed. Echo mode continues until reset with an /END, /STOP LINE, /STOP LINE PTERM, or a /STOP NODE command. The /DISPLAY command identifies a terminal or user in test mode or MFSTEST mode. If no keywords are supplied, the terminal entering the command is placed into test mode or MFSTEST mode.

Test mode is not a command significant status, so the commands to set test mode are not recoverable nor are they kept after signons and can only be set by the end user or terminal, not remotely by an operator. The /TEST LINE, /TEST NODE, and /TEST USER commands, which set test mode remotely, are no longer supported.

In MFSTEST mode, terminals supported by the Message Format Service use format blocks from a special test library if the requested format block is in the test library; otherwise, the blocks are obtained from the production library. MFSTEST mode continues until reset with an /END command. Certain error conditions can occur that cause MFSTEST mode to terminate. If an error condition occurs, the terminal operator receives an error message.

MFSTEST mode is a command significant status, is recoverable and is remembered across logons and signons. For example, if a /TEST MFS NODE command is entered at a node, the node logs off and logs back on at another terminal, MFSTEST mode is still in effect. If a dynamic user issues a /TEST MFS USER command, signs off, and then signs on again at another terminal, MFSTEST mode is still in effect.
/TEST MFS NODE applies to dynamic nodes in addition to static nodes because MFSTEST mode is associated with dynamic nodes as well as dynamic users. /TEST MFS NODE and /TEST MFS NODE USER set MFSTEST mode at the node level. /TEST MFS USER sets MFSTEST at the user level. /TEST MFS with no keywords sets MFSTEST at the node level for static terminals (they have no user level) and at the user level for dynamic terminals.

The /TEST NODE USER command is supported for static and dynamic ISC sessions. For ISC, /TEST MFS NODE USER is required. You cannot use /TEST MFS NODE (without USER) for ISC and have it apply to all of the half-sessions.

If global resource information is kept in Resource Manager, MFSTEST mode is set globally. If global resource information is not kept in Resource Manager, the resource does not exist, and ETO is enabled, the resource (node or user) is created and MFSTEST mode is set. If a temporary node is dynamically created to hold command status, and the temporary node has MFSTEST status, then, when a logon occurs for the node, the MFSTEST status is set for the logged-on node. If the node logging on is an ISC parallel session, MFSTEST is set only for the first half-session that is logged on. Subsequent ISC half-sessions will not be put into MFSTEST mode.

Examples

The following are examples of the /TEST command:

Example 1 for /TEST command

Entry ET:
/TEST

Response ET:
DFS058I TEST COMMAND COMPLETED

Entry ET:
NOW IS THE TIME TO COME TO THE AID

Response ET:
NOW IS THE TIME TO COME TO THE AID

Explanation: The entering terminal is placed in echo mode and continues to receive message input as output until test mode is terminated.

Example 2 for /TEST command

Entry ET:
/TEST MFS

Response ET:
DFS058I TEST COMMAND COMPLETED

Explanation: The entering terminal is placed into MFSTEST mode.
Chapter 28. /TRACE commands

Use the /TRACE commands to direct and to control the IMS capabilities for tracing internal IMS events. They also start, stop, and define the activity to be monitored by the IMS Monitor.

The information developed by the LINE, LINK, NODE, UNITYPE, TRANSACTION, PROGRAM, PSB, and TCO keywords is written on the IMS system log (type X'5F' for PSB, and type X'67' records for the other keywords mentioned.) PI (program isolation) and TABLE trace information is kept in storage or logged (type X'67' records), depending on specification of additional keywords. The MONITOR keyword provides no such output on the system log; it only controls the IMS Monitor. The monitor develops its own output data and writes it on a separate data set.

This command can be issued to an IMSplex using the Batch SPOC utility.

The status and options of the current IMS traces can be displayed with the /DISPLAY TRACE command.

</tr>
<tr>
<td>EXIT</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
... /TRACE EXIT ON
... /TRA SET OFF
... DFSMSCE0
```

Keywords

The following keyword is valid for the /TRACE EXIT command:

**DFSMSCE0**

The TM and MSC Message Routing and Control user exit. When this keyword is used on the /TRACE EXIT command, the traces causes IMS to write type 6701-MSEA and 6701-MSEB log records to the log data set when the exit routine is called. A 6701-MSEA record is logged when the exit is called if the trace is active for the entry point. A 6701-MSEB record is logged when the exit returns to IMS.

Usage notes

When using the EXIT keyword, you must specify one of the following parameters to turn on or off:
ALL  The trace is turned on or off for all entry points.
LRDI  Calls the Link Receive Direct Routing exit entry point.
LRIN  Calls the Link Receive Intermediate exit entry point.
LRLT  Calls the Link Receive LTERM exit entry point.
LRTR  Calls the Link Receive Transaction exit entry point.
PRCH  Calls the Program Routing CHNG Call exit entry point.
PRGU  Calls the Program Routing GU Call exit entry point.
PRIS  Calls the Program Routing ISRT Call exit entry point.
TR62  Calls the Terminal Routing LU62 exit entry point.
TRBT  Calls the Terminal Routing non-VTAM exit entry point.
TROT  Calls the Terminal Routing OTMA exit entry point.
TRVT  Calls the Terminal Routing VTAM exit entry point.

/TRACE LINE command

Use the /TRACE LINE command to cause events related to the lines to be traced.

Chapter 28. /TRACE commands  913
Keywords

The following keywords are valid for the /TRACE LINE command:

**LEVEL**

Expands the LINE, LINK, NODE, or UNITYPE trace functions. The LEVEL specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

LEVEL indicates the extent of the control block trace information desired. The indicated control blocks are only traced at relevant times. All levels are inclusive of numerically lower levels. The following list displays the levels and their associated blocks.

<table>
<thead>
<tr>
<th>Level</th>
<th>Blocks</th>
</tr>
</thead>
</table>
| 1     | CLB (DECB) or LLB(MSC)  
CTB or LTB(MSC)  
IOB (for non-VTAM lines) or IOSB (MSC for channel-to-channel links) |
| 2     | CNT or LNB(MSC)  
CXB  
CRB  
CIB  
CCB  
PD stack |
| 3     | queue manager buffers  
Input/output line buffers  
LXB (for channel-to-channel links and processor storage to processor storage) |
| 4     | save area sets (IMS dispatching) |

If the first /TRACE SET ON command does not specify LEVEL, a default of 4 will be used. Specifying LEVEL on subsequent commands will change the defaults.

**MODULE**

Is used to expand the LINE, LINK, NODE, or UNITYPE trace functions. The MODULE specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

MODULE indicates which modules are to have their control blocks traced.

**ALL**  Both device-dependent module (DDM) and MFS

**DDM**  Communication analyzer and device-dependent module interfaces
MFS  Communication analyzer and Message Format Service (MFS) module interfaces

If the first /TRACE SET ON command does not specify MODULE, a default of ALL will be used. Specifying MODULE on subsequent commands will change the defaults.

TAKEOVER
Controls tracing during takeover only, and is separate from regular tracing. TAKEOVER tracing can be set for LINE, LINK, NODE, and UNITYPE keywords.

TAKEOVER only applies in an XRF environment. When TAKEOVER is used with SET OFF, the trace is turned off before takeover. When an output message is dequeued for a terminal, takeover tracing will stop for that terminal.

If both regular and takeover tracing are entered, the most recent setting will override any previous settings; for example, takeover tracing will override regular tracing if regular tracing was entered first. This means that either regular or TAKEOVER tracing can be in effect, but not both.

/TRACE TAKEOVER can be issued only from an XRF active system. It is rejected if entered from an alternate or non-XRF system. It is recovered across restart and takeover, and only needs to be entered once until cold start. Tracing occurs only if the session was active at the time of the takeover.

Examples

The following is an example of the /TRACE LINE command:

To turn on the Message Format Service module and communication analyzer level 4 control block tracing for all physical terminals on line 4.

Entry ET:
/TRACE SET ON LINE 4 LEVEL 4 MODULE MFS

Response ET:
DFS058I TRACE COMMAND COMPLETED

/TRACE LINK command

Use the /TRACE LINK command to cause events related to the logical links to be traced.

Subsections:
• "Environment"
• “Syntax” on page 916
• “Keywords” on page 916
• “Examples” on page 917

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.
Table 354. Valid environments for the /TRACE LINK command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>

<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TAKEOVER</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
►►/TRACE  SET  ON  LINK  \link#  ALL  LEVEL  A
      OFF
```

**A:**

```
MODULE  DDM  MFS  ALL  TAKEOVER
```

**Keywords**

The following keywords are valid for the /TRACE LINK command:

**LEVEL**

Expands the LINE, LINK, NODE, or UNITYPE trace functions. The LEVEL specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

LEVEL indicates the extent of the control block trace information desired. The indicated control blocks are only traced at relevant times. All levels are inclusive of numerically lower levels. The following list displays the levels and their associated blocks.

**Level**  **Blocks**

1. CLB (DECB) or LLB(MSC)
   - CTB or LTB(MSC)
   - IOB (for non-VTAM lines) or IOSB (MSC for channel-to-channel links)

2. CNT or LNB(MSC)
   - CXB
   - CRB
   - CIB
   - CCB
PD stack
3 queue manager buffers
   Input/output line buffers
   LXB (for channel-to-channel links and processor storage to processor storage)
4 save area sets (IMS dispatching)

If the first /TRACE SET ON command does not specify LEVEL, a default of 4 will be used. Specifying LEVEL on subsequent commands will change the defaults.

MODULE
Is used to expand the LINE, LINK, NODE, or UNITYPER trace functions. The MODULE specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

MODULE indicates which modules are to have their control blocks traced.

ALL Both device-dependent module (DDM) and MFS
DDM Communication analyzer and device-dependent module interfaces
MFS Communication analyzer and Message Format Service module interfaces

If the first /TRACE SET ON command does not specify MODULE, a default of ALL will be used. Specifying MODULE on subsequent commands will change the defaults.

TAKEOVER
Controls tracing during takeover only, and is separate from regular tracing. TAKEOVER tracing can be set for LINE, LINK, NODE, and UNITYPER keywords.

TAKEOVER only applies in an XRF environment. When TAKEOVER is used with SET OFF, the trace is turned off before takeover. When an output message is dequeued for a terminal, takeover tracing will stop for that terminal.

If both regular and takeover tracing are entered, the most recent setting will override any previous settings; for example, takeover tracing will override regular tracing if regular tracing was entered first. This means that either regular or TAKEOVER tracing can be in effect, but not both.

/TRACE TAKEOVER can be issued only from an XRF active system. It is rejected if entered from an alternate or non-XRF system. It is recovered across restart and takeover, and only needs to be entered once until cold start. Tracing occurs only if the session was active at the time of the takeover.

Examples
The following is an example of the /TRACE LINK command:

To turn on tracing for a logical link:

Entry ET:
   /TRACE SET ON LINK 2 LEVEL 4 MODULE ALL
/TRACE LUNAME command

Use the /TRACE LUNAME command to activate and deactivate tracing for a particular LU name or TP name of the LU name.

Subsections:

<td></td>
</tr>
<tr>
<td>OUTPUT</td>
<td>X</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SET</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Usage notes

Specifying this command causes trace entries to be written to the LUMI trace table. For this reason, the /TRACE SET ON TABLE LUMI command must be entered first in order to create the table for trace entries that will be created by subsequent /TRACE SET ON LUNAME commands. A trace entry is written:
- On LU 6.2 module entries/exits
- When APPC calls are made
- When errors are encountered

The INPUT and OUTPUT keywords provide the operator with the flexibility to control the volume of trace data for LU 6.2 devices.

Specifying the keyword INPUT with the LUNAME keyword indicates tracing is activated or deactivated for input and synchronous outbound activities. Specifying
the parameter ALL with the INPUT keyword causes all future LU 6.2 input and synchronous outbound activities to be traced as well.

Specifying the keyword OUTPUT with the LUNAME keyword indicates tracing is activated or deactivated for asynchronous outbound activities. Specifying the parameter ALL with OUTPUT causes all future LU 6.2 asynchronous outbound activities to be traced as well.

Specifying neither INPUT or OUTPUT is the same as both INPUT and Tracing is activated or deactivated for input and both synchronous and asynchronous outbound activities. Specifying the parameter ALL in this case causes all future LU 6.2 inbound activities, synchronous and asynchronous outbound activities to be traced as well.

The network-qualified LU name is optional for the LUNAME keyword. If the LU name is not a network-qualified LU name and no TP name is specified, tracing is activated or deactivated for all the network-qualified LU names in the system whose LU name matches the LU name specified.

If the specified resource does not exist and tracing is activated, a structure is created to retain the status.

/TRACE MONITOR command

Use the /TRACE MONITOR command to activate or deactivate the IMS Monitor.

Syntax

```
/TRACE MONITOR [ON|OFF]
```

```
/TRACE MONITOR [ON|OFF]
```

Chapter 28. /TRACE commands
Keywords

When activating the monitor, you must specify one or more of the following MONITOR parameters to indicate the events to be monitored:

**ALL**
- Monitors all of the activity in this list.

**APDB**
- Monitors activity between application programs and databases, including Fast Path activity. Monitoring includes all application program requests to external subsystem databases. Monitoring can optionally be limited to a subset of full-function databases or partitions, Fast Path DEDBs and MSDBs, and the areas comprising those DEDBs by specifying database names or area names.
- You can specify the ALL parameter to indicate all databases, areas, and partitions, or you can explicitly enter database names, area names, and partition names.

**APMQ**
- Monitors activity between application programs and message queues, including Fast Path activity.

**INTERVAL**
- Monitors events for a fixed interval of time, entered in seconds. INTERVAL defines the period of time after which no monitor log records will be written.
- The duration of the monitoring must be less than twenty-four hours (86,400 seconds). When INTERVAL is not specified, monitoring will continue until the /TRACE SET OFF MONITOR command is issued, or until IMS shuts down.
- INTERVAL does not define when the Monitor will be turned off, because the IMS Monitor will not be turned off until the first attempt is made to write a monitor log record after the defined interval has expired.

**LA**
- Monitors line and logical link events.
REGION
Monitors events related to specific dependent regions. The regions might or might not currently be active. Each region can be specified as:

- A region number from 1 to 999 (reg#). The number cannot exceed the MAXPST with which IMS was brought up.
- A range of region numbers from 1 to 999 (reg#–reg#). The number cannot exceed the MAXPST with which IMS was brought up.
- A region name (regionname).

If REGION is not specified, or when REGION ALL is specified, the activities of all dependent regions are monitored.

SCHD
Monitors scheduling and termination events, including Fast Path activities.

Usage notes

You can specify any combination of ALL, APDB, APMQ, INTERVAL, LA, REGION, and SCHD parameters on the MONITOR keyword, as shown in the following table.

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the MONITOR keyword parameters can be issued.

Table 357. MONITOR keyword parameter environments

<table>
<thead>
<tr>
<th>Keyword parameter</th>

</tbody>
</table>

The IMS Monitor report output varies depending upon which keywords or parameters you specify. Sections of the report can be misleading if required records are excluded. For example, if you specify the APDB parameter without the SCHD parameter, PSB/PCB relationships will not be correctly represented. To get the total DL/I call reports without the IMS line activity, the correct parameters to specify are APDB, APMQ, and SCHD.

The monitor writes log records until one of the following occurs:

- /TRACE SET OFF MONITOR is entered.
- The time interval specified by the INTERVAL parameter is reached.
- IMS is shut down.

When deactivating the monitor, no parameters are required. Any parameters that are entered, other than ALL, are ignored. ALL is the default. If the monitor is to be reactivated, a new set of MONITOR keyword parameters must be selected.

The APDB dbname option cannot be used to filter the TYPE62 monitor log records by database names.
Examples

The following are examples of the /TRACE MONITOR command:

Entry ET:

/TRACE SET ON MONITOR ALL

Response ET:

DFS058I TRACE COMMAND COMPLETED
DFS2500I DATASET DFSDCMON SUCCESSFULLY ALLOCATED
DFS2212I DC MONITOR STARTED

Explanation: The monitor is activated and all events will be monitored.

Entry ET:

/TRACE SET OFF MONITOR

Response ET:

DFS058I TRACE COMMAND COMPLETED
DFS2500I DATASET DFSDCMON SUCCESSFULLY DEALLOCATED
DFS2212I DC MONITOR STOPPED

Explanation: The monitor is deactivated.

Entry ET:

/TRACE SET ON MONITOR LA

Response ET:

DFS058I TRACE COMMAND COMPLETED

Explanation: The monitor is activated. Line and logical link activities will be monitored. The monitoring of events from the previous activation of the monitor no longer apply.

/TRACE NODE command

Use the /TRACE NODE command to cause events related to the node or nodes to be traced.

Subsections:
- “Environment”

<td>X</td>
</tr>
<tr>
<td>TAKEOVER</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>USER</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/TRACE SET ON
/TRACE SET OFF
```

```
/TRACE NODE nodename
/TRACE NODE nodename USER username
/TRACE NODE ALL
/TRACE NODE Level
```

A:

```
/TRACE MODULE DDM
/TRACE MODULE MFS
/TRACE MODULE ALL
/TRACE TAKEOVER
```

Keywords

The following keywords are valid for the /TRACE NODE command:

**LEVEL**

Expands the LINE, LINK, NODE, or UNITYPE trace functions. The LEVEL specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

LEVEL indicates the extent of the control block trace information desired. The indicated control blocks are only traced at relevant times. All levels are inclusive of numerically lower levels. The following list displays the levels and their associated blocks.

**Level Blocks**

1. CLB (DECB) or LLB(MSC)
   - CTB or LTB(MSC)
   - IOB (for non-VTAM lines) or IOSB (MSC for channel-to-channel links)
2. CNT or LNB(MSC)
   - CXB
CRB
CIB
CCB
PD stack

3 queue manager buffers
Input/output line buffers
LXB (for channel-to-channel links and processor storage to processor storage)

4 save area sets (IMS dispatching)

If the first /TRACE SET ON command does not specify LEVEL, a default of 4 will be used. Specifying LEVEL on subsequent commands will change the defaults.

**MODULE**

Is used to expand the LINE, LINK, NODE, or UNITYPE trace functions. The MODULE specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

MODULE indicates which modules are to have their control blocks traced.

- **ALL** Both device-dependent module (DDM) and MFS
- **DDM** Communication analyzer and device-dependent module interfaces
- **MFS** Communication analyzer and Message Format Service module interfaces

If the first /TRACE SET ON command does not specify MODULE, a default of ALL will be used. Specifying MODULE on subsequent commands will change the defaults.

**TAKEOVER**

Controls tracing during takeover only, and is separate from regular tracing. TAKEOVER tracing can be set for LINE, LINK, NODE, and UNITYPE keywords.

TAKEOVER only applies in an XRF environment. When TAKEOVER is used with SET OFF, the trace is turned off before takeover. When an output message is dequeued for a terminal, takeover tracing will stop for that terminal.

If both regular and takeover tracing are entered, the most recent setting will override any previous settings; for example, takeover tracing will override regular tracing if regular tracing was entered first. This means that either regular or TAKEOVER tracing can be in effect, but not both.

/TRACE TAKEOVER can be issued only from an XRF active system. It is rejected if entered from an alternate or non-XRF system. It is recovered across restart and takeover, and only needs to be entered once until cold start. Tracing occurs only if the session was active at the time of the takeover.

**Usage notes**

The NODE parameter can be generic if the USER keyword is not specified and applies to nodes that already exist. Generic NODE parameters do not cause any dynamic nodes to be created.
For ISC nodes, the /TRACE NODE nodename without the USER applies to all half-sessions for NODE nodename, including dynamic ISC sessions that are dynamically allocated later.

For nodes that do not exist, /TRACE SET ON NODE nodename without the USER keyword causes the dynamic NODE nodename to be created to maintain knowledge of the trace request when the node becomes active. Until the node becomes active, /DISPLAY NODE shows a type of UNK (unknown). If the trace is subsequently turned off and the temporary node still exists, it is deleted at the next checkpoint.

**Restrictions for using NODE and USER parameters together:**
- Commands with the NODE USER keyword pair are valid only if:
  - The USER is signed on to the NODE
  - In an ISC environment, the USER is allocated to the NODE
  - The nodes and users already exist
- /TRACE NODE USER commands are valid for ISC and non-ISC nodes and users.

If global resource information is kept in Resource Manager, /TRACE NODE sets a global trace status for the node and sets the trace status locally. If global resource information is not kept in Resource Manager, /TRACE NODE sets the trace status locally. If the node does not exist in an ETO environment, IMS creates the node and sets trace status for the local node.

**Examples**

The following are examples of the /TRACE NODE command:

The following example shows how IMS creates temporary nodes to retain trace status data.

The /TRACE command is issued for a dynamic ISC NODE that does not yet exist, DTSelu607, causing a temporary node to be created to retain the trace status. Once the ISC parallel sessions IMSUS01 and IMSUS02 are allocated, the trace status is applied to them both.

**Entry ET:**

/TRACE SET ON NODE DTSelu607

**Response ET:**

DFS058 TRACE COMMAND COMPLETED

**Entry ET:**

/DISPLAY NODE DTSelu607

**Response ET:**

</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>VOLUME</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the /TRACE PI command:

OPTION
- Indicates a request for one of the following program isolation trace options:
  - ALL Both LOG and TIME.
  - LOG Requests that traced data be written to the system log. If SET OFF, tracing continues but no buffers are transferred to the system log. LOG is the default.
The log option includes the possibility of externally tracing to a data set other than the IMS OLDS. If specified, DASD external tracing has first priority, TAPE external tracing has second priority, and IMS OLDS has third priority. External tracing to the OLDS is not done without operator approval. EXTERNAL trace is available to the alternate system only for DASD/TAPE type, but not for OLDS.

**TIME** Requests that an additional time field be included in each ENQ/DEQ request trace record if a WAIT was needed. This field will contain elapsed wait time. If set OFF, tracing continues but only the time of day is recorded.

Entries for Fast Path have no elapsed wait time.

**VOLUME**

Specifies the volume of entries to be written to the PI trace table: LOW volume, MEDIUM volume (default), or HIGH volume.

**Usage notes**

PI trace entries are written in the same trace table as DL/I and lock activity trace entries. A PI trace entry contains information about program isolation ENQ/DEQ calls and DL/I calls. The trace entry created by /TRACE TABLE DLI contains different information about DL/I calls and is written as a separate entry in the same trace table. Starting the LOCK trace also causes PI tracing to occur.

If PI is entered without the OPTION keyword, the program isolation trace is kept in storage without being logged. If you are using the program isolation trace to provide statistics and performance data, you should enter OPTION(ALL).

The following table lists various /TRACE command formats and shows whether the command influences tracing, logging, and the additional time field.

**Table 361. /TRACE command formats**

<table>
<thead>
<tr>
<th>Command</th>
<th>Tracing</th>
<th>Logging</th>
<th>Additional time field</th>
</tr>
</thead>
<tbody>
<tr>
<td>/TRACE SET ON PI</td>
<td>Yes</td>
<td>No</td>

<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>/TRACE SET OFF PI OPTION ALL</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note:**

1. This is the same command as /TRACE SET ON | OFF PI OPTION LOG.
Examples

The following are examples of the /TRACE PI command:

Example 1

To turn on program isolation tracing, include the additional time field in the trace record and have the trace information logged:

Entry ET:
/TRACE SET PI OPTION ALL

Response ET:
DFS058I TRACE COMMAND COMPLETED

Example 2

To turn off logging of program isolation trace data but continue the trace in storage:

Entry ET:
/TRACE SET OFF PI OPTION LOG

Response ET:
DFS058I TRACE COMMAND COMPLETED

Example 3

To stop program isolation tracing.

Entry ET:
/TRACE SET OFF PI

Response ET:
DFS058I TRACE COMMAND COMPLETED

/TRACE PGM command

Use the /TRACE PGM command to trace the DL/I portion of Data Communications (DC) for a specific program.

Subsections:
- “Environment”
- “Syntax” on page 930
- “Usage notes” on page 930
- “Equivalent IMS type-2 commands” on page 931

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.
Table 362. Valid environments for the /TRACE PGM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>

</tr>
<tr>
<td>PGM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/TRACE ON PGM programname
```

Usage notes

Each DL/I call to a TPPCB, issued by the user application program, is traced on entry to and exit from the DC call handler DFSDLA30. On entry to DFSDLA30 a type 6701-LA3A record is written, on exit from DFSDLA30 a type 6701-LA3B record is written.

Each record will contain the following items if applicable:
- TPPCB
- Up to 64 bytes of the I/O area
- SMB
- PST

If the batch message program (BMP) being traced is IBM IMS Queue Control Facility for z/OS, a 6701-MRQB record is logged by the IMS Queue Control Facility module DFSQMRQ0. The default program name for the IMS Queue Control Facility BMP is MRQPSB, and can be overridden on the MSGQUEUE system definition macro.

Items logged in the 6701-MRQB record, if applicable, are:
- TPPCB
- AIB
- I/O AREA
- PST
- QTPDST
- QSAPWKAD
- QMBA
- PSTDCA
- REG14-12

When CPI Communications driven transaction programs issue the DL/I APSB call specifying a PSB that contains alternate PCBs, only the PGM keyword is applicable.
Equivalent IMS type-2 commands

The following table shows variations of the /TRACE PGM command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/TRACE PGM command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts the tracing of a program.</td>
<td>/TRACE SET ON PGM \textit{pgmname}</td>
<td>UPDATE PGM NAME(\textit{pgmname}) START(TRACE)</td>
</tr>
<tr>
<td>Stops the tracing of a program.</td>
<td>/TRACE SET OFF PGM \textit{pgmname}</td>
<td>UPDATE PGM NAME(\textit{pgmname}) STOP(TRACE)</td>
</tr>
</tbody>
</table>

<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Synax

```
/TRACE SET ON PSB psbname COMP
```

Keywords

The following keywords are valid for the /TRACE PSB command:

**COMP**

Used with the /TRACE SET PSB command to generate PCB and data-compare statement images.

The /TRACE SET PSB *psbname* COMP command only applies to BMPs in a DBCTL environment.

**NOCOMP**

Prevents PCB and data-compare statement images from being generated. NOCOMP is the default.

Usage notes

For LU 6.2, the PSB keyword is applicable only if the CPI Communications driven transaction program has issued a DL/I APSB call to allocate a PSB.

The information resulting from the use of this keyword is written on the X'5F' log record.

Examples

The following is an example of the /TRACE PSB command:

To trace all DL/I calls issued for PSB AALST:

Entry ET:
```
/TRACE SET ON PSB AALST COMP
```

Response ET:
```
DFS058I TRACE COMMAND COMPLETED
```

/TRACE TABLE command

Use the /TRACE TABLE command with the SET keyword to start or stop online tracing into the specified trace tables.

Subsections:

</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the /TRACE TABLE command:

**OPTION**

Indicates whether the trace tables are to be logged.
**NOLOG**

Indicates that the trace tables are not logged. This means that there will be no record of trace tables that have been reused. NOLOG is the default.

The same trace table is used for DL/I, LOCK, and PI trace information. Whether this table is logged depends on the logging option of the last /TRACE command that was entered for DL/I, PI, or LOCK.

**LOG**

Requests that the trace tables be written to the system log before they are reused (wrapped).

The log option includes the possibility of externally tracing to a data set other than the IMS OLDS. If specified, DASD external tracing has first priority, TAPE external tracing has second priority, and IMS OLDS has third priority. External tracing to the OLDS is not done without operator approval. This option is ignored for the retrieve trace and the Fast Path trace (default).

FPTRACE has its own SYSOUT. External trace is available to the alternate system only for DASD/TAPE type, but not for OLDS.

**VOLUME**

Specifies the volume of entries to be written to the specified trace table: LOW volume, MEDIUM volume (default), or HIGH volume.

The VOLUME keyword is valid on active and RSR tracking subsystems.

You can specify the trace that you want to activate or deactivate by using one of the following TABLE keyword parameters:

- **ALL**
  Indicates that traces into all trace tables are to be enabled or disabled. This is the default.

- **CSLT**
  Indicates that the CSL trace is to be activated or deactivated.

- **DIAG**
  Indicates that the /DIAGNOSE command trace tables are to be activated or deactivated.

- **DISP**
  Indicates that the dispatcher trace is to be activated or deactivated.

- **DL/I**
  Indicates that DL/I tracing is to be activated or deactivated.

- **DLOG**
  Indicates that the logging trace is to be activated or deactivated.

- **FAST**
  Indicates that the Fast Path trace is to be activated or deactivated.

  Fast Path trace is activated by including the FPTRACE DD statement in the dependent region JCL to define the destination of the trace output and by issuing the operator command /TRACE SET ON TABLE FAST.

  **Recommendation:** Run this trace only in a test environment because the FPTRACE output is large.

- **FPTT**
  Indicates that the Fast Path table trace is to be activated or deactivated.

</tr>
<tr>
<td>SECT</td>
<td>Indicates that the security trace table is to be activated or deactivated.</td>
</tr>
<tr>
<td>SQTT</td>
<td>Indicates that the shared queues trace is to be activated or deactivated. SQTT is only valid in a shared-queues environment.</td>
</tr>
<tr>
<td>STRG</td>
<td>Indicates that the storage manager trace is to be activated or deactivated.</td>
</tr>
</tbody>
</table>
**SUBS**

Indicates that the external subsystem trace is to be activated or deactivated. SUBS is not valid for an RSR tracking subsystem.

**Usage notes**

The TABLE keyword parameter indicates the specific trace that is to be activated or deactivated. The DL/I, LOCK, and PI traces share the same trace tables. However, turning on the DL/I trace does not turn on the LOCK trace, and vice versa.

The following trace into trace tables can be turned on or off with the online /TRACE command.

The following table shows the environments in which the trace tables are valid.

*Table 366. Trace tables and environments in which they are valid*

Examples

The following are examples of the /TRACE TABLE command:

Example 1 for /TRACE TABLE command

To turn on online tracing into the DL/I trace table:

Entry ET:
  /TRACE SET ON TABLE DL/I

Response ET:
  DFS058I TRACE COMMAND COMPLETED

Example 2 for /TRACE TABLE command

To turn on the dispatcher's trace tables and have them written to the system log:

Entry ET:
  /TRACE SET ON TABLE DISP OPTION LOG

When the dispatcher's trace tables are no longer required:

Entry ET:
  /TRACE SET OFF TABLE DISP

Response ET:
  DFS058I TRACE COMMAND COMPLETED

Example 3 for /TRACE TABLE command

To turn on storage manager trace tables:

Entry ET:
  /TRACE SET ON TABLE STRG

Response ET:
  DFS058I TRACE COMMAND COMPLETED

When the storage manager trace tables are no longer needed:

Entry ET:
  /TRACE SET OFF TABLE STRG

Response ET:
  DFS058I TRACE COMMAND COMPLETED

Example 4 for /TRACE TABLE command

To turn on online tracing into the security trace table:

Entry ET:
  /TRACE SET ON TABLE SECT
/TRACE TCO command

Use the /TRACE TCO command to trace TCO (Time Controlled Operation) activity. For the first /TRACE command with the TCO keyword, the default module and level information is used.

TCO trace is basically a DC LINE or NODE trace, and the information developed is also written on the type X'67' log record.

<td></td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
►►/TRACE SET OFF TIMEOUT
```

Keywords

The following keywords are valid for the /TRACE TIMEOUT command:

- **time#$**
  is the number of minutes used to determine if the I/O response is overdue. After this number of minutes, time has run out for the response. The range is from 1 through 60; the default value is 0.

  If `time#$` is 0, or not specified, then when I/O is initiated for a node, the node will be placed on a queue, so that its status can be displayed with the /DISPLAY TIMEOVER command. You will not be notified if the node does not receive a response and the time elapses, and the node will not be reactivated.

  If `time#$` is not 0, then the following keywords can be used.

- **MSG**
  Indicates that a message is issued to the master terminal when I/O takes longer than `time#$` minutes. The message indicates that the time has elapsed.

- **AUTO**
  IMS issues a message to the master terminal, then perform a VTAM VARY NET,INACT and a VARY NET,ACT, if I/O takes longer than `time#$` minutes. An /OPNDST is performed for operable devices that are not shared. For ISC nodes, a message is issued, but there is no automatic (AUTO) restart of any sessions and no VTAM VARY commands issued.

Usage notes

If you want to change the time period or the action to be taken if timeout occurs, you can enter the /TRACE SET ... TIMEOUT command while the Timeout Detection facility is already active. However, if nodes are receiving or sending input or output, they will function according to the previous settings of the /TRACE ... TIMEOUT command. If this is undesirable, then you should enter the /TRACE SET OFF TIMEOUT command before reentering /TRACE SET ... TIMEOUT.

Chapter 28. /TRACE commands 939
If the timeout trace facility failed during IMS initialization, the /TRACE SET ... TIMEOUT command is rejected with an error message.

The VTAM TIMEOUT I/O facility is automatically started during IMS shutdown. It is set for 1 minute and AUTO.

/TRACE TMEMBER command

Use the /TRACE TMEMBER command to trace IMS Open Transaction Manager Access (OTMA) client activity for OTMA clients.

Subsections:

<tr>
<td>/TRACE SET TPIPE tmembername</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>/TRACE SET TPIPE ALL</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keyword is valid for the /TRACE TMEMBER command:

TPIPE

Is used to trace transaction pipe activity for OTMA clients.

While processing the /TRACE TMEMBER TPIPE command, IMS creates a temporary transaction pipe (if one does not already exist) with the trace status. IMS sets the synchronization status for this transaction pipe when it sends or receives the first message for the transaction pipe.
If the member specified is a super member, trace status is updated for the super member’s transaction pipe. If the member specified is a regular member whose hold queue output is managed by a super member, trace status is updated for both the regular member’s transaction pipe and the super member’s transaction pipe.

Usage notes

If the member specified is a super member, trace status is updated for the super member. If the member specified is a regular member whose hold queue output is managed by a super member, the trace status is only updated on the IMS that processes the command. If the member specified is a regular member whose hold queue output is managed by a super member, and the trace status cannot be updated for both the regular member and the super member, the status is not updated for either member. The DFS058I COMMAND COMPLETED EXCEPT message is issued with the name of the regular member for which trace status could not be updated.

The TRACE SET ON/OFF TMEMBER xxxx command is issued to trace all the member activities, including transaction pipe activities. This command is the superset of the TRACE SET ON/OFF TMEMBER xxxx TPIPE ALL command.

Examples

The following is an example of the /TRACE TMEMBER command:

Entry ET:

/TRACE SET ON TMEMBER CLIENT1 TPIPE TPIPESY

Response ET:

DFS058I 15:45:05 TRACE COMMAND COMPLETED SYS3
DFS996I *IMS READY* SYS3

/TRACE TRAN command

Use the /TRACE TRAN command to trace the DL/I portion of Data Communications (DC) for a specific transaction.

Subsections:

- “Environment”
- “Syntax” on page 942

Table 370. Valid environments for the /TRACE TRAN command and keywords (continued)

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>TRAN</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/TRACE ON
/TRA OFF
TRAN tranname
```

Usage notes

Each DL/I call to a TPPCB, issued by the user application program, is traced on entry to and exit from the DC call handler DFSDLA30. Upon entry to DFSDLA30, a type 6701-LA3A record is written; upon exit from DFSDLA30, a type 6701-LA3B record is written.

Additionally, in a shared-queues environment, a type 6701-ITQA record is written by module DFSITQS0 whenever a notification is received from CQS that there are messages available for the transaction.

Each of type 6701-LA3A and 6701-LA3B records will contain the following items, if applicable:
- TPPCB
- Up to 64 bytes of the I/O area
- Scheduler message block (SMB)
- Partition specification table (PST)

Each type 6701-ITQA record will contain the following items:
- IMSID of the IMS that wrote the record
- The AWE that was queued to DFSITQS0 to notify it that the transaction had messages to process
- SMB

Equivalent IMS type-2 commands

The following table shows variations of the /TRACE TRAN command and the IMS type-2 commands that perform similar functions.

Table 371. Type-2 equivalents for the /TRACE TRAN command

<table>
<thead>
<tr>
<th>Task</th>
<th>/TRACE TRAN command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starts the tracing of a transaction.</td>
<td>/TRACE SET ON TRAN tranname</td>
<td>UPDATE TRAN NAME(tranname) START(TRACE)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Stops the tracing of a transaction.</td>
<td>/TRACE SET OFF TRAN tranname</td>
<td>UPDATE TRAN NAME(tranname) STOP(TRACE)</td>
</tr>
</tbody>
</table>
Examples

The following is an example of the /TRACE TRAN command:

To log the PCB, I/O area, and PST whenever module DFSDLA30 is invoked to process transaction APPLE:

Entry ET:
   /TRACE SET ON TRAN APPLE

Response ET:
   DFS058I TRACE COMMAND COMPLETED

Related reference:
   “UPDATE TRAN command” on page 1263

/TRACE TRAP command

Use the /TRACE TRAP command to detect overwrites of MFS blocks. When /TRACE is used, IMS attempts to detect overwrites in the MFS blocks.

If an overwrite occurs, IMS sends a warning message.

Subsections:
   • “Environment”
   • “Syntax”

Environment

<td></td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>UNITYPE</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the /TRACE UNITYPE command:

LEVEL

Expands the LINE, LINK, NODE, or UNITYPE trace functions. The LEVEL specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

LEVEL indicates the extent of the control block trace information desired. The indicated control blocks are only traced at relevant times. All levels are inclusive of numerically lower levels. The following list displays the levels and their associated blocks.

<table>
<thead>
<tr>
<th>Level</th>
<th>Blocks</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>CLB (DECB) or LLB(MSC)</td>
</tr>
<tr>
<td></td>
<td>CTB or LTB(MSC)</td>
</tr>
<tr>
<td></td>
<td>IOB (for non-VTAM lines) or IOSB (MSC for channel-to-channel links)</td>
</tr>
<tr>
<td>2</td>
<td>CNT or LNB(MSC)</td>
</tr>
</tbody>
</table>
CXB
CRB
CIB
CCB
PD stack
3 queue manager buffers
Input/output line buffers
LXB (for channel-to-channel links and processor storage to processor storage)
4 save area sets (IMS dispatching)

If the first /TRACE SET ON command does not specify LEVEL, a default of 4 is used. Specifying LEVEL on subsequent commands will change the defaults.

**MODULE**

Is used to expand the LINE, LINK, NODE, or UNITYPE trace functions. The MODULE specification is for the entire IMS system and is changed only by reissuing /TRACE with different values or by restarting the IMS control region.

MODULE indicates which modules are to have their control blocks traced.

**ALL** Both device-dependent module (DDM) and MFS

**DDM** Communication analyzer and device-dependent module interfaces

**MFS** Communication analyzer and Message Format Service module interfaces

If the first /TRACE SET ON command does not specify MODULE, a default of ALL will be used. Specifying MODULE on subsequent commands will change the defaults.

**Usage notes**

The UNITYPE keyword is used to trace all terminals of a specific type. Parameters (*unitypename*) are similar to the identifiers displayed in the TYPE column by the /DISPLAY NODE and /DISPLAY LINE/PTERM commands. The following table shows the terminal types for UNITYPE parameters.

**Table 374. UNITYPE parameters and terminal types**

</table>

If global resource information is kept in Resource Manager, /TRACE UNITYPE sets a global trace status for all of the nodes of a specific type. This requires that the inactive static nodes be processed on every IMS system. The UNITYPE keyword is similar to specifying a generic parameter. If global resource information is not kept in Resource Manager, /TRACE UNITYPE sets the trace status locally.
Chapter 29. /UNLOCK commands

/UNLOCK commands release resources that, in most cases, have been previously locked by the /LOCK command.

If the terminals are on a switched communication network and a physical or logical terminal disconnection occurs, an implied /UNLOCK is processed against the physical terminal and inquiry logical terminal.

When using ISC, the /UNLOCK command can only be used with logical terminals assigned to allocated users.

This command can be issued to an IMSplex using the Batch SPOC utility.

/UNLOCK SYSTEM is only valid if it is entered from the master terminal or from the system console on an XRF system.

A resource name can be defined with password protection in SAF for the DATABASE, LTERM, PROGRAM, and TRANSACTION keywords. If the parameter, LOCKSEC=Y (N is the default) is specified on the DFSPBxxx IMS.PROCLIB member, IMS calls the SAF and user exit. If the resource is not defined to SAF, or is defined and is authorized to the user, the command is processed. If the resource is defined to SAF but not authorized for use, the command is rejected with a DFS3689W message.

A period that is specified in the password brackets is not treated as a delimiter.

Subsections:
- “/UNLOCK DB command” on page 949
- “/UNLOCK LTERM command” on page 950
- “/UNLOCK NODE command” on page 950

- “/UNLOCK PTERM command” on page 952
- “/UNLOCK SYSTEM command” on page 953
- “/UNLOCK TRAN command” on page 955

/UNLOCK DB command

The /UNLOCK DB command specifies the database to be unlocked.

Subsections:
- “Environment” on page 948
- “Syntax” on page 948
- “Usage notes” on page 948
- “Equivalent IMS type-2 commands” on page 949
- “Examples” on page 949
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/UNLOCK</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>DB</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/UNLOCK
/UNLOCK DB dbname (password)
```

Usage notes

The output of the /UNLOCK DB command is changed when the command is entered through the OM API. In this case, the DFS058I message is not returned to OM. The command response returned to OM contains one or more of the following messages: DFS0488I, DFS3466I, DFS132.

When you enter this command, the database name can be an existing non-HALDB, a HALDB master, or a HALDB partition. A command against a HALDB partition operates exactly like a command against a non-HALDB with the exception of the /START DB and the UPDATE DB START(ACCESS) command. A HALDB partition is not allocated during the command unless it was previously authorized but not allocated, the OPEN keyword was specified, or the partition has EEQEs. The partition is allocated at first reference.

The HALDB partition reflects conditions such as STOPPED, LOCKED, or NOTOPEN. When a HALDB partition is stopped, it must be explicitly started again. Commands with the keyword ALL and commands against a HALDB master do not change the STOPPED and LOCKED indicators in each HALDB partition.

When the command target is a HALDB master, processing acts on all HALDB partitions. For example, if the IMS command is /DBR on the HALDB master, all of the HALDB partitions are closed, deallocated, and deauthorized. Only the HALDB master displays STOPPED (each HALDB partition does not display STOPPED unless it was itself stopped). If a /DBR command was issued against a HALDB master, the display output of a /DISPLAY DB command shows the HALDB master (as STOPPED), but does not display the status of the partitions.

Each partition inherits the access limitations of its HALDB master. If the /DBD command is issued against a HALDB master, all of its partitions close. A subsequent reference to any of the partitions results in the partition opening for input, although the partition's access might be UPDATE or EXCLUSIVE. The DBRC authorization state reflects the limited access.

This command can be issued by APPC and OTMA clients.
/UNLOCK DB is valid only if entered from the master terminal, the system console, a TCO script, or from an AOI application program.

While the database is being quiesced, this command cannot be processed successfully.

**Equivalent IMS type-2 commands**

The following table shows variations of the /UNLOCK DB command and the IMS type-2 commands that perform similar functions.

*Table 376. Type-2 equivalents for the /UNLOCK DB command*

<table>
<thead>
<tr>
<th>Task</th>
<th>/UNLOCK DB command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlocks a database.</td>
<td>/UNLOCK DB dbname</td>
<td>UPDATE DB NAME(dbname)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>SET(LOCK(OFF))</td>
</tr>
</tbody>
</table>

**Examples**

The following is an example of the /UNLOCK DB command:

**Entry ET:**

```
/UNLOCK DB TREEFARM
```

**Response ET:**

```
DFS058I UNLOCK COMMAND COMPLETED
```

Explanation: Database TREEFARM is unlocked and can be used.

**Related reference:**

[“UPDATE DB command” on page 988](#)

**/UNLOCK LTERM command**

The /UNLOCK LTERM command specifies the logical terminal to be unlocked. This keyword applies only to the entering physical terminal and to logical terminals assigned to that physical terminal.

**Subsections:**

- [“Environment”](#)
- [“Syntax” on page 950](#)
- [“Usage notes” on page 950](#)

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

*Table 377. Valid environments for the /UNLOCK LTERM command and keywords*

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/UNLOCK</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>LTERM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>
Syntax

```
/UNLOCK LTERM ltermname (password)
/UNLOCK NODE
```

Usage notes

The `/UNLOCK LTERM ALL` command can only be used when all of the logical terminals associated with the entering physical terminal do not have passwords.

/UNLOCK LTERM applies only to the entering physical terminal.

/UNLOCK LTERM is not allowed from the OM API.

/UNLOCK NODE command

The `/UNLOCK NODE` command specifies the VTAM node to be unlocked. This keyword applies only to the entering physical terminal and to logical terminals assigned to that physical terminal.

Subsections:

- “Environment”
- “Syntax”
- “Usage notes”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>

<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/UNLOCK NODE
```

Usage notes

/UNLOCK NODE applies only to the entering physical terminal.

/UNLOCK NODE is not allowed from the OM API.
/UNLOCK PGM command

The /UNLOCK PGM command specifies the application program to be unlocked.

This command can be issued by APPC and OTMA clients.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Equivalent IMS type-2 commands”
- “Examples”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 379. Valid environments for the /UNLOCK PGM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/UNLOCK</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>PGM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/UNLOCK PGM pgmname [password]
```

Usage notes

The /UNLOCK PGM command is valid only if entered from the master terminal, the system console, a TCO script, or from an AOI application program.

Equivalent IMS type-2 commands

The following table shows variations of the /UNLOCK PGM command and the IMS type-2 commands that perform similar functions.

Table 380. Type-2 equivalents for the /UNLOCK PGM command

<table>
<thead>
<tr>
<th>Task</th>
<th>/UNLOCK PGM command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlocks a program.</td>
<td>/UNLOCK PGM pgmname</td>
<td>UPDATE PGM NAME(pgmname)</td>
</tr>
<tr>
<td></td>
<td></td>
<td>SET(LOCK(OFF))</td>
</tr>
</tbody>
</table>

Examples

The following is an example of the /UNLOCK PGM command:

Entry ET:

```
/UNLOCK PGM APPLETRE
```
Response ET:

DFS058I UNLOCK COMMAND COMPLETED

Explanation: Application program APPLETRE is unlocked and can be executed.

Related reference:
“UPDATE PGM command” on page 1201

/UNLOCK PTERM command

The /UNLOCK PTERM command specifies the physical terminal to be unlocked. This keyword applies only to the entering physical terminal and to logical terminals assigned to that physical terminal.

This command can be issued by APPC and OTMA clients.

Subsections:
• “Environment”
• “Syntax”
• “Usage notes”
• “Examples”

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

Table 381. Valid environments for the /UNLOCK PTERM command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/UNLOCK PTERM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

►► /UNLOCK PTERM ◄◄

Usage notes

/UNLOCK PTERM applies only to the entering physical terminal.

/UNLOCK PTERM is not allowed from the OM API.

Examples

The following is an example of the /UNLOCK PTERM command:

Entry ET:

/UNLOCK PTERM

Response ET:

DFS058I UNLOCK COMMAND COMPLETED
Explanation: The physical terminal from which the command is entered is unlocked.

/UNLOCK SYSTEM command

The /UNLOCK SYSTEM command notifies a newly created active system in an XRF complex that I/O prevention is complete.

Subsections:
- "Environment"
- "Syntax"
- "Usage notes"
- "Examples"

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/UNLOCK SYSTEM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>SYSTEM</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
/UNLOCK SYSTEM
```

Usage notes

I/O prevention is initiated at takeover to ensure that the failing active system cannot write to the databases. The alternate system then initiates I/O toleration to ensure database integrity and to enable new transaction processing as soon as possible. /UNLOCK SYSTEM ends the I/O toleration phase of processing.

/UNLOCK SYSTEM is valid only if it is entered from the master terminal or from the system console on an XRF system.

Examples

The following is an example of the /UNLOCK SYSTEM command:

The following three figures illustrate the use of the /UNLOCK SYSTEM command on a newly created active system. Each figure is a formatted master screen for the newly created active system IMSB.

The following figure shows a screen of a newly created active system in the I/O toleration phase of processing (awaiting I/O prevention). Database DD41M803 has an I/O toleration EEQE.
The following figure shows a screen of the use of the /UNLOCK SYSTEM command to notify the newly created active system that I/O prevention is complete (the XRF system status line now indicates that processing is no longer degraded by I/O toleration).

The following figure is a screen that shows that the I/O toleration EEQE for database DD41M803 has been deleted as part of /UNLOCK SYSTEM processing.

The following figure is a screen that shows the I/O toleration EEQE for database DD41M803 has been deleted as part of /UNLOCK SYSTEM processing.

Figure 3. I/O toleration phase of processing

Figure 4. /UNLOCK SYSTEM command

The following figure is a screen that shows that the I/O toleration EEQE for database DD41M803 has been deleted as part of /UNLOCK SYSTEM processing.

Figure 5. EEQE deleted as part of /UNLOCK SYSTEM processing

<tbody>
<tr>
<td>/UNLOCK TRANS</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>/UNLOCK TRAN</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
/UNLOCK TRAN tranname
```

Usage notes

The /UNLOCK TRAN command cannot be used for Fast Path exclusive or CPI Communications driven transaction programs.

This command can be issued by APPC and OTMA clients.

The /UNLOCK TRAN command is valid only if entered from the master terminal, the system console, a TCO script, or from an AOI application program.

Equivalent IMS type-2 commands

The following table shows variations of the /UNLOCK TRAN command and the IMS type-2 commands that perform similar functions.

<table>
<thead>
<tr>
<th>Task</th>
<th>/UNLOCK TRAN command</th>
<th>Similar IMS type-2 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unlocks a transaction.</td>
<td>/UNLOCK TRAN tranname</td>
<td>UPDATE TRAN NAME(tranname) SET(LOCK(OFF))</td>
</tr>
</tbody>
</table>
Examples

The following is an example of the /UNLOCK TRAN command:

Entry ET:
    /UNLOCK TRAN SEED

Response ET:
    DFS058I  UNLOCK COMMAND COMPLETED

Explanation: Transaction SEED is unlocked and can be scheduled.
Related reference:
    “UPDATE TRAN command” on page 1263
Chapter 30. UPDATE commands

Use the IMS UPDATE commands to update IMS resources or resource descriptors.

These commands can be issued through TSO SPOC, IBM Management Console for IMS and DB2 for z/OS, the Manage Resources options in the IMS Applications menu, or other user-written programs that issue commands through OM API. These commands can also be issued to an IMSpex by using the Batch SPOC utility.

UPDATE commands are:

- “UPDATE AREA command”
- “UPDATE DATAGRP command” on page 971
- “UPDATE DB command” on page 988
- “UPDATE DBDESC command” on page 1015
- “UPDATE IMS command” on page 1021
- “UPDATE IMSCON commands” on page 1033
- “UPDATE LE command” on page 1137
- “UPDATE MSLINK command” on page 1142
- “UPDATE MSNAME command” on page 1153
- “UPDATE MSPLINK command” on page 1160
- “UPDATE ODBM commands” on page 1170
- “UPDATE OLREORG command” on page 1186
- “UPDATE OTMADESC command” on page 1192
- “UPDATE PGM command” on page 1201
- “UPDATE PGMDESC command” on page 1218
- “UPDATE POOL command” on page 1228
- “UPDATE RM command” on page 1240
- “UPDATE RTC command” on page 1250
- “UPDATE RTCDESC command” on page 1257
- “UPDATE TRAN command” on page 1263
- “UPDATE TRANDESC command” on page 1297

UPDATE AREA command

Use the UPDATE AREA command to change the status of area resources.

When the UPDATE AREA command is issued, the command is processed only by the IMS to which it is routed. The command does not preload or preopen areas on other IMS systems in the IMSpex that share the area. The UPDATE AREA command is routed by OM. OM routes the command to all active DB/DC or DBCTL IMS systems, unless specific routing is specified. OM selects one IMS as the command master.

Subsections:

- “Environment” on page 958
- “Syntax” on page 958
- “Keywords” on page 959
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE AREA command and keywords can be issued.

Table 385. Valid environments for the UPDATE AREA command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE AREA</td>
<td>X</td>
<td>X</td>
<td></td>

<td></td>
</tr>
<tr>
<td>START</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>STOP</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

```
UPDATE AREA NAME (areaname, areaname*, (+) areaname+)

START (ACCESS)
  SET(ACCTYPE(BRWS, EXCL, READ, UPD))
  SET(TIMEOUT(nnm))
  (QUIESCE)

STOP (ACCESS) (QUIESCE) (SCHD)
```
Keywords

The following keywords are valid for the UPDATE AREA command:

NAME()

Specifies the names of the specific areas that are to be processed or a group of areas to be processed.

Wildcard parameters can be specified. The area names that match the generic or wildcard parameter are processed. For specific or wildcard names, response lines are returned for all the area names that are processed.

NAME(*) indicates that the command is to be applied to all the areas in the system. When the NAME(*) is specified, the response lines are returned for only the area names that resulted in an error. If OPTION(ALLRSP) is specified with NAME(*), response lines are returned for all the area names that are processed.

OPTION()

Specifies the additional functions to be performed. Following is a list of additional functions:

ALLRSP

Indicates that the response lines are to be returned for all areas that are processed on the command. ALLRSP is only valid with NAME(*). The default action is to return response lines only for the areas that resulted in an error.

FEOV

Indicates to force end of volume after the command processing is complete. The IMS log switches to the next OLDS, and a simple checkpoint is taken unless specified with STOP(QUIESCE). This switch is marked as a recovery point for log archiving purposes. A simple checkpoint is not taken when specified with STOP(QUIESCE).

FEOV is valid only with START(QUIESCE) OPTION(NOHOLD), STOP(ACCESS), or STOP(QUIESCE), and is not valid on an RSR tracker. OPTION(FEOV) is the default when specified with START(QUIESCE) OPTION(NOHOLD) or STOP(QUIESCE).

For quiesce processing, the end of volume will be forced after the quiesce point has been reached, causing the logs to be switched before the quiesce is released, so that any new updates occur on the new IMS log. This occurs during the stop quiesce processing of a START(QUIESCE) OPTION(NOHOLD) or when a
STOP(QUIESCE) is issued to release a quiesce from a previous START(QUIESCE) OPTION(HOLD).

**HOLD**

Specifies that after the quiesce has been achieved successfully the area should remain quiesced. A subsequent STOP(QUIESCE) would be required to release the quiesce on the DEDB area. HOLD is valid only with the START(QUIESCE) keyword. This keyword is mutually exclusive with the NOHOLD keyword.

**NOFEOV**

Indicates to not force end of volume after the command processing is complete. The IMS log does not switch to the next OLDS and a simple checkpoint is not taken.

NOFEOV is valid only with START(QUIESCE) OPTION(NOHOLD), STOP(ACCESS), or STOP(QUIESCE). OPTION(NOFEOV) is the default when specified with STOP(ACCESS).

**NOHOLD**

Specifies that after the quiesce has been achieved successfully the area should automatically release the quiesce. If neither HOLD nor NOHOLD is specified, NOHOLD is assumed. NOHOLD is valid only with the START(QUIESCE) keyword. This keyword is mutually exclusive with the HOLD keyword.

**OPEN**

Specifies to open the DEDB area data sets that are specified on the NAME() parameter, even if the area is not registered on DBRC as PREOPEN. The OPTION(OPEN) is processed locally by all IMS systems that receive the command and is not maintained as a global status in RM.

**PFA**

Sets or resets the prevent further authorization (PFA) status in the RECON data set for the DEDB area. Use the PFA option with UPDATE AREA START(ACCESS) to enable access to a DEDB area. Use the PFA option with UPDATE AREA STOP (ACCESS|SCHD) to prevent access to a DEDB area. If you specify OPTION(PFA), the command master IMS updates the RECON only if the command is successful at the master IMS.

**SCOPE()**

Specifies where IMS should apply the change. The default is ALL.

**ALL**

Changes are applied to the active IMS systems to which the command is routed. If you specify that global area status is to be maintained, changes are also applied globally by updating the value maintained by RM. The RM status is updated only by the command master IMS. If global area status is not maintained, the command action is same as the SCOPE(ACTIVE) command.

This option does not apply to the quiesce function. The scope of a quiesce is always all instances of the area usage across the IMSplex. There is not a global status of QUIESCE for a DEDB area. Using SCOPE(ALL) for a START(QUIESCE) or STOP(QUIESCE) does not change the global status for the area.

**ACTIVE**

Changes are applied to the active IMS systems to which the command
is routed to. Any global status information maintained in the RM resource structure is not changed by the SCOPE(ACTIVE) command.

This option does not apply to the quiesce function. The scope of a quiesce is always all instances of the area usage across the IMSplex. There is no quiesce which would only apply to a subset of the IMSplex.

The UPDATE AREA command keywords that update information locally in the active IMS system and globally in RM when SCOPE(ALL) is specified include:

- START(ACCESS)
- STOP(SCHD)
- STOP(ACCESS)

**SET()** Specifies the attribute values to be changed.

**ACCTYPE()**

Specifies the access intent for the named area. This keyword can be specified only if START(ACCESS) is specified. This keyword overrides the database access intent of its DEDB.

You can specify one of the following keywords:

**BRWS**

Specifies that the named area is available for read-only processing on this IMS subsystem. The only programs that can use the area on this subsystem are those that have a PCB processing option of GO (PROCOPT=GO). Programs that access the data by using the GO processing option might access uncommitted data because a sharing IMS subsystem could be updating the area. The area is opened for read-only processing.

**EXCL**

Specifies that the named area is to be used exclusively by this IMS subsystem. This exclusive access is guaranteed only when the area is registered to DBRC.

**READ**

Specifies that the named area is available for read processing in this IMS subsystem. Programs with update intent can be scheduled, but cannot update the area. ACCTYPE of READ differs from ACCTYPE of BRWS in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The area is opened for read.

**UPD**

Specifies that the named area is available for update as well as read processing in the IMS subsystem.

**TIMEOUT)** Specifies the number of seconds to wait before a timeout occurs in a DEDB area quiesce. The timeout value can be 1 - 999 seconds. The TIMEOUT parameter value can override the DBQUIESCETO parameter in the DFSCGxxx member of the IMS PROCLIB data set. If the TIMEOUT parameter is omitted and the DBQUIESCETO parameter is not specified, the default timeout value is 30 seconds. The TIMEOUT keyword is valid only with the START(QUIESCE) keyword.
START()
Specifies the attributes that are to be started.

ACCESS
Specifies the specific areas of a DEDB to be allocated or reallocated.

An UPDATE AREA START(ACCESS) can be issued on an RSR tracker to resume tracking for those areas that were stopped or had tracking errors. In addition, Online Forward Recovery (OFR) is started for areas that are not current with mainline tracking.

For Virtual Storage Option (VSO) areas, the UPDATE AREA START(ACCESS) can be used to preopen areas that are defined with the PREOPEN option. For VSO areas defined with the PRELOAD option, the command causes the areas to be loaded into the z/OS data space or an XES structure depending on the share level of the area. The command has no effect on VSO areas that are in virtual storage.

QUIESCE
Specifies that the DEDB areas named on the command are to be quiesced to establish a new recovery point. The scope of a quiesce is always all instances of the area usage across the IMSplex. There is no quiesce that would apply only to a subset of the IMSplex.

STOP()
Specifies the attributes that are to be stopped.

ACCESS
Stops the access and updating of the specified DEDB areas and closes them.

The UPDATE AREA STOP(ACCESS) command for VSO areas removes the areas from the data space or XES structure and forces updates to be written back to DASD.

An UPDATE AREA START(ACCESS) command is required to open and reallocate the areas closed by the UPDATE AREA STOP(ACCESS) command.

QUIESCE
Specifies that the DEDB areas named on the command should be made available again by releasing the quiesce on the areas.

Unlike START(QUIESCE), where each area resource listed must be quiesced in order for the command to complete successfully, STOP(QUIESCE) continues to process each listed resource even if some resources are not in quiesced state or cannot be released from quiesced state. For those resources that are not in quiesced state or cannot be released from quiesced state, the command returns a response line for each of those resources.

SCHD Specifies that the data sets associated to the areas are to be closed and deallocated.

Note: An UPDATE AREA START(ACCESS) is required to reallocate the areas stopped by the UPDATE AREA STOP(SCHD) command.

If UPDATE AREA STOP(SCHD) is processed during HSSP processing, the area will be released after the current commit
processing completes. Any image copy option in process when the command is issued can affect the continued system operation.

For VSO DEDB areas that are in a z/OS data space or XES structure, the UPDATE AREA STOP(SCHD) command action results in the removal of the VSO areas from the data space or XES structure and the writing of updates to DASD.

**Usage notes**

The UPDATE AREA command can only be specified using the OM API. The command is also not allowed on the XRF alternate.

The UPDATE AREA STOP(SCHD) command and the UPDATE AREA START(ACCESS) SET(ACCTYPE()) command are not allowed on any RSR tracker. However, the commands UPDATE AREA START(ACCESS) or UPDATE AREA STOP(ACCESS) are allowed only on a database level RSR tracker. The UPDATE AREA START(ACCESS) and UPDATE AREA STOP(SCHD) commands are recoverable, and a X'22' log record is written but the UPDATE AREA STOP(ACCESS) command is not recoverable.

A new log record, X'594C', is written for every DEDB area to which the UPDATE AREA command applies. It also includes global status and the global command time stamp.

The UPDATE AREA command is enhanced to return CCTXT with a non-zero completion code. The CCTXT can be up to 32 bytes, and it includes information about what the completion code means. The UPDATE AREA SCOPE(ALL) command returns a response line with the completion code for the global status update. The CCTXT for that code is GBL CC.

While the database is being quiesced, this command with keywords other than STOP(QUIESCE) cannot be processed successfully.

**Equivalent IMS type-1 commands**

The following table shows variations of the UPDATE AREA command and the type-1 IMS commands that perform similar functions.

*Table 386. Type-1 equivalents for the UPDATE AREA command*

<table>
<thead>
<tr>
<th>UPDATE AREA command</th>
<th>Similar IMS type-1 commands</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE AREA NAME(name) STOP(ACCESS)</td>
<td>/DBR AREA areaname</td>
</tr>
<tr>
<td>UPDATE AREA NAME(name) START(ACCESS)</td>
<td>/START AREA areaname</td>
</tr>
<tr>
<td>UPDATE AREA NAME(name) STOP(SCHD)</td>
<td>/STOP AREA areaname</td>
</tr>
</tbody>
</table>

**Output fields**

The following table shows the UPDATE AREA output fields. The columns in the table are as follows:

**Short label**

Contains the short label generated in the XML output.

**Keyword**

Identifies keyword on the command that caused the field to be generated.
N/A appears for output fields that are always returned. ERR appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

**Table 387. Output fields for the UPDATE AREA command**

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AREA</td>
<td>N/A</td>
<td>Area name. The area name is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>error</td>
<td>The completion code text that briefly explains the meaning of the completion code.</td>
</tr>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code for the line of output. Completion code is always returned.</td>
</tr>
<tr>
<td>GBL</td>
<td>SCOPE(ALL)</td>
<td>Indicates that the response line is for the global update.</td>
</tr>
<tr>
<td>EERT</td>
<td>ERR</td>
<td>Error text returned to add more meaning to the completion code and may include a return code from a service. The error text may be returned for a non-zero completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>The IMSplex member that built the output line. The IMS identifier of the IMS for which the area information is displayed. The IMS identifier is always returned.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

An IMS return and reason code is returned to OM by the UPDATE AREA command. The OM return and reason codes that may be returned as a result of the UPDATE AREA command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 388. Return and reason codes for the UPDATE AREA command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The UPDATE AREA command completed successfully.</td>
</tr>
<tr>

</thead>
<tbody>
<tr>
<td>D9</td>
<td>COMMAND PROCESSING ERROR</td>
<td>The UPDATE AREA START(ACCESS) command could not be processed for the area name because the area open failed.</td>
</tr>
<tr>
<td>E0</td>
<td>DATABASE OR AREA IN RECOVERY</td>
<td>The command is not processed because the database or area is in recovery.</td>
</tr>
<tr>
<td>E5</td>
<td>PARTICIPANTS UNABLE TO QUIESCE</td>
<td>This error is returned when the quiesce could not be completed successfully across the IMSplex. The IMS with this completion code was the quiesce participant that was not able to be quiesced.</td>
</tr>
<tr>
<td>E6</td>
<td>QUIESCE COMMUNICATION FAILURE</td>
<td>This error is returned when the quiesce could not be completed because of a failure to communicate across the IMSplex. There could be a problem with RM, OM, or SCI that has caused the communication failure to occur.</td>
</tr>
<tr>
<td>E7</td>
<td>CMD NOT ALLOWED</td>
<td>This error is returned when the database command could not be processed because a quiesce command was in progress.</td>
</tr>
<tr>
<td>E8</td>
<td>DATABASE HAS INTENT TO REORGANIZE</td>
<td>This error is returned when the quiesce could not be started because the RECON data sets indicate that there is an intent to reorganize the database.</td>
</tr>
<tr>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
<td>This error is returned when the named resource is in the wrong state for quiesce processing to proceed.</td>
</tr>
<tr>
<td>EF</td>
<td>DATABASE IS IN ERROR</td>
<td>This error is returned when the quiesce could not be completed because the database is in error.</td>
</tr>
<tr>
<td>F0</td>
<td>NO AREA LOCK</td>
<td>The command processing failed because the area lock could not be obtained.</td>

</tbody>
</table>

Examples

The following are examples of the UPDATE AREA command:

Example 1 for UPDATE AREA command

TSO SPOC input:

UPD AREA NAME(DB21AR1*) STOP(ACCESS)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AreaName</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB21AR1</td>
<td>IMS2</td>
<td>0</td>
</tr>
<tr>
<td>DB21AR1</td>
<td>SYS3</td>
<td>0</td>
</tr>
<tr>
<td>DB21AR10</td>
<td>IMS2</td>
<td>0</td>
</tr>
<tr>
<td>DB21AR10</td>
<td>SYS3</td>
<td>0</td>
</tr>
<tr>
<td>DB21AR11</td>
<td>IMS2</td>
<td>0</td>
</tr>
<tr>
<td>DB21AR11</td>
<td>SYS3</td>
<td>0</td>
</tr>
</tbody>
</table>

OM API input:

CMD(UPD AREA NAME(DB21AR1*) STOP(ACCESS))

OM API output:

<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.2.0</omvsn>
<xmlvsn>1</xmlvsn>
<statime>2003.132 16:17:33.260435</statime>
<brottime>2003.132 16:17:33.281165</brottime>
<staseq>B968A333F5A93283</staseq>
<stosseq>B968A333F3B8DDC83</stosseq>
<rqsttkn1>USR7005 10091733</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>IMS2</master>
<userid>USR7005</userid>
<verb>UPD</verb>
<kwd>AREA</kwd>
<input>UPD AREA NAME(DB21AR1*) STOP(ACCESS)</input>
Explanation: The command stops access to all the areas that match the area name specified and makes them unavailable. The areas data sets are closed and deallocated.

Example 2 of UPDATE AREA command

TSO SPOC input:
UPD AREA NAME(*) STOP(SCHD)

TSO SPOC output:
Log for . . . : UPD AREA NAME(*) STOP(SCHD)
IMSpexus . . . . : PLEX1
Return code . . . : 00000000
Reason code . . . : 00000000
Command master . . IMS2

OM API input:
CMD(UPD AREA NAME(*) STOP(SCHD))

OM API output:
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.2.0</omvsn>
<xmlvsn>1</xmlvsn>
<statime>2003.132 16:22:15.799896</statime>
<staseq>8968A44169058C8E</staseq>
<stoseq>8968A44310E6BE2D</stoseq>
<rqsttkn>USR005</rqsttkn>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>IMS2</master>
<userid>USR005</userid>
<verb>UPD</verb>
</cmd>
Explanation: The command is routed to IMS2 and SYS3, and the command is successful at both IMS systems. No response lines are returned because the default action for NAME(*) is to return response lines only for the area names that resulted in an error. OPTION(ALLRSP) can be specified to obtain all the area names processed on the command.

**Example 3 of UPDATE AREA command**

TSO SPOC input:

```
UPD AREA NAME(DD01AR0) STOP(ACCESS) SCOPE(ALL)
```

TSO SPOC output:

```
AreaName | MbrName | CC | Global
DD01AR0  | IMS1    | 0  | Y
DD01AR0  | IMS1    | 0  |
DD01AR0  | IMS2    | 0  
```

Explanation: The UPDATE AREA STOP(ACCESS) command for area DD01AR0 is successfully processed at IMS1 and IMS2. Command master IMS1 successfully updates the global status.

**Example 4 of UPDATE AREA command**

TSO SPOC input:

```
UPDATE AREA NAME(DB22AR0, DB22AR1, DB22AR2, DB22AR3) START(ACCESS) OPTION(OPEN)
```

TSO SPOC output:

```
AreaName | MbrName | CC | CCText
DB22AR0  | IMS1    | 0  |
DB22AR1  | IMS1    | 0  |
DB22AR2  | IMS1    | A9 | DB OR AREA AUTHORIZATION ERROR
DB22AR3  | IMS1    | A9 | DB OR AREA AUTHORIZATION ERROR
```

Explanation: This command opens the DEDB area data sets that are specified on the NAME() parameter, even if the area is not registered on DBRC as PREOPEN. The OPTION(OPEN) is processed locally by all IMS systems that receive the command and is not maintained as a global status in RM.

**Example 5 of UPDATE AREA command**

TSO SPOC input:

```
UPDATE AREA NAME(AWXYZ01) START(QUIESCE) OPTION(HOLD)
```

TSO SPOC output:

```
AreaName | MbrName | CC
AWXYZ01  | IM02    | 0
AWXYZ01  | IM01    | 0
AWXYZ01  | IM03    | 0
```

Explanation: This example is of a successful quiesce and hold for a DEDB area.

**Example 6 of UPDATE AREA command**
Example 7 of UPDATE AREA command

Example: example is of releasing the quiesce for a DEDB area.

Explanation: DEDB DEDBJ0001 has database access of update. Area D0010001 of DEDB DEDBJ001 access is changed from update to read.

UPDATE DATAGRP command

Use the UPDATE DATAGRP command to allow changes to the status of the members of a data group.

Subsections:
- “Environment”
- “Syntax” on page 972
- “Keywords” on page 972
- “Usage notes” on page 976
- “Equivalent IMS type-1 commands” on page 976
- “Output fields” on page 976
- “Return, reason, and completion codes” on page 977
- “Examples” on page 985

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE DATAGRP command and keywords can be issued.
### Syntax

```
UPDATE DATAGRPNAMEdatagrpname)
```

- **START**
  - (ACCESS)
  - SET(ACCTYPE(BRWS))
  - EXCL
  - READ
  - UPD
  - (QUIESCE)
  - SET(TIMEOUT(nn))
  - Stop(ACCESS QUIESCE)

- **OPTION**
  - ALLRSP
  - DBALLOC
  - FEOV
  - HOLD
  - NODBALLOC
  - NOFEOV
  - NOHOLD
  - PFA

- **SCOPE**
  - (ALL)
  - (ACTIVE)

### Keywords

The following keywords are valid for the UPDATE DATAGRPN command:

**NAME()**

Specifies the name of the data group to be processed.

**OPTION()**

Specifies the additional functions to be performed. Following is a list of additional functions:

- **ALLRSP**

  Indicates that the response lines are to be returned for all the members of the data group (all databases, areas, or both) that are processed on the command.
The default action is to return response lines only for the databases and areas or both that resulted in an error. A response line with the data group name is always returned.

**DBALLOC**
Indicates that the databases in the data group are to be allocated when they are started.

DBALLOC can only be specified with START(ACCESS).

Only one of DBALLOC or NODBALLOC can be specified.

**FEOV**
Indicates to force end of volume after the command processing is complete. The IMS log switches to the next OLDS, and a simple checkpoint is taken unless specified with STOP(QUIESCE). This switch is marked as a recovery point for log archiving purposes. A simple checkpoint is not taken when specified with STOP(QUIESCE).

FEOV is valid only with START(QUIESCE) OPTION(NOHANDLE) or STOP(ACCESS) or STOP(QUIESCE). FEOV is not valid on an RSR tracker. OPTION(FEOV) is the default when specified with START(QUIESCE) OPTION(NOHANDLE) or STOP(QUIESCE).

For quiesce processing, the end of volume will be forced after the quiesce point has been reached, causing the logs to be switched before the quiesce is released, so that any new updates occur on the new IMS log. This occurs during the stop quiesce processing of a START(QUIESCE) OPTION(NOHANDLE) or when a STOP(QUIESCE) is issued to release a quiesce from a previous START(QUIESCE) OPTION(HOLD).

**HOLD**
Specifies that after the quiesce has been achieved successfully the data group members should remain quiesced. A subsequent STOP(QUIESCE) would be required to release the quiesce on the data group members. This keyword is only valid with the START(QUIESCE) keyword. HOLD is mutually exclusive with NOHANDLE.

**NODBALLOC**
Indicates that the databases in the data group are not to be allocated when they are started. The databases will be allocated when they are scheduled.

NODBALLOC can only be specified with START(ACCESS).
NODBALLOC is the default action for UPDATE DATAGRP command if OPTION(DBALLOC) is not specified.

Only one of DBALLOC or NODBALLOC can be specified.

**NOFEOV**
Indicates to not force end of volume after the command processing is complete. The IMS log does not switch to the next OLDS, and a simple checkpoint is not taken.

NOFEOV is valid only with START(QUIESCE) OPTION(NOHANDLE), STOP(ACCESS), or STOP(QUIESCE). OPTION(NOFEOV) is the default when specified with STOP(ACCESS).
NOHOLD  
Specifies that after the quiesce has been achieved successfully the data group members should automatically release the quiesce. If you do not specify either HOLD or NOHOLD, NOHOLD is assumed. This keyword is only valid with the START(QUIESCE) keyword. NOHOLD is mutually exclusive with HOLD.

SCOPE()  
Specifies where IMS should apply the change.

ACTIVE  
SCOPE(ACTIVE) specifies that the changes are to be applied to the IMS systems that are currently active and to which the command is routed.

This option does not apply to the quiesce function. The scope of a quiesce is always all instances of the data group usage across the IMSplex. There is no quiesce which would only apply to a subset of the IMSplex.

ALL  
SCOPE(ALL) specifies that the changes are to be applied to the active IMS systems.

This option does not apply to the quiesce function. The scope of a quiesce is always all instances of the data group members usage across the IMSplex. There is not a global status of QUIESCE for a data group or its members. Using SCOPE(ALL) for a START(QUIESCE) or STOP(QUIESCE) does not change the global status for the data group members.

Currently, ACTIVE and ALL produce the same results.

SET()  
Specifies the attribute values to be changed or sets the database state.

ACCTYPE  
Specifies the access intent for the named database. This keyword can be specified only if START(ACCESS) is specified. This keyword overrides the database access intent specified at system definition.

BRWS  
Specifies that the named database is available for read-only processing on this IMS subsystem. The only programs that can use the database on this subsystem are those that have a PCB processing option of GO (PROCOPT=GO). Programs that access the data using the GO processing option might see uncommitted data because another program could be updating the database. The database is opened for read-only processing.

EXCL  
Specifies that the named database is to be used exclusively by this IMS subsystem. This exclusive access is guaranteed only when the database is registered to DBRC.

READ  
Specifies that the named database is available for read-only processing in this IMS subsystem. Programs with update intent can be scheduled, but cannot update the database. ACCTYPE of READ differs from ACCTYPE of BRWS in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The database is opened for read-only processing.
UPD  Specifies that the named database is available for update as well as read processing in this IMS subsystem.

TIMEOUT(\textit{nnn})
Specifies the number of seconds to wait before a timeout occurs in a data group quiesce. The timeout value can be 1 - 999 seconds. The TIMEOUT parameter value can override the DBQUIESCETO parameter in the DFSCGxxx member of the IMS PROCLIB data set. If the TIMEOUT parameter is omitted and the DBQUIESCETO parameter is not specified, the default timeout value is 30 seconds. The TIMEOUT keyword is valid only with the START(QUIESCE) keyword.

START()
Specifies the attributes that are to be started.

ACCESS
Specifies that the members of the specified data group name are to be started. See UPDATE AREA START(ACCESS) and UPDATE DB START(ACCESS) for a description of the actions performed on the databases and areas in the data group.

Additional functions to be performed along with START(ACCESS) can be specified using the OPTION keyword.

An UPDATE DATAGRP START(ACCESS) command with SET(ACCTYPE) or OPTION(DBALLOC | NODBALLOC | NOBACKOUT | OPEN | NOOPEN) is invalid on the RSR tracker.

QUIESCE
Specifies that the data group named on the command is to be quiesced to establish a new recovery point. The scope of a quiesce is always all instances of the data group usage across the IMSplex.

STOP()
Specifies the attributes to be stopped.

ACCESS
Specifies that offline processing is to be done for the members of the specified data group. See UPDATE AREA STOP(ACCESS) and UPDATE DB STOP(ACCESS) for a description of the actions performed on the databases and areas in the data group.

QUIESCE
Specifies that the data group named on the command should be made available again by releasing the quiesce on the data group members.

Unlike START(QUIESCE), where each data group resource listed must be quiesced in order for the command to complete successfully, STOP(QUIESCE) continues to process each listed resource even if some resources are not in quiesced state or cannot be released from quiesced state. For those resources that are not in quiesced state or cannot be released from quiesced state, the command returns a response line for each of those resources.

SCHD
Specifies that the members of the specified data group name are to be stopped. See UPDATE AREA STOP(ACCESS) and UPDATE DB STOP(ACCESS) for a description of the actions performed on the databases and areas in the data group.
Usage notes

The UPDATE DATAGRP command can only be specified through the OM API and can be processed only by the DB/DC and DBCTL environments. In addition, the UPDATE DATAGRP command is not allowed on the XRF alternate.

When the UPDATE DATAGRP command is issued, it only applies to the IMS system to which it is routed. It does not apply to the other IMS systems in the IMSplex that share the database or areas in the data group. The routing of the UPDATE DATAGRP command is done by OM. OM routes the command to all active DB/DC or DBCTL IMS systems, unless specific routing is specified. OM selects one IMS as the command master.

A response line is returned for the data group name from each IMS. Response lines are also returned for each data group member that resulted in an error. No response lines are returned for the data group members that are processed successfully unless OPTION(ALLRSP) is specified.

A data group is defined in the RECON data set by using the INIT.DBDSGRP command with the parameters GRPNAME and DBGRP (to define a DB group), MEMBERS (to define a DBDS group), or RECOVGRP (to define a recovery group). The DATAGRP keyword on the UPDATE command can specify either a DBDS group or a DB group (DL/I databases or DEDB areas).

If the ACCESS keyword is specified on the UPDATE DATAGRP command along with the DBDS group name, the ACCESS keyword is not applied to the Fast Path DEDB databases associated with the Fast Path DEDB areas in the DBDS group. If the intent is to use the ACCESS keyword for Fast Path DEDB databases, the DATAGRP parameter must be a data group name that does not contain area names.

While the database is being quiesced, this command with keywords other than STOP(QUIESCE) cannot be processed successfully.

Equivalent IMS type-1 commands

The following table shows variations of the UPDATE DATAGRP command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE DATAGRP command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE DATAGRP NAME(name) STOP(ACCESS)</td>
<td>/DBR DATAGRP datagrpname</td>
</tr>
<tr>
<td>UPDATE DATAGRP NAME(name) START(ACCESS)</td>
<td>/START DATAGRP datagrpname</td>
</tr>
<tr>
<td>UPDATE DATAGRP NAME(name) STOP(SCHD)</td>
<td>/STOP DATAGRP datagrpname</td>
</tr>
</tbody>
</table>

Output fields

The following table shows the output fields for the UPDATE DATAGRP. The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Keyword
Identifies the keyword on the command that caused the field to be
generated. N/A appears for output fields that are always returned. ERR appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

**Table 391. Output fields for UPDATE DATAGRP command**

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>AREA</td>
<td>N/A</td>
<td>Area name. The Area name is returned if there are one or more areas in the data group.</td>
</tr>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code for the line of output. Completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>error</td>
<td>The completion code text that briefly explains the meaning of the completion code.</td>
</tr>
<tr>
<td>DB</td>
<td>N/A</td>
<td>Database name. The database name is returned if there are one or more databases in the data group.</td>
</tr>
<tr>
<td>DG</td>
<td>N/A</td>
<td>Data group name. The data group name is always returned.</td>
</tr>
<tr>
<td>ERRRT</td>
<td>ERR</td>
<td>Error text returned to add more meaning to the completion code and may include a return code from a service. The error text is only returned if the completion code is non-zero.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>The IMSplex member that built output line. The IMS identifier of the IMS for which the database information is displayed. The IMS identifier is always returned.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

An IMS return and reason code is returned to OM by the UPDATE DATAGRP command. The OM return and reason codes that may be returned as a result of the UPDATE DATAGRP command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

### Examples

The following are examples of the UPDATE DATAGRP command:

**Example 1 for UPDATE DATAGRP command**

**TSO SPOC input:**

```
UPD DATAGRP NAME(GROUP1) STOP(ACCESS)
```

**TSO SPOC output:**

```
DataGroup DBName AreaName MbrName CC
GROUP1 IMSA 0
GROUP1 IMS1 8
GROUP1 DEDBJN03 IMS1 C
GROUP1 DEDBJN03 DB3AREA0 IMS1 F0
```

**OM API input:**

```
CMD(UPD DATAGRP NAME(GROUP1) STOP(ACCESS))
```

**OM API output:**

```
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.2.0</omvsn>
<statime>2003.129 22:45:55.898843</statime>
<stotime>2003.129 22:45:55.990001</stotime>
<staseq>8965346AB45DB229</staseq>
<stoseq>8965346ACA9F1263</stoseq>
<rqsttknl>USRT005 10154555</rqsttknl>
<rc>0200000C</rc>
<rsn>00003000</rsn>
</ctl>
<cmderr>
<mbr name="IMS1">
<typ>IMS</typ>
<styp>DBDC</styp>
<rc>0000000C</rc>
<rsn>00003000</rsn>
<rsntext>At least one request successful</rsntext>
</mbr>
</cmderr>
<cmd>
<master>IMSA</master>
<userid>USRT005</userid>
<verb>UPD</verb>
<kwd>DATAGRP</kwd>
<input>UPD DATAGRP NAME(GROUP1) STOP(ACCESS)</input>
</cmd>
</cmdshdr>
```

Chapter 30. UPDATE commands 985
Explanation: The command stops access to all the members of data group GROUP1 and takes them offline. The command response lines are returned for all the databases or areas that resulted in an error. No response lines are returned for members for which the command was successful.

Example 2 for UPDATE DATAGRP command

TSO SPOC input:
```
UPD DATAGRP NAME(GROUP1) START(ACCESS) OPTION(ALLRSP)
```

TSO SPOC output:
```
<table>
<thead>
<tr>
<th>DataGroup</th>
<th>DBName</th>
<th>AreaName</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>GROUP1</td>

<td></td>
</tr>
<tr>
<td>GROUP1</td>
<td>IMS1</td>
<td></td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>GROUP1</td>
<td>DB21AR1</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>GROUP1</td>
<td>BE3PARTS</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>GROUP1</td>
<td>DEDBJN03</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
</tbody>
</table>
```

OM API input:
```
CMD(UPD DATAGRP NAME(GROUP1) START(ACCESS) OPTION(ALLRSP))
```

OM API output:
```
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.2.0</omvsn>
<xmlvsn>1</xmlvsn>
<staseq>B965349FB88B4445</staseq>
<stoseq>B965349FE4F0C36A</stoseq>
<rqsttkn1>USRT005 10154651</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
<cmd>
<master>IMSA</master>
<userid>USRT005</userid>
<verb>UPD</verb>
<kwd>DATAGRP</kwd>
<input>UPD DATAGRP NAME(GROUP1) START(ACCESS) OPTION(ALLRSP)</input>
```
Chapter 30. UPDATE commands  987

Explanation: The command starts access of all the members of data group, GROUP1, and makes them available. The command response lines are returned for all the databases or areas that are processed with OPTION(ALLRSP) specified.

**Example 3 for UPDATE DATAGRP command**

**TSO SPOC input:**

```
UPDATE DATAGRP NAME(DBGXYZ) START(QUIESCE) OPTION(HOLD)
```

**TSO SPOC output:**

```
DataGroup | DBName | MbrName | CC
DBGXYZ    | DB1XYZ | IM02    | 0
DBGXYZ    | DB2XYZ | IM02    | 0
DBGXYZ    | IM02   | 0
DBGXYZ    | DB1XYZ | IM01    | 0
DBGXYZ    | DB2XYZ | IM01    | 0
DBGXYZ    | IM01   | 0
DBGXYZ    | DB1XYZ | IM03    | 0
DBGXYZ    | DB2XYZ | IM03    | 0
DBGXYZ    | IM03   | 0
```

Explanation: This example is of a successful quiesce-and-hold for a data group.

**Example 4 for UPDATE DATAGRP command**

**TSO SPOC input:**

```
UPD DATAGRP NAME(DBGXYZ) START(QUIESCE)
```

**TSO SPOC output:**

```
DataGroup | DBName | MbrName | CC
DBGXYZ    | DB1XYZ | IM02    | 0
DBGXYZ    | DB2XYZ | IM02    | 0
DBGXYZ    | IM02   | 0
DBGXYZ    | DB1XYZ | IM01    | 0
DBGXYZ    | DB2XYZ | IM01    | 0
DBGXYZ    | IM01   | 0
```
Explanation: This example is of a successful quiesce-and-go for a data group.

**Example 5 for UPDATE DATAGRP command**

TSO SPOC input:
```
UPD DATAGRP NAME(DBGXYZ) STOP(QUIESCE)
```

TSO SPOC output:
```
DataGroup DBName MbrName CC
DBGXYZ DB1XYZ IM02 0
DBGXYZ DB2XYZ IM02 0
DBGXYZ IM02 0
DBGXYZ DB1XYZ IM01 0
DBGXYZ DB2XYZ IM01 0
DBGXYZ IM01 0
DBGXYZ DB1XYZ IM03 0
DBGXYZ DB2XYZ IM03 0
DBGXYZ IM03 0
```

Explanation: This example is of releasing the quiesce for a data group.

- “/STOP DATAGRP command” on page 839

**UPDATE DB command**

Use the UPDATE DB command to update status or definition information about databases. For example, UPDATE DB can make a database available, take the database offline, stop scheduling, stop updates, lock, and unlock a database.

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE DB command and keywords can be issued.
### Table 394. Valid environments for the UPDATE DB command and keywords

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>

<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

### Syntax

```
UPDATE (dbname*)

START
  (ACCESS)
  SET(ACCTYPE(brws))
  AREA(*)
  QUIESCE
  SET(TIMEOUT(nnn))
  ACCESS(SCHD)
  ACCESS(UPDATES)
  ACCESS(QUISCE)
  SET(LOCK(ON))
  SET(RESIDENT(N))

STOP

OPTION
  ALLRSP
  DBALLOC
  FEOV
  HOLD
  NOBACKOUT
  NOOBACKOUT
  NODBALLOC
  NOFEOV
  NOHOLD
  NOOPEN
  NORAND
  OPEN
  PFA
```
Keywords

The following keywords are valid for the UPDATE DB command:

AREA(*)

Specifies the areas of the databases that are to be processed or, if you specify AREA(*), indicates that the command applies to all the areas in the database.

The UPDATE DB START(ACCESS) AREA(*) command starts the DEDB and all of its areas and allows scheduling of new applications against the DEDB.

The AREA(*) keyword is ignored for non-DEDB databases. You cannot specify both the AREA(*) and the NAME(*) keywords. If you specify the AREA(*) keyword with the START(ACCESS) SET(ACCTYPE) keyword, all the DEDB areas are restarted after they are stopped by the START(ACCESS) SET(ACCTYPE) keyword.

NAME()

Specifies the 1-8 character name of the database (DBD name). Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the resource names that are processed. For NAME(*) command responses are returned only for the resource names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the resource names that are processed.

NAME(*) is the designed method on IMSplex commands to enable the user to specify that the command applies to all the database resources.

The database names that match the generic or wildcard parameter are processed. For specific or wildcard names, response lines are returned for all the database names that are processed.

When the database specified is a DEDB, a response line is returned for the DEDB name. A response line is also returned for all the areas of a DEDB that resulted in errors. A response line is not returned for the areas of a DEDB for which the command action is successful.

OPTION()

Specifies additional functions to be performed along with the UPDATE DB command.

ALLRSP

Indicates that the response lines are to be returned for all resources that are processed on the command. The default action is to return response lines only for the resources that resulted in an error. It is only valid with NAME(*) or AREA(*). ALLRSP is ignored for other NAME values.

DBALLOC

Indicates that the database is to be allocated when it is started. DBALLOC can be specified with START(ACCESS) only. DBALLOC is the default action when specific database names are specified on the command. Only one of DBALLOC or NODBALLOC can be specified.

OPTION(DBALLOC) is not valid for a HALDB master.
FEOV  Indicates to force end of volume after the command processing is complete.

The IMS log switches to the next OLDS, and a simple checkpoint is taken unless specified with STOP(QUIESCE). This switch is marked as a recovery point for log archiving purposes. A simple checkpoint is not taken when specified with STOP(QUIESCE).

FEOV is valid only with START(QUIESCE) OPTION(NOHOLD), STOP(QUIESCE), STOP(UPDATES), or STOP(ACCESS), and does not apply to an RSR tracker. OPTION(FEOV) is the default when specified with START(QUIESCE) OPTION(NOHOLD) or STOP(QUIESCE).

When START(QUIESCE) or STOP(QUIESCE) is specified, OPTION(FEOV) is the default; that is, the end of volume will be forced after the quiesce point has been reached. The logs are switched before the quiesce is released so that any new updates occur on the new IMS log. Switching of the logs occurs when STOP(QUIESCE) is issued to release a quiesce from a previous START(QUIESCE) OPTION(HOLD).

HOLD  Specifies that after the quiesce has been achieved successfully, the database should remain quiesced. A subsequent STOP(QUIESCE) would be required to release the quiesce on the database.

OPTION(HOLD) is valid only with the START(QUIESCE) keyword. OPTION(HOLD) is mutually exclusive with OPTION(NOHOLD).

NOBACKOUT  Indicates to suppress backout restart for a database not registered in DBRC.

NOBACKOUT can be specified with START(ACCESS) only and is not valid with NAME(*). OPTION(NOBACKOUT) is not valid for a HALDB master.

NODBALLOC  Indicates that the database is not to be allocated when it is started.

The database is allocated when it is scheduled. NODBALLOC can be specified with START(ACCESS) only. NODBALLOC is the default action when NAME(*) is specified. Only one of DBALLOC or NODBALLOC can be specified. OPTION(NODBALLOC) is ignored for HALDB masters.

NOFEOV  Indicates to not force end of volume after the command processing is complete. The IMS log does not switch to the next OLDS and a simple checkpoint is not taken.

OPTION(NOFEOV) can be specified only with START(QUIESCE) OPTION(NOHOLD), STOP(ACCESS), STOP(QUIESCE), or STOP(UPDATES). OPTION(NOFEOV) is the default except when START(QUIESCE) or STOP(QUIESCE) is specified.

NOHOLD  Specifies that after the quiesce has been achieved successfully the database should automatically release the quiesce. If either HOLD or NOHOLD is not specified, NOHOLD is assumed.
OPTION(NOHOLD) is valid only with the START(QUIESCE) keyword. OPTION(NOHOLD) is mutually exclusive with OPTION(HOLD).

**NOOPEN**

Indicates that the database is not to be opened when it is started.

NOOPEN can only be specified with START(ACCESS). NOOPEN is the default action unless the database has EEQF’s.

Only one of OPEN or NOOPEN can be specified. OPTION(NOOPEN) is not valid for a HALDB master.

**NORAND**

Indicates that the randomizer stays loaded while the UPDATE DB STOP(ACCESS) command is being processed.

This option solves the problem of the Extended Common Service Area (ECSA) becoming fragmented by continuous unloading and reloading of randomizers.

**Restriction:** OPTION(NORAND) only works for Fast Path DEDBs. It is ignored for full-function databases.

OPTION(NORAND) status is not maintained in the RM resource structure if global database status is maintained. If an UPD DB STOP(ACCESS) OPTION(NORAND) command is issued for a Fast Path DEDB, the STOACC status is saved in the RM resource structure. The randomizer is unloaded when the global STOACC status is applied.

**OPEN**

Indicates that the database is to be opened when it is started.

OPEN can be specified only with START(ACCESS). Specifying START(ACCESS) OPTION(OPEN) causes the randomizer routine or the selection partition routine to be loaded.

The randomizer is loaded into memory the first time it is referenced by a database. If no other database references the randomizer and the randomizer is deleted from memory, the randomizer is deleted from memory.

OPEN cannot be specified with NAME(*) or if NODBALLOC is specified. Either OPEN or NOOPEN can be specified. OPTION(OPEN) is not valid for a HALDB master, but the partition structure rebuild is done if structure rebuild is needed and if only one HALDB master was specified in the command. No rebuild is attempted if there is more than one database name listed in the command.

The UPDATE DB AREA(*) START(ACCESS) OPTION(OPEN) command starts and opens all areas under one or more DEDBs specified in the NAME() keyword even if the areas are not registered on DBRC as PREOPEN. The OPTION(OPEN) is processed locally by all IMS systems that receive the command and is not maintained as a global status in RM.

**PFA**

Sets or resets the “prevent further authorization” (PFA) or the “read-only” status in the RECON for the database. Use the PFA option with UPDATE DB START(ACCESS) to enable access to a database. Use the PFA option with the UPDATE DB STOP (ACCESS|SCHD|UPDATES) command to prevent access to a
database. PFA is optional. If you specify OPTION(PFA), the command master updates the RECON data set only if the command is successful at the master IMS. All other IMS systems that receive the command process is locally. OPTION(PFA) is not valid with SET(LOCK(ON|OFF)).

**SCOPE()**

Specifies where IMS should apply the change.

**ALL**

Changes are applied to the IMS systems that are currently active and to which the command is routed. Changes are also applied globally by updating the value maintained by RM. The global status that RM saves can be propagated across some IMS restarts. When an IMS system starts, it obtains global status information from RM. Maintaining global status in RM allows IMS systems to start without a specific setting or status for an area.

If the status or attribute that this command is updating is not maintained globally by RM, then the command is processed as if SCOPE(ACTIVE) is specified. If this command updates status or attributes that are both global and local, RM only updates the global status or attributes.

You must specify if the global area status must be maintained in RM. You can specify this during IMS initialization in either the DFSDFxxx or DFSCGxxx PROCLIB member with PLEXPARM(GSTSDB(Y)). You can also change it dynamically using the UPD IMS SET(PLEXPARM(GSTSDB(Y)) command. If you do not specify that global database status is to be maintained, the GLOBAL keyword is processed as in prior releases, and the global status is not updated.

**Restriction:** SCOPE(ALL) does not apply to the quiesce function. The scope of a quiesce is always all instances of the database usage across the IMSplex. There is not a global status of QUIESCE for a database. For START(QUIESCE) and STOP(QUIESCE), SCOPE(ALL) is the same as SCOPE(ACTIVE).

**ACTIVE**

Changes are applied to the active IMS systems to which the command is routed to. Any global status information maintained in the RM resource structure is not changed by the SCOPE(ACTIVE) command.

**Restriction:** SCOPE(ACTIVE) does not apply to the quiesce function. The scope of a quiesce is always all instances of the database usage across the IMSplex.

RM maintains global status information for some database attributes and values. IMS updates those values in RM based on commands or other internal events. When SCOPE(ALL) is specified, every IMS system that processes the command updates information in its local control blocks. Only the IMS command master calls RM to update the information globally.

The UPDATE DB command keywords that update information locally in the active IMS system and globally in RM when SCOPE(ALL) is specified include:

- START(ACCESS)
- **START(ACCESS) SET(ACCTYPE())**
- **STOP(ACCESS|SCHD|UPDATES)**
- **SET(LOCK(ON|OFF))**

    If global status is maintained, UPD DB START(ACCESS) STOP(ACCESS,SCHD,UPDATES) SCOPE(ALL) writes an X'4C' log record to include global status and global time stamp.

**SET0**  Specifies the attribute values to be changed or sets the database state.

**ACCTYPE**  Specifies the access intent for the named database. ACCTYPE() can only be specified if START(ACCESS) is also specified. This keyword overrides the database access intent specified at system definition.

**BRWS**  The database is available for read-only processing on this IMS subsystem. The only programs that can use the database on this subsystem are those databases that have a PCB processing option of GO (PROCOPT=GO). Programs that access the data using the GO processing option might see uncommitted data since a sharing IMS subsystem could be updating the database. The database is opened for read-only processing.

**EXCL**  The database is to be used exclusively by this IMS subsystem. This exclusive access is guaranteed only when the database is registered to DBRC.

**READ**  The database is available for read-only processing in this IMS subsystem. Programs with update intent can be scheduled, but cannot update the database. Access type READ differs from access type BRWS in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The database is opened for read-only processing.

**UPD**  The database is for update as well as read processing in the IMS subsystem.

**RESIDENT**  Specifies the resident option. The RESIDENT(N) option takes effect right away. The RESIDENT(Y) option takes effect at the next restart, unless the database was updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart. A database defined as a DEDB in ACBLIB always sets the RESIDENT(Y) attribute when the DEDB is loaded, regardless of the RESIDENT value specified. RESIDENT(N) is rejected for a DEDB.

**N**  The DMB associated with the named database resource is not made resident in storage. The DMB is loaded at scheduling time.

**Y**  The DMB associated with the named database resource is made resident in storage at the next IMS restart. At the next IMS restart, IMS loads the DMB and initializes it. A resident database is accessed in local storage, which eliminates I/O to the ACBLIB. In an online environment, the DMB control blocks are stored in the ACBLIB. If the DLI/SAS address space exists, DLI/SAS loads the DMB, otherwise, it is the IMS control
The database must be stopped in order for this attribute to be changed. You may need to issue a /DBR DB command or an UPDATE DB STOP(ACCESS) command to stop the database before issuing an UPDATE DB SET(RESIDENT(Y|N)) command.

An UPDATE command specified with SET(RESIDENT) is not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). The UPDATE DB command changes a MODBLKS database to dynamic, if the RESIDENT attribute is changed. These commands are recoverable.

**LOCK**

Locks and unlocks the specified database. NAME(*) cannot be specified with SET(LOCK(ON | OFF)).

**ON**

Locks and prevents subsequently scheduled programs from accessing the database, without affecting currently scheduled programs. The database is not closed.

For a shared secondary index database, an UPDATE DB SET(LOCK(ON)) on the first secondary index or subsequent secondary indexes affects only the named database.

**OFF**

Unlocks the specified databases and resets the effect of an UPDATE DB SET(LOCK(ON)) command. An UPDATE DB SET(LOCK(OFF)) on the first secondary index or subsequent secondary indexes affects only the named database.

**TIMEOUT(mnn)**

Specifies the number of seconds to wait before a timeout occurs in a database quiesce. The timeout value can be 1 - 999 seconds. The TIMEOUT parameter value can override the DBQUIESCETO parameter in the DFSCGxxx member of the IMS PROCLIB data set. If the TIMEOUT parameter is omitted and the DBQUIESCETO parameter is not specified, the default timeout value is 30 seconds. The TIMEOUT keyword is valid only with the START(QUIESCE) keyword.

**START()**

Specifies the attributes that are to be started.

**ACCESS**

The UPDATE DB START(ACCESS) command starts the database and permits access from transactions or programs. The UPDATE DB START(ACCESS) command resets the actions done by a prior UPDATE DB STOP(SCHD), or UPDATE DB STOP(UPDATE). The access intent is set to the database access intent specified at system definition unless SET(ACCTYPE) is specified.

The UPDATE DB START(ACCESS) command can be used to allocate or reallocate all databases other than DEDBs. For a DEDB, an UPDATE AREA command can be used to allocate or reallocate the DEDB areas.
For a DEDB, the UPDATE DB START(ACCESS) command also causes any unloaded randomizer that was specified in the DBD source to be reloaded.

When the UPDATE DB START(ACCESS) command is specified for a HALDB partition, the partition is not allocated unless it has EEQEs, the OPEN keyword is specified, or it was previously authorized but not allocated. The action taken to allocate the data sets is dependent on the status of the master database and its availability.

The UPDATE DB START(ACCESS) command may reset the USTOPPED status for transactions that are suspended. If the transaction is suspended and its processing program has access to the started database, the UPDATE DB START(ACCESS) command results in the USTOPPED attribute being reset. Any messages on the suspend queue for that transaction is transferred to the normal processing queue.

If there was a prior dynamic backout or emergency restart backout failure, then the UPDATE DB START(ACCESS) command attempts to perform the backout again.

If the database is registered to DBRC, then DBRC is informed when batch backout is successfully executed, and the failing backout is not attempted again when an UPDATE DB START(ACCESS) command is issued.

The UPDATE DB START(ACCESS) command is not processed for the databases being accessed by batch programs.

For a HIDAM database, the UPDATE DB START(ACCESS) command must be issued for both the index and the data area DBD. If a backout failure occurs for this database, the command causes the backout to be attempted again.

On an RSR tracker, the UPDATE DB START(ACCESS) command can be used to resume tracking for those databases that were stopped by a tracking subsystem processing. The command can also be used to start online forward recovery (OFR) for those databases that are not current with mainline tracking.

For shared secondary index databases, the UPDATE DB START(ACCESS) can be issued on the first secondary index or subsequent secondary indexes to undo the actions of the prior UPDATE DB STOP(SCHD) and UPDATE DB STOP(UPDATES) commands.

Additional functions can be performed with START(ACCESS) by specifying the OPTION keyword. OPTION(DBALLOC | NODBALLOC), OPTION(NOBACKOUT), OPTION(NOOPEN | OPEN) can be specified along with START(ACCESS). The OPTION keyword is not valid for a HALDB master.

**QUIESCE**

Specifies that the databases named on the command are to be quiesced to establish a new recovery point. The scope of a quiesce is always all instances of the database usage across the IMSplex. There is no quiesce that would apply only to a subset of the IMSplex.
STOP

Specifies the attributes that are to be stopped.

ACCESS

Starts offline processing of the database. This processing closes and deallocates the database and deauthorizes the database to DBRC. An UPDATE DB START(ACCESS) command is required to reset the effect of an UPDATE DB STOP(ACCESS).

Specifying UPDATE DB STOP(ACCESS), UPDATE DB STOP(UPDATES), or UPDATE DB STOP(SCHEDULE) can cause the randomizer routine or the selection partition routine to be deleted from memory.

OPTION(NOFEOV) is the default action for STOP(ACCESS). The IMS log is not switched to the next OLDS and a simple checkpoint is not taken. OPTION(FEOV) can be specified on the command to switch to the next OLDS and take an IMS simple checkpoint.

The UPDATE DB STOP(ACCESS) command can be used on a database readiness level (DLT) tracker to take shadow areas and databases offline for image copy and recovery. The command can also be used to stop online forward recovery (OFR) in progress for the specified database.

The UPDATE DB STOP(ACCESS) command does not deallocate a data set if a VSAM data set hardware error occurred. For shared secondary index databases, an UPDATE DB STOP(ACCESS) on the first secondary index affects all databases sharing the secondary index data set. An UPDATE DB STOP(ACCESS) command on the subsequent secondary indexes affects only the named database.

QUIESCE

Specifies that the databases named on the command should be made available again by releasing the quiesce on the databases.

Unlike START(QUIESCE), where each database resource listed must be quiesced in order for the command to complete successfully, STOP(QUIESCE) continues to process each listed resource even if some resources are not in quiesced state or cannot be released from quiesced state. For those resources that are not in quiesced state or cannot be released from quiesced state, the command returns a response line for each of those resources.

SCHD

Stops or prevents subsequently scheduled programs from accessing the database, without affecting currently scheduled programs. The database is not closed.

An UPDATE DB START(ACCESS) command can be used to reset the effect of an UPDATE DB STOP(SCHD) command.

If the command is issued for a DEDB or MSDB, programs using the database will not be scheduled. For other databases, the programs will still be scheduled. If the INIT call was issued, however, a call against the database will result in either a 3303 pseudoabend or a BA status code.

When the UPDATE DB STOP(SCHD) command is issued for a database that is in use by an MPP region, the command is processed after the region completes processing the current message. After the current message processing is complete, the
application program receives a QC status indicating no more messages even if there are messages to be processed.

When the UPDATE DB STOP(SCHD) command is issued for a database that is in use by a BMP region, the command is rejected.

In a DBCTL system, CCTL can specify LONG or SHORT when it schedules a PSB. When the UPDATE DB STOP(SCHD) command is issued for a database that is in use by a LONG thread, the command is rejected. When the command is issued for a database that is in use by a SHORT thread, the thread completes before the command is processed.

For a shared secondary index database, an UPDATE DB STOP(SCHD) on the first secondary index or subsequent secondary indexes affects only the named databases.

**UPDATES**

Stops or prevents transactions or programs from updating the specified DL/I database.

STOP(UPDATES) is not valid for DEDBs or MSDBs.

An UPDATE DB START(ACCESS) command is required to reset the effect of an UPDATE DB STOP(UPDATES) command.

When the UPDATE DB STOP(UPDATES) command is processed, the message processing regions using the specified database are terminated at the conclusion of processing their transactions in preparation to close the database and enable the databases to be opened input only. As the message processing regions terminate programs, the data sets of the database are closed.

OPTION(FEOV) forces the IMS log to switch to the next OLDS. This switch is marked as a recovery point for log archiving purposes. IMS also issues a simple checkpoint. OPTION(NOFEOV), which is the default, overrides this action.

After the command is processed, the scheduling of transactions is resumed. No transactions will be allowed to update the specified databases. Programs with update intent will be scheduled, but update calls to DL/I databases will result in a 3303 pseudoabend, a BA, or BB status code. The pseudoabend or status codes appear only if the application program informed IMS through the INIT STATUS GROUPA or GROUPB call that it is prepared to accept status codes regarding data unavailability.

An UPDATE DB STOP(UPDATES) on the first secondary index affects all databases sharing the secondary index data set. An UPDATE DB STOP(UPDATES) on subsequent secondary indexes affects only the named database.

**Usage notes**

The UPDATE DB command can only be specified through the OM API and can only be processed by the DB/DC and DBCTL environments. When the UPDATE DB command is issued, it only applies to the IMS system to which it is routed. The command is not processed by other IMS systems in the IMSplex that share the database but do not receive the command. OM selects one IMS as the command master. Also, the command is not allowed on the XRF alternate system, RSR tracker, or FDBR region.
Resources exist for the life of IMS unless they are deleted using a DELETE command or online change for MODBLKS. Resource updates are recoverable across an IMS warm start or emergency restart. Updates to database runtime resource definition attributes such as RESIDENT are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

Each database is updated individually, unlike the online change process where either all databases are updated or no databases are updated. Some runtime resource definition values for a database can only be updated if the database is not in use. If the database is in use, the update fails. An exception to this rule is status. You can update the status of a database while it is in use. In a sysplex environment with multiple IMS systems, the update might succeed on some IMS systems and fail on others.

Runtime resource definition attributes include the following: RESIDENT.

An UPDATE DB command that changes runtime resource definition attributes such as the RESIDENT attribute is rejected for MSDBs and DEDBs.

The UPDATE DB command returns CCTXT with a nonzero completion code. The CCTXT can be up to 32 bytes, and it includes information about what the completion code means. The UPDATE DB SCOPE(ALL) command returns a response line with the completion code for the global status update. The CCTXT for that code is GBL CC.

If all the attributes specified by the UPDATE command are already defined for the resource, no update is actually made, no resources are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

When you enter this command, the database name can be an existing non-HALDB, a HALDB master, or a HALDB partition. A command against a HALDB partition operates exactly like a command against a non-HALDB with the exception of the /START DATABASE and the UPDATE DB START(ACCESS) command. A HALDB partition is not allocated during the command unless it was previously authorized but not allocated, the OPEN keyword was specified, or the partition has EEQEs. The partition is allocated at first reference.

The HALDB partition reflects conditions such as STOPPED (shown as STOACC or STOSCHD or SToupds on QUERY DB), LOCKED, or NOTOPEN. When a HALDB partition is stopped, it must be explicitly started again. The type-1 commands with the keyword ALL, type-2 commands with NAME(*), and commands against a HALDB master do not change the STOPPED (shown as STOACC, STOSCHD or SToupds on QUERY DB) and LOCKED indicators in each HALDB partition.

When the command target is a HALDB master, processing acts on all HALDB partitions. For example, if the IMS command is /DBR on the HALDB master, all of the HALDB partitions are closed, deallocated, and deauthorized. On a /DISPLAY DB command, only the HALDB master displays STOPPED (each HALDB partition does not display STOPPED unless it was itself stopped). If a /DBR command was issued against a HALDB master, the display output of a /DISPLAY DB command shows the HALDB master (as STOPPED), but does not display the status of the partitions.
Each partition inherits the access limitations of its HALDB master. If the /DBD command is issued against a HALDB master, all of its partitions close. A subsequent reference to any of the partitions results in the partition opening for input, although the partition's access might be UPDATE or EXCLUSIVE. The DBRC authorization state reflects the limited access.

If received during an UPD DB NAME(partname) START(ACCESS) command, where partname is a HALDB partition that was added and partition structure rebuild has not been done, then issue an UPD DB NAME(haldbmst) START(ACCESS) OPTION(OPEN), where haldbmst is the partition's master, followed by an UPD DB NAME(partname) START(ACCESS) command or issue a call for a key in the key range of the new or redefined partition. This will invoke partition structure rebuild and allow the partition to be used.

**Restrictions:**

- The UPDATE DB START(ACCESS | QUIESCE) and UPDATE DB STOP(ACCESS | QUIESCE | SCHD | UPDATES) commands cannot be processed against a HALDB partition on an IMS system while HALDB Online Reorganization (OLR) is running against that partition on the same IMS system.
- The UPDATE DB START(ACCESS) SET(ACCTYPE(UPD)) and UPDATE DB STOP(ACCESS | UPDATES) commands cannot be issued against a HALDB master while OLR is reorganizing any of its partitions.
- While the database is being quiesced, this command cannot be processed successfully.
- If the /DBRECOVERY DB or UPDATE DB STOP(ACCESS) commands are issued for a DEDB database that has newly added areas using the DEDB Alter utility, you might need to start the DEDB database using the ACCESS option if your PSB has a PCB that is not accessing the newly added areas by their DEDB name. In this situation, issue one of the following commands:
  - /STA DB ACCESS=UP
  - UPDATE DB START(ACCESS) SET(ACCTYPE(UPD))

**Equivalent IMS type-1 commands**

The following table shows variations of the UPDATE DB command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE DB command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE DB NAME(name) STOP(UPDATES)</td>
<td>/DBD DB dbname</td>

<td>/UNLOCK DB dbname</td>
</tr>
</tbody>
</table>

**Output fields**

The following table shows the output fields for the UPDATE DB. The columns in the table are as follows:
Short label
Contains the short label generated in the XML output.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

Meaning
Provides a brief description of the output field.

Return and reason codes

An IMS return and reason code is returned to OM by the UPDATE DB command. The OM return and reason codes that may be returned as a result of the UPDATE DB command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

</table>

**Examples**

The following are examples of the UPDATE DB command:

**Example 1 for UPDATE DB command**

TSO SPOC input:

```
UPDATE DB NAME(DEDBJ00%,BADNAME,BAD*) SET(RESIDENT(Y))
```
TSO SPOC output:

Response for: UPDATE DB NAME(DEDBJ00%,BADNAME,BAD*) SET(RESIDENT(Y))

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
</tr>
</thead>
<tbody>
<tr>
<td>BAD*</td>
<td>IMS1</td>
<td>10</td>
<td>NO RESOURCES FOUND</td>
</tr>
<tr>
<td>BADNAME</td>
<td>IMS1</td>
<td>10</td>
<td>NO RESOURCES FOUND</td>
</tr>
<tr>
<td>DEDBJ001</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ002</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>DEDBJ003</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ004</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ005</td>
<td>IMS1</td>
<td>0</td>
<td></td>
</tr>
<tr>
<td>DEDBJ006</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ007</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ008</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
<tr>
<td>DEDBJ009</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR'D</td>
</tr>
</tbody>
</table>

OM API input:

CMD(UPDATE DB NAME(DEDBJ00%,BADNAME,BAD*) SET(RESIDENT(Y)))

OM API output:

<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.3.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2006.311 00:34:47.028100</statime>

<rc>0200000C</rc>
<rsn>00003008</rsn>
<rsnmsg>CSLN054I</rsnmsg>
<rsntxt>None of the clients were successful.</rsntxt>
</ctl>
<cmderr>
<mbr name="IMS1">
<typ>IMS</typ>
<styp>DBDC</styp>
<rc>0000000C</rc>
<rsn>00003000</rsn>
<rsntxt>At least one request successful</rsntxt>
</mbr>
</cmderr>
<cmd>
<master>IMS1</master>
<userid>USRT011</userid>
<verb>UPD</verb>
<kwd>DB</kwd>
<input>UPDATE DB NAME(DEDBJ00%,BADNAME,BAD*) SET(RESIDENT(Y))</input>
</cmd>
</imsout>
Explanation: Update some databases to be resident. The update succeeds for databases DEDBJ002 and DEDBJ005, as shown by completion code 0. The update fails for several databases with completion code E1, because the databases need to be taken offline by use of the /DBRECOVER command in order to change a runtime resource definition attribute. The update fails for database BADNAME and for parameter BAD* with completion code 10, since database BADNAME does not exist and no database name starts with BAD.

Example 2 for UPDATE DB command

TSO SPOC input:
UPDATE DB NAME(DEDBJN22) AREA(*) START(ACCESS) OPTION(OPEN)

TSO SPOC output:

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCtext</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEDBJN22</td>
<td>IMS1</td>
<td>E1</td>
<td>DATABASE HAS NOT BEEN DBR*D</td>
</tr>
<tr>
<td>DB22AR0</td>
<td>IMS1</td>
<td>0</td>
<td>DB OR AREA AUTHORIZATION ERROR</td>
</tr>
<tr>
<td>DB22AR1</td>
<td>IMS1</td>
<td>A9</td>
<td>DB OR AREA AUTHORIZATION ERROR</td>
</tr>
</tbody>
</table>

Explanation: In this example, CC=A9 means that DBRC returned a nonzero return code for authorization request.

Example 3 for UPDATE DB command

TSO SPOC input:
UPD DB NAME(DEDBJN22) START(QUIESCE) OPTION(HOLD) SET(TIMEOUT(60))

TSO SPOC output:

<table>
<thead>
<tr>
<th>DBName</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEDBJN22</td>
<td>IMS1</td>
<td>0</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>IMS2</td>
<td>0</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>IMS3</td>
<td>0</td>
</tr>
</tbody>
</table>

Explanation: This example is of a successful quiesce and hold for Fast Path DEDB DEDBJN22, which is coordinated across three IMS systems.

Example 4 for UPDATE DB command
TSO SPOC input:
UPD DB NAME(DEDBJN22) STOP(QUIESCE)

TSO SPOC output:
<table>
<thead>
<tr>
<th>DBName</th>
<th>AreaName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEDBJN22</td>
<td>IMS1</td>
<td></td>
<td>C</td>
<td>COMMAND COMPLETE FOR NONE</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR0</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR1</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR2</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR3</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR4</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
</tbody>
</table>

**Explanation:** This example attempts to release a quiesce on a DEDB. DEDB DEDBJN22 consists of five areas. The command failed because none of the areas were held in quiesced state. A response line is returned for the DEDB name with CC=C (“COMMAND COMPLETE FOR NONE”) because none of the areas under the DEDB were in a state to be released. A response line is also returned for each area.

**Example 5 for UPDATE DB command**

TSO SPOC input:
UPD DB NAME(DEDBJN22) STOP(QUIESCE)

TSO SPOC output:
<table>
<thead>
<tr>
<th>DBName</th>
<th>AreaName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEDBJN22</td>
<td>IMS1</td>
<td></td>
<td>8</td>
<td>COMMAND COMPLETE FOR SOME</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR0</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR3</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
<tr>
<td>DEDBJN22</td>
<td>DB22AR4</td>
<td>IMS1</td>
<td>E9</td>
<td>DB IN WRONG STATE TO BE QUIESCED</td>
</tr>
</tbody>
</table>

**Explanation:** This example attempts to release a quiesce on a DEDB. DEDB DEDBJN22 consists of five areas. The command was partially successful because it was able to release the quiesce on DB22AR1 and DB22AR2 only. In this example, DB22AR0, DB22AR3, and DB22AR4 were not in quiesced state. A response line is returned for the DEDB name with CC=8 (“COMMAND COMPLETE FOR SOME”) because only some of the areas under the DEDB were in a state to be released. A response line is also returned for each area that could not be processed.

**UPDATE DBDESC command**

Use the UPDATE DBDESC command to update database descriptors. A descriptor is a model that can be used to create descriptors or resources.

Updating a descriptor changes only the attributes explicitly specified on the UPDATE command. Attributes not specified retain their existing values. Any database resource or descriptor can be created using this descriptor as a model, by specifying the CREATE command with LIKE(DESC(descriptor_name)). Any descriptor or resource that was already created using this descriptor is not updated.

<td></td>
</tr>
<tr>
<td>OPTION</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

**Syntax**

```plaintext
UPDATE DBDESC NAME(name*) A B OPTION(ALLRSP)
```

A:

```plaintext
SET ACCTYPE(BRWS EXCL READ UPD DEFAULT(Y))
```
Keywords

The following keywords are valid for the UPDATE DBDESC command:

**NAME**

Specifies the 1-8 character name of the database descriptor name. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the descriptor names that are processed. For NAME(*) command responses are returned only for the descriptor names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the descriptor names that are processed.

**OPTION**

Specifies additional functions to be performed along with the command.

**ALLRSP**

Indicates that the response lines are to be returned for all descriptors that are processed on the command. The default action is to return response lines only for the descriptors that resulted in an error. It is only valid with names that include a wildcard character. ALLRSP is ignored for other NAME values.

**SET**

Specifies the attribute values to be changed.

**ACCTYPE**

Specifies the access intent for a database created using this descriptor.

**BRWS**

The database is available for read-only processing on this IMS subsystem. The only programs that can use the database on this subsystem are those that have a PCB processing option of GO (PROCOP=GO). Programs that access the data using the GO processing option might see uncommitted data since a sharing IMS subsystem could be updating the database. The database is opened for read-only processing.

**EXCL**

The database is to be used exclusively by this IMS subsystem. This exclusive access is guaranteed only when the database is registered to DBRC.

**READ**

The database is available for read-only processing in this IMS subsystem. Programs with update intent can be scheduled, but cannot update the database. Access type READ differs from access type BRWS in that the data is read with integrity (locking is performed) and all programs can access the data, not just those with a processing option of GO. The database is opened for read-only processing.
UPD

The database is for update as well as read processing in the IMS subsystem.

DEFAULT(Y)

Specifies this descriptor as the default, which resets the existing default descriptor to DEFAULT(N). When a descriptor is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type. IMS defines a database descriptor called DFSDSDB1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor. Since only one database descriptor can be the default at one time, only one database name can be specified with DEFAULT(Y).

RESIDENT

Specifies the resident option of a database created using this descriptor. The RESIDENT(Y) option takes effect at the next restart, unless the database was updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart. A database defined as a DEDB in ACBLIB always sets the RESIDENT(Y) attribute when the DEDB is loaded, regardless of the RESIDENT value specified. RESIDENT(N) is rejected for a DEDB.

N  The DMB associated with the named database resource is not made resident in storage. The DMB is loaded at scheduling time.

Y  The DMB associated with the named database resource is made resident in storage at the next IMS restart. At the next IMS restart, IMS loads the DMB and initializes it. A resident database is accessed from local storage, which eliminates I/O to the ACBLIB. In an online environment, the DMB control blocks are stored in the ACBLIB. If the DLI/SAS address space exists, DLI/SAS loads the DMB, otherwise, it is the IMS control region that loads it. This makes the DMB dependent on the existence of the corresponding database resource.

Usage notes

Descriptors exist for the life of the IMS unless they are deleted using a DELETE command. Descriptors are recoverable across an IMS warm start or emergency restart. Descriptors are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

If all the attributes specified by the UPDATE command are already defined for the descriptor, no update is actually made, no descriptors are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

The UPDATE DBDESC command can be issued only through the OM API. This command applies to DB/DC and DBCTL systems. The UPDATE DBDESC commands are not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE DBDESC commands are not valid if online change for MODBLKS is enabled (DFSDFXxx or DFSGCXxx defined with MODBLKS=OLC, or MODBLKS not defined). This command is recoverable.

Each descriptor is updated individually. Individual updating does not work like online change where either all descriptors are updated or no descriptors are updated. Descriptors can be successfully updated if they are not currently in use. If
a descriptor is in use, the update fails. In a sysplex environment, the update might succeed on some IMS systems and fail on others. A descriptor is in use if another command is in progress that references the command.

If the descriptor is the IMS-defined database descriptor (DFSDSDB1), the only attribute that can be updated is the DEFAULT attribute.

**Output fields**

The following table shows the UPDATE DBDESC output fields. The columns in the table are as follows:

**Short label**

Contains the short label generated in the XML output.

**Keyword**

Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Meaning**

Provides a brief description of the output field.

*Table 400. Output fields for the UPDATE DBDESC command*

<table>
<thead>
<tr>
<th>Short label</th>

**UPDATE IMS command**

Use the UPDATE IMS command to update local and global IMS attributes, which include global status for areas, databases, and transactions in an IMSplex. You can also use the UPDATE IMS command to enable IMS to use the IMSRSC repository.

To change global PLEXPARM values in an IMSplex, use the UPDATE IMS SET(PLEXPARM) command. To change local LCLPARM values in one or more IMS systems in an IMSplex, use the UPDATE IMS SET(LCLPARM) command.
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE IMS command and keywords can be issued.

Table 403. Valid environments for the UPDATE IMS command and keywords

<table>

</tbody>
</table>

Syntax

```
UPDATE IMS

SET(LCLPARM(AUTOEXPORT(N)
  FPBP64STAT(N)
  LOCKTIME(BMP(xx)
    BMPOPT(ABEND)
    MSG(yyy)
    MSGOPT(ABEND)
  )
  REPO(Y)
  REPOTYPE(IMSRC)
)

SET(PLEXPARM(GSTSAREA(N)
  GSTDDB(N)
  GSTSTRAN(N)
)

SET(PLEXPARM()) OPTION(CONTINUE, FORCE)
```

Keywords

The following keywords are valid for the UPDATE IMS command:
LCLPARM()

Specifies the values for the local parameters to be modified. The LCLPARM() keyword is mutually exclusive with the PLEXPARM() keyword in the UPDATE IMS SET() command.

The UPDATE IMS SET(LCLPARM()) command can be used to modify local parameters such as FPBP64STAT at each IMS system.

For the UPDATE IMS SET(LCLPARM()) command, all IMS systems that received the command from OM process the command.

Specify one of the following options:

AUTOEXPORT(N)

Specifies that the automatic export processing during system checkpoint should be disabled. The AUTOEXPORT keyword is valid in a DRD environment with or without the IMSRSC repository.

For the DRD users who are enabled with RDDS data sets, the UPDATE IMS SET(LCLPARM(AUTOEXPORT(N))) command can be used after successful migration to the repository. This command reduces the processor usage of automatic export at system checkpoints.

AUTOEXPORT(N) turns off automatic export to both the IMSRSC repository and RDDS if both are enabled. If there is an error during automatic export to the repository during IMS shutdown, you can use the UPDATE IMS SET(AUTOEXPORT(N)) command to turn off automatic export to the repository and try the IMS shutdown again.

Changes made by the UPDATE IMS SET(AUTOEXPORT(N)) command only remain in effect until IMS restarts. To permanently change the AUTOEXPORT settings in IMS, modify the AUTOEXPORT setting in the DFSDFxxx PROCLIB member.

After the UPDATE IMS command with the AUTOEXPORT(N) keyword is issued, you can continue using system RDDS data sets on the EXPORT and IMPORT commands and during automatic import. However, during import and automatic import, make sure that the RDDS contains the current data especially if AUTOEXPORT is turned off.

Automatic export to the RDDS, the IMSRSC repository, or both, can be enabled by a cold start of IMS with AUTOEXPORT=RDDS | REPO | AUTO specified for the DFSDFxxx PROCLIB member.

Automatic export to the RDDS can be enabled by specifying AUTOEXPORT=N for the DFSDFxxx PROCLIB member and then starting IMS.

FPBP64STAT

Specifies whether Fast Path 64-bit buffer usage statistics per unit of work (UOW) for dependent regions are to be written to OLDS. The Fast Path 64-bit buffer usage is recorded in X'5945' log records.

N  Does not write Fast Path 64-bit buffer usage statistics per unit of work for dependent regions in X'5945' log records to OLDS.

Y  Writes Fast Path 64-bit buffer usage statistics per unit of work for dependent regions in X'5945' log records to OLDS.

LOCKTIME

Specifies the IMS LOCKTIME values. You can specify LOCKTIME values in any combination of the following keywords and parameters:
BMP(xx)
Specifies the amount of time that IMS waits before lock requests for BMP regions are timed out. BMP regions include IMS BMP and JBP regions. The value, which represents time in seconds, can range 1 - 32767.

BMPOPT(ABEND | STATUS)
Specifies whether IMS ends a timed-out task abnormally (ABEND) or returns a status code to the application (STATUS).

MSG(yy)
Specifies the amount of time that IMS waits before lock requests for MSG regions are timed out. MSG regions include IMS MPP, JMP, and IFP regions, as well as DRA threads. The value, which represents time in seconds, can range 1 - 32767.

MSGOPT(ABEND | STATUS)
Specifies whether IMS ends a timed-out task abnormally (ABEND) or returns a status code to the application (STATUS).

Updating IMS LOCKTIME values does not affect the lock timeout value in an IRLM. To change the lock timeout value in an IRLM, use the existing MODIFY IRLM command.

Recommendation: Generally, use the same timeout values for both IMS and IRLM. When using two values in IMS, setting the IRLM timeout value to the lower of the two IMS values allows IMS and IRLM to act together. When more than one IMS is identified to the same IRLM, workload conditions might require using different timeout values across IMS systems. In such a case, note the following:

- Using a lower timeout value in IRLM results in lock requests to wait until the time spent for waiting equals the lowest IMS LOCKTIME value.
- Using a higher timeout value in IRLM results in lock requests to wait beyond the IMS time because IRLM does not call IMS until the IRLM timeout value is exceeded.

REPO(Y)
Enables IMS to use the repository.

REPOTYPE(IMSRSC)
The repository type that is to be enabled. REPOTYPE is required with REPO(Y).

During command processing, IMS connects to RM for the repository services to enable IMS to use the repository. If RM is not enabled to use the repository, the UPDATE IMS command results in an error. You must first enable RM to use the repository by issuing the UPDATE RM command.

To disable use of the repository, IMS must be cold started.

When IMS is initialized, repository usage is enabled only if the REPOSITORY=(TYPE=IMSRSC) statement is defined in the REPOSITORY section of the DFSDFxxx PROCLIB member. Therefore, when the UPDATE IMS SET(LCLPARM(REPO(Y) REPOTYPE(IMSRSC)) command is successfully processed, the
REPOSITORY=(TYPE=IMSRSC) statement must be added before any IMS restarts because we can disable usage of the repository only across an IMS cold start.

During IMS restart, if the IMS log records indicate that the IMSRSC repository was enabled before the restart and the REPOSITORY=(TYPE=IMSRSC) statement is not defined, IMS terminates with a U0168 abend code and X‘1C’ error code.

For an XRF complex, entering the command on the IMS active system results in the command being processed on the IMS alternate system. Successful completion of the command requires that both the IMS active and alternate systems add the REPOSITORY=(TYPE=IMSRSC) statement in the REPOSITORY section of their respective DFSDFxxx PROCLIB members.

After IMS connects to the IMSRSC repository, autoexport to the IMSRSC repository is also enabled if AUTOEXPORT=AUTO or REPO is explicitly specified in the DFSDFxxx member that was used during IMS initialization.

The autoexport is done based on the AUTOEXPORT_IMSID= value specified in the DFSDFxxx member. If the AUTOEXPORT_IMSID= is not specified in the DFSDFxxx member then AUTOEXPORT_IMSID is set to THIS_IMS for the autoexport.

If you would like AUTOEXPORT_IMSID=ALL then the DFSDFxxx member must be modified to add the repository section and the AUTOEXPORT_IMSID=ALL and IMS must be restarted.

If AUTOEXPORT=AUTO or REPO was not explicitly specified in the DFSDFxxx member then autoexport to the IMSRSC repository is not enabled by the UPD IMS command. You must modify the DFSDFxxx member to add AUTOEXPORT=AUTO or REPO and the AUTOEXPORT_IMSID= keyword and restart IMS.

PLEXPARM() Specifies the values for the global parameters to be modified. The LCLPARM keyword is mutually exclusive with the PLEXPARM keyword in the UPDATE IMS SET() command.

The UPDATE IMS SET(PLEXPARM()) command can be used to modify global status for areas, databases, and transactions that is maintained in an IMSplex. If the command is successful, the values in the RM global PLEXPARM entry along with the values maintained in each IMS system are updated.

For the UPDATE IMS SET(PLEXPARM()) command, all IMS systems in an IMSplex receive the command, but only the command master IMS processes the command. The non-master IMS systems do not process the command that is sent from OM. Instead, the command master IMS coordinates the change across all IMS systems in the IMSplex.

Specify one or more of the following resources:

GSTSAREA Specifies how area status is maintained in the IMSplex.

N No global status is maintained for area resources in RM. All global status in RM for area resources is deleted.

Y Global status is maintained for area resources in RM. Global status is
maintained on subsequent UPD AREA SCOPE(ALL) commands or type-1 area commands that include a GLOBAL keyword.

**GSTSDB**
Specifies how database status is maintained in the IMSplex.

N  No global status is maintained for database resources in RM. All global status in RM for database resources is deleted.

Y  Global status is maintained for database resources in RM. Global status is maintained on subsequent UPD DB SCOPE(ALL) commands or type-1 database commands that include a GLOBAL keyword.

**GSTSTRAN**
Specifies how transaction status is maintained in the IMSplex.

N  No global status is maintained for transaction resources in RM. All global status in RM for transaction resources is deleted.

Y  Global status is maintained for transaction resources in RM. Global status is maintained on subsequent UPD TRAN SCOPE(ALL) commands.

**OPTION()**
Specifies options for the UPDATE IMS SET command.

**CONTINUE**
Indicates that IMS should continue to process a previously entered UPDATE IMS SET command that encountered an error before it completed. The command must be at a point that allows processing to continue, otherwise the command is aborted.

If OPTION(CONTINUE) is specified, no parameters can be passed on the PLEXPARM parameter.

**FORCE**
OPTION(FORCE) can be used in a DBCTL warm-standby environment when the UPD IMS command fails because the standby did not finish restart processing. If OPTION(FORCE) is specified, the UPD IMS command can be completed even when an IMS is in restart mode. When OPTION(FORCE) is specified, the IMS in restart mode does not participate and update the UPD IMS values; this option only allows the UPD IMS command to finish at other IMS systems. The DBCTL standby rereads the global entry when it restarts to become the active in order to obtain the current PLEXPARM values. If OPTION(FORCE) is used when a non-DBCTL standby system did not finish restart, the results might not be as expected because the IMS does not run the UPD IMS command. This could lead to errors because of mismatch in the PLEXPARM values.

**Usage notes**

The UPDATE IMS SET command is a type-2 command that must be issued through the OM API. The command is defined to OM as ROUTE=ALL. OM routes the command to all IMS systems in an IMSplex. This command is not a recoverable command.

The only case in which the command is processed from a log record is on an XRF alternate system, which reads an X'220E' log record of the XRF active system to stay in step with the XRF active. Even in the XRF environment, if a takeover occurs and an IMS restart is required (/ERE or /NRE), the command is not recovered. It requires that the DFSDFxxx PROCLIB member be changed to include
a REPOSITORY=(TYPE=IMSRSC) statement in the REPOSITORY section. Otherwise, IMS terminates with a U0168 abend code and X'1C' error code.

In general, when a nonzero return code is received for the UPDATE IMS command, you must enter the UPD IMS SET(PLEXPARM Grüne OPTION(CONTINUE) command, which tells IMS to either complete the command or to cancel the command and clean up as required. The reason code from the UPD IMS SET(PLEXPARM Grüne OPTION(CONTINUE) command might indicate the state of the original UPD IMS command. If the command is unable to determine the state of the original UPD IMS command, the reason code indicates that fact. The user can use the QUERY IMS command to find out the state of the global IMSplex parameters.

If an error is encountered during the UPD IMS command processing, another new UPD IMS command cannot be processed until the UPDATE IMS SET(PLEXPARM Grüne OPTION(CONTINUE) command is issued and completes successfully.

If the error condition that caused the nonzero return code to be received for the UPDATE IMS command is not resolved, the UPDATE IMS SET(PLEXPARM Grüne OPTION(CONTINUE) command continues to encounter the same error condition. The error condition must be resolved before the command can be cleaned up and another UPDATE IMS command can be entered.

This command is not valid on an RSR tracker, an FDBR system, or an XRF alternate system. However, an FDBR system and an XRF alternate system maintain global PLEXPARM values internally and report their values with a QUERY IMS SHOW (PLEXPARM) command. IMS systems on RST tracker or FDBR systems return a completion code of ICC_NA or 1. The UPD IMS command is allowed to complete at other IMS systems.

The UPD IMS SET command is not allowed if an IMS is in restart. The command fails with a 'B0' return code. The UPD IMS command must be issued after the IMS completed restart processing.

When REPO(Y) is specified, some error conditions result in a DFS3308E, DFS4400E, DFS4457E, or other error message being sent as message output in the command reply. These messages can be used to help diagnose the cause of the error.

**Output fields**

The following table shows the UPDATE IMS output fields. The columns in the table are as follows:

**Short label**
- Contains the short label generated in the XML output.

**Long label**
- Contains the long label generated in the XML output.

**Keyword**
- Identifies keyword on the command that caused the field to be generated.
- N/A appears for output fields that are always returned. *error* appears for output fields that are returned only in case of an error.

**Scope**
- Identifies the scope of the output field.
Meaning

Provides a brief description of the output field.

Table 404. Output fields for the UPDATE IMS command

Examples

The following are examples of the UPDATE IMS command:

Example 1 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(PLEXPARM(GSTSAREA(Y),GSTSDB(Y),GSTSTRAN(N)))

TSO SPOC output:
Response for UPDATE IMS SET(PLEXPARM(GSTSAREA(Y),GSTSDB(Y),GSTSTRAN(N)))
ParmName  MbrName  CC
PLEXPARM  PRODIMS1  0
PLEXPARM  PRODIMS2  0
PLEXPARM  SYS3     0

Explanation: The UPD IMS command is processed successfully at the three active IMS systems (PRODIMS1, PRODIMS2, and SYS3) in the IMSplex and is updated successfully in RM.

Example 2 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(PLEXPARM(GSTSTRAN(Y)))

TSO SPOC output:
Response for UPDATE IMS SET(PLEXPARM(GSTSTRAN(Y)))
ParmName  MbrName  CC  GSTSTRAN
PLEXNAME  PRODIMS1  0  Y
PLEXNAME  PRODIMS2  0  Y
PLEXNAME  SYS3     0  Y

Explanation: The UPD IMS command is processed successfully at the three active IMS systems (PRODIMS1, PRODIMS2, and SYS3) in the IMSplex and is updated successfully in RM.

Example 3 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(PLEXPARM(GSTSTRAN(N)))

TSO SPOC output:
Response for: UPDATE IMS SET(GSTSTRAN(Y))
MemberName  CC  GSTSTRAN  CCText
SYS3 0  Y
PRODIMS1 0  Y
PRODIMS2 16  Y  IMS TIMED OUT

Example 4 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(LCLPARM(FPBP64STAT(Y)))

TSO SPOC output:
ParmName  LclParmName  MbrName  CC
LCLPARM  FPBP64STAT  IMS1  0
LCLPARM  FPBP64STAT  IMS2  0
Explanation: In this example, the UPDATE IMS command turns on FPBP64STAT logging.

Example 5 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(LCLPARM(FPBP64STAT(N)))

TSO SPOC output:

<table>
<thead>
<tr>
<th>ParmName</th>
<th>LclParmName</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCLPARM</td>
<td>FPBP64STAT</td>
<td>IMS1</td>
<td>0</td>
</tr>
<tr>
<td>LCLPARM</td>
<td>FPBP64STAT</td>
<td>IMS2</td>
<td>0</td>
</tr>
</tbody>
</table>

Explanation: In this example, the UPDATE IMS command turns off FPBP64STAT logging.

Example 6 for UPDATE IMS command

TSO SPOC input:
UPD IMS SET(LCLPARM(LOCKTIME(MSG(40),MSGOPT(ABEND),BMP(30),BMPOPT(STATUS))))

TSO SPOC output:

<table>
<thead>
<tr>
<th>ParmName</th>
<th>LclParmName</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCLPARM</td>
<td>LOCKTIME</td>
<td>IMS1</td>
<td>0</td>
</tr>
<tr>
<td>LCLPARM</td>
<td>LOCKTIME</td>
<td>IMS2</td>
<td>0</td>
</tr>
</tbody>
</table>

Explanation: In this example, the UPDATE IMS command updates IMS LOCKTIME values.

Example 7 for UPDATE IMS command

TSO SPOC input:
UPD IMS SET(LCLPARM(REPO(Y) REPOTYPE(IMSRSC)))

TSO SPOC output:

<table>
<thead>
<tr>
<th>ParmName</th>
<th>LclParmName</th>
<th>RepositoryType</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCLPARM</td>
<td>REPO</td>
<td>IMSRSC</td>
<td>IMS1</td>
<td>0</td>
</tr>
<tr>
<td>LCLPARM</td>
<td>REPO</td>
<td>IMSRSC</td>
<td>IMS2</td>
<td>0</td>
</tr>
</tbody>
</table>

OM API input:

CMD(UPD IMS SET(LCLPARM(REPO(Y) REPOTYPE(IMSRSC))))

OM API output:

```xml
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.190 01:45:07.574341</statime>
<stotime>2011.190 01:45:07.618879</stotime>
<staseq>C80A9624D1245C48</staseq>
<stoseq>C80A9624DC03F148</stoseq>
<rqsttkn1>USRTO05 10184507</rqsttkn1>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</cmd>
```
Example 8 for UPDATE IMS command

TSO SPOC input:
UPDATE IMS SET(LCLPARM(AUTOEXPORT(N))

TSO SPOC output:
ParmName LclParmName MbrName CC
LclParm AUTOEXPORT IMS1 0
LclParm AUTOEXPORT IMS2 0

Explanation: In this example, IMS1 and IMS2 have AUTOEXPORT disabled at the next checkpoint.

**UPDATE IMSCON commands**

Use the UPDATE IMSCON commands to update status or configuration definitions of one or more IMS Connect resources.

The TYPE keyword is a required keyword that specifies the type of IMS Connect resource to update. There is no default TYPE parameter.
The UPDATE IMSCON command is processed by every IMS Connect to which OM routes the command, whether or not OM has designated a particular IMS Connect as the command master.

Subsections:

- “UPDATE IMSCON TYPE(ALIAS) command”
- “UPDATE IMSCON TYPE(CLIENT) command” on page 1039

Related reference:

- Equivalent IMS Connect WTOR, z/OS, and type-2 commands (Commands)

**UPDATE IMSCON TYPE(ALIAS) command**

Use the UPDATE IMSCON TYPE(ALIAS) command to set or change the attributes of an IMS alias that is associated with an IMS Open Database Manager (ODBM).

Subsections:

- “Environment”
- “Syntax” on page 1035
- “Keywords” on page 1035
- “Usage notes” on page 1036
- “Equivalent WTOR and z/OS commands” on page 1036
- “Output fields” on page 1036
- “Return, reason, and completion codes” on page 1037
- “Examples” on page 1038

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.
Syntax

```
UPDATE IMSCON TYPE(ALIAS) NAME(alias_name*)
```

```
ODBM(odbm_name*)
```

```
START(ROUTE) | STOP(ROUTE)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(ALIAS) command.

**NAME**

Specifies the name of the IMS alias. You can specify a single alias name or a list of alias names separated by commas. Wildcards can be used in the names.

**ODBM**

Specifies the name of the IMS ODBM to be updated. You can specify a single ODBM name or a list of ODBM names separated by commas. Wildcards can be used in the names. This keyword is optional.

**START(ROUTE) | STOP(ROUTE)**

Mutually exclusive keywords that you use to enable or disable message routing to an IMS ODBM that is associated with the specified IMS alias.

**START(ROUTE)**

Enables message routing to an IMS ODBM that is associated with the specified IMS alias. The alias represents the IMS data store that the client wants to send a message to. The START(ROUTE) keyword sets the specified IMS alias to active so that IMS Connect can route to that alias.

Whereas the UPDATE IMSCON TYPE(ODBM) command starts communication between the IMS Connect and an IMS ODBM, the UPDATE IMSCON TYPE(ALIAS) command sets the specified IMS alias to active so that IMS Connect can route to that alias.

**STOP(ROUTE)**

Disables message routing to an IMS ODBM that is associated with the specified IMS alias. The STOP(ROUTE) keyword sets the specified alias to inactive so that IMS Connect cannot route to that alias. You can resume routing by specifying the START(ROUTE) keyword.

If you stop routing messages to a particular alias by using the STOP(ROUTE) keyword, and then issue the UPDATE IMSCON TYPE(ODBM) STOP(COMM) command followed by UPDATE IMSCON TYPE(ODBM) START(COMM), the alias status is lost. In other words, the alias will be active again after the UPDATE IMSCON TYPE(ODBM) commands.
Usage notes

You can issue the UPDATE IMSCON TYPE(ALIAS) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Equivalent WTOR and z/OS commands

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(ALIAS) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 407. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(ALIAS) command

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) is displayed for output fields that are always returned. error is displayed for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.
Table 408. Output fields for the UPDATE IMSCON TYPE(ALIAS) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALIAS</td>
<td>AliasName</td>
<td>N/A</td>
<td>The alias name of an IMS data store defined to the instance of ODBM. The alias name is always returned.</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned. See Table 410.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Identifier of the IMS Connect that built the output line. The identifier is always returned.</td>
</tr>
<tr>
<td>ODBM</td>
<td>ODBMName</td>
<td>ODBM</td>
<td>Name of the ODBM associated with the alias.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(ALIAS) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 409. Return and reason codes for the UPDATE IMSCON TYPE(ALIAS) command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The UPDATE IMSCON TYPE(ALIAS) command completed successfully. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C0000C'</td>
<td>X'00003000'</td>
<td>The command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
<tr>
<td>X'0C0000C'</td>
<td>X'00003004'</td>
<td>The command was not successful for any resource. The command output contains a line for each resource, accompanied by its completion code.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

</tr>
</tbody>
</table>

Examples

Example 1 for UPDATE IMSCON TYPE(ALIAS) command

TSO SPOC input:

UPDATE IMSCON TYPE(ALIAS) NAME(IMS1) ODBM(ODBMA) START(ROUTE)

TSO SPOC output:

<table>
<thead>
<tr>
<th>AliasName</th>
<th>MbrName</th>
<th>CC</th>
<th>ODBMName</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>HWS1</td>
<td>0</td>
<td>ODBMA</td>
</tr>
</tbody>
</table>

OM API input:

CMD ( UPDATE IMSCON TYPE(ALIAS) NAME(IMS1) ODBM(ODBMA) START(ROUTE) )

OM API output:

```xml
<imsout>
  <ctl>
    <omname>OMIOM </omname>
    <omvsn>1.5.0 </omvsn>
    <xmlvsn>20 </xmlvsn>
    <statime>2010.298 15:34:49.371591 </statime>
    <stotime>2010.298 15:34:49.372641 </stotime>
    <staseq>C6C83044FA3C7630 </staseq>
    <stoseq>C6C83044FA7E1E70 </stoseq>
    <rqsttkn1>USRT001 10083449 </rqsttkn1>
    <rc>00000000 </rc>
    <rsn>00000000 </rsn>
  </ctl>
  <cmd>
    <master>HWS1 </master>
    <userid>USRT001 </userid>
    <verb>UPD </verb>
    <kwdo>IMCON </kwdo>
    <input>UPDATE IMSCON TYPE(ALIAS) NAME(IMS1) ODBM(ODBMA) START(ROUTE) </input>
  </cmd>
</imsout>
```
Explanation: Message routing to the IMS Open Database (ODBM), ODBMA, associated with the IMS alias, IMS1, has been enabled.

Related reference:
- STARTIA command (Commands)
- STOPIA command (Commands)

**UPDATE IMSCON TYPE(CLIENT) command**

Use the UPDATE IMSCON TYPE(CLIENT) command to terminate communication with a client that uses a specific TCP/IP port.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 1040
- “Equivalent WTO and z/OS commands” on page 1042
- “Output fields” on page 1042
- “Return, reason, and completion codes” on page 1041
- “Examples” on page 1042

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON TYPE(CLIENT) NAME(client_name)
```

```
PORT(LOCAL portnum portnum*)
```

**Keywords**

The following keywords are valid for the UPDATE IMSCON TYPE(CLIENT) command.
NAME
Specifies the name of the client.

PORT
Specifies the port that the client is using for the TCP/IP connection with the IMS Connect.

This port number must match the port number defined in the PORT, PORTID, or CICSPORT substatement of the TCPIP configuration statement, or the DRDAPORT substatement of the ODACCESS configuration statement in the HWSCFGxx configuration member.

To filter on the local port used by the IMS TM Resource Adapter, specify PORT(LOCAL). You can also use wildcards in the port number.

The SSL port is displayed with the character “S” appended to the end of the port number. To filter on the SSL port, specify the port number either with or without the character “S” appended to the end of the port number.

The port defined for ODBM use is displayed with the character “D” appended to the end of the port number. To filter on the ODBM port, specify the port number either with or without the character “D” appended to the end of the port number.

The port defined for ISC over TCP/IP use (CICSPORT) is displayed with the character “C” appended to the end of the port number. To filter on the CICSPORT, specify the port number either with or without the character “C” appended to the end of the port number.

STOP(COMM)
Stops communication with a client that uses a specific TCP/IP port.

Usage notes
You can issue the UPDATE IMSCON TYPE(CLIENT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Use the UPDATE IMSCON TYPE(CLIENT) command whenever a client is unable to accept response messages being sent to it, or when a client is waiting for a nonexistent response message (for example, when an error occurred that caused a response message to be lost before it was sent back to the client).

Work currently in progress for that client is ended.

Output fields
Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be
generated. N/A (not applicable) is displayed for output fields that are always returned. error is displayed for output fields that are returned only in the case of an error.

**Meaning**

Provides a brief description of the output field.

**Table 411. Output fields for the UPDATE IMSCON TYPE(CLIENT) command**

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned. See Table 413 on page 1042</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>CLID</td>
<td>ClientID</td>
<td>N/A</td>
<td>Name of the client. The client name is always returned.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Identifier of the IMS Connect that built the output line. The identifier is always returned.</td>
</tr>
</tbody>
</table>
| PORT        | Port       | N/A     | The port number on which the client is active. If one of the following characters is appended to the end of the port number, it indicates that the port is dedicated to a particular purpose:  
  C Identifies a CICS port.  
  D Identifies an ODBM port.  
  S Identifies an SSL port.  
  If "LOCAL" is displayed instead of a port number, the port is a local port that is used by the IMS TM Resource Adapter. |

**Return, reason, and completion codes**

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(CLIENT) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 412. Return and reason codes for the UPDATE IMSCON TYPE(CLIENT) command**

**UPDATE IMSCON TYPE(CONFIG) command**

Use the UPDATE IMSCON TYPE(CONFIG) command to terminate IMS Connect with the option QUIESCE or FORCE, to open and close the line trace data set, and to enable and disable features such as ODBM registration, password support, RACF, and z/OS Resource Recovery Services (RRS).

Subsections:
“Environment”
“Syntax”
“Keywords”
“Usage notes” on page 1047
“Equivalent WTOR and z/OS commands” on page 1047
“Output fields” on page 1049
“Return, reason, and completion codes” on page 1049
“Examples” on page 1050

Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(CONFIG)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(CONFIG) command.

**SHUTDOWN(COMM)**

Specifies that IMS Connect ends all client and data store connections in a controlled manner.

**OPTION**

Specifies an option for SHUTDOWN.
**QUIESCE**

Ends all client and data store connections in a controlled manner. If no parameter is specified for the SHUTDOWN keyword, QUIESCE is used by default.

All work that is in progress, or that is queued for processing, is completed before IMS Connect is stopped. No new work is accepted after this command is entered and accepted.

IMS Connect shuts down in the following sequence:
1. All active units of work for clients and browsers are completed.
2. Communication between IMS Connect and IMS is terminated.
3. IMS Connect terminates.

**FORCE**

Ends all client and data store connections immediately. This keyword forces any IMS applications that are being run for the connected clients to end abnormally.

**SET**

Specifies the attribute values to be changed.

**CASCADE**

Defines the IMS Connect default setting for support for cascading global, two-phase commit (synclevel=syncpoint) transactions from IMS TM Resource Adapter via a TCP/IP connection to an IMS TM or IMS DB/DC system that is on a different z/OS image than IMS Connect. Cascading transactions that are received via a LOCAL option connection is not supported.

A CASCADE specification in the definition of a data store connection overrides the CASCADE specification in the IMS Connect system configuration. Any data store connection definition that does not specify a value for CASCADE inherits the CASCADE specification from the IMS Connect system configuration.

Until the next restart of IMS Connect, a CASCADE specification made by the UPDATE IMSCON TYPE(CONFIG) SET(CASCADE()) command overrides the CASCADE specification on the HWS configuration statement.

The CASCADE parameter applies only to the support for cascading global, RRS transactions between IMS Connect and IMS TM when they are on different z/OS images. The specification of the IMS Connect CASCADE parameter does not affect support between other components or subsystems, such as between IMS subsystems in a shared queues environment.

**OFF**

Specifies that, by default, data store connections do not support the cascading of global, two-phase commit (synclevel=syncpoint) transactions to IMS TM and IMS DB/DC systems that are running on a different z/OS image than IMS Connect.

If a synclevel=syncpoint transaction is routed to an IMS system that resides on a different LPAR than IMS Connect, IMS Connect rejects the transaction with return code 4 and reason code NCASCADE.

**ON**

Specifies that, by default, data store connections support the cascading of global, two-phase commit (synclevel=syncpoint) transactions to IMS TM and IMS DB/DC systems that are running on different z/OS images than IMS Connect.
If IMS Connect and IMS reside on the same LPAR, the transaction is processed without using cascaded transaction support. If IMS Connect and IMS reside on different LPARs, the transaction is processed using cascaded transaction support.

**MULTIRTP=**

Sets the IMS Connect default specification for OTMA multiple RESUME TPIPE (MULTIRTP) support.

The IMS Connect default specification for MULTIRTP support can be overridden for individual DATASTORE connections by specifying a MULTIRTP value in the DATASTORE definition.

If MULTIRTP is not specified on either the HWS statement or a DATASTORE statement, the OTMA MULTIRTP value defines the default.

- **0** The numeric character “0” removes any existing MULTIRTP specification from the IMS configuration so that, by default, data store client bid requests do not include any specification for MULTIRTP support. MULTIRTP support is determined by either the DATASTORE definition or the OTMA client descriptor in the DFSYDTx member of the PROCLIB data set.

- **OFF** Specifies that IMS Connect client bid requests indicate that IMS Connect requires an OTMA tpipe that supports only a single active RESUME TPIPE request. Output messages on the tpipe are sent serially.

- **ON** Specifies that IMS Connect client bid requests require an OTMA TPIPE that can support multiple active RESUME TPIPE requests in parallel. When a tpipe has multiple active RESUME TPIPE requests from multiple DATASTORE connections, OTMA sends the callout or CM0 output messages on the first available DATASTORE connection that is in a receive state.

**OAUTO**

Specifies whether IMS Connect automatically connects to ODBM when an instance of ODBM is activated in the IMSplex.

- **ON** IMS Connect will connect to all the future ODBMs that enter the IMSplex. This option can be specified in the ODBMATOCONN= parameter of the IMS Connect configuration member.

- **OFF** IMS Connect will not register with any future ODBMs that enter the IMSplex. After turning off the automatic connection of IMS Connect to ODBM, you can connect to ODBM manually by using the UPDATE IMSCON TYPE(ODBM) START(COMM) or equivalent command to open communication with an instance of ODBM.

**PSWDMC**

Specifies whether IMS Connect support for mixed-case passwords is to be turned on or off, or if it depends on the mixed-case password specification in RACF.

- **ON** Enables IMS Connect support for mixed-case passwords.

- **OFF** Disables IMS Connect support for mixed-case passwords. If mixed-case password support is disabled, IMS Connect converts any lowercase characters in passwords to uppercase characters.
RCF
Depends on the mixed-case password specification in RACF. If it is off, IMS Connect converts any lowercase characters in passwords to uppercase characters.

RACF
Specifies that the RACF flag is to be turned on or off.
ON Enables the RACF user identification and verification.
OFF Disables the RACF user identification and verification.

RRS
Specifies that z/OS Resource Recovery Services (RRS) is to be turned on or off. RRS is required for two-phase-commit support.
ON Enables communication between IMS Connect and RRS.
OFF Disables communication between IMS Connect and RRS.

UIDCACHE
Specifies whether RACF user ID caching is used when RACF authentication is enabled.
ON Enables RACF user ID caching when RACF authentication is enabled.
OFF Disables RACF user ID caching when RACF authentication is enabled.

START(RECORDER)
Starts the line trace data set for IMS Connect. This keyword is mutually exclusive with STOP(RECORDER).

STOP(RECORDER)
Stops the line trace data set for IMS Connect. This keyword is mutually exclusive with START(RECORDER).

Usage notes
You can issue the UPDATE IMSCON TYPE(CONFIG) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Equivalent WTOR and z/OS commands
The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(CONFIG) command.

Notes:
• IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
• IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

**UPDATE IMSCON TYPE(CONVERTER) command**

Use the UPDATE IMSCON TYPE(CONVERTER) command to refresh one or more IMS Connect XML converters.

Subsections:

- "Environment" on page 1053
- "Syntax" on page 1053
Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(CONVERTER)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(CONVERTER) command.

**NAME**

Specifies one or more XML converters to be refreshed. You can specify a single converter name or a list of converter names separated by commas. Wildcards can be used in the names.

**OPTION(REFRESH)**

Refreshes the specified XML converters.

Usage notes

You can issue the UPDATE IMSCON TYPE(CONVERTER) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.
Equivalent WTOR and z/OS commands

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(CONVERTER) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 419. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(CONVERTER) command

UPDATE IMSCON TYPE(DATASTORE) command

Use the UPDATE IMSCON TYPE(DATASTORE) command to start or stop communication between IMS Connect and an IMS OTMA data store, or to change data store attributes.

Subsections:
- “Environment” on page 1057
- “Syntax” on page 1057
- “Keywords” on page 1057
- “Usage notes” on page 1061
- “Equivalent WTOR and z/OS commands” on page 1061
- “Output fields” on page 1062
- “Return and reason codes” on page 1062
Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(DATASTORE) NAME(datastore_name)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(DATASTORE) command.
NAME
Specifies one or more data store names to be updated. You can specify a single data store name or a list of data store names that are separated by commas. Wildcards can be used in the names.

SET
Specifies the attribute values to be changed.

ACKTO
Specifies a numeric value of the timeout interval for acknowledgments to OTMA for CM0 and CM1 output messages, and for IMS-to-IMS transaction messages.

The timeout interval is in seconds. The range is 0 - 255. If the timeout value is 0, the OTMA ACK timeout default value of 120 seconds is set.

APPL
Specifies a 1- to 8-character alphanumeric name of the APPL name that is defined to RACF in the PTKTDATA statement.

If the character string “0” is specified, the APPL name is set to blanks.

CASCADE=
For this data store connection only, enables or disables support for the cascading of global, two-phase commit (synclevel=syncpoint) z/OS Resource Recovery Services transactions from IMS TM Resource Adapter via a TCP/IP connection to an IMS TM or IMS DB/DC system that is on a different z/OS image (LPAR) than IMS Connect. Cascading transactions that are received via a LOCAL option connection is not supported.

The CASCADE parameter applies only to the support for cascading global, RRS transactions between IMS Connect and IMS TM when they are on different z/OS images. The specification of the IMS Connect CASCADE parameter does not affect support between other components or subsystems, such as between IMS subsystems in a shared queues environment.

The CASCADE specification in the definition of a data store connection overrides the value of CASCADE that is in effect for the IMS Connect system.

Until the next restart of IMS Connect, a CASCADE specification made by the UPDATE IMSCON TYPE(DATASTORE) SET(CASCADE()) command overrides the CASCADE specification on the DATASTORE configuration statement.

Before you can change the CASCADE specification in a data store connection definition, you must stop the data store connection in IMS Connect by issuing an UPDATE IMSCON TYPE(DATASTORE) STOP(COMM) command or a similar WTOR or z/OS MODIFY command.

0 When the numeric character “0” is specified, the CASCADE specification is removed from the definition of the data store connection. The data store connection inherits the CASCADE value that is in effect for the IMS Connect system configuration.

OFF Disables support for cascading of global, two-phase commit (synclevel=syncpoint) RRS transactions to an IMS TM or IMS DB/DC system that is running on a different LPAR than IMS Connect. If a synclevel=syncpoint transaction is routed to an IMS system that resides
When support is disabled, you can send a synccommit=syncpoint transaction to IMS on this data store connection only if IMS Connect and IMS reside on the same LPAR.

**ON** Enables support for cascading of global, two-phase commit (synccommit=syncpoint) RRS transactions to an IMS TM or IMS DB/DC system that is running on different LPAR than IMS Connect.

IMS Connect detects whether the IMS system is on the same LPAR. If IMS Connect and IMS are running on different LPARs, two-phase commit processing uses cascaded transactions. If IMS Connect and IMS are running on the same LPAR, two-phase commit processing does not use cascaded transactions.

**CM0ATOQ**

Specifies a 1-to 8-character alphanumeric name of the OTMA CM0 ACK timeout queue. This value overrides both the OTMA default value of DFS$$STQ and any value that is set on the HWS statement of the IMS Connect configuration member.

If the character string “0” is specified, the queue name is set to blanks.

**DRU**

Specifies a 1- to 8-character alphanumeric name of the OTMA destination resolution user exit that is to be passed to OTMA.

If the character string “0” is specified, the DRU name is set to blanks.

**GROUP**

Specifies the 1- to 8-character alphanumeric name of the z/OS cross-system coupling facility (XCF) group for the IMS OTMA. IMS Connect uses this value to join the XCF group.

Because IMS Connect and IMS must be in the same XCF group to communicate, this group name must match the XCF group name that you define to IMS (GRNAME) in the IMS startup JCL (for example, "OTMA=Y,GRNAME=&GROUP,USERVAR=&MEMBER", ...).

**MAXI**

Specifies a numeric value of the OTMA input message flood control value.

The range is 0 - 9999. If you specify a value of 0, the OTMA default value of 5000 is used. If you specify a value 1-200, the OTMA minimum value of 200 is used.

**MEMBER**

Specifies the 1- to 16-character alphanumeric XCF member name that identifies IMS Connect in the XCF group that is specified by the GROUP parameter. This name is the XCF name that IMS uses to communicate with IMS Connect in that XCF group. This XCF member name for IMS Connect must be unique in the data store definitions for all data stores that are members of the same XCF group.

**MULTIRTP**

Specifies whether IMS Connect requests an OTMA tpipe that supports multiple active resume tpipe requests (MULTIRTP) when IMS Connect establishes DATASTORE connection with the IMS data store.

Any MULTIRTP value specified other than the character string “0” overrides the MULTIRTP value that is in effect for the IMS Connect system.
configuration. To accept the MULTIRTP value that is in effect for the IMS Connect system configuration, specify MULTIRTP(0).

The following values are valid for the MULTIRTP keyword:

0 When the numeric character “0” is specified, the MULTIRTP specification is removed from the definition of the data store connection. The data store connection inherits the MULTIRTP value that is in effect for the IMS Connect system configuration. If the IMS Connect system does not specify a MULTIRTP value, the OTMA client descriptor determines whether the tpipes for this data store connection support multiple active resume tpipe requests.

# Specifies that the OTMA client descriptor determines the MULTIRTP value for this data store connection.

OFF Enables support for multiple active resume tpipe requests on tpipes for this data store connection.

ON Disables support for multiple active resume tpipe requests on tpipes for this data store connection.

OAAV Specifies a numeric value of the OTMA accessor environment element (ACEE) aging value. When the OTMA ACEE aging value is reached, OTMA refreshes the ACEE before it processes the next input message that is received from IMS Connect.

The OTMA ACEE aging value is in seconds. The range is 0 - 999999. If you specify 0, OTMA uses the default value of 999999. If you specify a value 1-300, OTMA uses a value of 300 seconds.

RRNAME Specifies a 1-to 8-character alphanumeric name of the alternate destination of a client reroute request.

If the character string “0” is specified, the alternate destination name is set to the default setting of HW$DEF.

SMEMBER Specifies the 1-to 4-character name of the OTMA super member to which this IMS data store belongs. If specified, this value overrides the attribute values for the SMEMBER parameter in the HWS statement of the HWSCFGxx member of the IMS PROCLIB data set.

If the character string “0” is specified, the value of SMEMBER specified on this IMS data store is set to blanks, and the super member function is disabled for this data store.

TMEMBER Specifies the 1- to 16-character alphanumeric XCF member name of the IMS that this IMS Connect communicates with in the XCF group. This target member name must match the member name that IMS uses when it joins the XCF group. The XCF member name for IMS is specified in the IMS startup JCL (for example, "...OTMA=Y,GRNAME=&GROUP,OTMANM= &TMEMBER,...").

START(COMM) | STOP(COMM)

Mutually exclusive keywords that you use to start or stop communication with the data stores specified.
**START(COMM)**
Starts communication with the data stores specified.

**STOP(COMM)**
Stops communication with the data stores specified.

**Usage notes**

You can issue the UPDATE IMSCON TYPE(DATASTORE) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSpex from which the commands were issued has a status of ACTIVE.

Updates that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect, unless the updates are also made to the corresponding configuration statement in the HWSCFGxx member of the IMS PROCLIB data set before the next restart.

All attributes except for APPL and RRNAME require the data store to be stopped (in NOTACTIVE state) before they can be updated with the UPDATE IMSCON TYPE(DATASTORE) command.

Attributes that are specified on the SET() keyword of the UPDATE IMSCON TYPE(DATASTORE) command override any specification for that attribute in the DATASTORE statement.

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(DATASTORE) command.

**Notes:**
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

<table>
<thead>

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Table 424. Output fields for the UPDATE IMSCON TYPE(DATASTORE) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned. See &quot;Completion codes&quot; on page 1063.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>DS</td>
<td>DataStore</td>
<td>N/A</td>
<td>The data store name. The data store name is always returned.</td>
</tr>

</table>

Return and reason codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(DATASTORE) command are standard for all commands that are entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 425. Return and reason codes for the UPDATE IMSCON TYPE(DATASTORE) command

<td>1A</td>
<td>BPEGETM error</td>
<td>During START(COMM) processing, IMS Connect failed to obtain storage from the BPEGETM service. The command output might also contain the following message: HWSO1205W.</td>
</tr>
</tbody>
</table>
| 25              | IXCQUERY call failed | During START(COMM) processing, the call to IXCQUERY to query the XCF group member failed. IMS Connect will still try to join the XCF group. If IMS Connect is able to join the XCF group, it waits for a notification that indicates that the member it is waiting for has also joined the XCF group. When the XCF group member also joins, IMS Connect proceeds with connection to the data store. The command output might also contain one of the following messages:  
  • HWSO1210W  
  • HWSD0292I |
| 26              | IXCJOIN call failed | During START(COMM) processing, IMS Connect encountered an error when it attempted to join the XCF group through a call to IXCJOIN. The command output might also contain the following message: HWSO1220W. |
| 27              | Client BID process failed | During START(COMM) processing, IMS Connect encountered an error when it performed the client BID process with OTMA. The command output might also contain one of the following messages:  
  • HWSO1310W  
  • HWSO1320W |
| 28              | IXCLEAVE call failed | During START(COMM) processing, IMS Connect encountered an error when it attempted to leave the XCF group through a call to IXCDELETE. The command output might also contain the following message: HWSO1315W. |
| 29              | XCF group member not active | During START(COMM) processing, IMS Connect detected that the XCF group member is not active. IMS Connect will still try to join the XCF group. If IMS Connect is able to join the XCF group, it waits for a notification that indicates that the member that it is waiting for has also joined the XCF group. When the XCF group member also joins, IMS Connect proceeds with connection to the data store. The command output might also contain the following message: HWSO1215W. |

### Examples

**Example 1 for `UPDATE IMSCON TYPE(DATASTORE)` command**

TSO SPOC input:

```
UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1) START(COMM)
```

TSO SPOC output:

```
DataStore MbrName CC
IMS1 HWS1 0
```

OM API input:

```
CMD(UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1) START(COMM))
```

OM API output:

```
<imsout>
<ctl>
<omname>OM10M </omname>
<omvsn>1.5.0 </omvsn>
<xmlvsn>20 </xmlvsn>
<statime>2010.298 02:34:53.534886</statime>
<stotime>2010.298 02:34:53.536353</stotime>
<staseq>C6C781F0FD6A67A5</staseq>
<stoseq>C6C781F0FDC61CA5</stoseq>
<rqtstkni>USRTO01 10193453</rqtstkni>
<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</cmd>
```
Explanation: Communication between IMS Connect, HWS1, and the data store IMS1 has been started.

Example 2 for UPDATE IMSCON TYPE(DATASTORE) command

TSO SPOC input:
UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1) SET(ACKTO(100),CMQATOQ(TIMEOUT1))

TSO SPOC output:
DataStore MbrName CC
IMS1 HWS1 0

OM API input:
CMD(UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1) SET(ACKTO(100),CMQATOQ(TIMEOUT1)))

OM API output:
<?xml version="1.0"?>
<!DOCTYPE imsout SYSTEM "imsout.dtd">
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.7.0</omvsn>
<xmlvsn>20</xmlvsn>

<verb>UPD</verb>
<kwd>IMSCON</kwd>
<input>UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1) SET(ACKTO(100),CMQATOQ(TIMEOUT1))</input>
</cmd>
</cmdrsphdr>
</cmdrspdata>
</imsout>
Explanation: For communications to the data store IMS1, the ACKTO attribute is set to 100 and the CM0ATOQ attribute is set to TIMEOUT1.

**Example 3 for UPDATE IMSCON TYPE(DATASTORE) command**

**TSO SPOC input:**

```
UPDATE IMSCON TYPE(DATASTORE) NAME(IMS*)
SET(ACKTO(120),MAXI(6000))
```

**TSO SPOC output:**

<table>
<thead>
<tr>
<th>DataStore</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
<th>ErrorText</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>HWS1</td>
<td>0</td>
<td></td>
<td></td>
</tr>
<tr>
<td>IMS2</td>
<td>HWS1</td>
<td>14</td>
<td>Resource is not stopped</td>
<td>ACKTO</td>
</tr>
<tr>
<td>IMS2</td>
<td>HWS1</td>
<td>14</td>
<td>Resource is not stopped</td>
<td>MAXI</td>
</tr>
</tbody>
</table>

**OM API input:**

```
CMD(UPD IMSCON TYPE(DATASTORE) NAME(IMS*)
SET(ACKTO(120),MAXI(6000)))
```

**OM API output:**

```
<?xml version="1.0"?>
<!DOCTYPE imsout SYSTEM "imsout.dtd">
<imsout>
  <ctl>
    <omname>OM1OM</omname>
    <omvsn>1.7.0</omvsn>
    <xmlvsn>20</xmlvsn>
    <staseq>CD273C589FF8082</staseq>
    <stoseq>CD273C5800F8882</stoseq>
    <rqsttkn1>USRT002 10151611</rqsttkn1>
    <rc>0200000C</rc>
    <rsn>00003000</rsn>
    <rsntxt>CSLN054I</rsntxt>
  </ctl>
  <cmderr>
    <mbr name="HWS1">
      <typ>IMSCON</typ>
      <rc>00000000</rc>
      <rsn>00003000</rsn>
      <rsntxt>None of the clients were successful.</rsntxt>
    </mbr>
    </cmderr>
  <cmd>
    <master>HWS1</master>
    <userid>USRT002</userid>
    <verb>UPD</verb>
    <kwd>IMSCON</kwd>
  </cmd>
</imsout>
```
The command is attempting to set the ACKTO and MAXI attributes for all data stores that start with the characters “IMS”. For data store IMS1, the ACKTO attribute is set to 120 and the MAXI attribute is set to 6000. For data store IMS2, the updates to the attributes failed because the resource data store IMS2 is not stopped. There is a line of output for each attribute that IMS Connect failed to set for each IMS data store.

Example 4 for UPDATE IMSCON TYPE(DATASTORE) command

TSO SPOC input:
UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1)
SET(MEMBER(HWS2),SMEMBER(0))

TSO SPOC output:
Ins1 MbrName CC Ctxt
HWS1 3 Some attributes not updated

OM API input:
CMD(UPDATE IMSCON TYPE(DATASTORE) NAME(IMS1)
SET(MEMBER(HWS2),SMEMBER(0)))

OM API output:
<?xml version="1.0"?>
<!DOCTYPE imsout SYSTEM "imsout.dtd">
<imsout>

<cmdrspdata>
  <rsp>DS(IMS1) MBR(HWS1) CC(4E) CCTXT(Duplicate XCF member name)
  <rsp>DS(IMS1) MBR(HWS2) CCTXT(Some attributes not updated)
  </cmdrspdata>
</imsout>

**Explanation:** The command is attempting to set the MEMBER and SMEMBER attributes for data store IMS1. Some updates were successful. A separate CC is displayed for each attribute update that was not successful. IMS Connect detected that another data store in the same XCF group as IMS1 has the same member name, HWS2, that was specified in MEMBER(), so MEMBER was not set. The SMEMBER attribute was set successfully because there was no CC for it.

**UPDATE IMSCON TYPE(IMSPLEX) command**

Use the UPDATE IMSCON TYPE(IMSPLEX) command to start or stop communication between IMS Connect and the specified IMSplex.

**Subsections:**
- "Environment” on page 1071
- "Syntax” on page 1071
- "Keywords” on page 1071
Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON
```

```
NAME(imsplex_name)
START(COMM)
STOP(COMM)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(IMSplex) command.

NAME

Specifies the name of the IMSplex. This name must be defined to the IMS Connect through the configuration member HWSCFGxx. In addition, this name must match the TMEMBER that is defined in the IMSplex configuration statement.

START(COMM) | STOP(COMM)

Mutually exclusive keywords that you use to start or stop communication with the IMSplex.

START(COMM)

Starts communication with the IMSplex. Use this command to reestablish communication with the IMSplex that is communicating with OM or ODBM if communication between IMS Connect and the IMSplex fails. For example, use this command to restart communication when all activities for the IMSplex in the IMS Connect are terminated, or after an UPDATE IMSCON TYPE(IMSplex) STOP(COMM) command terminated communication with the IMSplex.

Type-2 commands require that communication between IMS Connect and the IMSplex of which OM is a member is already established. Therefore, the UPDATE IMSCON TYPE(IMSplex) START(COMM) command can be used only to start communication between IMS Connect and a different IMSplex. To start communication between IMS Connect and the IMSplex that is used for type-2 command support, use either the WTO R command STARTIP or OPENIP, or the z/OS command UPDATE IMSPLEX START(COMM).

STOP(COMM)
Stops communication with the IMSplex. Work currently in progress for the IMSplex is ended and communication with the IMSplex and its threads are terminated. This option can also be used for any error situation that requires immediate termination of communication with the IMSplex.

Note: If you stop communication with the IMSplex that is used for type-2 commands, you will not be able to issue further commands to IMS Connect through OM because the connection to SCI is terminated. To restart communication with the IMSplex, use either the WTOR command STARTIP or OPENIP, or the z/OS command UPDATE IMSPLEX START(COMM).

Usage notes

You can issue the UPDATE IMSCON TYPE(IMSPLEX) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

When the UPDATE IMSCON TYPE(IMSPLEX) NAME(imsplexName) STOP(COMM) is issued, work currently in progress for the IMSplex ends and communication with the IMSplex and its threads are terminated. Any messages in progress are rejected and an error message is returned to the requester. STOPIP can also be used for any error situation that requires immediate termination of communication with the IMSplex.

If IMS Connect supports ISC TCP/IP links and the STOP(COMM) keyword is used, IMS Connect sends a notification to IMS for each ISC link to inform IMS that all of the ISC parallel sessions are terminated on the ISC link.

If IMS Connect supports MSC IMS-to-IMS TCP/IP connections and the STOP(COMM) keyword is used, IMS Connect sends a notification to IMS for each MSC physical link to inform IMS that all of the MSC logical links are terminated on the physical link.

Use the START(COMM) keyword to start communication with the IMSplex at a later time.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.
Table 427. Output fields for the UPDATE IMSCON TYPE(IMSPLEX) command

- IMS Connect UPDATE IMSPLEX command (Commands)

**UPDATE IMSCON TYPE(ISC) command**

Use the UPDATE IMSCON TYPE(ISC) command to stop or restart communications on an ISC link.

**Subsections:**

- "Environment"
- "Syntax"
- "Keywords" on page 1078
- "Usage notes" on page 1078
- "Equivalent WTOR and z/OS commands" on page 1078
- "Output fields" on page 1079
- "Return, reason, and completion codes" on page 1079
- "Examples" on page 1082

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON--TYPE(ISC)--NAME(isc_stmt_id)........isc_stmt_id*
```

Chapter 30. UPDATE commands  1077
Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(ISC) command.

**NAME**

Specifies the ID of an ISC statement that defines an ISC link. You can specify a single ISC link ID or a list of ISC link IDs separated by commas. Wildcards can be used in the names.

**START(COMM)**

Starts or restarts the ISC communications on the ISC link after it has been terminated. The status of the ISC link is set to “ACTIVE” after the completion of the command. START(COMM) is mutually exclusive with STOP(COMM).

**STOP(COMM)**

Terminates all communications on an ISC link. The status of the ISC link is set to “NOTACTIVE” after the completion of the command. STOP(COMM) is mutually exclusive with START(COMM).

Usage notes

**Recommendation**: Do not issue the UPDATE IMSCON TYPE(ISC) command if any ISC sessions (ISCUSERS) are active on the ISC link. Any active sessions should be shut down from IMS by using the /QUIESCE or /CLSDST command before issuing this command. If the sessions are terminated in IMS, but still appear active in IMS Connect, you can issue the UPDATE IMSCON TYPE(ISC) command to clean them up.

You can issue the UPDATE IMSCON TYPE(ISC) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

When the UPDATE IMSCON TYPE(ISC) STOP(COMM) command is issued, IMS Connect:

- Stops active parallel sessions and prevents further communication on the specified ISC link
- Informs IMS that communication has stopped on the ISC link
- Changes the status of the ISC link to NOT ACTIVE
- Issues message HWSG4005I

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(ISC) command.
Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

[ISC statement (System Definition)]
[RMTCICS statement (System Definition)]
UPDATE IMSCON TYPE(ISCUSER) command

Use the UPDATE IMSCON TYPE(ISCUSER) command to stop an ISC user session (ISCUSER) that is assigned to an ISC link in IMS Connect.

Subsections:
- "Environment"
- "Syntax"
- "Keywords"
- "Usage notes" on page 1084
- "Equivalent WTOR and z/OS commands" on page 1084
- "Output fields" on page 1085
- "Return, reason, and completion codes" on page 1085
- "Example" on page 1086

Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```plaintext
UPDATE IMSCON TYPE(ISCUSER) NAME(isc_user_name), ISC(isc_link_id)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(ISCUSER) command.

ISC

Specifies the ISC link ID defined in the ID parameter of the ISC statement. You can specify a single ISC link ID or a list of ISC link IDs separated by commas. Wildcards can be used in the names.

ISC is an optional keyword. If specified, the command applies only to those user sessions that are associated with the specified link ID. If omitted, then the command applies to user sessions that are associated with any link ID.
NAME
Specifies the ISC user session name. You can specify a single ISC user name or a list of ISC user names that are separated by commas. Wildcards can be used in the names.

STOP (COMM)
Stops communication for the ISC user.

Usage notes

You can issue the UPDATE IMSCON TYPE(ISCUSER) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Use the UPDATE IMSCON TYPE(ISCUSER) STOP(COMM) command to clean up IMS Connect resources that are associated with an ISC user session when the user session was already terminated, but the IMS Connect resources that are associated with the user session were not cleaned up correctly.

Recommendation: Use the IMS command /QUIESCE NODE to terminate ISC user sessions. Use the UPDATE IMSCON TYPE(ISCUSER) command only when the IMS Connect resources that are associated with an ISC user session that was terminated failed to clean up correctly.

When the UPDATE IMSCON TYPE(ISCUSER) STOP(COMM) command is issued, IMS Connect:
• Stops communication on the ISC user session
• Informs IMS that communication is stopped on the user session
• Deletes the control blocks associated with the user session and frees the associated storage
• Issues message HWSG4010I

To avoid accidentally stopping a user session that uses the same user session name on another ISC link, limit the command processing to a specific ISC link by specifying the ID of the target ISC link on the ISC keyword.

If the UPDATE IMSCON TYPE(ISCUSER) command is issued against two or more ISC links, or the isc_link_id value is omitted, IMS Connect stops all of the ISC user sessions that match the specified ISC user names on each ISC link.

To display information about the ISC user sessions that are assigned to the ISC links that are defined to an IMS Connect instance, use either of the IMS type-2 commands QUERY IMSCON TYPE(ISCUSER) or QUERY IMSCON TYPE(ISC).

Equivalent WTOR and z/OS commands

The UPDATE IMSCON TYPE(ISCUSER) command does not have an equivalent IMS Connect WTOR (Write to Operator with Reply) or IMS Connect z/OS command.
Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading that is displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) is displayed for output fields that are always returned. error is displayed for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Table 435. Output fields for the UPDATE IMSCON TYPE(ISCUSER) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned. See Table 437 on page 1086.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. The CCText field is returned only for an error completion code.</td>
</tr>
<tr>
<td>IUSER</td>
<td>ISCUser</td>
<td>N/A</td>
<td>Specifies the ISC user session that was terminated. The identifier is always returned.</td>

ISC statement (System Definition)
RMTCICS statement (System Definition)

**UPDATE IMCON TYPE(LINK) command**

Use the UPDATE IMCON TYPE(LINK) command to stop communications on an MSC logical link that is assigned to an MSC physical link in IMS Connect.

Subsections:
- “Environment” on page 1088
- “Syntax” on page 1088
- “Keywords” on page 1088
- “Usage notes” on page 1088
- “Equivalent WTOR and z/OS commands” on page 1089
- “Output fields” on page 1090
- “Return, reason, and completion codes” on page 1090
Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(LINK) NAME(logical_link_name*, logical_link_name*)
```

```
STOP(COMM) MSC(lclplk_id*, lclplk_id*)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(LINK) command.

**MSC**

Specifies the MSC physical link ID defined in the LCLPLKID parameter of the MSC statement. You can specify a single MSC physical link name or a list of MSC physical link names separated by commas. Wildcards can be used in the names.

This is an optional keyword. If specified, the command applies only to those logical links that are associated with the specified physical link ID. If omitted, then the command applies to logical links that are associated with any physical link ID.

**NAME**

Specifies the MSC logical link name. You can specify a single MSC logical link name or a list of MSC logical link name separated by commas. Wildcards can be used in the names.

**STOP(COMM)**

Stops logical link communication for the MSC that is associated with the link.

Usage notes

You can issue the UPDATE IMSCON TYPE(LINK) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of **ACTIVE**.
Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Use the UPDATE IMSCON TYPE(LINK) command to clean up the resources associated with an MSC logical link when the link has already been terminated, but the IMS Connect resources associated with the link were not cleaned up correctly.

**Recommendation:** Use the IMS command /PSTOP to terminate MSC logical links. Use the UPDATE IMSCON TYPE(LINK) command only when the IMS Connect resources associated with an MSC logical link that has already been terminated have failed to clean up correctly.

When the UPDATE IMSCON TYPE(LINK) command is issued, IMS Connect:
- Stops communication on the MSC logical link
- Informs IMS that communication has stopped on the logical link
- Deletes the control blocks associated with the logical link and frees the associated storage
- Issues message HWSF3310I

To avoid accidentally stopping a logical link that uses the same logical link name on another physical link, limit the command processing to a specific physical link by specifying the name of the target physical link as the `lclplk_id` value.

If the UPDATE IMSCON TYPE(LINK) command is issued against two or more physical links, or the `lclplk_id` value is omitted, IMS Connect stops communication on all MSC logical links that match the `logical_link_name` specified on the UPDATE IMSCON TYPE(LINK) command.

To display information about the MSC logical links that are assigned to the MSC physical links that are defined to an IMS Connect instance, use any of the following commands:
- In the IMS type-2 command format, either QUERY IMSCON TYPE(LINK) or QUERY IMSCON TYPE(MSC)
- In the WTOR command format, VIEWMSC
- In the z/OS MODIFY command format, QUERY MSC

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(LINK) command.

**Notes:**
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect `jobname`. 
Table 438. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(LINK) command

Explanation: The communication for the MSC, MSC12, associated with the logical link MSCLINK1 has been stopped.

Related reference:
- [STOPLINK command (Commands)](#)
- [IMS Connect DELETE LINK command (Commands)](#)
- [MSC statement (System Definition)](#)

**UPDATE IMSCON TYPE(MSC) command**

Use the UPDATE IMSCON TYPE(MSC) command to restart the MSC communications after it has been terminated and to terminate all communications to an MSC physical link, including all associated logical links.

Subsections:
- "Environment"
- "Syntax" on page 1093
- "Keywords" on page 1093
- "Usage notes" on page 1093
- "Equivalent WTOR and z/OS commands" on page 1094
- "Output fields" on page 1094
- "Return, reason, and completion codes" on page 1095
- "Examples" on page 1097

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
• A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(MSC) NAME(lclPlkid*) START(COMM) STOP(COMM)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(MSC) command.

**NAME**

Specifies the MSC physical link ID defined in the LCLPLKID parameter of the MSC statement. You can specify a single MSC physical link name or a list of MSC physical link name separated by commas. Wildcards can be used in the names.

**START(COMM)**

Starts or restarts the MSC communications of the MSC physical link after it has been terminated by an UPDATE IMSCON TYPE(MSC) STOP(COMM) command. The status of the MSC communication for the MSC physical link is set to “ACTIVE” after the completion of the command. START(COMM) is mutually exclusive with STOP(COMM).

**STOP(COMM)**

Terminates all communications to an MSC physical link, including all its logical links. The status of the MSC communication for the MSC physical link is set to “NOTACTIVE” after the completion of the command. STOP(COMM) is mutually exclusive with START(COMM).

Usage notes

You can issue the UPDATE IMSCON TYPE(MSC) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

When the UPDATE IMSCON TYPE(MSC) STOP(COMM) command is issued, IMS Connect:

• Stops communication on the specified MSC physical link, including communications on all the MSC logical links that are assigned to the physical link
• Informs IMS that communication has stopped on the physical link so that IMS can also terminate the physical link and any logical links that are assigned to the physical link
• Changes the status of the MSC physical link and its assigned logical links to NOT ACTIVE
• For TCP/IP generic resources, clears affinity of a physical link to the IMS system
• Issues message HWSF3305I
Equivalent WTOR and z/OS commands

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(MSC) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 442. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(MSC) command

Explanation: The communication between IMS Connect, HWS1, and MSC MSC12 has been stopped.

Related reference:

- STARTMSC command (Commands)
- STOPMSC command (Commands)
- IMS Connect UPDATE MSC command (Commands)
**UPDATE IMSCON TYPE(ODBM) command**

Use the UPDATE IMSCON TYPE(ODBM) command to start and stop communication between the IMS Connect and an IMS Open Database Manager (ODBM).

Use the UPDATE IMSCON TYPE(ODBM) command to reestablish communication with an ODBM after communication fails between the IMS Connect and the ODBM. For example, use this command to restart communication when all activities for the ODBM in the IMS Connect is terminated.

Subsections:
- "Environment"
- "Syntax"
- "Keywords"
- "Usage notes” on page 1099
- "Equivalent WTOR and z/OS commands” on page 1099
- "Output fields” on page 1099
- "Return, reason, and completion codes” on page 1100
- "Examples” on page 1102

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON TYPE(ODBM) NAME(odbm_name*, odbm_name)
```

**Keywords**

The following keywords are valid for the UPDATE IMSCON TYPE(ODBM) command.

**NAME**

Specifies the names of one or more IMS ODBMs to be updated. You can specify a single ODBM name or a list of ODBM names separated by commas. Wildcards can be used in the names.

**START(COMM) | STOP(COMM)**

Specifies to start or stop communication with IMS ODBM.
**START(COMM)**
Starts communication with IMS ODBM. START(COMM) is mutually exclusive with STOP(COMM).

**STOP(COMM)**
Stops communication with IMS ODBM. STOP(COMM) is mutually exclusive with START(COMM).

**Usage notes**

You can issue the UPDATE IMSCON TYPE(ODBM) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of **ACTIVE**.

Use the UPDATE IMSCON TYPE(ODBM) command for any type of error situation that requires immediate termination of communication with an ODBM. Work currently in progress for an ODBM is ended and communications with that ODBM and its threads are terminated.

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(ODBM) command.

**Notes:**
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect **jobname**.

**Table 446. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(ODBM) command**

</tbody>
</table>

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Long label**
Contains the column heading displayed on the TSO SPOC screen.

**Keyword**
Identifies the keyword on the command that caused the field to be
generated. N/A (not applicable) appears for output fields that are always returned. **error** appears for output fields that are returned only in the case of an error.

### Meaning
Provides a brief description of the output field.

#### Table 447. Output fields for the UPDATE IMSCON TYPE(ODBM) command

<td>CCText</td>
<td><strong>error</strong></td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Identifier of the IMS Connect that built the output line. The identifier is always returned.</td>
</tr>
<tr>
<td>ODBM</td>
<td>ODBMName</td>
<td>N/A</td>
<td>Name of the ODBM. The ODBM name is always returned.</td>
</tr>
</tbody>
</table>

### Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(ODBM) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

#### Table 448. Return and reason codes for the UPDATE IMSCON TYPE(ODBM) command

<table>

**Examples**

**Example 1 for UPDATE IMCON TYPE(ODBM) command**

TSO SPOC input:

`UPDATE IMCON TYPE(ODBM) NAME(ODBMA) START(COMM)`

TSO SPOC output:

```
ODBManame MbrName CC
ODBMA HWS1 0
```

OM API input:

`CMD(UPDATE IMCON TYPE(ODBM) NAME(ODBMA) START(COMM))`

OM API output:

```
<imsout>  
<ctl>  
<omname>OM10M </omname>  
<omvsn>1.5.0</omvsn>  
<xmlvsn>20 </xmlvsn>  
<statime>2010.298 15:54:38.327140</statime>  
<stotime>2010.298 15:54:38.328400</stotime>
```
Explanation: The communication between IMS Connect, HWS1, and the IMS ODBM, ODBMA, has been restarted.

Related reference:
- STARTOD command (Commands)
- STOPOD command (Commands)

**UPDATE IMSCON TYPE(PORT) command**

Use the UPDATE IMSCON TYPE(PORT) command to terminate listening on a TCP/IP port, to reestablish a TCP/IP connection to enable listening on a TCP/IP port, or to change port attributes.

Subsections:
- “Environment”
- “Syntax” on page 1104
- “Keywords” on page 1104
- “Usage notes” on page 1106
- “Equivalent WTOR and z/OS commands” on page 1106
- “Output fields” on page 1106
- “Return, reason, and completion codes” on page 1107
- “Examples” on page 1109

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON TYPE(PORT) NAME(port_name*)

START(COMM)
STOP(COMM)

SET(EDITRTN(editexit_name)
KEEPAV(keepalive_value)
PORTTMOT(timeout_value))
```

**Keywords**

The following keywords are valid for the UPDATE IMSCON TYPE(PORT) command:

**NAME**

Specifies the names of one or more ports. You can specify a single port name or a list of port names separated by commas. Wildcards can be used in the names. The port name must match a port defined to IMS Connect on one of the configuration statements in the IMS Connect PROCLIB member or by using the CREATE IMSCON TYPE(PORT) command.

To update the local port used by the IMS TM Resource Adapter, specify NAME(LOCAL).

An SSL port is displayed with the character “S” appended to the end of the port number. To update the SSL port, specify the port number either with or without the character “S” appended to the end of the port number.

A DRDA port for ODBM use is displayed with the character “D” appended to the end of the port number. To update the DRDA port, specify the port number either with or without the character “D” appended to the end of the port number.

A port defined as a CICSPORT for receiving messages on an ISC link from a CICS subsystem is displayed with the character “C” appended to the end of the port number. To update a CICSPORT port, specify the port number either with or without the character “C” appended to the end of the port number.

**SET()**

Specifies the attribute values to be changed. The SET() keyword cannot be used in conjunction with the keywords START() or STOP().

**EDITRTN(editexit_name)**

Specifies a 1- to 8-character alphanumeric name of the Port Message Edit exit routine that can modify messages that do not conform to standard message formats for IMS Connect. The exit routine must be accessible to IMS Connect by either JOBLIB, STEPLIB, or LinkList.
The Port Message Edit exit routine and the EDITR TN attribute are only valid for regular ports. Invalid port types are: LOCAL, ODBM, SSL, and CICS.

To set the EDITR TN attribute, the port must be in NOTACTIVE state by issuing the UPD IMSCON TYPE(PORT) STOP(COMM) command. If needed, run the command with the STOP(COMM) attribute prior to running the command with the EDITR TN attribute.

When IMS Connect is unable to load the specified Port Message Edit exit routine, it will use the previously defined, if any, Port Message Edit exit routine when the port is started.

To disable the use of the Port Message Edit exit routine, use a zero as the value for the EDITR TN parameter, EDITR TN(0). The name of the previously set Port Message Edit exit routine still shows in the output of the BPE DISPLAY USEREXIT command, but IMS Connect does not call the Port Message Edit exit routine.

The use of the BPE REFRESH USEREXIT command to refresh the existing Port Message Edit exit routine might produce unexpected results when the IMS Connect port is active, because the new copy of the exit becomes available immediately after command completion. This might affect both input and output messages for currently connected TCP/IP clients. The BPE REFRESH USEREXIT command is processed by BPE, so IMS Connect does not issue the TERM call to the old version of the exit or the INIT call to the new version of the exit. Instead of using the BPE REFRESH USEREXIT command to update the port's edit exit routine, try to use the UPD IMSCON TYPE(PORT) SET(EDITR TN) command with the current name of the Port Message Edit exit routine.

KEEPA V(keepalive_value)

Specifies a numeric value for the TCP/IP KeepAlive interval for sockets on this port. The KeepAlive interval is in seconds. The range is from 0 to 2,147,460 seconds. If zero is specified, the TCP/IP stack interval value is used.

The KEEPA V attribute is only valid for regular, DRDA, and CICS ports. Invalid port types are: LOCAL and SSL.

PORTTMOT(timeout_value)

Specifies a numeric value for the amount of time that IMS Connect waits for the next input message from a client application that is connected on a DRDA port before IMS Connect disconnects the client. The timeout interval is in hundredths of a second. The range is from 0 to 2,147,483,647 hundredths of a second. A value of zero disables the timeout function.

The PORTTMOT attribute is only valid for DRDA ports. Invalid port types are: LOCAL, regular, SSL, and CICS.

START(COMM) | STOP(COMM)

Specifies to start or stop communication on the port.

START(COMM)

Starts communication on the port. Use the UPDATE IMSCON TYPE(PORT) START(COMM) command when communication stops between the IMS Connect and a TCP/IP port, but the IMS Connect has not terminated.

STOP(COMM)

Stops communication on the port. Work currently in progress can continue
for existing clients. Only the listening for new request messages on the port is terminated immediately. When existing work has completed, the port is no longer active.

Usage notes

You can issue the UPDATE IMSCON TYPE(PORT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Updates that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect, unless the updates are also made to the corresponding configuration statement in the HWSFCGxx member of the IMS PROCLIB data set before the next restart.

A port must be stopped (in NOTACTIVE state) before its EDITRTN attribute can be updated with the UPDATE IMSCON TYPE(PORT) SET(EDITRTN()) command.

Equivalent WTOR and z/OS commands

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(PORT) command.

Notes:
• IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
• IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 450. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(PORT) command.

<table>
<thead>
<tr>
<th>UPDATE IMSCON TYPE(PORT) command</th>
<th>Equivalent IMS Connect WTOR command</th>
<th>Equivalent IMS Connect z/OS command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE IMSCON TYPE(PORT) NAME(port_name) START(COMM)</td>
<td>OPENPORT port_id</td>
<td>UPDATE PORT NAME(port_name) START(COMM)</td>
</tr>
<tr>
<td></td>
<td>STARTPT port_id</td>
<td></td>
</tr>
<tr>
<td>UPDATE IMSCON TYPE(PORT) NAME(port_name) STOP(COMM)</td>
<td>STOPPORT port_id</td>
<td>UPDATE PORT NAME(port_name) STOP(COMM)</td>
</tr>
</tbody>
</table>

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.
Meaning

Provides a brief description of the output field.

Table 451. Output fields for the UPDATE IMSCON TYPE(PORT) command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code that indicates whether IMS Connect was able to process the command for the specified resource. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>ERRT</td>
<td>ErrorText</td>
<td>error</td>
<td>Error text that provides diagnostic information. Error text can be returned for a non-zero completion code and further explains the completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Identifier of the IMS Connect that built the output line. The identifier is always returned.</td>
</tr>
<tr>
<td>PORT</td>
<td>Port</td>
<td>N/A</td>
<td>The port number. The port number is always returned.</td>
</tr>
</tbody>
</table>

If one of the following characters is appended to the end of the port number, it indicates that the port is dedicated to a particular purpose:

- **C**: Identifies a CICS port.
- **D**: Identifies an ODBM port.
- **S**: Identifies an SSL port.

If "LOCAL" is displayed instead of a port number, the port is a local port that is used by the IMS TM Resource Adapter.

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(PORT) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 452. Return and reason codes for the UPDATE IMSCON TYPE(PORT) command

Examples

Example 1 for `UPDATE IMSCON TYPE(PORT)` command

TSO SPOC input:
`UPDATE IMSCON TYPE(PORT) NAME(9999) START(COMM)`

TSO SPOC output:
```
<table>
<thead>
<tr>
<th>Port</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>9999</td>
<td>HW51</td>
<td>0</td>
</tr>
</tbody>
</table>
```

OM API input:
`CMD(UPDATE IMSCON TYPE(PORT) NAME(9999) START(COMM))`

OM API output:
```
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2010.298 02:49:44.222509</statime>
<stotime>2010.298 02:49:44.225852</stotime>
<staseq>C6C785426A72DABA</staseq>
```
Example: IMS Connect, HWS1, is now listening on the TCP/IP port 9999.

Example 2 for `UPDATE IMS CON TYPE(PORT)` command

TSO SPOC input:

```
UPDATE IMS CON TYPE(PORT) NAME(9999) START(COMM)
```

TSO SPOC output:

```
IMSplex . . . . : PLEX1
Routing . . . . : HWS1
Start time . . . : 2013.253 16:52:42.35
Stop time . . . : 2013.253 16:52:42.35
Return code . . . : 0200000C
Reason code . . . : 00003008
Reason text . . . : None of the clients were successful.
Command master . . : HWS1
```

<table>
<thead>
<tr>
<th>MbrName</th>
<th>Return Code</th>
<th>Reason Code</th>
<th>Reason text</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWS1</td>
<td>0C00000C</td>
<td>00003008</td>
<td>No requests were successful</td>
</tr>
</tbody>
</table>

Explanation: IMS Connect, HWS1, could not start communication on the TCP/IP port 9999, because a TCP/IP socket function call failed.

Example 3 for `UPDATE IMS CON TYPE(PORT)` command

TSO SPOC input:

```
UPDATE IMS CON TYPE(PORT) NAME(9999)
SET(KEEPAV(120000))
```

Explanation: IMS Connect, HWS1, could not start communication on the TCP/IP port 9999, because a TCP/IP socket function call failed.
TSO SPOC output:

<table>
<thead>
<tr>
<th>Port</th>
<th>MbrName</th>
<th>CC</th>
</tr>
</thead>
<tbody>
<tr>
<td>9999</td>
<td>HWS1</td>
<td>0</td>
</tr>
</tbody>
</table>

OM API input:

CMD(UPD IMSCON TYPE(PORT) NAME(9999)
SET(KEEPAV(120000)))

OM API output:

```xml
<?xml version="1.0"?>
<!DOCTYPE imsout SYSTEM "imsout.dtd">

<rsp>PORT(7777) MBR(HWS1) CC(3) CCTXT(Command complete for some)</rsp>
</cmdrspdata>
</imsout>
```
The command is attempting to set the KEEPAV, EDITRTN, and PORTTMOT attributes for regular port 9999 and DRDA port 7777.

For DRDA port 7777, some updates are successful. A separate completion code is displayed for each attribute update that is not successful. The Port Message Edit exit routine (EDITRTN) attribute is not valid for a DRDA port, so it is not set. The KeepAlive interval (KEEPAV) and the DRDA port timeout (PORTTMOT) attributes are set successfully since there no completion codes are returned for them.

For DRDA port 7777, the Port Message Edit exit routine (EDITRTN) attribute is not valid for a DRDA port, so none of the attributes for port 7777 are set.

**UPDATE IMSCON TYPE(RACFUID) command**

Use the UPDATE IMSCON TYPE(RACFUID) command to refresh one or more RACF user IDs in the user ID cache.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 1114
- “Usage notes” on page 1114
- “Equivalent WTOR and z/OS commands” on page 1114
- “Output fields” on page 1114
- “Return, reason, and completion codes” on page 1115
- “Examples” on page 1116

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON TYPE(RACFUID) NAME(userid) OPTION(REFRESH)
```
Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(RACFUID) command.

NAME
Specifies one or more RACF user IDs in the user ID cache to be refreshed. You can specify a single RACF user ID, or a list of RACF user IDs separated by commas. Wildcards cannot be used in the names.

OPTION(REFRESH)
Refreshes the specified RACF user IDs.

Usage notes

You can issue the UPDATE IMSCON TYPE(RACFUID) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Equivalent WTOR and z/OS commands

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(RACFUID) command.

Notes:
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 454. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(RACFUID) command

<table>
<thead>
<tr>
<th>UPDATE IMSCON TYPE(RACFUID) command</th>
<th>Equivalent IMS Connect WTOR command</th>
<th>Equivalent IMS Connect z/OS command</th>

<td>UPDATE RACFUID</td>
</tr>
</tbody>
</table>

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.
Meaning

Provides a brief description of the output field.

Table 455. Output fields for the UPDATE IMSCON TYPE(RACFUID) command

<table>

</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(RACFUID) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

- [IMS Connect UPDATE RACFUID command (Commands)](#)

**UPDATE IMSCON TYPE(RMTCICS) command**

Use the UPDATE IMSCON TYPE(RMTCICS) command to stop or restart communication between an IMS Connect instance and a remote CICS subsystem.

**Recommendation:** Before issuing the UPDATE IMSCON TYPE(RMTCICS) command, confirm that there are no active ISC sessions (ISCUSERs) on the connection. Any active sessions should be shut down from IMS by using the /QUIESCE or /CLSDST command. If the sessions are terminated in IMS but still appear active in IMS Connect, the UPDATE IMSCON TYPE(RMTCICS) command cleans them up.

**Subsections:**
- "Environment"
- "Syntax"
- "Keywords" on page 1118
- "Usage notes" on page 1118
- "Equivalent WTO and z/OS commands" on page 1119
- "Output fields" on page 1119
- "Return, reason, and completion codes" on page 1120
- "Example of the UPDATE IMSCON TYPE(RMTCICS) command" on page 1122

**Environment**

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

**Syntax**

```
UPDATE IMSCON TYPE(RMTCICS) NAME(rmtcics_name)

START(COMM)
STOP(COMM)
```
Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(RMTCICS) command.

NAME

Specifies one or more remote CICS connection names to be updated. You can specify a single remote CICS connection name or a list of remote CICS connection names separated by commas. You can use wildcard characters in the names.

START(COMM) | STOP(COMM)

Mutually exclusive keywords that you use to start or stop communications for the remote CICS connection.

START(COMM)

Starts the named remote CICS connection in IMS Connect. After issuing this command, the TCP/IP connection between IMS Connect and the remote CICS is enabled. However, if an ISC link was also stopped by the UPDATE IMSCON TYPE(ISC) STOP(COMM) command, to fully enable communications for ISC, you also need to issue the UPDATE IMSCON TYPE(ISC) START(COMM) command.

STOP(COMM)

Stops communications on the remote CICS connection.

When the UPDATE IMSCON TYPE(RMTCICS) STOP(COMM) command is issued, IMS Connect:

- Stops all communication with a remote CICS instance on the connection specified in the command.
- Informs IMS that the connection to the remote CICS instance has been stopped so that IMS can shut down any affected ISC parallel sessions.
- Terminates existing socket connections and prevents new socket connections until the UPDATE RMTCICS START(COMM) is issued.
- Changes the status of the connection to STOPPED.
- Issues message HWSV4405I.

If IMS Connect receives a message for a connection in the STOPPED state, IMS Connect returns a NAK response to IMS and issues message HWSG4040W. IMS retains the message at the front of the queue.

Usage notes

You can issue the UPDATE IMSCON TYPE(RMTCICS) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

When the UPDATE IMSCON TYPE(RMTCICS) START(COMM) command is issued, IMS Connect resumes communications on the specified connection to a remote CICS instance. IMS Connect changes the status of the connection to NOT ACTIVE until new sockets are opened for communications with the remote instance of CICS.
The UPDATE IMSCON TYPE(RMTCICS) START(COMM) command is required only when communication on a connection with a remote CICS instance have been previously stopped by an UPDATE RMTCICS STOP(COMM) command.

For ISC communications, the UPDATE IMSCON TYPE(RMTCICS) START(COMM) command resumes only TCP/IP communications in IMS Connect, and does not change the stopped status of ISC links. If the ISC links have been stopped by an UPDATE IMSCON TYPE(ISC) STOP(COMM) command, after you issue the UPDATE IMSCON TYPE(RMTCICS) START(COMM) command, you also need to restart the ISC links in IMS Connect by issuing the UPDATE IMSCON TYPE(ISC) START(COMM) command.

**Recommendation:** When restarting ISC communications, to prevent IMS from sending ISC messages to IMS Connect before TCP/IP communications have been restarted, always issue the UPDATE IMSCON TYPE(RMTCICS) START(COMM) command before issuing the UPDATE IMSCON TYPE(ISC) START(COMM).

Use the QUERY IMSCON TYPE(RMTCICS) command to display information about the current connections to a remote CICS instance that are defined to the local IMS Connect instance.

**Equivalent WTOR and z/OS commands**

The UPDATE IMSCON TYPE(RMTCICS) command does not have an equivalent WTOR or z/OS MODIFY command.

**Notes:**

- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Table 458. WTOR and IMS Connect z/OS equivalents for the UPDATE IMSCON TYPE(RMTCICS) command

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE IMSCON TYPE(RMTCICS) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 460. Return and reason codes for the UPDATE IMSCON TYPE(RMTCICS) command

Example of the UPDATE IMSCON TYPE(RMTCICS) command

In the following example, the UPDATE IMSCON TYPE(RMTCICS) command is used to start the remote CICS connection CONNECT2.

**TSO SPOC input:**

```
UPD IMSCON TYPE(RMTCICS) NAME(CICS4) START(COMM)
```

**TSO SPOC output:**

```
RmtCICS MbrName CC
CICS4 HWS1 0
```

**OM API input:**

```
CMD ( UPD IMSCON TYPE(RMTCICS) NAME(CICS4) START(COMM) )
```

**OM API output:**

```
<imsout>

</ctl>
<cmd>
<master>HWS1 </master>
<userid>USRT001 </userid>
<verb>UPD </verb>
<kwd>IMSCON </kwd>
<input>UPD IMSCON TYPE(RMTCICS) NAME(CICS4) START(COMM) </input>
</cmd>
```

1122 Commands, Volume 2: IMS Commands N - V
UPDATE IMSCON TYPE(RMTIMSCON) command

Use the UPDATE IMSCON TYPE(RMTIMSCON) command to enable communications for the remote IMS Connect connection after it has been stopped, or to stop the communications of the remote IMS Connect connection.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 1124
- “Equivalent WTO and z/OS commands” on page 1125
- “Output fields” on page 1126
- “Return, reason, and completion codes” on page 1126
- “Examples” on page 1129

Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:
- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(RMTIMSCON) NAME(rmtimscon_name),
START(COMM), STOP(COMM)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(RMTIMSCON) command.
NAME
Specifies one or more remote IMS Connect connection names to be updated. You can specify a single remote IMS Connect connection name or a list of remote IMS Connect connection names separated by commas. Wildcards can be used in the names.

START(COMM) | STOP(COMM)
Mutually exclusive keywords that you use to start or stop communications for the remote IMS Connect connection.

START(COMM)
Starts communications for the remote IMS Connect connection. After issuing this command, OTMA communications with the remote IMS Connect are enabled. To enable communications for MSC, you might need to additionally issue the UPDATE IMSCON TYPE(MSC) START(COMM) command in order to complete the MSC physical link to the remote IMS Connect if MSC communications were disabled with the UPDATE IMSCON TYPE(MSC) STOP(COMM) command.

STOP(COMM)
Stops communications for the remote IMS Connect connection.

When the UPDATE IMSCON TYPE(RMTIMSCON) STOP(COMM) command is issued, IMS Connect:

- Stops all communication with a remote IMS Connect instance on the connection specified in the command.
- Informs IMS that the connection to the remote IMS Connect instance has been stopped so that IMS can shut down any affected MSC logical links.
- Terminates existing socket connections and prevents new socket connections until the UPDATE RMTIMSCON START(COMM) or an equivalent command is issued.
- Changes the status of the connection to STOPPED.
- Issues message HWST3505I.

After the UPDATE IMSCON TYPE(RMTIMSCON) STOP(COMM) command is issued, if IMS Connect receives a message for the connection in the STOPPED state, IMS Connect returns a NAK response to OTMA and issues message HWST3575W. OTMA retains the message at the front of the queue.

Usage notes
You can issue the UPDATE IMSCON TYPE(RMTIMSCON) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

When the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command is issued, IMS Connect resumes communications on the specified connection to a remote IMS Connect instance. IMS Connect changes the status of the connection to NOT ACTIVE until new sockets are opened for communications with the remote instance of IMS Connect.

The UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command is required only when communications on a connection with a remote IMS Connect
instance have been previously stopped by either a STORMT command or an UPDATE RMTIMSCON STOP(COMM) command.

If the specified RMTIMSCON connection is defined with AUTOCONN=Y, when the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) is issued, IMS Connect automatically creates socket connections to the remote IMS Connect. The number of socket connections IMS Connect opens is determined by the RESVSOCK parameter.

OTMA communications can resume as soon as IMS Connect executes the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command.

For MSC communications, the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command resumes only TCP/IP communications in IMS Connect, and does not change the stopped status of MSC links. If the MSC links have been stopped by an UPDATE IMSCON TYPE(MSC) STOP(COMM) command, a WTOR command STOPMSC, or an IMS Connect z/OS command UPDATE MSC STOP(COMM), after you issue the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command, you also need to restart the MSC links in IMS Connect by issuing the UPDATE IMSCON TYPE(MSC) START(COMM) command, the STARTMSC command, or the UPDATE MSC START(COMM) command.

**Recommendation:** When restarting MSC communications, to prevent IMS from sending MSC messages to IMS Connect before TCP/IP communications have been restarted, always issue the UPDATE IMSCON TYPE(RMTIMSCON) START(COMM) command before issuing the UPDATE IMSCON TYPE(MSC) START(COMM) or an equivalent command.

Use the QUERY IMSCON TYPE(RMTIMSCON) command, the VIEWRMT command, or the QUERY RMTIMSCON command to display information about the current connections to a remote IMS Connect instance that are defined to the local IMS Connect instance.

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(RMTIMSCON) command.

**Notes:**

- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) appears for output fields that are always returned. error appears for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Explanation: The remote IMS Connect connection for CONNECT2 has been started.

Related reference:

- STARTRMT command (Commands)
- STOPRMT command (Commands)
- IMS Connect UPDATE RMTIMSCON command (Commands)

**UPDATE IMSCON TYPE(SENDCLNT) command**

Use the UPDATE IMSCON TYPE(SENDCLNT) command to terminate the send socket clients on a specified connection to either a remote IMS Connect instance or a remote CICS subsystem.

Subsections:
- “Environment” on page 1131
- “Syntax” on page 1131
- “Keywords” on page 1131
- “Usage notes” on page 1131
- “Equivalent WTOR and z/OS commands” on page 1132
Environment

The UPDATE IMSCON command is applicable only to IMS Connect. To issue this command, the following conditions must be satisfied:

- IMS Connect must be active and configured to communicate with the Common Service Layer (CSL) Structured Call Interface (SCI).
- A type-2 command environment with Structured Call Interface (SCI) and Operations Manager (OM) must be active.

Syntax

```
UPDATE IMSCON TYPE(SENDCLNT) NAME(sendclient_name)
RMTCICS(rmtcics_name) RMTIMSCON(rmtimscon_name) STOP(COMM)
```

Keywords

The following keywords are valid for the UPDATE IMSCON TYPE(SENDCLNT) command.

**NAME**

Specifies the client ID of the send socket to terminate. You can specify a single send client name or a wildcard name.

**RMTCICS**

Specifies the remote CICS connection that the send client is on. Either the RMTCICS keyword or the RMTIMSCON keyword must be specified.

**RMTIMSCON**

Specifies the remote IMS Connect connection that the send client is on. Either the RMTCICS keyword or the RMTIMSCON keyword must be specified.

**STOP(COMM)**

Terminates the send socket clients for a specified remote IMS Connect connection.

Usage notes

You can issue the UPDATE IMSCON TYPE(SENDCLNT) command only through the Operations Manager (OM) API.

IMS Connect can process IMS Connect type-2 commands only if the IMSplex from which the commands were issued has a status of ACTIVE.

Modifications that are made to IMS Connect resources by use of this command are not saved across restarts of IMS Connect.

Use the UPDATE IMSCON TYPE(SENDCLNT) command to terminate send sockets on a connection to either another IMS Connect instance or a remote CICS subsystem.
To identify the IDs of the send sockets that you need to terminate, use the QUERY IMSCON TYPE(SENDCLNT) type-2 command.

If the connection is to another IMS Connect instance, you can optionally use the following IMS Connect commands to identify send client sockets:

- In the WTOR command format, VIEWRMT
- In the z/OS MODIFY command format, QUERY RMTIMSCON

If the socket connections are used for MSC links, do not use the UPDATE IMSCON TYPE(SENDCLNT) command to terminate the sockets. Issuing the UPDATE IMSCON TYPE(SENDCLNT) command breaks MSC links. Instead, stop MSC links by issuing the IMS command /PSTOP LINK from IMS, which automatically terminates the associated send and receive sockets in IMS Connect.

An alternative method of terminating send sockets that are used for MSC messages is by using the IMS Connect WTOR command STOPLINK or the IMS Connect z/OS modify command DELETE LINK. These commands terminate the send sockets and receive sockets that are used by the MSC link. The IMS type-2 command equivalent is UPDATE IMSCON TYPE(LINK).

If a socket connection is used for OTMA messages and the send socket connection is in RECV state when the UPDATE IMSCON TYPE(SENDCLNT) command is issued, IMS Connect issues a NAK to OTMA and then terminates the send socket connection. OTMA reroutes the message to the dead letter queue, HWS$DLQ.

Do not use the UPDATE IMSCON TYPE(SENDCLNT) command to terminate socket connections that are used for ISC links. The UPDATE IMSCON TYPE(SENDCLNT) command breaks ISC links. Instead, stop ISC links by issuing the IMS command /QUIESCE NODE USER from IMS, which automatically terminates the associated send and receive sockets in IMS Connect.

**Equivalent WTOR and z/OS commands**

The following table lists IMS Connect WTOR (Write to Operator with Reply) and IMS Connect z/OS commands that perform similar functions as the UPDATE IMSCON TYPE(SENDCLNT) command.

**Notes:**
- IMS Connect WTOR commands are replies to the outstanding IMS Connect reply message.
- IMS Connect z/OS commands are issued through the z/OS (MVS) interface by using the IMS Connect jobname.

Output fields

Short label
Contains the short label that is generated in the XML output.

Long label
Contains the column heading that is displayed on the TSO SPOC screen.

Keyword
Identifies the keyword on the command that caused the field to be generated. N/A (not applicable) is displayed for output fields that are always returned. error is displayed for output fields that are returned only in the case of an error.

Meaning
Provides a brief description of the output field.

Table 467. Output fields for the UPDATE IMSCON TYPE(SENDCLNT) command

<table>
<thead>
<tr>

Examples

Example of UPDATE IMSCON TYPE(SENDCLNT) RMTIMSCON(rmtimscon) command

In the following example, a send client socket, OTM12345, is stopped. The stopped send socket is on the remote IMS Connect connection, CONNECT2.

TSO SPOC input:
UPDATE IMSCON TYPE(SENDCLNT) NAME(OTM12345) RMTIMSCON(CONNECT2) STOP(COMM)

TSO SPOC output:

SendClient  RmtImsCon  MbrName  CC
OTM12345     CONNECT2   HWS1    0

OM API input:

CMD(UPDATE IMSCON TYPE(SENDCLNT) NAME(OTM12345) RMTIMSCON(CONNECT2) STOP(COMM))

OM API output:

UPDATE LE command

Use the UPDATE LE command to define Language Environment (LE) runtime parameter overrides or to change the system option to enable or disable LE override processing.

The parameters can be filtered by a transaction code, LTERM name, user ID, or program name for MPP and JMP regions. The parameters may be filtered by a program name for IFB, BMP, and JBP regions. Message driven BMP regions can also filter on a transaction code. Any combination of parameters may be used to qualify the application instance to which the runtime parameters are applied. The first available entry in the table is used. The new entry may be added before or after existing entries, depending on where free space exists in the table.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 1138
- “Usage notes” on page 1139
- “Output fields” on page 1139
- “Return, reason, and completion codes” on page 1139
- “Examples” on page 1140

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE LE command and keywords can be issued.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE LE</td>
<td>X</td>

<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>USERID</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```
UPDATE LE
```
Keywords

The following keywords are valid for the UPDATE LE command:

**LTERM()**

Specifies the 1-8 character name of the lterm to which the parameters are to be defined.

**PGM()**

Specifies the 1-8 character name of the program to which the parameters are to be defined.

**SET()**

Specifies the updates to attributes or parameters.

**LEOPT()**

Specifies whether LE runtime parameters can be overridden dynamically for all active IMS systems in the IMSplex. YES indicates that the IMS systems enable overrides which enables the DL/I INQY call to retrieve runtime parameters. NO indicates that the IMS systems do not enable dynamic overrides to the parameters.

This option allows the user to override the LEOPT=Y|N option that is specified in the DFSCGxxx PROCLIB member without having to bring down the IMS system.

When runtime overrides are disabled (IMS is started with LEOPT=N or the UPD LE SET(LEOPT(NO)) command is issued) the runtime parameter table continues to be updated as UPD LE SET(LERUNOPTS()) or DEL LE commands are issued. If the UPD LE SET(LEOPT(YES)) command is then specified, all changes that were made during the time overrides were disabled are available.

This command is automatically routed to all IMS systems that are active in the IMSplex. The user can not override the OM routing to route to a single IMS.

**LERUNOPTS()**

Specifies the LE dynamic runtime parameters. If an existing set of parameters is found for the specified TRAN, LTERM, USERID, or PGM, the new parameter string completely replaces the existing parameter string. The parameters are not appended to the existing string. The string is only replaced when the specified filters are an exact match for the existing entry.

If there is no existing entry, then the first unused entry that is large enough to contain the parameters is used for the update. An unused entry is one that was previously deleted by the DEL LE command. If there are no unused entries or none that are large enough, storage is allocated for a new entry and the entry is added to the top of the table.
The UPDATE LE SET(LERUNOPTS()) command is processed regardless of the LEOPT system option. This means that IMS continues to build the runtime parameter table entries even though they will not be retrieved through the DL/I INQY call.

This command is automatically routed to all IMS systems that are active in the IMSplex. The user cannot override the parameters on a single IMS.

**TRAN()**
Specifies the 1-8 character name of the transaction to which the parameters are to be defined.

**USERID()**
Specifies the 1-8 character name of the user ID to which the parameters are to be defined.

**Usage notes**
This command may be specified only through the Operations Manager API. The command syntax for this command is defined in XML and is available to automation programs that communicate with OM.

OM overrides the routing on the command and routes the command to all IMS systems in the IMSplex. The user specified route list is ignored.

At least one of the resource filters (TRAN, LTERM, USERID, or PGM) must be specified.

**Output fields**

The following table shows the UPDATE LE output fields. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Keyword**
Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. ERR appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code for the line of output. Completion code is always returned.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>IMSplex member (IMS identifier) that built the output line. Member name is always returned.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

The OM return and reason codes that may be returned as a result of this command are standard for all commands entered through the OM API. An IMS return and reason code is returned to OM by the UPDATE LE command.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>

<td>X'00005000'</td>
<td>Unable to get storage from IMODULE GETSTOR.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005010'</td>
<td>Unable to obtain latch.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005FFF'</td>
<td>Internal IMS error - should not occur.</td>
</tr>
</tbody>
</table>

The following table contains the completion code that can be returned on a UPDATE LE command.

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The UPDATE LE command completed successfully for the specified resource.</td>
</tr>
</tbody>
</table>

**Examples**

The following are examples of the UPDATE LE command.

**Example 1 for UPDATE LE command**

Assume the following filters and parameters are specified on UPD LE SET(LERUNOPTS()) commands that are processed in the order listed.

1. TRAN(PART) LTERM(TERM2) SET(LERUNOPTS(hhhh))
2. TRAN(PART) LTERM(TERM2) SET(LERUNOPTS(iiii))
3. LTERM(TERM2) USERID(BETTY) SET(LERUNOPTS(gggg))
4. TRAN(PART) LTERM(TERM1) USERID(BOB) SET(LERUNOPTS(ffff))
5. TRAN(PART) LTERM(TERM1) USERID(BARBARA) SET(LERUNOPTS(eeee))
6. PGM(DFSSAM02) SET(LERUNOPTS(dddd))
7. TRAN(PART) LTERM(TERM1) SET(LERUNOPTS(cccc))
8. TRAN(PART) USERID(BETTY) SET(LERUNOPTS(bbbb))
9. TRAN(PART) PGM(DFSSAM02) SET(LERUNOPTS(aaaa))
Rules for matching an entry which results in an update of an existing entry:

- The number of filters defined on the UPDATE LE must match the number of filters defined in the entry.
- The filter values defined on the UPDATE LE must be an exact match for those defined in the entry.

The following table is a logical representation of the parameter override table entries at the end of the command processing. The table includes the transaction name, LTERM, USERID, Program, and LERUNOPTS for each entry.

*Table 473. Parameter override table entries for UPDATE LE example 1*

</cmdrspdata>
</imsout>

Explanation: The UPDATE LE command adds an entry to the LE runtime options table. The entry added by this command defines two filters: user ID and transaction. The transaction is set to IAPMDI26 and the user ID is set to USRT001. The runtime options string for this table entry is RPTOPTS=((ON),NOOVR),RPTSTG=((OFF),NOOVR). The output shows that IMS member SYS3 processed the command with a return code of 0.

</tr>
</tbody>
</table>

Syntax

Type-1 command syntax

```
/UPDATE MSLINK NAME(linkname) SET BANDWIDTH(ON) OFF BUFSIZE(new_bufsize)
```

Type-2 command syntax

```
UPDATE MSLINK NAME(linkname) NAME(*)
```

A:

```
SET ASR(ON) OFF
BANDWIDTH(ON) OFF
BUFSIZE(new_bufsize)
MODETBL(modetablename)
MSLINK(new_linkname)
MSPINK(msplinkname)
PARTNER(partner_id)
SYNCOPT(FORCSESS SYNCSESS COLDSESS)
```  

B:

```
START COMM TRACE TKOTRC STATISTICS
```
Keywords

The following keywords are valid for the UPDATE MSLINK command:

NAME()
   Specifies the 1- to 8-character name of the MSC logical links to be processed. You can specify wildcard parameters (*) for the NAME keyword. The logical link names are processed if they match the wildcard name. NAME(*) and NAME(abc*) are examples of valid names.

SET()
   Specifies the updates to attributes or parameters. You cannot specify both the SET() parameter and the STOP(COMM) parameter.

ASR()
   The Automatic Session Restart (ASR) designation of a VTAM link changes when the Session Outage Notification facility of VTAM is used. The ASR parameter allows you to override the system definition option that is defined for the automatic session restart designation of a link.

   You cannot change the designation of ASR for non-VTAM MSC links.

   Stop the logical link before you change the ASR designation.

ON
   Specifies that the logical link uses automatic session restart. Automatic session restart is not necessarily activated for a link if a status of ASR is displayed for that link. You must also specify SONSCIP=YES on the APPL definition statement for VTAM when defining the network to VTAM. ASR works only if both sides of the link are using the ASR option.

OFF
   Specifies that the logical link does not use automatic session restart.

BANDWIDTH()
   Specifies whether the logical link uses bandwidth mode.

   The BANDWIDTH keyword does not apply to logical links assigned to a TCP/IP-type physical link. TCP/IP physical links always operate in bandwidth mode. If SET(BANDWIDTH(OFF)) is specified for a TCP/IP physical link, the command is rejected.
There is no system definition option to enable bandwidth mode. By default, logical links are initialized with bandwidth mode off.

To change the bandwidth mode, first stop the logical link. The link must not display a status ERE.

**ON** Specifies that the logical link uses bandwidth mode.

**OFF**

Specifies that the logical link does not use bandwidth mode.

**BUFSIZE()**

Changes the input and output buffer sizes for the logical link. The minimum buffer size is 1024, and the maximum buffer size is 65536.

The logical link must be stopped before changing the BUFSIZE value.

Buffer sizes for logical links follow the same specification requirements as buffer sizes specified on the MSPLINK definition by using the BUFSIZE= keyword.

**MODETBL()**

The default mode table name of a link changes if you specify the MODETBL() parameter without the START(COMM) parameter. This default is usually established by system definition. To reset this field to its null state (as if a mode table name was not specified at system definition), specify MODETBL().

If you specify both the START(COMM) parameter with the MODETBL() parameter, then the specified mode table name is used only for the START(COMM) session. When the session is terminated, the link mode table name reverts to the default mode table name.

The mode table name determines the mode table entries to be used when activating a VTAM MSC session. You cannot use the MODETBL keyword with non-VTAM sessions.

The logical link must be stopped before changing the MODETBL value.

**MSLINK()**

Specifies the 1- to 8-alphanumeric new link name for the specified logical link. If you specify the MSLINK parameter, you can specify only one NAME parameter. The new link name cannot already exist as a logical link name. If the command is successful, the link name specified on the NAME keyword is no longer valid.

The logical link must be stopped before changing the MSLINK name.

**MSPLINK()**

Enter the 1- to 8-character name of the MSC physical link to which you want to assign this logical link. You assign the logical link to the physical link for input and output purposes. The physical link name specified must already exist.

The logical link must be stopped before changing the MSPLINK. If the logical link is being assigned to either a TCP/IP physical link or a VTAM physical link, then the physical link must also be stopped. TCP/IP and VTAM physical links can be stopped by issuing the UPD MSPLINK NAME(plinkname) STOP(LOGON). If the TCP/IP physical link is used for TCP/IP generic resources, the physical link can be stopped with the UPD MSPLINK NAME(plinkname) STOP(GENLOGON) command.
If the logical link is being assigned to a TCP/IP physical link, bandwidth mode is turned on for the logical link. Bandwidth mode is always on for TCP/IP physical links and cannot be turned off.

If the logical link is being assigned to a CTC or MTM link, then the logical link that is currently assigned to the target physical link must also be stopped.

**PARTNER()**

Specifies the 2-character alphabetic partner identification. This partner identification ensures that the two related logical links in two systems are always logically and physically connected. Both systems must have logical links with the same partner ID. The new partner ID specified must not already exist.

Only one logical link can be specified in the NAME keyword to change the PARTNER keyword.

The logical link must be stopped before changing the PARTNER keyword.

**SYNCOPT()**

Specifies the system definition option to be overridden for the named logical link. This keyword allows the user to override the system definition option defined for forcing resynchronization until the next UPDATE MSLINK command is issued or IMS is cold started.

SYNCOPT() is valid only for TCP/IP and VTAM links.

The logical link must be stopped before changing SYNCOPT.

**FORCSESS**

Specifies that the session initiation is to be completed regardless of the agreement between session restart modes and the message sequence numbers. Use of the FORCSESS parameter could cause messages to be lost or duplicated.

**SYNCSESS**

Specifies that the session initiation is to be completed only when the session restart modes and message sequence numbers agree.

**COLDSESS**

Resets the session restart mode to COLD by resetting all the MSLINK dynamic flags and fields to zero, which allows cold session initiation of the link. Use the COLDSESS parameter when attempts to warm start the session fail.

Use of the COLDSESS parameter could cause messages to be lost or duplicated.

Before issuing the command with the COLDSESS option, stop the link first. When COLDSESS is specified, it should be used on both sides of the link.

The COLDSESS parameter does not override the current setting of SYNCSESS or FORCSESS.

**START()**

Starts the specified MSC logical links, or starts tracing of the specified logical links.

**COMM**

Starts the specified MSC logical links and allows IMS to start sending and receiving messages.
Communication between IMS systems does not begin until an UPDATE MSLINK command is entered in both systems for CTC or MTM links, or in one of the systems for either a TCP/IP or a VTAM link.

The COMM parameter cannot be specified in both START() and STOP(). The logical link must be stopped and idle, and the assigned physical link must be open, as shown in the QUERY command output.

TRACE
Turns on the tracing of internal IMS events that are related to the specified logical links. Unlike the equivalent type-1 /TRACE command, the trace level cannot be specified on the UPDATE command. Instead, IMS uses the default level of 4. The status and options of the current IMS traces can be displayed with the QUERY MSLINK command. TRACE cannot be specified in both START() and STOP().

Note: The type-2 command UPDATE MSLINK NAME(linkname)
START(TRACE) uses the same level and module settings that were used the last time the /TRACE SET (ON) LINK command was issued. If a /TRACE SET (ON) LINK command has not been issued since the last cold start, this command defaults to MODULE=ALL and LEVEL=4.

TKOTRC
Enables tracing during takeover. This tracing is separate from regular tracing. This keyword applies only in an XRF environment. TRACE and TKOTRC cannot both be specified under START(). TKOTRC cannot be specified in both START() and STOP().

STATISTICS
Provides statistics support to MSC logical links. These statistics can be used to determine the link performance, adjust the link and message queue buffer sizes to optimum sizes, and increase the link performance. Each logical link (MSLINK) has a work area where statistics are kept.

STOP()
Stops the specified MSC logical links or stops tracing of the specified logical links.

COMM
Stops the specified MSC logical links, and allows IMS to stop sending and receiving messages. The partner link in another IMS system stops itself. COMM cannot be specified in both START() and STOP(). You cannot specify both STOP(COMM) and SET() together.

TRACE
Turns off the tracing of internal IMS events that are related to the specified logical links. The status and options of the current IMS traces can be displayed with the QUERY MSLINK command. TRACE cannot be specified in both START() and STOP().

TKOTRC()
Disables tracing during takeover. This tracing is separate from regular tracing. This keyword applies only in an XRF environment. TKOTRC cannot be specified in both START() and STOP().

OPTION()
Specifies options for the UPDATE MSLINK command. OPTION is valid only with START(STATISTICS) or STOP(COMM).

FORCE
Can be specified only with STOP(COMM) for CTC, TCP/IP, and VTAM.
links. Use the FORCE parameter when an MSC link does not clean up and assume a PSTOP IDLE status in IMS after normal UPDATE STOP(COMM) processing, even though the session has been terminated.

After using the FORCE parameter, issue the UPDATE MSLINK command with the NAME(linkname | *) START(COMM) options to restart the link.

For TCP/IP links, the FORCE option is useful for shutting down an MSC TCP/IP link that did not shut down normally after the link was shut down in the partner IMS system. You are not required to shut down a link normally before using the FORCE option.

FORCE also notifies the local IMS Connect instance to clean up sessions for TCP/IP links and VTAM to clean up sessions for VTAM links.

IMS performs the following actions when processing the FORCE option for a TCP/IP link:
- Shuts down the link in the IMS where the command is issued
- Notifies the local IMS Connect instance to clean up the send socket
- Issues an error message
- Places the link in ERE IDLE status

For VTAM links, you can use the FORCE parameter with some network commands to clean up the VTAM link within IMS.

RESET | NORESET
Issuing the UPDATE MSLINK() START(STATISTICS) OPTION(RESET) command will reset the link statistics and set the start time to the current time. The logical link does not need to be stopped and idle to reset the statistics values, or the reset mode, as is the case for changing many of the link characteristics, such as buffer size and bandwidth mode.

OPTION(RESET), OPTION(CHKPT,RESET), and OPTION(CHKPT, NORESET) can be specified with START(STATISTICS).

RESET
When specified without CHKPT, this indicates that statistics for the specified logical link should be reset immediately. When specified with CHKPT, this indicates that statistics for the specified logical link should be reset at every system checkpoint. This only applies to statistics reported on the QUERY MSLINK command. Statistics reported in the log records during system checkpoints are cumulative over the life of IMS, and are not reset by the UPDATE MSLINK command.

NORESET
When specified with CHKPT, this indicates that statistics for the specified logical link should not be reset at any system checkpoint. This only applies to statistics reported on the QUERY MSLINK command. Statistics reported in the log records during system checkpoints are cumulative over the life of IMS, and are not reset by the UPDATE MSLINK command.

CHKPT
When specified with RESET, this indicates that statistics for the specified logical link should be reset at every system checkpoint. When specified with NORESET, this indicates that statistics for the specified logical link should not be reset at any system checkpoint. This only applies to statistics reported on the QUERY MSLINK command. Statistics reported in the log records during system checkpoints are cumulative over the life of IMS, and are not reset by the UPDATE MSLINK command.
OPTION(CHECKPOINT(RESET)) and OPTION(CHECKPOINT, NORESET) can be specified with START(STATISTICS).

**Usage notes**

You can issue the type-2 UPDATE MSLINK command only through the Operations Manager (OM) API. This command applies to DB/DC and DCCTL systems.

The syntax for the UPDATE MSLINK command is defined in XML and the syntax is available to automation programs that communicate with OM.

The CREATE MSLINK NAME(mslinkname) command specified with

set(MSPLINK(mslinkname)) is rejected if at least one logical link attribute specified in the command (ASR, BACKUP, MODETBL, or SYNOPT) conflicts with the physical link type. However, after the logical link is created, it can be reassigned to any type of physical link with an UPDATE MSLINK command or an /MSASSIGN command. If a logical link defined with attributes applicable to specific physical link types is reassigned to a different physical link type that does not support those attributes, they are ignored when the link is started.

**The UPDATE MSLINK command compared to other commands**

The following table shows variations of the UPDATE MSLINK command and the type-1 IMS commands that perform similar functions.

<table>
<thead>

Output fields

Short label
Contains the short label that is generated in the XML output.

Keyword
Identifies the keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Table 476. Output field descriptions for the UPDATE MSLINK command

<table>

<td>Logical link name.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE MSLINK command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 477. Return and reason codes for the UPDATE MSLINK command

Examples

The following are examples of the UPDATE MSLINK command:

Example 1 for UPDATE MSLINK command

TSO SPOC input:

```
UPD MSLINK NAME(STAR1L, STAR2L, STAR3L) SET(SYNCOPT(FORCCESS),
ASR(OFF),MODETBL(),MSPLINK(STAR1)) START(COMM,TRACE)
```

TSO SPOC output:

```
<table>
<thead>
<tr>
<th>MbrName</th>
<th>LinkNum</th>
<th>CC</th>
<th>CCText</th>
</tr>
</thead>
<tbody>
<tr>
<td>STAR1L</td>
<td>IMSA</td>
<td>12</td>
<td>0</td>
</tr>
<tr>
<td>STAR2L</td>
<td>IMSA</td>
<td></td>
<td>10 NOT FOUND</td>
</tr>
<tr>
<td>STAR3L</td>
<td>IMSA</td>
<td>5</td>
<td>0</td>
</tr>
<tr>
<td>STAR3L1</td>
<td>IMSA</td>
<td>6</td>
<td>0</td>
</tr>
<tr>
<td>STAR3L2</td>
<td>IMSA</td>
<td>7</td>
<td>0</td>
</tr>
</tbody>
</table>
```

Explanation: This UPDATE MSLINK command is issued to do the following:
1. Override the system definition option for the named logical links: STAR1L and logical links matching STAR3L* (STAR3L, STAR3L1, and STAR3L2). STAR2L is unknown.

2. Change the automatic session restart designation to OFF for the specified logical links.

3. Reset the mode table name of the specified logical links to NONE.

4. Assign the specified logical links to the physical link: STAR1.

5. Allow IMS to start sending and receiving messages on the specified links.

6. Enable tracing of control block trace information.

**Example 2 for UPDATE MSLINK command**

**TSO SPOC input:**

```
UPDATE MSLINK NAME(LNK12V02) SET(BANDWIDTH(ON), BUFSIZE(4096))
```

**TSO SPOC output:**

```
MSLink MSLink# MbrName CC
LNK12V02 10 IMS1 0
```

**Explanation:** This command changes the buffer size to 4096 and turns on the bandwidth.

Syntax

Syntax diagram for the UPDATE MSNAME command.

Keywords

The following keywords are valid for the UPDATE MSNAME command:

NAME()

Specifies the 1- to 8-character name of the MSC logical link path to be
processed. You can specify wildcards (*) for the NAME keyword. NAME(*) and NAME(abc*) are examples of valid names.

SET()
Specifies the updates to attributes or parameters. You can only change attributes for statically-defined MSNAMEs. Dynamic MSNAMEs cannot be changed.

MSLINK()
Assigns the specified logical link path to the logical link for input and output purposes. Enter the 1- to 8-character name of the MSC logical link to which you want to assign this logical link path. The logical link name specified must already exist.

Both the source logical link (where the MSNAME is currently assigned) and the target logical link (where the MSNAME is being assigned to) must be stopped.

SIDL()
Specifies the system identification of a local system in a multiple system configuration. The specified value must be a number from 1 to 2036. The new specified value must be currently undefined or already defined as a local SID on this system. The SID cannot already be defined as remote.

You can change the SIDL value for only one logical link path on a command. Therefore, if you specify the SIDL parameter, you can specify only one NAME parameter.

The logical link and logical link path must be stopped to change the SIDL.

To change the SIDR or SIDL value of a logical link path:
1. Verify the existing SID values of the logical link path of either /DIS ASMT MSNAME or QUERY MSNAME SHOW(SYSID).
   For SIDL verification only, the operator must verify that the current SIDL value is not the lowest SIDL value in the system. If it is the lowest SIDL value in the system, and there are no other logical link paths in the system with the same SIDL, then the SIDL cannot be changed because the lowest SIDL in the system cannot change.
2. Verify there are no transactions with the existing SID values of either /DIS SYSID TRAN or QUERY TRAN SHOW(MSNAME).
3. If any transactions were found in step 2, assign the transactions to a new valid system of either /MSASSIGN TRAN TO MSNAME, UPDATE TRAN SET(MSNAME()) or UPDATE TRAN SET(SIDR(),SIDL()).
4. Change the SID values of the logical link path using UPDATE MSNAME SET(SIDR(),SIDL()). However, this is not allowed if the new SIDL value is lower than the current lowest SIDL in the system. The lowest SIDL in the system cannot change, and must remain the lowest SIDL in the system.

SIDR()
Specifies the system identification of a remote system in a multiple system configuration. The value specified must be a number from 1 to 2036. The new value specified must be currently undefined on this system (it cannot be already defined as remote or local).

You can change the SIDR value for only one logical link path on a command. Therefore, if you specify the SIDR parameter, you can specify only one NAME parameter.
The logical link and logical link path must be stopped to change the SIDR.

To change the SIDR or SIDL value of a logical link path:

1. Verify the existing SID values of the logical link path of either /DIS ASMT MSNAME or QUERY MSNAME SHOW(SYSID).
2. Verify there are no transactions with the existing SID values of either /DIS SYSID TRAN or QUERY TRAN SHOW(MSNAME).
3. If any transactions were found in step 2, assign the transactions to a new valid system of either /MSASSIGN TRAN TO MSNAME, UPDATE TRAN SET(MSNAME()) or UPDATE TRAN SET(SIDR(),SIDL()).
4. Change the SID values of the logical link path using UPDATE MSNAME SET(SIDR(),SIDL()).

START()

Specifies the attributes to start. You cannot specify the START and STOP parameters with the same attributes.

Q Starts the queuing to the logical link path and starts input for the specified logical link path.

SEND

Starts the sending of messages to the specified logical link path.

STOP()

Specifies the attributes to stop. You cannot specify the START and STOP parameters with the same attributes.

Q Stops the queuing to the logical link path and stops input for the specified logical link path.

SEND

Stops the sending of messages to the specified logical link path.

Usage notes

You can issue this command only through the Operations Manager (OM) API. This command applies to DB/DC and DCCTL systems.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Equivalent IMS type-1 commands

The following table shows variations of the UPDATE MSNAME command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE MSNAME command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE MSNAME NAME(msname) SET(MSLINK(linkname))</td>
<td>/MSASSIGN MSNAME msname TO LINK link #</td>
</tr>
<tr>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE MSNAME command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 482. Return and reason codes for the UPDATE MSNAME command

<td>Command was successful for some resources but failed for others. The command output contains a line for each resource, accompanied by its completion code. See the following table for details on completion codes.</td>
</tr>
<tr>
<td>X'0000000C'</td>
<td>X'00003004'</td>
<td>Command was not successful for any of the resources. The command output contains a line for each resource, accompanied by its completion code. See the following table for details on completion codes.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004000'</td>
<td>Command is not valid during IMS restart.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'0000400C'</td>
<td>Command is not valid on the XRF alternate.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'00004014'</td>
<td>Command is not valid on the RSR tracker.</td>
</tr>
<tr>
<td>X'00000010'</td>
<td>X'0000402C'</td>
<td>Command is not valid on the non-MSC-capable system.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005004'</td>
<td>The UPDATE MSNAME command processing terminated because a DFSOCMD response buffer could not be obtained.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005008'</td>
<td>DFSPOOL storage could not be obtained.</td>
</tr>
<tr>
<td>X'00000014'</td>
<td>X'00005010'</td>
<td>A latch could not be obtained.</td>
</tr>
</tbody>
</table>

Errors that are unique to the processing of the UPDATE MSNAME command are returned as completion codes. A completion code is returned for each action against an individual resource.

### Table 483. Completion codes for the UPDATE MSNAME command

</table>
Table 483. Completion codes for the UPDATE MSNAME command (continued)

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>102</td>
<td>TARGET MSLINK NOT STOPPED</td>
<td>The update cannot complete because the link specified in MSLINK() is not stopped.</td>
</tr>
<tr>
<td>109</td>
<td>INVALID FOR DYNAMIC MSNAME</td>
<td>The update cannot complete because the logical link path specified in NAME() is dynamic. The update is not valid for dynamic logical link</td>
</tr>
<tr>
<td></td>
<td></td>
<td>paths that are built in a shared queues system, which represent logical link paths defined only on other IMS systems in the shared queues group.</td>
</tr>
<tr>
<td>10A</td>
<td>SOURCE MSLINK NOT STOPPED</td>
<td>The update cannot complete because the logical link to which the specified logical link path is assigned is not stopped.</td>
</tr>
<tr>
<td>10B</td>
<td>MSC RESOURCE IS IN USE</td>
<td>The update cannot complete because there is in-doubt message activity for a remote transaction or lterm related to the logical link path.</td>
</tr>
<tr>
<td>10D</td>
<td>INVALID SIDL, LESS THAN LOW SIDL</td>
<td>The value specified in SIDL() is invalid. The value cannot be lower than the current lowest local SID in this system.</td>
</tr>
<tr>
<td>10E</td>
<td>LAST MSNAME FOR LOW SIDL</td>
<td>The current local SIDL value cannot be changed for this logical link path because the current SIDL value is the lowest local SIDL value, and this is the only logical link path that has this local SIDL value.</td>
</tr>
<tr>
<td>10F</td>
<td>SIDL STILL LOCAL IN REMOTE TRAN</td>
<td>The current local SIDL value cannot be changed for this logical link path because there are remote transactions defined with this local SIDL value, and this the only logical link path that has this local SIDL value.</td>
</tr>
<tr>
<td>110</td>
<td>SIDR STILL LOCAL IN REMOTE TRAN</td>
<td>The current remote SIDR value cannot be changed for this logical link path because there are remote transactions defined with this remote SIDR value.</td>
</tr>
</tbody>
</table>

Examples

The following are examples of the UPDATE MSNAME command:

**Example 1 for UPDATE MSNAME command**

TSO SPOC input: UPD MSNAME NAME(STAR1N1,STAR2N1) STOP(Q,SEND)

TSO SPOC output:

<table>
<thead>
<tr>
<th>MSName</th>
<th>MbrName</th>
<th>CC</th>
<th>STAR1N1</th>
<th>IMSA</th>
<th>STAR2N1</th>
<th>IMSA</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>IMSA</td>
<td>0</td>
<td>IMSA</td>
<td>0</td>
</tr>
</tbody>
</table>

**Explanation:** This UPDATE MSNAME command is issued to stop queuing and the sending of messages to the named logical link paths. This allows the attributes to be changed by another UPD MSNAME command.
Example 2 for UPDATE MSNAME command

TSO SPOC input:
UPD MSNAME NAME(STAR1N1) SET(SIDR(10),SIDL(20))

TSO SPOC output:
MSName MbrName CC
STAR1N1 IMSA 0

Explanation: This UPDATE MSNAME command is issued to do the following:
• Identify the remote system that is represented by SIDR(10).
• Identify the local system as SIDL(20) for routing messages back to this system.

Example 3 for UPDATE MSNAME command

TSO SPOC input:
UPD MSNAME NAME(STAR1N1) SET(MSLINK(STAR3L))

TSO SPOC output:
MSName MbrName CC
STAR1N1 IMSA 0

Explanation: This UPDATE MSNAME command is issued to assign the specified logical link path STAR1N1 to STAR3L.

UPDATE MSPLINK command

Use the UPDATE MSPLINK command to set or change the MSC physical link attributes or to change the status of the specified physical links.

Subsections:
• "Environment” on page 1161
• “Syntax” on page 1161
• “Keywords” on page 1161
• “Usage notes” on page 1166
• “Equivalent IMS type-1 commands” on page 1166
• “Output fields” on page 1167
• “Return, reason, and completion codes” on page 1167
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDATE MSPLINK command and keywords can be issued.

**Table 484. Valid environments for the UPDATE MSPLINK command and keywords**

<table>
<thead>
<tr>
<th>Command / keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE MSPLINK</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>NAME</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>START</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>STOP</td>
<td>X</td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
UPDATE MSPLINK
  NAME(msplinkname)
  NAME(*)

START( )
  LOGON( )
  GENLOGON( )

STOP( )
  LOGON( )
  GENLOGON( )

SET( )
  ADDR(addr)
  ASR( ON | OFF )
  BACKUP( NO | size )
  BUFSIZE( size )
  ICONPLKID( TCPIP_IMS_Connect_LCLPLKID )
  IMSCON( TCPIP_local_IMS_Connect )
  MODETBL( modetable name )
  MSPLINK( new_msplinkname )
  NODE( VTAM_node_name )
  RMTIMS( TCPIP_remote_IMS_ID )
  SESSION(n)
```

**Keywords**

The following keywords are valid for the UPDATE MSPLINK command:
NAME()

Specifies the 1- to 8-character name of the MSC physical link that is processed. You can specify wildcards (*) in the name. NAME(*) and NAME(abc*) are examples of valid names.

SET()

Sets the attributes of the physical link. The required and optional parameters differ depending on the type of physical link that you are defining.

ASR(), NODEBL() and NODE() are VTAM link specific parameters.

ADDR()

Specifies the address of the channel-to-channel adapter. The address value can be 3 or 4 hexadecimal digits. This operand is valid only for CTC link types.

The ADDR value must be unique among all CTC physical links that are defined in the IMS system.

Stop the assigned logical link before you change the ADDR value.

All devices that are attached to the same channel as the CTC adapter must be accessible through an alternative channel. In addition, do not attach system resources, for example, paging devices, to the same channel as the CTC adapter.

ASR()

The Automatic Session Restart (ASR) designation for each logical link assigned to the specified VTAM physical link changes when the Session Outage Notification facility of VTAM is used. The ASR parameter allows you to override the system definition option that is defined for the automatic session restart designation of a link.

You cannot change the designation of ASR for non-VTAM MSC links.

Stop the physical link and each assigned logical link before you change the ASR designation.

ON Specifies that the logical link uses automatic session restart. Automatic session restart is not necessarily activated for a link if a status of ASR is displayed for that link. SONSCIP=YES must also be specified on the APPL definition statement for VTAM when defining the network to VTAM. ASR works only if both sides of the link use the ASR option.

OFF Specifies that the logical link does not use automatic session restart.

BACKUP()

For XRF-capable IMS systems, controls the automatic restart of TCP/IP and VTAM links after an XRF takeover. Before you change the BACKUP value, stop the physical link and each assigned logical link.

A numeric integer in the range 1 - 7 that sets the priority for reestablishing the session.

NO Specifying BACKUP=NO suppresses the automatic restart of the MSC physical link.

Although BACKUP prioritizes the order in which IMS restarts TCP/IP and VTAM links, the active requests might be completed in any order because of variables such as internal VTAM conflicts and pacing, and Internet Protocol network traffic.
BACKUP is an MSC physical link attribute that you can set by using the CREATE MSPLINK, CREATE MSLINK, or UPDATE MSPLINK command. You can display the physical link BACKUP value by using the QUERY MSPLINK and QUERY MSLINK commands.

**Important:** Even though BACKUP is a physical link attribute, the CREATE MSLINK NAME(linkname) SET(MSPLINK(msplinkname)) command can also change the BACKUP value of the specified physical link. You can use the QUERY MSPLINK command to display the updated BACKUP value. You can also use the QUERY MSLINK command and specify the MSC logical links, including the newly created logical link, that are assigned to the physical link to display the updated BACKUP value.

**BUFSIZE()**
Specifies the input and output buffer sizes for each logical link that is assigned to this physical link. The valid range of buffer sizes for all link types is 1024 - 65536 bytes. The same buffer size must be specified by the IMS systems at each end of a physical link.

For VTAM and TCP/IP links, stop the physical link and each assigned logical link before you change the BUFSIZE value.

The same buffer size must be specified by the IMS systems at each end of a physical link. If the buffer sizes are not equal, the logical link will fail to restart with message DFS3218.

IMS initializes the MSC link buffers to the size specified on the BUFSIZE parameter.

If you are using bandwidth mode, a BUFSIZE value of 1024 is too small to send multiple messages with one buffer. Specify a value of at least 4096.

You can change the size of a buffer of an individual logical link by using the type-2 command UPDATE MSLINK NAME (linkname) SET(BUFSIZE(new_bufsize)).

**ICONPLKID()**
For TCP/IP physical links, defines a 1- to 8-character alphanumeric ID by which IMS Connect knows the MSC physical link. This ID must match the ID defined to IMS Connect on the LCLPLKID parameter of the MSC configuration statement that defines the physical link to IMS Connect.

You can use the ICONPLKID keyword to modify the MSC physical link to reference a different IMS Connect MSC configuration statement.

This ID can also be specified on the LCLPLKID keyword of the MSPLINK macro.

**IMSCON()**
For TCP/IP physical links, specifies the IMSplex name of the local IMS Connect instance that manages the TCP/IP connections for this physical link. IMSCON accepts a 1- to 8- alphanumeric value.

You can use the IMSCON keyword to switch the IMS Connect instance that an MSC physical link uses.

**MODETBL()**
Changes the name of the default VTAM logon mode table entry (logon mode table) for this physical link. This changes the name for each logical link currently assigned to this physical link. This name is usually established by system definition. To reset this field to its null state (as if no mode table name was specified at system definition), specify MODETBL().

Chapter 30. UPDATE commands 1163
You cannot use the SET(MODETBL) parameter for a non-VTAM MSC link.

The physical link and each assigned logical link must be stopped before changing the MODETBL.

**MSPLINK()**

Specifies the 1- to 8-alphanumeric new physical link name for this physical link. This keyword also allows you to change the name of a reserved link to a real name and activate it. The name specified in MSPLINK() must be unique. If the command is successful, the old physical link name specified on the NAME keyword is no longer valid.

Only one NAME parameter can be specified to change the MSPLINK name.

The physical link must be stopped before changing the MSPLINK.

**NODE()**

Specifies a 1- to 8-alphanumeric name for the remote VTAM node (APPLID) name for the VTAM line. This node is the VTAM node name of the remote IMS system at the other end of the link. This node is the label on the VTAM APPL statement for the remote IMS system. For an MSC VTAM link communicating with an XRF complex, the node name must be the VTAM USERVARV that is associated with the partner XRF complex.

The physical link and each assigned logical link must be stopped before changing the NODE.

**RMTIMS()**

For TCP/IP physical links, defines the remote IMS system that this physical link connects to. Enter the 1- to 8-alphanumeric IMSID of the remote IMS system.

You can use the RMTIMS keyword to change the remote IMS system that an MSC physical link references.

**SESSION()**

For TCP/IP and VTAM physical link types only, specifies the number of parallel sessions that can be active for the physical link. Enter a value in the range 1 - 1018.

If you specify a larger number than you currently need, you can dynamically assign more logical links to the physical link later.

Because a logical parallel session uses the same amount of storage for control blocks and buffers as a physical link, allocating many parallel sessions can use an excessive amount of common storage area.

Predetermine how much common storage area you are likely to need.

If logical links are already assigned to the physical link and the value you specify for SESSION is less than the current number of assigned logical links, the number of logical links that can be started is limited to the new SESSION value specified. You will be unable to start the remaining logical links assigned to the physical link.

**START()**

Specifies the attributes to start.

**GENLOGON**

For IMS systems that participate in a TCP/IP generic resource group, enables the IMS systems that process this command to resume accepting logical link connection requests to the generic resource group on the specified physical link.
START(GENLOGON) is independent of LOGON, which is used for links that do not use the TCP/IP generic resource group. If STOP(LOGON) has been previously issued, you must issue START(LOGON), either separately or with the GENLOGON parameter, before the IMS system can resume starting and accepting logical links that do not use TCP/IP generic resources.

LOGON

For MSC TCP/IP and VTAM physical link types only. For TCP/IP-type links, START(LOGON) allows the starting of the logical links assigned to the physical link. For VTAM-type links, START(LOGON) enables logical links to logon to the physical link. START(LOGON) and STOP(LOGON) are mutually exclusive.

START(LOGON) is independent of GENLOGON, which is used for links that use a TCP/IP generic resource group. If STOP(GENLOGON) has been previously issued, you must issue START(GENLOGON), either separately or with the LOGON parameter, before the IMS system can resume starting and accepting logical links that use TCP/IP generic resources.

STOP()

Specifies the attributes to stop.

GENLOGON

For IMS systems that participate in a TCP/IP generic resource group, prevents the IMS systems that process this command from either starting or accepting the specified TCP/IP physical link.

The STOP(GENLOGON) keyword is applicable only to TCP/IP-type physical links that are defined in IMS systems that participate in a TCP/IP generic resource group.

The STOP(GENLOGON) does not affect links that are already in session.

Use STOP(GENLOGON) to control where the restart message from a remote link restart is accepted within the local IMSplex. Issue STOP(GENLOGON) against every IMS system in the TCP/IP generic resource group, except the IMS system with which you need to establish link affinity.

After an UPDATE MSPLINK NAME(plnkname) STOP(GENLOGON) command is issued, the QUERY MSPLINK command displays a local status of STOGENLGN.

STOP(GENLOGON) does not prevent the IMS system from accepting links that do not use the generic resource group. GENLOGON is independent of LOGON and both can be specified together on the STOP() keyword to prevent the IMS system from starting or accepting all links, regardless of whether they use TCP/IP generic resources.

LOGON

For MSC TCP/IP and VTAM physical link types only.

For TCP/IP links, STOP(LOGON) prevents the IMS systems that process this command from starting of the physical link or accepting start requests for the physical link from a link partner. The LOGON keyword does not affect TCP/IP physical links that are used for TCP/IP generic resources.

The LOGON keyword is independent of the GENLOGON keyword that is used for physical links that are used with TCP/IP generic resources. Both
keywords can be specified together on the STOP() keyword to prevent the IMS system from starting or accepting all links, regardless of whether they use TCP/IP generic resources.

For VTAM links, STOP(LOGON) prevents logons to the physical link. START(LOGON) and STOP(LOGON) are mutually exclusive.

After an UPDATE MSPLINK NAME(plnkname) STOP(LOGON) command is issued, the QUERY MSPLINK command displays a local status of STOLGN.

The STOP(LOGON) does not affect links that are already in session.

Usage notes

You can issue this command only through the Operations Manager (OM) API. This command applies to DB/DC and DCCTL systems.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Equivalent IMS type-1 commands

The following table shows variations of the UPDATE MSPLINK command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE MSPLINK command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(ASR(ON</td>
<td>OFF))</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(ICONPLKID(iconplkid))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(IMSCON(msconname))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(MODETBL(modetablename))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(MSPLINK(new_msplinkname))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(NODE(VTAM_node_name))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname) SET(RMTIMS(rmtims))</td>
<td>No similar type-1 IMS command exists.</td>
</tr>
<tr>
<td>UPDATE MSPLINK NAME(msplinkname</td>
<td>*) /RSTART MSPLINK msplinkname</td>

</tbody>
</table>
Output fields

Short label
Contains the short label that is generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

Table 486. Output field descriptions for the UPDATE MSPLINK command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

Examples

The following are examples of the UPDATE MSPLINK command:

Example 1 for UPDATE MSPLINK command

TSO SPOC input:
UPD MSPLINK NAME(STAR1) SET(MODETBL(LOGON12B), NODE(APPL12B), ASR(ON))

TSO SPOC output:
MSName MbrName CC
STAR1 IMSA 0

Explanation: This UPDATE MSPLINK command is issued to do the following:
1. Change the VTAM logon mode table entry to LOGON12B.
2. Change the VTAM node name of the remote system at the other end of the link to APPL12B.
3. Override the automatic session restart definitions established by system definition.

Example 2 for UPDATE MSPLINK command

TSO SPOC input:
UPD MSPLINK NAME(STAR1, STAR2, STAR2B*) START(LOGON)

TSO SPOC output:
MSName MbrName CC CCTEXT
STAR1 IMSA 0
STAR2 IMSA 10 NOT FOUND
STAR2B IMSA 0
STAR2B11 IMSA 0
STAR2B12 IMSA 0

Explanation: This command enables logon for the specified physical links: STAR1, STAR2B, STAR2B11, and STAR2B12. STAR2 is unknown.

Example 3 for UPDATE MSPLINK command

TSO SPOC input:
UPD MSPLINK NAME(PLNK12TA) STOP(LOGON,GENLOGON)

TSO SPOC output:
MSName MbrName CC CCTEXT
PLNK12TA IMS1 0

Explanation: This command prevents IMS1 from starting or accepting any and all logical links on the specified physical link PLNK12TA. The GENLOGON applies to links that use TCP/IP generic resources. The LOGON parameter applies to links that specify IMS1 explicitly.

Issuing the following QUERY MSPLINK NAME(PLNK12TA) SHOW(ALL)
command in IMS1 returns the following status:
MSPLink MbrName CC Type RntIms LclImsCon LclPlkID LclStat
PLNK12TA IMS1 0 TCP/IP IMS2 HWS1 MSC12 STOGENLGN

Chapter 30. UPDATE commands 1169
Example 4 for UPDATE MSPLINK command

TSO SPOC input:
UPD MSPLINK NAME(*) STOP(LOGON,GENLOGON)

TSO SPOC output:
MSPLink MbrName CC CCText
PLNK12C IMS1 10C INVALID START/STOP FOR LINK TYPE
PLNK12M IMS1 10C INVALID START/STOP FOR LINK TYPE
PLNK12TA IMS1 0
PLNK12V IMS1 0

Explanation:

In the example above each link is a different MSC physical link type:
- PLNK12C is a CTC link
- PLNK12M is an MTM link
- PLNK12TA is a TCPIP link
- PLNK12V is a VTAM link

The command is rejected for the CTC and MTM link types, because they do not support the LOGON and GENLOGON command options. After the command is processed, only the TCPIP and VTAM type links have the STOGENLGN and STOLGN status, as shown in the following example output of the QUERY MSPLINK NAME(*) SHOWSTATUS command:
MSPLink MbrName CC LclStat
PLNK12C IMS1 0
PLNK12M IMS1 0
PLNK12TA IMS1 0 STOGENLGN
PLNK12V IMS1 0 STOLGN

UPDATE ODBM commands

Use the UPDATE ODBM commands to change Open Database Manager (ODBM) settings.

Subsections:
- “UPDATE ODBM START(CONNECTION) command” on page 1171
- “UPDATE ODBM START(TRACE) command” on page 1174
- “UPDATE ODBM STOP(CONNECTION) command” on page 1176
- “UPDATE ODBM STOP(TRACE) command” on page 1180
- “UPDATE ODBM TYPE(CONFIG) command” on page 1182
UPDATE ODBM START(CONNECTION) command

Use the UPDATE ODBM START(CONNECTION) command to start connections to data stores and aliases for Open Database Manager (ODBM).

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 1172
- “Output fields” on page 1172
- “Return, reason, and completion codes” on page 1172
- “Examples” on page 1173

Environment

The UPDATE ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
UPDATE ODBM START(CONNECTION)
```

```
DATASTORE(datastore_name)
```

```
ALIAS(alias_name)
```

Keywords

The following keywords are valid for the UPDATE ODBM START(CONNECTION) command.

**ALIAS()**

Specifies the 1–4 character alias name. Wildcards can be specified for the alias name. You can specify more than one alias name.

There is no default for ALIAS(). Specifying the ALIAS keyword will start ODBM connections to all the aliases specified with alias_name. ALIAS() and DATASTORE() are mutually exclusive.

**DATASTORE()**

Specifies the 1–4 character data store name. Wildcards can be specified for the data store name. You can specify more than one data store names.

There is no default for DATASTORE(). Specifying the DATASTORE keyword will start ODBM connections to all the data stores specified with datastore_name as well as their associated aliases. DATASTORE() and ALIAS() are mutually exclusive.
Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

Short label
Contains the short label that is generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. error appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

Meaning
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALIAS</td>
<td>ALIAS</td>
<td>The 1–4 character alias name that is associated with an IMS data store connection.</td>
</tr>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>error</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code.</td>
</tr>
<tr>
<td>DSTR</td>
<td>N/A</td>
<td>Data store name.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>Name of the ODBM member that processed the command.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE ODBM START(CONNECTION) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>The UPD ODBM START(CONNECTION) command completed successfully.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002004'</td>
<td>Invalid command keyword or invalid command keyword combination.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002008'</td>
<td>Insufficient number of keywords.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'00002014'</td>
<td>Invalid character in resource name.</td>
</tr>
<tr>
<td>X'04000008'</td>
<td>X'0000203C'</td>
<td>Invalid parameter specified.</td>
</tr>
<tr>
<td>X'0400000C'</td>
<td>X'00003000'</td>
<td>At least one request was successful.</td>
</tr>
</tbody>
</table>
Table 490. Return and reason codes for the UPDATE ODBM START(CONNECTION) command (continued)

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'0400000C'</td>
<td>X'00003004'</td>
<td>No requests were successful.</td>
</tr>
<tr>
<td>X'04000014'</td>
<td>X'00005034'</td>
<td>An OM response buffer request failed.</td>
</tr>
<tr>
<td>X'04000014'</td>
<td>X'00005038'</td>
<td>A CSLDCMD0 GETBUF request failed to get a command buffer.</td>
</tr>
</tbody>
</table>

Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

Table 491. Completion codes for the UPDATE ODBM START(CONNECTION) command

<tr>
<td>ODBM010D</td>
<td>IMS2</td>
<td>0</td>
</tr>
<tr>
<td>ODBM020D</td>
<td>IMS3</td>
<td>0</td>
</tr>
</tbody>
</table>

Explanation: The UPDATE command will start connections with all data stores that are known to ODBM.

Example 2 for UPDATE ODBM START(CONNECTION) command
UPDATE ODBM START(TRACE) command

Use the UPDATE ODBM START(TRACE) command to request that ODBM traces be started.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes”
- “Output fields” on page 1175
- “Return, reason, and completion codes” on page 1175
- “Examples” on page 1176

Environment

The UPDATE ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
UPDATE ODBM START(TRACE)
```

Keywords

The following keywords are valid for the UPDATE ODBM START(TRACE) command.

```
DATASTORE(*)
```

Specifies the 1–4 character data store name. Wildcards can be specified for the data store name. The `datastore_name` is a repeatable parameter. The default is DATASTORE(*), which applies to all data store names that are known to ODBM.

Usage notes

You can issue this command only through the Operations Manager (OM) API.
The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

*Table 492. Output field descriptions for the UPDATE ODBM START(TRACE) command*

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>

Examples

Example 1 for UPDATE ODBM START(TRACE) command

TSO SPOC input:
UPD ODBM START(TRACE) DATASTORE(IMS1,IMS2)

TSO SPOC output:
MbrName    DatastoreName      CC
ODBM01OD    IMS1              0
ODBM01OD    IMS2              0

Explanation: The UPDATE command will start ODBM traces for data stores IMS1 and IMS2.

Example 2 for UPDATE ODBM START(TRACE) command

TSO SPOC input:
UPD ODBM START(TRACE) DATASTORE(*)

TSO SPOC output:
MbrName    DatastoreName      CC
ODBM01OD    IMS1              0
ODBM01OD    IMS2              0
ODBM02OD    IMS3              0

Explanation: The UPDATE command will start ODBM traces for all data stores that are known to ODBM.

UPDATE ODBM STOP(CONNECTION) command

Use the UPDATE ODBM STOP(CONNECTION) command to stop connections to data stores and aliases for Open Database Manager (ODBM).

Subsections:
- “Environment” on page 1177
- “Syntax” on page 1177
- “Keywords” on page 1177
- “Usage notes” on page 1177
Environment

The UPDATE ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
UPDATE ODBM STOP(CONNECTION)
```

```
DATASTORE(datastore_name)
```

```
ALIAS(alias_name)
```

Keywords

The following keywords are valid for the UPDATE ODBM STOP(CONNECTION) command.

**ALIAS()**

Specifies the 1–4 character alias name. Wildcards can be specified for the alias name. You can specify more than one aliases.

There is no default for ALIAS(). Specifying the ALIAS keyword will stop ODBM connections to all the aliases specified with `alias_name`. ALIAS() and DATASTORE() are mutually exclusive.

**DATASTORE()**

Specifies the 1–4 character data store name. Wildcards can be specified for the data store name. You can specify more than one data store.

There is no default for DATASTORE(). Specifying the DATASTORE keyword will stop ODBM connections to all the data stores specified with `datastore_name` as well as their associated aliases. DATASTORE() and ALIAS() are mutually exclusive.

To start connections to the data stores, you must issue an UPDATE ODBM START(CONNECTION) DATASTORE() command. Even if the actual data store subsystems are recycled after the UPDATE ODBM STOP(CONNECTION) DATASTORE() command, ODBM will not attempt to connect to the data stores until an UPDATE ODBM START(CONNECTION) DATASTORE() command is issued.

Usage notes

You can issue this command only through the Operations Manager (OM) API.
The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

**Output fields**

**Short label**
Contains the short label that is generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALIAS</td>
<td>ALIAS</td>
<td>The 1–4 character alias name that is associated with an IMS data store connection.</td>

Note: The command response is encapsulated in <rsp> and </rsp> tags. Message CSL4007W is returned within <msg> and </msg> tags.

Examples

Example 1 for UPDATE ODBM STOP(CONNECTION) command

TSO SPOC input:
UPD ODBM STOP(CONNECTION) DATASTORE(IMS*)

TSO SPOC output:

<table>
<thead>
<tr>
<th>MbrName</th>
<th>DatastoreName</th>
<th>CC</th>
<th>DatstoreName</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODBM01OD</td>
<td>IMS1</td>
<td>0</td>
<td>IMS1</td>
</tr>
<tr>
<td>ODBM01OD</td>
<td>IMS2</td>
<td>0</td>
<td>IMS2</td>
</tr>
<tr>
<td>ODBM02OD</td>
<td>IMS3</td>
<td>0</td>
<td>IMS3</td>
</tr>
</tbody>
</table>

Explanation: The UPDATE command will stop connections with all data stores whose name begin with “IMS”.

Example 2 for UPDATE ODBM STOP(CONNECTION) command

TSO SPOC input:
UPD ODBM STOP(CONNECTION) ALIAS(IO*)

TSO SPOC output:

<table>
<thead>
<tr>
<th>MbrName</th>
<th>AliasName</th>
<th>CC</th>
<th>DatstoreName</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODBM01OD</td>
<td>IO1A</td>
<td>0</td>
<td>IMS1</td>
</tr>
<tr>
<td>ODBM01OD</td>

<td>0</td>
<td>IMS2</td>
</tr>
<tr>
<td>ODBM02OD</td>
<td>IO3A</td>
<td>0</td>
<td>IMS3</td>
</tr>
<tr>
<td>ODBM02OD</td>
<td>IO3B</td>
<td>0</td>
<td>IMS3</td>
</tr>
</tbody>
</table>

Explanation: The UPDATE command will stop ODBM connections with the ODBM members whose alias names begin with “IO”.

Chapter 30. UPDATE commands 1179
UPDATE ODBM STOP(TRACE) command

Use the UPDATE ODBM STOP(TRACE) command to request that ODBM traces be stopped.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes”
- “Output fields”
- “Return, reason, and completion codes” on page 1181
- “Examples” on page 1182

Environment

The UPDATE ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
UPDATE ODBM STOP(TRACE)
```

Keywords

The following keywords are valid for the UPDATE ODBM STOP(TRACE) command.

**DATASTORE()**

Specifies the 1-4 character data store name. Wildcards can be specified for the data store name. The `datastore_name` is a repeatable parameter. The default is `DATASTORE(*)`, which applies to all data store names that are known to ODBM.

Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

Output fields

**Short label**
Contains the short label that is generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated.
error appears for output fields that can appear for a non-zero completion code. N/A (not applicable) appears for output fields that are always returned.

**Meaning**

Provides a brief description of the output field.

**Table 498. Output field descriptions for the UPDATE ODBM STOP(TRACE) command**

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALIAS</td>
<td>N/A</td>
<td>Alias name.</td>

Examples

Example 1 for UPDATE ODBM STOP(TRACE) command

TSO SPOC input:

```
UPD ODBM STOP(TRACE) DATASTORE(*)
```

TSO SPOC output:

```
MbrName  DatastoreName CC
ODBM01OD IMS1 0
ODBM01OD IMS2 0
ODBM02OD IMS3 0
```

Explanation: The UPDATE command will stop ODBM traces for all data stores that are known to ODBM.

**UPDATE ODBM TYPE(CONFIG) command**

Use the UPDATE ODBM TYPE(CONFIG) command to update active ODBM configuration.

Subsections:
- “Environment”
- “Syntax”
- “Keywords” on page 1183
- “Usage notes” on page 1183
- “Output fields” on page 1184
- “Return, reason, and completion codes” on page 1184
- “Examples” on page 1186

Environment

The UPDATE ODBM command is applicable only to the CSL Open Database Manager (ODBM). To issue this command, a CSL type-2 command environment must be enabled and an ODBM instance must be active.

Syntax

```
UPDATE ODBM TYPE(CONFIG) MEMBER(mambername)
```
Keywords

The following keywords are valid for the UPDATE ODBM TYPE(CONFIG) command.

**MEMBER()**

Specifies a 3–character CSLDCxxx suffix that identifies which ODBM configuration PROCLIB member is used to update the active ODBM configuration. The default is the current CSLDCxxx member.

**Note:** If a new CSLDCxxx member is used to update the active ODBM configuration, the new member becomes the current ODBM configuration PROCLIB member. Also, when restarting ODBM, the ODBMCFG= parameter on the EXEC statement or within the CSLDIxxx initialization PROCLIB member will be used to configure ODBM.

**OPTION()**

Specifies whether you want connections with the data stores to be attempted after the active ODBM configuration has been updated.

- **CONNECT**
  Specifies that after updating the active ODBM configuration, all data stores within the new configuration will be connected and all aliases associated with the data stores will be made available for use. CONNECT is the default.

- **NOCONNECT**
  Specifies that after updating the active ODBM configuration, no connections will be attempted. To start connections to the data stores, you must issue an UPDATE ODBM START(CONNECTION) DATASTORE() command. Even if the actual data store subsystems are started or recycled after the UPDATE ODBM TYPE(CONFIG) OPTION(NOCONNECT) command, ODBM will not attempt to connect to the data stores until an UPDATE ODBM START(CONNECTION) DATASTORE() command is issued.

- **TYPE(CONFIG)**
  Specifies to update the active ODBM configuration.

Usage notes

You can issue this command only through the Operations Manager (OM) API.

The syntax for this command is defined in XML and is available to automation programs that communicate with OM.

The UPDATE ODBM TYPE(CONFIG) command allows the user to update the active ODBM configuration by loading an updated copy of the current or an alternate CSLDCxxx ODBM configuration PROCLIB member.

Before processing the UPD ODBM TYPE(CONFIG) command, all data store connections must be stopped on all ODBMs to which the command will be routed.
Output fields

The following table shows the UPDATE ODBM output fields. The columns in the table are as follows:

**Short label**
Contains the short label that is generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. *error* appears for output fields that can appear for a non-zero completion code. *N/A* (not applicable) appears for output fields that are always returned.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code.</td>
</tr>
<tr>
<td>CCTXT</td>
<td><em>error</em></td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code.</td>
</tr>
<tr>
<td>CFG</td>
<td>N/A</td>
<td>ODBM configuration PROCLIB member (CSLDCxxx) used to establish the new active configuration.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>IMSplex member that built the output line. The ODBM identifier of the ODBM that built the output line.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The return and reason codes that can be returned as a result of the UPDATE ODBM TYPE(CONFIG) command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>

</tbody>
</table>
Table 503. Completion codes for the UPDATE ODBM TYPE(CONFIG) command (continued)

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>12</td>
<td>DATASTORES NOT STOPPED</td>
<td>Data store connections to the current ODBM have not been stopped before issuing the UPD ODBM TYPE(CONFIG) command.</td>
</tr>
</tbody>
</table>

Examples

Example 1 for UPDATE ODBM TYPE(CONFIG) command

TSO SPOC input:

UPD ODBM TYPE(CONFIG) MEMBER(009) OPTION(NOCONNECT)

TSO SPOC output:

<table>
<thead>
<tr>
<th>MbrName</th>
<th>CC</th>
<th>ConfigName</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODBM01OD</td>
<td>0</td>
<td>CSLDC009</td>
</tr>
<tr>
<td>ODBM01OD</td>
<td>0</td>
<td>CSLDC009</td>
</tr>
<tr>
<td>ODBM02OD</td>
<td>0</td>
<td>CSLDC009</td>
</tr>
</tbody>
</table>

Explanation: The MEMBER(009) keyword indicates that CSLDC009 will be used to configure both ODBM01 and ODBM02. To allow this to occur, both ODBM configurations must be specified in the CSLDC009 PROCLIB member. When using the NAME() keyword, routing of this command requires caution to insure the intended results are achieved.

Example 2 for UPDATE ODBM TYPE(CONFIG) command

TSO SPOC input:

UPD ODBM TYPE(CONFIG)

TSO SPOC output:

<table>
<thead>
<tr>
<th>MbrName</th>
<th>CC</th>
<th>ConfigName</th>
</tr>
</thead>
<tbody>
<tr>
<td>ODBM01OD</td>
<td>0</td>
<td>CSLDC001</td>
</tr>
<tr>
<td>ODBM01OD</td>
<td>0</td>
<td>CSLDC001</td>
</tr>
<tr>
<td>ODBM02OD</td>
<td>0</td>
<td>CSLDC002</td>
</tr>
</tbody>
</table>

Explanation: This example shows that the current configuration members were, and remain to be, CSLDC001 for ODBM1 and CSLDC002 for ODBM2, respectively.

UPDATE OLREORG command

Use the UPDATE OLREORG command to change the rate, the DEL or NODEL data set disposition flag, or the REL or NOREL release OLR ownership disposition flag of an owned HALDB Online Reorganization (OLR).

If you issue this command as a type-1 command, the command response is returned as a DFS0725I pre-edit message.

Subsections:

- “Environment” on page 1187
- “Syntax” on page 1187
- “Keywords” on page 1187
- “Usage notes” on page 1189
Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the UPDA TE OLREORG command and keywords can be issued.

<td>NAME</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>OPTION</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the UPDATE OLREORG command:

NAME()

Specifies one or more PHDAM or PHIDAM HALDB partitions to be updated.

For the type-1 version of the command, you can specify only one partition name.

A parameter with the wildcard character (*) is not allowed, except as NAME(*) for all HALDB partitions.

SET(RATE)

Specifies the rate at which the HALDB OLR is run.

rate

You can specify a value of 1 to 100 for the rate value.

You can use the RATE parameter to control the intensity at which the reorganization runs. This can affect both the reorganization's speed and its impact on the rest of the system. The value you specify for rate is the
percentage of elapsed time to be devoted to copying records. The remaining time is to be an intentionally introduced delay in the copying process that minimizes the reorganization's impact on other IMS work and on the whole system.

An online reorganization's impact on the system is affected by the available system resources, by total system utilization (including other online reorganizations), by total logging volume, by log contention, and by the intensity at which this reorganization was requested to run. These same factors also affect the speed at which the reorganization runs.

A rate value of 50 specifies that 50% of the elapsed time be spent copying records and the remaining 50% be spent in a delay. This causes the reorganization to run approximately twice as long as it would have run with a rate value of 100.

**OPTION()**

Allows the specification of the DEL, NODEL, REL, or NOREL options.

**DEL | NODEL**

Specifies whether the deletion of the inactive data sets is to be attempted when the online reorganization completes. DEL and NODEL are mutually exclusive keywords.

**DEL**

The deletion of the inactive data sets is to be attempted when the online reorganization completes. The attempted deletion occurs regardless of who created the data sets or when the data sets were created.

**NODEL**

The deletion of the inactive data sets is not to be attempted when the online reorganization completes.

If the partition is tracked at an RSR tracker site, the OPTION (DEL | NODEL) value in effect at the completion of the HALDB OLR also determines whether the inactive data sets for the shadow partition are deleted at the completion of the tracking of the reorganization.

If the HALDB Online Reorganization is stopped before completion, the DEL or NODEL keyword is not remembered and will need to be specified on the INITIATE OLREORG command that is issued to resume the stopped HALDB OLR.

**REL | NOREL**

Specifies whether the IMS system retains or releases control of the reorganization when it shuts down or terminates. REL and NOREL are mutually exclusive keywords.

**REL**

Specifies that the IMS system releases ownership of the OLR if it terminates before the online reorganization is completed. Specifying this keyword allows another IMS system to take control of the suspended reorganization.

The Partition Database record in the RECON data set is updated to show that the owning IMS (OLRIMSID=ssid) allows the OLR to be resumed if it terminates the online reorganization process or abnormally terminates itself. RELEASE OLR OWNERSHIP appears in a listing of the Partition Database record.
When OLR is active and running on an IMS and the IMS terminates abnormally, and if release OLR ownership is requested, the LIST.DB command will show OLRIMSID=ssid (instead of OLRIMSID=NULL) and RELEASE OLR OWNERSHIP because IMS was unable to request OLR ownership release.

**Requesting release OLR ownership in an XRF environment:** In an XRF environment, if release OLR ownership is requested while OLR is running on an active IMS, then OLR will not automatically resume on the new active IMS after an XRF takeover occurs. You must issue the INIT OLREORG command again on the new active IMS.

**NOREL**

Specifies that the IMS system retains control of the reorganization when it shuts down or terminates.

**Usage notes**

If an online reorganization is started with the ALTER option to modify the structure of the database, IMS reorganizes all of the partitions in the database. In this case, if you need to update the online reorganizations of all of the partitions in the database, specify an asterisk in the NAME keyword, for example UPDATE OLREORG NAME(*) SET(RATE(rate)). You cannot specify the name of the HALDB master database. You can use either the type-1 or type-2 format of the UPDATE OLREORG command to update alter processing; however, if the altered database is shared, only the type-2 command can be routed to all of the IMS systems that share the database.

**Command responses for /UPDATE OLREORG**

When the /UPDATE OLREORG command is entered as a type-1 command, the command response is returned in a message format.

When the command completes successfully message DFS0725I is returned to the system console and master terminal with a completion code of 0. If the command results in an error, a nonzero completion code or an error message is returned to the master terminal and system console.

DFSO725I INITIATE|UPDATE|TERMINATE OLREORG COMMAND FOR DB dbnamexx COMPLETE.

CC= nn

where: dbnamexx is the HALDB partition name entered on the command

   nn is the completion code

**Output fields**

This section describes the responses from the OM API for the UPDATE OLREORG command. The following table shows the UPDATE OLREORG output fields. The columns in the table are as follows:

**Short label**

Contains the short label that is generated in the XML output.

**Keyword**

Identifies the command keyword that caused the field to be generated.

N/A appears for output fields that are always returned.

**Meaning**

Provides a brief description of the output field.

USERID(userid) MQFORMAT(MQIMS)
```

Chapter 30. UPDATE commands 1193
Keywords

The following keywords are valid for the UPDATE OTMADESC command:

NAME(destname*)
A required keyword whose value cannot be modified.

SET()
Specifies to update the descriptors with at least one of the following keywords. The update applies to each of the descriptor names specified in the NAME keyword. If an asterisk is appended to the descriptor name, the update will not be applied to the group of names it is trying to mask.

ADAPTER(adaptername)
An optional parameter for TYPE(IMSCON) that identifies the IMS Connect adapter. adaptername is a 1- to 8-character adapter name. To clear the value of this keyword, specify the keyword with no value, for example, ADAPTER(). If the ADAPTER keyword is deleted, the CONVRTR keyword is also deleted. ADAPTER and TYPE(NONOTMA) are mutually exclusive.

CONVRTR(convertername)
A required parameter only if the ADAPTER keyword is specified. convertername is a 1- to 8-character converter name used by the adapter. The value of this keyword will be automatically deleted if the value of the ADAPTER keyword is being deleted. Coding this keyword without the ADAPTER keyword or with TYPE(NONOTMA) is not valid.

EXIT(N|Y)
When TYPE=IMSTRAN, this is an optional parameter used to indicate whether the IMS user exit (DFSCMUX0) can override the descriptor routing information for late messages.

For other descriptor types, this is an optional parameter used to specify whether the OTMA routing exits (DFSYPRX0 and DFYDRU0) can override the descriptor switch destination from ALT IOPCB.

LTERMOVR(ltermname)
When TYPE=IMSTRAN, this is an optional parameter used to specify a logical terminal name that overrides the name specified in the application I/O PCB. If an override name is also specified in the AIBRSNM2 field of the AIB, that name is used instead of the name in the descriptor. If an override name is not specified in the descriptor or the AIB, the IMS application terminal symbolic (PSTSYMBO) is used as the default logical terminal name for the target transaction.

MQAPPLID(mqmd_appidentitydata)
When TYPE=MQSERIES, this is an optional parameter that specifies a 1- to 32-character value for the MQMD_APPLIDENTITYDATA field. This field is used to pass data to the receiving IBM MQ application. The default is 32 blanks.
MQCOPYMD(Y | N)
When TYPE=MQSERIES, this is an optional parameter that specifies whether the original input values of the MQMD data structure from the MQ IMS Bridge are copied to the output message.

MQCORREL(mqmd_correlid)
When TYPE=MQSERIES, this is an optional parameter that specifies a 1- to 24-character value for the MQMD_CORRELID field. This value is passed directly to the receiving IBM MQ application if the value of the MQREPORT parameter is PASSCORR. The default is 0.

MQFORMAT(MQIMSVS | MQIMS | NONE | MQSTR)
When TYPE=MQSERIES, this is an optional parameter that specifies value for the MQMD_FORMAT field. The default value is MQIMSVS.

MQMSGID(mqmd_msgid)
When TYPE=MQSERIES, this is an optional parameter that specifies a 1- to 24-character value for the MQMD_MSGID field. This value is passed directly to the receiving IBM MQ application if the value of the MQREPORT parameter is PASSMSG1.

MQPERST(N | Y)
When TYPE=MQSERIES, this is an optional parameter that specifies whether messages that use this descriptor are persistent on a SYNC TPIPE. Setting this parameter to Y is analogous to setting X'40' for the output flag value of the DFSYDRU0 exit routine.

MQREPORT(COPYMTOC | NEWMSGID | PASSMSG1 | PASSCORR | NONE)
When TYPE=MQSERIES, this is an optional parameter that specifies the MQMD_REPORT field value for messages that use the descriptor. The default value is COPYMTOC. Each supported value corresponds to an equivalent value in the MQMD data structure:

<table>
<thead>
<tr>
<th>Parameter value</th>
<th>Equivalent MQMD structure value</th>
</tr>
</thead>
<tbody>
<tr>
<td>NEWMSGID</td>
<td>MQRO_NEW_MSG_ID</td>
</tr>
<tr>
<td>PASSMSG1</td>
<td>MQRO_PASS_MSG_ID</td>
</tr>
<tr>
<td>COPYMTOC</td>
<td>MQRO_COPY_MSG_ID_TO_CORREL_ID</td>
</tr>
<tr>
<td>PASSCORR</td>
<td>MQRO_PASS_CORREL_ID</td>
</tr>
<tr>
<td>PASSMSCO</td>
<td>MQRO_PASS_MSG_ID and MQRO_PASS_CORREL_ID</td>
</tr>
<tr>
<td>NONE</td>
<td>MQRO_NONE</td>
</tr>
</tbody>
</table>

MQRTF(mqmd_replytoformat)
When TYPE=MQSERIES, this is a 1- to 8-character value for the MQMD_REPLYTOFORMAT field. The default is 0.

MQRTQ(mqmd_replytoqueueename)
When TYPE=MQSERIES, this is a required parameter that specifies a 1- to 48-character value for the MQMD_REPLYTOQ field.
**MQRTQMGR**(mqmd_replytoqueuemanagername)
When TYPE=MQSERIES, this is an optional parameter that specifies a 1- to 48-character value for the MQMD_REPLYTOQMGR field. If this parameter is not specified, MQSeries® will use the local queue manager.

**REPLYCHK**(Y | N)
Specifies whether an IMS application replies to the IOPCB for a synchronous program switch request. When REPLYCHK=YES and the ICAL target application does not reply to the IOPCB or switch to another transaction, IMS gives the error return code X'0100', with reason code X'0110', and extended reason code X'0014' instead of a timeout to the ICAL call. The default is Y.

**RMTIMS**
An optional 1- to 8-character name of a remote, destination IMS system for ALTPCB output messages. The RMTIMS value must match the value specified on the ID parameter of a DATASTORE statement in the configuration member of the remote IMS Connect instance specified on the RMTIMSCON parameter. This parameter is valid only when TYPE(IMSCON) is specified. To clear the value of this parameter, specify the parameter with no value, for example, RMTIMS(). Clearing the value of RMTIMS also clears the value of RMTIMSCON.

**RMTIMSCON**
An optional 1- to 8-character name of a connection to the remote IMS Connect instance that manages TCP/IP communications for the remote IMS system that is named on the RMTIMS parameter. This value must match the value specified on the ID parameter of the RMTIMSCON statement in the configuration file of the local IMS Connect instance that is managing TCP/IP communications for the IMS system in which the OTMA ALTPCB output messages are originating. This parameter is valid only when TYPE(IMSCON) is specified. To clear the value of this parameter, specify the parameter with no value, for example, RMTIMSCON(). Clearing the value of RMTIMSCON also clears the value of RMTIMS.

**RMTTRAN**
An optional 1- to 8-character name of the transaction name to use at the remote, destination IMS system named on the RMTIMS parameter. When this parameter is specified with RMTIMSCON and RMTIMS parameters, IMS OTMA sends the ALTPCB output messages to the remote IMS system for transaction processing. This parameter is valid only when TYPE(IMSCON) is specified. To clear the value of this parameter, specify the parameter with no value, for example, RMTTRAN().

**SMEM**(N | Y)
An optional parameter that can either be a Y or N value to indicate whether the TME MEMBER name specified in the TME MEMBER parameter is a super member. To clear the value of this keyword, specify the keyword with no value, for example, SMEM(). Deleting SMEM() will default to SMEM(N). If the TME MEMBER name is a super member, the length of the TME MEMBER name has a maximum of 4 characters. SMEM and TYPE(NONOTMA) are mutually exclusive.

**SYNCTP**(N | Y)
When TYPE=MQSERIES, this parameter specifies whether a SYNC TPIPE must be created for messages that use this descriptor. Setting this parameter to Y is analogous to setting X'80' for the output flag value of the DFSYDRU0 exit routine.
SYNTIMER(sysntimer)
An optional parameter used for synchronous callout processing. In synchronous callout processing, a request is canceled if an ACK/NAK or response is not received by OTMA from the client within the time specified. This value is expressed in hundredths of a second or milliseconds. The value can be numeric with a maximum length of six digits. The value has a range of 0 through 999999 and when zero is specified, it will default to 10 seconds or 1000 hundredths of a second. If you specify SYNTIMER() or SYNTIMER( ), the timeout value will be reset as if no timeout value has been specified.

If TYPE(IMSTRAN) is specified, this parameter is the timeout value for synchronous program switch ICAL calls. If a timeout value is also specified in the AIB interface, IMS will compare the timeout values and use the lower value.

TMEMBER(tmem)
A required parameter for TYPE(IMSCON). If the TYPE of the descriptor is being changed from IMSCON to NONOTMA, the value of this keyword will be deleted. If the TYPE of the descriptor is being changed from NONOTMA to IMSCON, then the TMEMBER keyword must be coded. tmem is a 16-character OTMA TMEMBER name or a 4-character super member. TMEMBER and TYPE(NONOTMA) are mutually exclusive.

An optional parameter for TYPE(IMSTRAN). The tmem value is a 1- to 16-character OTMA TMEMBER name. IMS queues late responses from a synchronous program switch to this OTMA TMEMBER. The destination name is used as the default OTMA TPIPE name if the TPIPE parameter is not specified in the descriptor.

TPIPE(tpipename)
An optional parameter that is a 1- to 8-character TPIPE name when TYPE(IMSCON) is specified. To delete the value of this keyword, specify the keyword with no value, for example, TPIPE(). If this keyword is not specified, the TPIPE name is the destination name specified in the NAME keyword. TPIPE and TYPE(NONOTMA) are mutually exclusive.

An optional parameter for TYPE(IMSTRAN) that specifies a 1- to 8-character TPIPE name. This parameter defaults to the destination name. IMS queues late responses from a synchronous program switch to this OTMA TPIPE. A value for the TMEMBER parameter is required when TPIPE is specified.

USERID
For TYPE=IMSCON, this is an optional 1- to 8-character RACF user ID. When this parameter is specified with RMTIMCON, RMTTRAN, and RMTIMS parameters, a remote, destination IMS system uses the USERID value to perform transaction authorization. The value of USERID specified in the OTMA destination descriptor overrides the user ID provided by the IMS application program that issued the ISRT call to the OTMA ALTPCB. This parameter is valid only when TYPE(IMSCON) is specified.

For TYPE=MQSERIES, this is a 1- to 8-character user ID that corresponds with the MQMD_USERIDENTIFIER field in the MQMD data structure. This field allows the OTMA descriptor to override the default user ID in the MQMD structure. Specify the value *USERID* to use the IMS user ID value from the PST.
Usage notes

The UPDATE OTMADESC command is used to modify existing destination routing descriptors that were either included in DFSYDTx or added by using the CREATE OTMADESC command. A log record will be written to track changes and to persist from one IMS restart to another. The log record will also be used to track the currency of updates to an XRF alternate and to an RSR tracking environment. The checkpoint record is X4035 and the log record for the CREATE, UPDATE, and DELETE commands is X221B.

The UPDATE OTMADESC command cannot change the TYPE value for a destination descriptor. If you want to change the type for a descriptor, you must create a new descriptor with the CREATE OTMADESC command or by modifying the DFSYDTx member of the IMS.PROCLIB data set. You can then delete the existing descriptor.

Output fields

The following table shows the UPDATE OTMADESC output fields. The columns in the table are:

- Short label
  Contains the short label generated in the XML output.

- Long label
  Contains the column heading for the output field in the formatted output.

- Keyword
  Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

- Meaning
  Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code for the line of output. The completion code indicates whether IMS was able to process the command for the specified resource. See <a href="#">“Return, reason, and completion codes”</a> for more information. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>N/A</td>
<td>Completion code text that briefly explains the meaning of the non-zero completion code. This field is returned only for an error completion code.</td>
</tr>
<tr>
<td>DEST</td>
<td>DestName</td>
<td>NAME</td>
<td>Destination name.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Member name.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

An IMS return and reason code is returned to OM by the UPDATE OTMADESC command. The OM return and reason codes that might be returned as a result of the UPDATE OTMADESC command are standard for all commands entered through the OM API.
The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

**Table 510. Return and reason codes for the UPDATE OTMADESC command**

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each resource, accompanied by its completion code. See Table 511 for details.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002000'</td>
<td>The command contains an invalid verb or no client is registered for the verb.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002004'</td>
<td>The command contains an invalid primary keyword or no client is registered for the keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002028'</td>
<td>The command contains an invalid keyword.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000202C'</td>
<td>The command contains an unknown positional parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002034'</td>
<td>The command contains an incomplete keyword parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'00002038'</td>
<td>The command is missing a required parameter.</td>
</tr>
<tr>
<td>X'02000008'</td>
<td>X'0000203C'</td>
<td>The command contains an invalid keyword parameter value.</td>
</tr>
</tbody>
</table>

The following table includes an explanation of the completion codes. Errors unique to the processing of this command are returned as completion codes. A completion code is returned for each action against an individual resource.

**Table 511. Completion codes for the UPDATE OTMADESC command**

<table>
<thead>
<tr>
<th>Completion code</th>
<th>Completion code text</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Command completed successfully</td>

</tbody>
</table>

Examples

The following are examples of the UPDATE OTMADESC command:

Example 1 for UPDATE OTMADESC command

TSO SPOC input:

```
UPDATE OTMADESC NAME(OTMACL*,OTMACL99) SET(TYPE(NONOTMA))
```

TSO SPOC output:

```
DestName  MbrName  CC
OTMACL99  IMSA     0
OTMACL*   IMSA     0
```

**Explanation:** This UPDATE command changes the output type to NONOTMA. This keyword will delete any other keywords (such as TMEM or TPIPE), because no other keywords are relevant for TYPE(NONOTMA).

Example 2 for UPDATE OTMADESC command

TSO SPOC input:

```
UPDATE OTMADESC NAME(OTMACL*,OTMACL99) SET(TPIPE(HWS1TP02))
```

TSO SPOC output:

```
DestName  MbrName  CC
OTMACL99  IMSA     0
OTMACL*   IMSA     0
```

**Explanation:** This UPDATE command changes the TPIPE name to HWS1TP02. The TPIPE name will be changed from HWS1TP01 to HWS1TP02 for OTMACL99 and the TPIPE for OTMACL* will be set to HWS1TP02.

Example 3 for UPDATE OTMADESC command

TSO SPOC input:

```
UPDATE OTMADESC NAME(OTMACL*) SET(TPIPE())
```

TSO SPOC output:

```
DestName  MbrName  CC
OTMACL*   IMSA     0
```
**Explanation:** This UPDATE command for descriptor OTMACL* will delete the TPIPE name by coding TPIPE(). An asterisk in the UPDATE command does not update the group of names the asterisk is masking. It updates only the OTMACL* entry in the table of destination routing descriptors. It does not update OTMACL99.

**Example 4 for UPDATE OTMADESC command**

TSO SPOC input:

```
UPDATE OTMADESC NAME(OTMACL01) SET(RMTIMS(IMS3) RMTTRAN(TRAN03))
```

TSO SPOC output:

```
DestName MbrName CC
OTMACL01 IMS1 0
```

**Explanation:** When the UPDATE OTMADESC command is issued to IMS1, the command changes the name of the destination remote IMS system to IMS3 and the transaction to be scheduled for processing messages on IMS3 to TRAN03.

**UPDATE PGM command**

Use the UPDATE PGM command to update program resources.

A program resource defines the resource requirements for application programs that run under the control of the DB/TM environment, as well as for application programs that access databases through DBCTL. Program resources combined with transactions define the scheduling and resource requirements for an application program.

Subsections:

- “Environment”
- “Syntax” on page 1202
- “Keywords” on page 1202
- “Usage notes” on page 1209
- “Equivalent IMS type-1 commands” on page 1210
- “Output fields” on page 1210
- “Return, reason, and completion codes” on page 1211
- “Examples” on page 1215

**Environment**

The following table lists the environments (DB/BC, DBCTL, and DCCTL) in which you can use the commands and keywords.

**Table 512. Valid environments for the UPDATE PGM command and keywords**

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE PGM</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>
Table 512. Valid environments for the UPDATE PGM command and keywords (continued)

<table>
<thead>
<tr>
<th>Command / Keywords</th>

<td></td>
</tr>
<tr>
<td>START</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>STOP</td>
<td></td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

**Syntax**

```
UPDATE PGM NAME('name')

START('SCHD TRACE REFRESH')

STOP('SCHD TRACE')

START('SCHD TRACE') STOP('SCHD TRACE')

SET('BMPTYPE('Y')')

DOPT('N')

FP('Y')

GPSB('N')

LANG('ASSEM')

COBOL

JAVA

PASCAL

PLI

LOCK('ON')

OFF

RESIDENT('N')

Y

SCHDTYPE('PARALLEL')

SERIAL

TRANSTAT('N')

Y
```

**Keywords**

The following keywords are valid for the UPDATE PGM command:
NAME
Specifies the 1-8 character name of the program. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the resource names that are processed. For NAME(*), command responses are returned only for the resource names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the resource names that are processed.

OPTION
Specifies functions to be performed along with the command.

ALLRSP
Indicates that the response lines are to be returned for all resources that are processed on the command. The default action is to return response lines only for the resources that resulted in an error. It is only valid with NAME(*). ALLRSP is ignored for other NAME values.

SET
Specifies the attribute values to be changed.

BMPTYPE
BMP type option. Specifies whether the program runs in a BMP type region (Y) or not (N). A BMP type region can be a BMP region or a JBP region. Updating this attribute stops the program from scheduling during command processing.

PSBs scheduled by DB2 stored procedures, by programs running under WebSphere Application Server, and by other users of the ODBA interface might be defined with BMPTYPE Y or N.

Y The program runs in a BMP type region. It might run in an IMS BMP region or a JBP region. Any associated transactions are assigned normal and limit priority values of zero.

N The program does not run in a BMP type region. It might run in an IMS TM MPP, JMP, or IFP region or it might use either the ODBA or DRA interface. This specification should be used for programs running in IMS TM MPP, JMP, and IFP regions, or PSBs scheduled by CICS programs using DBCTL and other users of the DRA interface. This is the default.

Keyword combination rules include the following:
• FP(E) and BMPTYPE(Y) are mutually exclusive.

DOPT
Specifies the dynamic option.

N The PSB associated with this program is not located dynamically. The control blocks for the PSB must exist in an ACBLIB or the IMS catalog, otherwise the program is set to a NOTINIT status, and cannot be scheduled.

Y The PSB associated with this program is located dynamically. Each time the program that is associated with this PSB is scheduled, the latest copy of the PSB is loaded. When the program terminates, the PSB is deleted from the PSB pool.

Until the PSB is required to process a transaction, the ACB for the PSB does not need to be in the ACBLIB or, if the IMS management of ACBs is enabled, in the IMS catalog. A new version of the PSB can be
defined and added to the ACBLIB or the IMS catalog at any time. IMS loads the new version of the ACB the next time the PSB is scheduled.

A DOPT PSB cannot be scheduled if the control blocks for the DBDs that the PSB references are not in the ACBLIB or the IMS catalog.

Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- DOPT(Y) and GPSB(Y) are mutually exclusive.
- DOPT(Y) and LANG(JAVA) is a valid combination.
- LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
- LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
- RESIDENT(Y) and DOPT(Y) are mutually exclusive.
- SCHDTYPE(PARALLEL) and DOPT(Y) are mutually exclusive.

**FP** specifies the Fast Path option.

- **E** The program is a Fast Path-exclusive application program. This implicitly defines a wait-for-input (WFI) application program. Either a transaction or a routing code that can be assigned by the user Input Edit/Routing exit routine must be defined for the Fast Path-exclusive application, in order for this program to be usable.

- **N** The program is not a Fast Path-exclusive application program. When FP(N) is specified, any attempt to use Fast Path resources or commands might yield unpredictable results.

Updating this attribute is rejected if any routing codes or transactions that reference this program have conflicting attributes. To update this attribute, you might need to delete the routing codes and transactions that reference it. Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- FP(E) requires Fast Path to be defined.
- LANG(JAVA) and FP(E) are mutually exclusive.
- BMPTYPE(Y) and FP(E) are mutually exclusive.

**GPSB** specifies the generated PSB option.

- **N** The PSB associated with the program is not generated by IMS. The control blocks for the PSB must exist in the ACBLIB or, if the IMS management of ACBs is enabled, in the IMS catalog, otherwise the program is set to a NOTINIT status, and cannot be scheduled.

- **Y** The PSB and application control block (ACB) that are associated with the program are generated by IMS. The scheduling process of all environments generates a PSB that contains an I/O PCB and an alternate modifiable PCB.

You do not need to generate the PSB and ACB or submit DDL to define the PSB. The ACB for the PSB is not loaded from either ACBLIB or, if the IMS management of ACBs is enabled, the IMS catalog. Thus, I/O to retrieve the ACB from either the ACBLIB or the IMS catalog is eliminated.
The generated PSB contains an I/O PCB named IOPCBbbb and a modifiable, alternate PCB named TPPCB1bb. With an alternate modifiable PCB, an application can use the CHNG call to change the output destination and send output to a destination other than the input destination.

Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- DOPT(Y) and GPSB(Y) are mutually exclusive.
- DOPT(Y) and LANG(JAVA) is a valid combination.
- GPSB(Y) requires LANG.
- LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
- LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
- RESIDENT(Y) and GPSB(Y) are mutually exclusive.

**LANG**

Specifies the language interface of the program for a GPSB, or defines a DOPT(Y) program as using the Java language.

In order to define a DOPT program using the Java language, the program must be defined with DOPT(Y) and LANG(JAVA). DOPT PSBs are not loaded at IMS restart; they are loaded every time the program is scheduled. When the program is scheduled for the first time, IMS does not know the language until after the program is scheduled in a region and the PSB is loaded. Unless LANG(JAVA) is defined for the DOPT(Y) program, the program is incorrectly scheduled in a non-Java region.

The LANG parameters and their meanings are identified in the following table.

<table>
<thead>
<tr>
<th>LANG parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSEM</td>
<td>Assembly language</td>
</tr>
<tr>
<td>COBOL</td>
<td>COBOL</td>
</tr>
<tr>
<td>JAVA</td>
<td>Java</td>
</tr>
<tr>
<td>PASCAL</td>
<td>Pascal</td>
</tr>
<tr>
<td>PLI</td>
<td>PL/I</td>
</tr>
</tbody>
</table>

Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
- DOPT(Y) and LANG(JAVA) is a valid combination.
- LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
- FP(E) and LANG(JAVA) are mutually exclusive.

**LOCK**

Specifies that the LOCK status is to be set on or off. SET(LOCK(ON | OFF)) cannot be specified with any other SET attribute. SET(LOCK(ON | OFF)) can be specified with the START or STOP keyword.

**ON**

Locks the program and prevents it from being scheduled.
OFF

Unlocks the program and allows it to be scheduled.

RESIDENT

Specifies the resident option. The RESIDENT(N) option takes effect immediately. The RESIDENT(Y) option takes effect at the next restart, unless an error is encountered such as no ACB for the PSB for the program, or if the program was updated as RESIDENT(Y) after the checkpoint from which this IMS is performing emergency restart.

N  The PSB associated with the program is not resident in storage. The PSB is loaded at scheduling time.

Y  The PSB associated with the program is made resident in storage at IMS cold start or restart. IMS loads the PSB and initializes it.

A resident PSB is accessed in local storage, which avoids I/O to retrieve the ACB.

Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- DOPT(Y) and RESIDENT(Y) are mutually exclusive.
- GPSB(Y) and RESIDENT(Y) are mutually exclusive.

SCHDTYPE

Specifies whether this application program can be scheduled into more than one message region or batch message region simultaneously.

PARALLEL

The application program can be scheduled in multiple regions simultaneously.

SERIAL

The application program can be scheduled in only one region at a time.

Updating this attribute to SCHDTYPE(SERIAL) is rejected if a transaction that references this program is defined with a parallel limit count other than 65535.

Updating this attribute stops the program from scheduling for the duration of command processing.

Keyword combination rules include the following:
- DOPT(Y) and SCHDTYPE(PARALLEL) are mutually exclusive.

TRANSTAT

Specifies whether transaction level statistics should be logged. The value specified has meaning only if the program is a JBP or a non-message driven BMP. If Y is specified, transaction level statistics are written to the log in an X’56FA’ log record.

N  Transaction level statistics should not be logged.

Y  Transaction level statistics should be logged.

The TRANSTAT keyword on the UPDATE PGM or UPDATE PGMDESC command gives the user the ability to override the system default or the current value of the TRANSTAT parameter. If the TRANSTAT keyword is
omitted on the UPDATE PGM command, the current transaction level
statistics setting is unchanged for the program.

START
Specifies attributes that are to be started.

SCHD
Starts scheduling of the application program. Or, resets the NOTINIT
status if set because of an invalid database or DMB, in case the database or
DMB has been created since the scheduling failure. If the database or DMB
is still invalid when the program is next scheduled, the program will be
marked with a status of NOTINIT again.

TRACE
Starts the tracing of the DL/I portion of Data Communications (DC) for
the application program. Each DL/I call to a TPPCB, issued by the user
application program, is traced on entry to and exit from the DC call
handler DFSDLA30. On entry to DFSDLA30 a type 6701-LA3A record is
written, on exit from DFSDLA30 a type 6701-LA3B record is written.

Each record contains the following items if applicable:
- TPPCB
- Up to 64 bytes of the I/O area
- SMB
- PST

If the batch message program (BMP) being traced is the IBM IMS Queue
Control Facility for z/OS (5697-E99), a 6701-MRQB record is logged by the
IMS Queue Control Facility module DFSQMRQ0. The default program
name for the IMS Queue Control Facility BMP is MRQPSB, and can be
overridden on the MSGQUEUE system definition macro.

Items logged in the 6701-MRQB record, if applicable, are:
- TPPCB
- AIB
- I/O area
- PST
- QTPDST
- QSAPWKAD
- QMBA
- PSTDCA
- REG14-12

REFRESH
Specifies that the regions the program is scheduled in are posted so that a
new refreshed copy of the program can be obtained on the next schedule
of the program.

The UPDATE PGM START(REFRESH) command is supported for
programs scheduled in the following region types:
- MPP pseudo-wait-for-input (PWFI) regions in which the program is
  scheduled and the program is not preloaded by the DFSMPLxx
  PROCLIB member
- JMP PWFI regions in which the specified program name is scheduled
MPP, JMP, and message-driven BMP regions in which the program is scheduled and that are running a transaction defined as WFI=YES

The UPDATE PGM START(REFRESH) command is not supported for the following region types:

- MPP regions where the program is loaded by the DFSMPLxx PROCLIB member
- IFP regions
- JBP regions
- Non-message-driven BMP regions

The UPDATE PGM START(REFRESH) command is not valid in a DBCTL environment or on an XRF alternate.

During UPDATE PGM START(REFRESH) command processing, if the region is waiting for a message on SUBQ6 in WAIT-MESSAGE or WAIT-INPUT status, the region is posted and the program receives a QC status code. If the region is active and is processing a message, the program receives a QC status code after the current work is processed and before the next GU call is made. If there is new work on the queue for the program, the next GU call will obtain the refreshed program if the program was refreshed in the PGMLIB before the command was issued.

For MPP regions that are coded with the DBLDL=xx parameter, if the program name specified is in the dependent region BLDL list, the program is removed from the BLDL list when the region is posted. For JMP regions that are posted, the JVM will be automatically recycled and the DFSJVMMS (JVMOPMAS=), DFSJVMENV (ENVIRON=), DFSJVMAP configuration members will be refreshed so that the next schedule of the program can obtain a refreshed copy of the Java program. For a Java program, any changes to the class path can also be refreshed by the UPDATE PGM START(REFRESH) command.

You can use the UPDATE PGM START(REFRESH) command when application programs have been modified and the program needs to pick up the new changes. When the program is rescheduled, it will pick up the application program changes.

When the regions are posted, the MPP and JMP regions remain available to schedule other work. Programs that are running in BMP regions receive a QC status when the UPDATE PGM START(REFRESH) command is issued. On receiving the QC status code,

- If the program handles the QC status code correctly and terminates, the BMP region is terminated and the region must be restarted.
- If the program does not handle the QC status code and does not terminate but it issues a subsequent GU/CHKP call, the program will receive a U330 abend during the processing of the subsequent GU/CHKP call. The region must be restarted.

When the region is restarted, it will pick up the updated program from the PGMLIB.

If a program has alias programs defined, both the program name and the alias program name need to be specified on the command so that a refreshed copy can be loaded at the next schedule of the programs.

The UPDATE PGM START(REFRESH) command is applicable in both DRD and non-DRD environments. The command is processed by each IMS that
receives the command. The command processing is not coordinated among all IMS systems where the program is scheduled.

The UPDATE PGM command is not allowed for IMS internal programs such as DBF#FPU0 and for the IMS PSB for QCF MRQPSB.

When NAME(*) is specified with START(REFRESH) and OPTION(ALLRSP) is not specified, the command response consists of only the program names that are scheduled in the PWFI region or in a region with a WFI=YES transaction. When OPTION(ALLRSP) is specified, all the program names in IMS are returned.

The UPDATE PGM command is processed by all IMS systems that receive the command.

The START(REFRESH) keyword is not allowed with START(SCHD), START(TRACE), SET(), or STOP().

STOP
Specifies attributes that are to be stopped.

SCHD
Stops scheduling of the application program.

TRACE
Stops the tracing of the DL/I portion of Data Communications (DC) for the application program.

Usage notes

Resources exist for the life of the IMS unless they are deleted by using a DELETE command. Resources are recoverable across an IMS warm start or emergency restart. Resources are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

The UPDATE PGM command can be issued only through the OM API. This command applies to DB/DC, DBCTL and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE PGM command specified with SET() is not valid if online change for MODBLKS is enabled (DFSDFxxy or DFSCGxxy defined with MODBLKS=OLC, or MODBLKS not defined), except for SET(LOCK()) and SET(TRANSTAT()). This command is recoverable.

The UPDATE commands are not allowed for IMS-defined resources, except with keywords START, STOP, SET(LOCK(ON | OFF)), and SET(TRANSTAT(YES | NO)). For the UPDATE PGM command, this means Fast Path utility program DBF#FPU0.

The UPDATE PGM command changes a MODBLKS program to a dynamic program with a definition type of UPDATE, if the BMPTYPE, DOPT, FP, GPSB, LANG, RESIDENT, SCHDTYPE, or TRANSTAT value is changed.

Each program is updated individually, unlike the online change process where either all programs are updated or no programs are updated. Most runtime resource definition values for a program can be updated only if the program is not in use. If the program is in use, the update fails.

You can update the status of a program (LOCK, START, STOP) while the program is in use.
If all the attributes specified by the UPDATE command are already defined for the resource, no update is actually made, no resources are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary processor usage when no action needs to be taken.

The following program attributes cannot be updated if online change for MODBLKS is enabled: BMPTYPE, DOPT, FP, GPSB, LANG, RESIDENT, SCHDTYPE.

**Equivalent IMS type-1 commands**

The following table shows variations of the UPDATE PGM command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE command</th>
<th>Similar IMS type-1 command</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE PGM START(REFRESH)</td>
<td>/PSTOP REGION TRAN xxx</td>
</tr>
</tbody>
</table>

**Output fields**

The following table shows the UPDATE PGM output fields. The columns in the table are as follows:

- **Short label**: Contains the short label generated in the XML output.
- **Long label**: Contains the long label generated in the XML output.
- **Keyword**: Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. `error` appears for output fields that are returned only in case of an error.
- **Meaning**: Provides a brief description of the output field.

Examples

The following are examples of the UPDATE PGM command:

Example 1 for UPDATE PGM command

TSO SPOC input:

```
UPDATE PGM NAME(BADNAME,AUTPSB2,CDEBS,BMP011,BAD*) SET(SCHDTYPE(PARALLEL))
```

TSO SPOC output:

```
Response for: UPDATE PGM NAME(BADNAME,AUTPSB2,CDEBS,BMP011,BAD*) SET(SCHDTYPE(PARALLEL))
PgName  MbrName  CC  CText
AUTPSB2 IMS1    0
BAD*    IMS1    10 NO RESOURCES FOUND
BADNAME IMS1    10 NO RESOURCES FOUND
BMP011  IMS1    2A DOPT=Y/PARALLEL CONFLICT
CDEBS   IMS1    0
```

OM API input:

```
CMD(UPDATE PGM NAME(BADNAME,AUTPSB2,CDEBS,BMP011,BAD*) SET(SCHDTYPE(PARALLEL)))
```
OM API output:

<brsp>PGM(BAD* ) MBR(IMS1) CC( 10) CCTXT(NO RESOURCES FOUND)</brsp>
</cmdrspdata>
</imsout>

Explanation: Update some programs so that they can be scheduled in multiple regions simultaneously. The update completed successfully for programs AUTPSB2 and CDEBS, as shown by the completion code 0. The update failed for program BMP011 with completion code 2A, indicating that the SCHDTYPE(PARALLEL) attribute conflicts with the DOPT(Y) attribute already defined for program BMP011. The update fails for program BADNAME and for parameter BAD* with completion code 10, since program BADNAME does not exist and no program name starts with BAD.
**Example 2 for UPDATE PGM command**

TSO SPOC input:

```
UPD PGM NAME(PGM*,PGX) START(REFRESH)
```

TSO SPOC output:

<table>
<thead>
<tr>
<th>PgmName</th>
<th>MbrName</th>
<th>CC</th>
<th>CCText</th>
<th>RgnNum</th>
<th>RgnType</th>
<th>JobName</th>
</tr>
</thead>
<tbody>

<td>MPP</td>
<td>MPP4</td>
</tr>
<tr>
<td>PGMNBMPI</td>
<td>IMS1</td>
<td>225</td>
<td>Non message driven BMP region</td>
<td>10</td>
<td>BMP</td>
<td>BMP1</td>
</tr>
<tr>
<td>PGMY</td>
<td>IMS1</td>
<td>0</td>
<td></td>
<td>4</td>
<td>JMP</td>
<td>JMP1</td>
</tr>
<tr>
<td>PGX</td>
<td>IMS1</td>
<td>10</td>
<td>Name not found</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

OM API input:

```
OM API input:
CMD(UPD PGM NAME(PGM*) START(REFRESH))
```

**Explanation:** PGMA is scheduled in region IDs 1 and 3, and these regions are posted. PGMA1, which is scheduled in Region 2, cannot be refreshed because Region 2 is an IFP. PGMA2 is scheduled in Region 8, which is not PWFI and is not running a WFI=YES transaction, and thus is not posted. PGMB is not currently scheduled. PGMMPL1 is scheduled in MPP and is preloaded in DFSMPLxx PROCLIB member and thus is not posted. PGMNBMPI is scheduled in a non-message driven BMP, which is not posted. PGMY is scheduled in Region 4, which is processing work, and this region will be posted when the work is complete. PGX is not a valid program.

**Example 3 for UPDATE PGM command**

TSO SPOC input:

```
UPD PGM NAME(*) START(REFRESH)
```

TSO SPOC output:

<table>
<thead>
<tr>
<th>PgmName</th>
<th>MbrName</th>

OM API input:

```
OM API input:
CMD(UPD PGM NAME(*) START(REFRESH))
```

**Explanation:** Because OPTION(ALLRSP) is not specified with NAME(*), only the program names that are scheduled in PWFI regions or regions with WFI=YES transactions are returned. APGM1 is scheduled in region ID 6, and this region is posted. PGMA is scheduled in region IDs 1 and 3, which are posted. PGMA1 is scheduled in Region 2, which cannot be posted because it is an IFP. PGMA2 is scheduled in Region 8, which is not PWFI and is not running a WFI=YES transaction, and so this region is not posted. PGMY is scheduled in Region 4, which is processing work, and this region will be posted when the work is complete.

**Related concepts:**

Chapter 30. UPDATE commands 1217
UPDATE PGMDESC command

Use the UPDATE PGMDESC command to update program descriptors. A descriptor is a model that can be used to create descriptors or resources.

Updating a descriptor changes only the attributes explicitly specified on the UPDATE command. Attributes not specified retain their existing values. Any program resource or descriptor can be created using this descriptor as a model, by specifying the CREATE LIKE(DESC(descriptor_name)) command. Any descriptor or resource that was already created using this descriptor is not updated.

Subsections:

</table>
Table 517. Valid environments for the UPDATE PGMDESC command and keywords (continued)

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Syntax

```plaintext
UPDATE PGMDESC
  NAME(name)
  SET
    BMPTYPE(Y)
    DEFAULT(Y)
    DOPT(Y)
    FP(Y)
    GPSB(Y)
    LANG(ASSEM)
    RESIDENT(Y)
    SCHDTYPE(PARALLEL)
    TRANSTAT(Y)
  OPTION(ALLRSP)
```

Keywords

The following keywords are valid for the UPDATE PGMDESC command:

**NAME**

Specifies the 1-8 character name of the program descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the descriptor names that are processed. For NAME(*), command responses are returned only for the descriptor names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the descriptor names that are processed.

**OPTION**

Specifies additional functions to be performed along with the command.

**ALLRSP**

Indicates that the response lines are to be returned for all descriptors that are processed on the command. The default action is to return response lines only for the descriptors that resulted in an error. It is only valid with NAME(*). ALLRSP is ignored for other NAME values.
SET
Specifies the attribute values to be changed.

BMPTYPE
BMP type option. Specifies whether the program executes in a BMP type region or not. A BMP type region can be a BMP region or a JBP region.

PSBs scheduled by DB2 stored procedures, by programs running under WebSphere Application Server, and by other users of the ODBA interface may be defined with BMPTYPE Y or N.

Y The program executes in a BMP type region. It can execute in an IMS BMP region or a JBP region. Any associated transactions are assigned normal and limit priority values of zero.

N The program does not execute in a BMP type region. It may execute in an IMS TM MPP, JMP, or IFP region, or it may use either the ODBA or DRA interface. This specification should be used for programs running in IMS TM MPP, JMP, and IFP regions, or PSBs scheduled by CICS programs using DBCTL and other users of the DRA interface. This is the default.

Keyword combination rules include the following:
• BMPTYPE(Y) and FP(E) are mutually exclusive.

DEFAULT (Y)
Specifies this descriptor as the default, which resets the existing default descriptor to DEFAULT(N). When a descriptor or resource is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type. IMS defines a program descriptor called DFSDSPG1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor. Since only one program descriptor can be the default at one time, only one descriptor name can be specified with DEFAULT(Y).

DOPT
Specifies the dynamic option.

N The PSB associated with this program is not located dynamically. The control blocks for the PSB must exist in an ACBLIB or the IMS catalog, otherwise the program is set to a NOTINIT status, and cannot be scheduled.

Y The PSB associated with this program is located dynamically. Each time the program that is associated with this PSB is scheduled, the latest copy of the PSB is loaded. When the program terminates, the PSB is deleted from the PSB pool.

Until the PSB is required to process a transaction, the ACB for the PSB does not need to be in the ACBLIB or, if the IMS management of ACBs is enabled, in the IMS catalog. A new version of the PSB can be defined and added to the ACBLIB or the IMS catalog at any time. IMS loads the new version of the ACB the next time the PSB is scheduled.

A DOPT PSB cannot be scheduled if the control blocks for the DBDs that the PSB references are not in the ACBLIB or the IMS catalog.

Keyword combination rules include the following:
• DOPT(Y) and GPSB(Y) are mutually exclusive.
• DOPT(Y) and LANG(JAVA) is a valid combination.
• LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
• LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
• RESIDENT(Y) and DOPT(Y) are mutually exclusive.
• SCHDTYPE(PARALLEL) and DOPT(Y) are mutually exclusive.

FP Specifies the Fast Path option.

E The program is a Fast Path-exclusive application program. This implicitly defines a wait-for-input (WFI) application program. Either a transaction or a routing code that can be assigned by the user Input Edit/Routing exit routine must be defined for the Fast Path-exclusive application, in order for this program to be usable.

N The program is not a Fast Path-exclusive application program. When FP(N) is specified, any attempt to use Fast Path resources or commands will yield unpredictable results.

Keyword combination rules include the following:
• FP(E) requires Fast Path to be defined.
• LANG(JAVA) and FP(E) are mutually exclusive.
• BMPTYPE(Y) and FP(E) are mutually exclusive.

GPSB Specifies the generated PSB option.

N The PSB associated with the program is not generated by IMS. The control blocks for the PSB must exist in the ACBLIB or, if the IMS management of ACBs is enabled, in the IMS catalog, otherwise the program is set to a NOTINIT status, and cannot be scheduled.

Y The PSB and application control block (ACB) that are associated with the program are generated by IMS. The scheduling process of all environments generates a PSB that contains an I/O PCB and an alternate modifiable PCB.

You do not need to generate the PSB and ACB or submit DDL to define the PSB. The ACB for the PSB is not loaded from either ACBLIB or, if the IMS management of ACBs is enabled, the IMS catalog. Thus, I/O to retrieve the ACB from either the ACBLIB or the IMS catalog is eliminated.

The generated PSB contains an I/O PCB named IOPCBbbb and a modifiable, alternate PCB named TPPCB1bb. With an alternate modifiable PCB, an application can use the CHNG call to change the output destination and send output to a destination other than the input destination.

Keyword combination rules include the following:
• DOPT(Y) and GPSB(Y) are mutually exclusive.
• DOPT(Y) and LANG(JAVA) is a valid combination.
• GPSB(Y) requires LANG.
• LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
• LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
• RESIDENT(Y) and GPSB(Y) are mutually exclusive.
**LANG**

Specifies the language interface of the application program for a GPSB.

The LANG parameters and their meanings are identified in the following table.

<table>
<thead>
<tr>
<th>LANG parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ASSEM</td>
<td>Assembler</td>
</tr>
<tr>
<td>COBOL</td>
<td>COBOL</td>
</tr>
<tr>
<td>JAVA</td>
<td>Java</td>
</tr>
<tr>
<td>PASCAL</td>
<td>Pascal</td>
</tr>
<tr>
<td>PLI</td>
<td>PL/I</td>
</tr>
</tbody>
</table>

Keyword combination rules include the following:
- LANG is invalid with GPSB(N), except if DOPT(Y) and LANG(JAVA).
- DOPT(Y) and LANG(JAVA) is a valid combination.
- LANG(JAVA), DOPT(Y), and GPSB(N) is a valid combination.
- FP(E) and LANG(JAVA) are mutually exclusive.

**RESIDENT**

Specifies the resident option.

- **N** The PSB associated with the program is made to be not resident in storage. The PSB is loaded at scheduling time.
- **Y** The PSB associated with the program is made to be resident in storage immediately. IMS loads the PSB and initializes it. The PSB is removed from the PSB pool, if applicable. A resident PSB is accessed in local storage, which eliminates I/O to retrieve the ACB.

Keyword combination rules include the following:
- DOPT(Y) and RESIDENT(Y) are mutually exclusive.
- GPSB(Y) and RESIDENT(Y) are mutually exclusive.

**SCHDTYPE**

Specifies whether this application program can be scheduled into more than one message region or batch message region simultaneously.

- **PARALLEL** The application program can be scheduled in multiple regions simultaneously.
- **SERIAL** The application program can be scheduled in only one region at a time.

Updating this attribute to SCHDTYPE(SERIAL) is rejected if a transaction referencing this program is defined with a parallel limit count other than 65535.

Keyword combination rules include the following:
- DOPT(Y) and SCHDTYPE(PARALLEL) are mutually exclusive.

**TRANSTAT**

Specifies whether transaction level statistics should be logged. The value
specified has meaning only if the program is a JBP or a non-message driven BMP. If Y is specified, transaction level statistics are written to the log in a X'56FA' log record.

N  Transaction level statistics should not be logged.

Y  Transaction level statistics should be logged.

The TRANSTAT keyword on the UPDATE PGMDESC command gives the user the ability to override the system default or the current value of the TRANSTAT parameter. If the TRANSTAT keyword is omitted on the UPDATE PGMDESC command, the current transaction level statistics setting is unchanged for the program.

Usage notes

If all the attributes specified by the UPDATE command are already defined for the descriptor, no update is actually made, no descriptors are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

Descriptors exist for the life of the IMS unless they are deleted using a DELETE command. Descriptors are recoverable across an IMS warm start or emergency restart. Descriptors are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

The UPDATE PGMDESC command can be issued only through the OM API. This command applies to DB/DC, DBCTL and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE PGMDESC commands are not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). This command is recoverable.

If the descriptor is the IMS-defined program descriptor (DFSDSPG1) the only attributes that can be updated are the DEFAULT (SET(DEFAULT(Y))) and the TRANSTAT (SET(TRANSTAT(Y | N))) attributes.

Each descriptor is updated individually. Individual updating does not work like online change where either all descriptors are updated or no descriptors are updated.

Output fields

The following table shows the UPDATE PGMDESC output fields. The columns in the table are as follows:

Short label
Contains the short label generated in the XML output.

Keyword
Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

Meaning
Provides a brief description of the output field.
Table 518. Output fields for the UPDATE PGMDESC command

</cmdrsp>

Chapter 30. UPDATE commands 1227
Explanation: Update all program descriptors to be BMPTYPE(Y). The update completed successfully for most program descriptors, as shown by completion code 0. The update failed for IMS-defined descriptor DFSDSPG1 with completion code 48, because the only attribute that can be updated for DFSDSPG1 is DEFAULT(Y). The update failed for program descriptor FPEDESC with completion code 2F, because the BMPTYPE(Y) attribute conflicts with the Fast Path exclusive FP(E) attribute already defined for program descriptor FPEDESC.

- “Output fields” on page 1232
- “Return, reason, and completion codes” on page 1233
- “Examples” on page 1235

**Environment**

The following table lists the environments (DB/DC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>UPDATE POOL</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>MEMBER</td>
<td>X</td>
<td>X</td>
<td></td>

<tr>
<td>SECTION</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>SET</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>TYPE</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
</tbody>
</table>

Restriction: The dynamic database buffer pools function is not supported in a DBCTL warm standby environment.
Syntax

```
UPDATE POOL
  TYPE(DBAS)  SECTION(OSAMxxx)
  MEMBER(xxx)
  VSAMxxx
  VSAMxxx(FOBP64)
  SET(LIMIT(xxxxx))
```

Keywords

The following keywords are valid for the UPDATE POOL command:

**TYPE()**

This required keyword specifies which type of UPDATE POOL command to issue.

**DBAS**

This option specifies that the command dynamically adds, updates, or deletes OSAM or VSAM subpools. TYPE(DBAS) is mutually exclusive with other options on the TYPE() keyword. The command is rejected with a syntax error if multiple options are specified.

The UPDATE POOL TYPE(DBAS) command is not valid for DCCTL environments.

**FPBP64**

This option specifies that the command sets or changes values for storage used by the Fast Path 64-bit buffer manager. TYPE(FPBP64) is mutually exclusive with other options on the TYPE() keyword. The command is rejected with a syntax error if multiple options are specified.

**SET()**

Specifies the attribute values to be changed. This keyword is valid only if TYPE(FPBP64) is specified.

**LIMIT**

Specifies the maximum amount of 64-bit storage used by the Fast Path 64-bit buffer manager.

`xxxxx`

You can specify the value in bytes, kilobytes, or megabytes, as follows:

- `xxxxx` - Value in bytes. The maximum value is 2,147,483,647 bytes.
- `xxxxxK` - Value in kilobytes. The maximum value is 2,097,151 KB.
- `xxxxxM` - Value in megabytes. The maximum value is 2,047 MB.

The valid range is between 2GB-1 megabytes and the initial size of the buffer pool at IMS startup.

You can also set this value at IMS startup by specifying the parameter FPBP64M on the DFSDFxxx member of the IMS PROCLIB data set.

**MEMBER(xxx)**

This keyword is valid only if TYPE(DBAS) is specified. It is optional. The `xxx` on the MEMBER keyword specifies a 1- to 3-alphanumeric character value that represents the suffix to a DFSDFxxx member name. The identified DFSDFxxx member is read in and parsed for OSAM and VSAM subpool definitions. If the
keyword is not specified, the DFSDFxxx member specified by the DBA on system initialization is used as the default. The DFSDFxxx member specified on system initialization can be determined from message DFS1929I on the system console or log. The command fails if the MEMBER keyword is specified with an invalid xxx value or if the DFSDFxxx member is not found.

**Note:** This keyword is optional and by default the command will always refer to the DFSDFxxx member specified on system initialization. Normally the DFSDFxxx member specified on system initialization should be the only one available. The purpose of this keyword is to allow the capability to have the command point to an alternate DFSDFxxx member (different from the system default) for test purposes. In other cases, the MEMBER keyword is expected to be omitted.

**SECTION()**

This keyword is valid only if TYPE(DBAS) is specified. It is required if TYPE(DBAS) is specified. This keyword specifies the section names in the DFSDFxxx member to read in for subpool definitions. It must be followed with a valid section name. One or both of the following section name types can be specified with this keyword:

- **OSAMxxx**
  
  Specifies the OSAM section in the DFSDFxxx member to read and process. The xxx value is the 1- to 3-alphanumeric character suffix of the OSAM section name. The indicated OSAM section must exist in the DFSDFxxx member and must contain valid OSAM subpool definition statements. Only one OSAM section name can be specified on the command.

- **VSAMxxx**
  
  Specifies the VSAM section in the DFSDFxxx member to read and process. The xxx value is the 1- to 3-alphanumeric character suffix of the VSAM section name. The indicated VSAM section must exist in the DFSDFxxx member and must contain valid VSAM subpool definition statements. Only one VSAM section name can be specified on the command.

If you are reassigning the DBD association (for example, changing a database data set association from one subpool to another subpool), you must stop and restart the database. The reason for the stop and restart is that the subpool assignment is done during data set open time.

**Usage notes for UPDATE POOL TYPE(FPBP64)**

The value that can be changed by the UPDATE POOL TYPE(FPBP64) SET(LIMIT(xxxxx)) command is not recoverable.

Enter the UPDATE POOL TYPE(FPBP64) SET(LIMIT(xxxxx)) command after an IMS restart, if needed. Because this command updates the value set by FPBP64M in the DFSDFxxx member, you might want to update FPBP64M with a new value before IMS cold restart.

**Usage notes for UPDATE POOL TYPE(DBAS)**

*Determination of success, failure, or partial success of the command*

There can be multiple change requests in the OSAMxxx or VSAMxxx sections of the DFSDFxxx member of the IMS PROCLIB data set. The UPDATE POOL
TYPE(DBAS) command processes the change requests serially. When the UPDATE POOL TYPE(DBAS) command is completed, the results can be success, failure, or partial success.

The UPDATE POOL TYPE(DBAS) command cannot be canceled or aborted after it is issued.

The command can complete either before or after the TSO SPOC timeout occurs:
- If it completes before the TSO SPOC timeout occurs, the results are shown in the TSO SPOC with completion codes next to each requested change indicating success, failure, or partial success of the request.
- If it completes after the TSO SPOC timeout occurs, the command continues to run in the background. The TSO SPOC is no longer available to display the completion codes for each change requested by the command.

A series of targeted QUERY POOL TYPE(DBAS) commands can be issued to determine the success or failure of the requested changes.

You can also use the QUERY POOL TYPE(DBAS) command after an emergency restart to determine the success or failure of the requested changes.

It is also possible to use the Operations Manager (OM) audit trail to determine which changes succeed, which changes fail, and which changes succeed partially. The token rqsttkn1 can be used to associate the commands in the OM audit trail to the command responses.

**Command completion if storage is unavailable**

There are circumstances where the storage requested by the UPDATE POOL TYPE(DBAS) command cannot be satisfied. Because IMS cannot cancel or abort the command, it attempts to find the next best solution to satisfy the command, which means the command might result in less storage being allocated for the requested subpool change.

When the storage requested by the UPDATE POOL TYPE(DBAS) command cannot be satisfied, both OSAM and VSAM make a sequence of attempts to find a smaller amount of storage.

If a reduced amount of buffer pool storage is allocated as a result of the UPDATE POOL TYPE(DBAS) command, an X'EC' completion code is displayed to indicate the condition.

The minimum number of buffers for a VSAM buffer pool is 3. If a VSAM pool cannot allocate this minimum number of buffers, the databases that are using this pool are left without a buffer assignment. An internal /DBRECOVERY command is issued for all these databases. The UPD POOL command must be issued again to create the buffer pools. A subsequent /STA DB command must be issued to reestablish the buffer pool connection.

**Effect of long-running BMPs on the command**

For VSAM, a long-running batch message processing (BMP) program that does not take any checkpoint can affect the ability of the command to complete, since the command cannot be canceled or aborted. Either the subpool is eventually freed up by the BMP and the command can complete, or the subpool is not freed up by the BMP and the command waits indefinitely for the subpool to become available for the change. This effect applies to any subpool in the same VSAM local shared resource pool (that is, under the same POOLID statement).
OSAM and VSAM have different mechanisms for freeing up the target subpool. In general, OSAM waits for the target subpool to become unowned, while VSAM waits for DL/I activity for the target subpool to reach commit points. Since there is no timeout for this command, all partition specification tables (PSTs) with subpools affected by this command wait until the command completes.

Spreading database data sets across many subpools tends to lessen the impact of a change to any one of these subpools.

**Buffer pool statistics and database data set reassignment**

Buffer pool statistics are handled differently for VSAM and for OSAM following an UPDATE POOL TYPE(DBAS) command. For VSAM, the buffer pool statistics are reset and the old statistics are not carried over. It is advisable to issue a QUERY POOL command for the VSAM buffer pool statistics before issuing the command. The OSAM statistics are carried over and are not reset with the command.

When a database data set is reassigned from one buffer pool to a different buffer pool, the database data set must be closed and reopened. For OSAM, the closing and reopening of the database data set must be done explicitly. In other words, it is not performed as part of the command. For VSAM, the database data set must also be closed and reopened. However, if there is a corresponding change to the target buffer pool along with the reassignment of the database data set (for example, an increase in buffers), then the closing and opening of the database data set is done implicitly by the command.

**Output fields**

The following table shows the UPDATE POOL output fields. The columns in the table are as follows:

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>SHOW parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUFS</td>
<td>BufSize</td>
<td>Error</td>
<td>Buffer size</td>
</tr>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code. The completion code indicates whether IMS was able to process the command for the specified resource. The completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCText</td>
<td>Error</td>
<td>Completion code text that briefly explains the nonzero completion code. This field is returned only for an error completion code.</td>
</tr>
</tbody>
</table>

Table 522. Output fields for the UPDATE POOL command
Table 522. Output fields for the UPDATE POOL command (continued)

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>SHOW parameter</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERRT</td>
<td>ErrorText</td>
<td>Error</td>
<td>Error text with diagnostic information. Error text can be returned for a nonzero completion code and contains information that further explains the completion code.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>ID</th>
<th>PoolId</th>
<th>Error</th>
<th>OSAM subpool or VSAM shared pool ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>The IMSplex member that built the output line. The IMS identifier of the IMS for which the database information is displayed. The IMS identifier is always returned.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>SEC</th>
<th>Section</th>
<th>Error</th>
<th>Section of the DFSDFxxx member that is processed</th>
</tr>
</thead>
<tbody>
<tr>
<td>STMT</td>
<td>Stmt</td>
<td>Error</td>
<td>OSAM or VSAM definition statement</td>
</tr>
</tbody>
</table>

The following are examples of the output headers for the UPDATE POOL TYPE(DBAS) command:

- Output headers for a successful UPDATE POOL TYPE(DBAS) command:
  ```
  Section  MbrName CC
  """
  ````
- Output headers for the UPDATE POOL TYPE(DBAS) command with errors:
  ```
  Section  MbrName CC CText Stmt  BufSize PoolId  ErrorText
  """

Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

Table 523. Return and reason codes for the UPDATE POOL command

<table>
<thead>
<tr>

| EC              | REDUCED BUFFER ALLOCATION             | Unable to allocate the number of buffers specified. A reduced number of buffers is used.                                             |
| ED              | MINIMUM BUFFER ALLOCATION             | Unable to allocate the number of buffers specified. The minimum number of buffers is used.                                         |
| 1C0             | POOLID ERROR IN DFSDF MEMBER          | Unable to process the POOLID statement in the DFSDFxxx member of the IMS PROCLIB data set. Refer to the ErrorText column in the command output for further information on the error. |
| 1C1             | DBD ERROR IN DFSDF MEMBER             | Unable to process the DBD statement in the DFSDFxxx member of the IMS PROCLIB data set. Refer to the ErrorText column in the command output for further information on the error. |

Examples

The following are examples of the UPDATE POOL command:

**Example 1 for UPDATE POOL command**

TSO SPOC input:

```sql
UPD POOL TYPE(FPBP64) SET(LIMIT(1000M))
```

TSO SPOC output:

```
Pool Type  MbrName  CC
FPBP64    SYS3     0
```

OM API input:

```sql
CMD(UPD POOL TYPE(FPBP64) SET(LIMIT(1000M)))
```

OM API output:

```
<imsout>
<ctl>
<omname>OM1OM </omname>
<omvsn>1.4.0</omvsn>
<xmlvsn>20 </xmlvsn>
<statime>2008.318 21:54:49.340430</statime>
```
Explanation: The buffer usage limit for the Fast Path 64-bit buffer manager was changed to 1000M (1 GB) and the command ended successfully.

Example 2 for UPDATE POOL command

TSO SPOC input:
UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAM001,VSAMTUE)

TSO SPOC output:
Section MbrName CC
OSAM001 IMS1 0
VSAMTUE IMS1 0

Explanation: This is an example of a successful invocation of the UPDATE POOL command to dynamically reconfigure OSAM and VSAM subpools using the OSAM001 and VSAMTUE sections of the DFSDFxxx member.

Example 3 for UPDATE POOL command

TSO SPOC input:
UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAM001,VSAMTUE)

TSO SPOC output:
Section MbrName CC CCText Stmt BufSize PoolID ErrorTxt
OSAM001 IMS1 8 COMMAND COMPLETE FOR SOME IOBF 1024 OSM2 PARSED ENTRY INV
OSAM001 IMS1 11 RESOURCE ALREADY EXISTS IOBF 1024 OSM2 PARSED ENTRY INV
VSAMTUE IMS1 0

Explanation: This is an example of a partially successful invocation of the UPDATE POOL command to dynamically reconfigure OSAM and VSAM subpools
using the OSAM001 and VSAMTUE sections of the DFSDFxxx member. Some (but not all) of the definitions within the OSAM001 section were successfully implemented.

**Example 4 for UPDATE POOL command**

TSO SPOC input:

```
UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAM123,VSAM123)
```

TSO SPOC output:

```
Section MbrName CC CCText Stmt BufSize PoolID ErrorTxt
OSAM123 IMS1 0
VSAM123 IMS1 0 COMMAND COMPLETE FOR NONE
```

**Explanation:** This is an example of a failed invocation of the UPDATE POOL command to dynamically reconfigure OSAM and VSAM subpools using the OSAM123 and VSAM123 sections of the DFSDFxxx member. None of the definitions within the VSAM123 section were successfully implemented.

**Example 5 for UPDATE POOL command**

TSO SPOC input:

```
UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAMFEB,VSAMFEB)
```

TSO SPOC output:

```
Log for . . . : UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAMFEB,VSAMFEB)

IMSplex . . . : PLEX1
Routing . . . . : 
Return code . . : 0200000C
Reason code . . : 00003004
Reason text . . : No requests were successful.
Command master . : IMS1

MbrName Return Reason Reason text
-------- -------- -------- ---------------
IMSm1 00000008 0000212B Invalid section
```

**Explanation:** This is an example of a failed invocation of the UPDATE POOL command to dynamically reconfigure OSAM and VSAM subpools using the OSAM123 and VSAMTUE sections of the DFSDFxxx member. A failure occurred because invalid section names were specified when issuing the UPDATE POOL command.

**Example 6 for UPDATE POOL command**

TSO SPOC input:

```
UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAM001,VSAMTUE)
```

TSO SPOC output:
Log for . . : UPDATE POOL TYPE(DBAS) MEMBER(001) SECTION(OSAM001,VSAMTUE)

IMSplex . . . . : PLEX1
Routing . . . . . :
Return code . . : 0200000C
Reason code . . : 00003000
Reason text . . : None of the clients were successful.
Command master. . : IMS1

<table>
<thead>
<tr>
<th>MbrName</th>
<th>Return Code</th>
<th>Reason Code</th>
<th>Reason text</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>00000000</td>
<td>000212C</td>
<td>PDS member read error</td>
</tr>
</tbody>
</table>

MbrName Messages
--------- -----------------------
IMS1 BPE0003E AN ERROR OCCURRED PARSING PROCLIB MEMBER DFSDF001
IMS1 BPE0003E AT LINE 29, CHARACTER 14
IMS1 BPE0003E FAILING TEXT: "VARBF=(2048,9,D)"
IMS1 BPE0003E INVALID KEYWORD DETECTED

Explanation: This is an example of a failed invocation of the UPDATE POOL command to dynamically reconfigure OSAM and VSAM subpools using the OSAM001 and VSAMTUE sections of the DFSDFxxx member. A parsing error occurred while reading the DFSDFxxx member.

Example 7 for UPDATE POOL command

TSO SPOC input:
UPDATE POOL TYPE(DBAS) SECTION(OSAM123) MEMBER(001)

TSO SPOC output:
Log for . . : UPDATE POOL TYPE(DBAS) SECTION(OSAM123) MEMBER(001)

IMSplex . . . . : PLEX1
Routing . . . . . :
Return code . . : 00000000
Reason code . . : 00000000
Reason text . . :
Command master. . : IMS1

<table>
<thead>
<tr>
<th>MbrName</th>
<th>Messages</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMS1</td>
<td>DFS3127I WRITE ERROR OCCURRED ON THE RESTART DATA SET</td>
</tr>
</tbody>
</table>

Explanation: This is an example of a failed invocation of the UPDATE POOL command to dynamically reconfigure OSAM subpools using the OSAM123 section of the DFSDFxxx member. A write error occurred on the restart data set (RDS).

Example 8 for UPDATE POOL command

TSO SPOC input:
UPDATE POOL TYPE(DBAS) SECTION(VSAM003)

TSO SPOC output:
Section MbrName CC CCText Stmt BufSize PoolId ErrorText
-------- ------ ---- ----------- ------ ------- ---------
VSAM003 IMS1  8 COMMAND COMPLETE FOR SOME
VSAM003 IMS1  8 COMMAND COMPLETE FOR SOME VSRBF 1024 VSM2 DUP

Explanation: This is an example of a successful invocation of the UPDATE POOL command to dynamically reconfigure VSAM subpools using the VSAM003 section of the DFSDFxxx member. IMS received condition code 8 for one of the POOLID statements for VSM2, because a duplicate VSRBF was specified under the same POOLID. The rest of the statements are still processed. Condition code 8 is treated as a warning message in this situation.

Example 9 for UPDATE POOL command

Specification in DFSDFxxy member:

```
<SECTION=OSAM001>
IOBF=(512,100,N,N)
IOBF=(1024,1000,N,Z,OSM1,Y)
IOBF=(2048,5000,Y,Y,OSM2,A)
IOBF=(4096,5000,N,Y,OSM3,N)
IOBF=(32K,32767,N,N,OSM9,N)
```

TSO SPOC input:
UPDATE POOL TYPE(DBAS) SECTION(OSAM001) MEMBER(XYZ)

TSO SPOC output:
Log for . . . : UPDATE POOL TYPE(DBAS) SECTION(OSAM001) MEMBER(XYZ) More: >

```
IMSPlex . . . . : PLEX1
Routing . . . . : 
Return code . . . : 02000008
Reason code . . . : 00002004
Reason text . . . : Invalid command keyword or invalid command keyword combination
Command master. . :
```

```
IMSM1 Messages
-------- --------------
IMS1 BPE0003E AN ERROR OCCURRED PARSING PROCLIB MEMBER DFSDFXYZ
IMS1 BPE0003E AT LINE 22, CHARACTER 18
IMS1 BPE0003E FAILING TEXT: "Z,OSM1,Y) "
IMS1 BPE0003E UNKNOWN KEYWORD VALUE DETECTED
```

Explanation: In this example, the OSAM001 section in the DFSDFXYZ member is parsed on invocation of the UPDATE POOL command. An invalid option of “Z” is specified for the second IOBF statement in the DFSDFXYZ member.

UPDATE RM command

Use the UPDATE RM command to enable or disable Resource Manager (RM) to use the IMSRSC repository dynamically.

Subsections:
- “Environment”
- “Syntax”
- “Keywords”
- “Usage notes” on page 1242
- “Output fields” on page 1243
- “Return, reason, and completion codes” on page 1243
- “Examples” on page 1246

Environment

The UPDATE RM command is processed by the Common Service Layer (CSL) RM address space.

Syntax

```
UPDATE RM TYPE(REPO) REPTYPE(IMSRSC)
```

Keywords

The following keywords are valid for the UPDATE RM command:
TYPE
Specifies the resource type to be updated. The only valid value is REPO.

REPO
Specifies the repository type to be updated. The only valid value is IMSRSC.

SET
Specifies the parameters to be modified.

AUDITACCESS
Specifies the repository audit access level for the specified repository. It can be specified with REPO(Y) to set a different AUDITACCESS value than the default or to change the AUDITACCESS level for the IMSplex.

If the SET(AUDITACCESS()) keyword is specified with REPO(Y) and the Repository Server (RS) does not have AUDIT LOG defined (AUDIT=YES is not specified in the FRPCFG PROCLIB member), the AUDITACCESS(x) value specified is ignored and the AUDITACCESS at RM is set to NOAUDIT. If the SET(AUDITACCESS()) keyword is specified without REPO(Y) and the RS does not have AUDIT LOG defined, the command results in an error reason code.

If the RS is defined with AUDIT LOG (AUDIT=YES), the specified AUDITACCESS value overrides the default audit access level set by the AUDIT_DEFAULT= keyword in the FRPCFG member of the IMS PROCLIB data set. The values that can be specified are:

- DEFAULT
  Sets the audit access level to the value specified with the AUDIT_DEFAULT parameter in the FRPCFG member.

- NOAUDIT
  No auditing of member access.

- SECURITY
  Audit security failures only.

- UPDATE
  Audit member access with update intent.

- READ
  Audit member access with read or update intent. Under an audit access rule of READ, system read requests do not cause a read audit record to be generated.

- SYSTEMREAD
  Audit member access with system-level read, read, or update intent. A read of the resource definition by the system before the update request is identified as a system read request. Under an audit access rule of SYSTEMREAD, all read requests, including system read requests, are audited.

REPO
Specifies the repository attribute to be modified.

- Y
  Updates RM to use the repository for the specified repository type.

  The RM initialization PROCLIB member (CSLRRIxxx), which is used during RM initialization and specified by the RM startup parameter RMINIT=, is to be reread to obtain the REPOSITORY= specifications for the TYPE(Immsrsc) repository.
The REPOSITORY section in the CSLRIxxx member, which is specified on the RM startup parameter RMINIT=, must be updated with any changes before the UPDATE RM command is issued.

The command master RM rereads the REPOSITORY section in the CSLRIxxx member for the TYPE(IMSRSC) repository. During command processing, RM registers to the Repository Server (RS) if RM is not already registered. RM connects to the repository whose name is specified in the REPOSITORY section of the CSLRIxxx member.

If the command is successful at the command master RM, the command master RM communicates the changes to other active RMs in the IMSplex. All RMs in the IMSplex will have the same repository settings.

CSL25xxx messages are displayed on the system console at both the command master and the non-master RMs. Any error messages such as CSL2510E or CSL2511E are also sent to the OM API that issued the UPDATE RM command.

If RM is defined to use the resource structure, the command master RM updates the resource structure with the repository name and repository type that it is connected to. Subsequent RMs that are restarted after the change ensure that they are connected to the same repository name and repository type as read from the resource structure.

**N** Updates RM to not use the repository for the specified repository type. RM disconnects from the repository specified for the repository type.

If the command is successful at the command master RM, the command master RM communicates the changes to other active RMs in the IMSplex. All RMs in the IMSplex will have the same repository settings.

CSL25xxx messages are displayed on the system console at both the command master and the non-master RMs. Any error messages such as CSL2510E or CSL2511E are also sent to the OM API that issued the UPDATE RM command.

If RM is defined to use the resource structure, the command master RM updates the resource structure to remove the repository name and repository type. If RM is not connected to any repository, it deregisters from the Repository Server.

The RMINIT parameter or the CSLRIxxx member is not read during the UPDATE RM SET(REPO(N)) processing.

You must modify the CSLRIxxx member to remove the REPOSITORY= statement for the repository type before, or right after, the UPDATE RM SET(REPO(N)) command is issued. If the REPOSITORY= statement is not removed and an RM is started after the UPDATE RM SET(REPO(N)) command is issued, all RMs in the IMSplex will be reconnected to the repository during the RM startup.

**Usage notes**

The UPDATE RM command can be specified only through the Operations Manager (OM) API.
The UPDATE RM command is defined as ROUTE=ANY to OM. The command is processed by the command master RM that receives the command. The command specifies that the specified section within a PROCLIB member be reread and reprocessed.

**Output fields**

The following table shows the UPDATE RM output fields. The columns in the table are as follows:

- **Short label**
  - Contains the short label generated in the XML output.

- **Long label**
  - Contains the long label generated in the XML output.

- **Keyword**
  - Identifies the keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned.

- **Meaning**
  - Provides a brief description of the output field.

*Table 525. Output fields for UPDATE RM command*

<table>
<thead>
<tr>
<th>Short label</th>
<th>Long label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>CC</td>
<td>N/A</td>
<td>Completion code for the line of output. Completion code is always returned.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>CCTX</td>
<td>N/A</td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>MbrName</td>
<td>N/A</td>
<td>Resource Manager name.</td>
</tr>
<tr>
<td>REPONM</td>
<td>RepositoryName</td>
<td>N/A</td>
<td>Repository name.</td>
</tr>
<tr>
<td>REPOTYPE</td>
<td>RepositoryType</td>
<td>N/A</td>
<td>Repository type.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

An IMS return and reason code is returned to OM by the UPDATE RM command. The OM return and reason codes that might be returned as a result of the UPDATE RM command are standard for all commands entered through the OM API.

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.

*Table 526. Return and reason codes for the UPDATE RM command*

</ctl>
</imsout>

Chapter 30. UPDATE commands 1247
Explanation: The UPDATE RM SET(REPO(Y)) command for the repository is processed by the command master RM RM3. The command response indicates that the repository is enabled successfully at the command master RM. Additionally, because RM is using the resource structure, the command response indicates that the resource structure is updated to indicate that the repository is enabled in the IMSplex and that a directive was sent to RM1 and RM2, the other RMs in the IMSplex, to have them enable the repository. You can issue the QUERY RM command to ensure that the repository is enabled at all RMs in the IMSplex.

Example 2 for UPDATE RM command

TSO SPOC input:
UPDATE RM TYPE(REPO) REPOTYPE(IMSRSC) SET(AUDITACCESS(UPDATE))

TSO SPOC output:
RepositoryType MbrName CC RepositoryName
IMSRSC RM3RM 0 IMSRC_REPOSITORY

OM API input:
CMD(UPDATE RM TYPE(REPO) REPOTYPE(IMSRSC) SET(AUDITACCESS(UPDATE)) )

OM API output:
<imsout>
<ctl>
<omname>OM1OM</omname>
<omvsn>1.5.0</omvsn>
<xmlvsn>20</xmlvsn>
<statime>2011.187 17:01:05.705662</statime>

<cmd>
<mbr name="RM2RM ">
<typ>RM </typ>
<styp>MULTRM </styp>
<rc>02000004</rc>
<rsn>00001000</rsn>
<rsntxt>Command not routed to this command processing client. Client is not master.</rsntxt>
</mbr>
</cmderr>
</cmd>

<master>RM3RM </master>
<userid>USRT005 </userid>
<verb>UPD </verb>
<kwd>RM </kwd>
<input>UPDATE RM TYPE(REPO) REPOTYPE(IMSRSC) SET(AUDITACCESS(UPDATE))</input>
</cmd>
</cmdrsphdr>
Explanation: The UPDATE RM SET(AUDITACCESS()) command is processed by the command master RM RM3. The command response indicates that the auditaccess value was updated in the repository to be used for subsequent audit requests. Additionally, because RM is using the resource structure, the command response indicates that the audit access value was updated in the resource structure and that a directive was sent by RM3 to RM1 and RM2, the other active RMs in the IMSplex, to update their audit access values.

Example 3 for UPDATE RM command

TSO SPOC input:
UPD RM TYPE(REPO) REPOTYPE(IMSRC) SET(REPO(N))

TSO SPOC output:
RepositoryType MbrName CC RepositoryName
IMSRC RM3RM 0 IMSRC_REPOSITORY

OM API input:
CMD(UPD RM TYPE(REPO) REPOTYPE(IMSRC) SET(REPO(N)) )

OM API output:

<rc>00000000</rc>
<rsn>00000000</rsn>
</ctl>
</imsout>
Explanation: The UPDATE RM SET(REPO(N)) command for the repository is processed by the command master RM RM3. The command response indicates that the repository is no longer enabled at the command master RM. Additionally, because RM is using the resource structure, the command response indicates that the resource structure is updated to indicate that the repository is not enabled in the IMSplex and that a directive was sent to the other RMs to have them disable their usage of the repository.

### UPDATE RTC command

Use the UPDATE RTC command to update Fast Path routing codes. A Fast Path routing code can be used by the Fast Path Input Edit/Routing Exit Routine (DBFHAGU0) to route a transaction to a different application program for processing.

**Subsections:**
- “Environment” on page 1251
- “Syntax” on page 1251
Environment

The following table lists the environments (DB/BC, DBCTL, and DCCTL) in which you can use the commands and keywords.

<table>
<thead>
<tr>
<th>Command / Keywords</th>
<th>DB/DC</th>

<td>X</td>
</tr>
</tbody>
</table>

Syntax

Keywords

The following keywords are valid for the UPDATE RTC command:

**NAME**

Specifies the 1-8 character name of the routing code. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the resource names that are processed. For NAME(*), command responses are returned only for the resource names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the resource names that are processed.

**OPTION**

Specifies additional functions to be performed along with the command.
**ALLRSP**
Indicates that the response lines are to be returned for all resources that are processed on the command. The default action is to return response lines only for the resources that resulted in an error. It is only valid with NAME(*). ALLRSP is ignored for other NAME values.

**SET**
Specifies the attribute values to be changed.

**INQ**
Specifies the inquiry option.

- **N**  This is not an inquiry routing code.
- **Y**  This is an inquiry routing code. Any message associated with the routing code is an inquiry transaction. This option should be specified only for programs that do not cause a change to a database. Programs are prohibited from issuing Insert, Delete, or Replace calls to a database when processing an inquiry transaction.

Updating this attribute quiesces the routing code for the duration of command processing.

**PGM**
The name of the application program associated with the routing code. The program must exist and be defined with a BMPTYPE of N.

Updating this attribute quiesces the routing code for the duration of command processing.

**START**
Specifies attributes that are to be started.

- **Q**  Starts queuing of messages.

**STOP**
Specifies attributes that are to be stopped.

- **Q**  Stops queuing of messages.

**Usage notes**
Resources exist for the life of the IMS unless they are deleted using a DELETE command. Resources are recoverable across an IMS warm start or emergency restart. Resources are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

The UPDATE RTC command can be issued only through the OM API. Fast Path must be installed on the system. This command applies to DB/DC and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE RTC commands specified with SET() are not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). This command is recoverable.

The UPDATE RTC command changes a MODBLKS routing code to dynamic, if the INQ or PGM attribute is changed.

Each routing code is updated individually, unlike the online change process where either all routing codes are updated or no routing codes are updated. The runtime resource definition for a routing code can be updated only if the routing code is
not in use. If the routing code is in use, the update fails. An exception to this rule is status. You can update the status of a routing code while it is in use. In a sysplex environment, the update might succeed on some IMS systems and fail on others. In order to maximize the likelihood that the update will succeed, perform the following steps before attempting the update:

- Check for work in progress with a QRY RTC SHOW(WORK) command and either wait for the work to finish or address the work in progress. See the output fields for the QUERY RTC command for examples of work that might cause the delete to fail. Examples of work include a command in progress for the routing code or the routing code is active.
- The routing code cannot be updated if the program is scheduled. If the program is scheduled, you must stop the region before you issue the UPDATE RTC command.

Runtime resource definition attributes include the following: INQ and PGM. If all the attributes specified by the UPDATE command are already defined for the resource, no update is actually made, no resources are quiesced, no log record is created, and a completion code of zero is returned.

The following routing code attributes cannot be updated if online change for MODBLKS is enabled: INQ, PGM.

**Output fields**

The following table shows the UPDATE RTC output fields. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code.</td>
</tr>
<tr>
<td>CCTXT</td>
<td>error</td>
<td>Completion code text that briefly explains the non-zero completion code.</td>
</tr>
<tr>
<td>ERRT</td>
<td>error</td>
<td>Error text with diagnostic information. Error text can be returned for a non-zero completion code and contains information that further explains the completion code.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>IMSplex member that built the output line.</td>
</tr>
<tr>
<td>RTC</td>
<td>RTC</td>
<td>Routing code name.</td>
</tr>
</tbody>
</table>

**Return, reason, and completion codes**

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 530. Return and reason codes for the UPDATE RTC command

<table>

<input>UPD RTC NAME(BADNAME,FPTRN02,SMQFP7*,BAD*) SET(PGM(DBFSAMP3))</input>
</cmd>
</cmdrsphdr>
</cmdrspdata>
Explanation: The UPDATE RTC command is issued to update the program for several routing codes. The update completed successfully for most of the routing codes, as shown by completion code 0. The update fails for routing code BADNAME and for parameter BAD* with completion code 10 because routing code BADNAME does not exist and no routing code name starts with BAD.

**UPDATE RTCDESC command**

Use the UPDATE RTCDESC command to update Fast Path routing code descriptors.

A descriptor is a model that can be used to create descriptors or resources. Updating a descriptor changes only the attributes explicitly specified on the UPDATE command. Attributes not specified retain their existing values. Any routing code resource or descriptor can be created using this descriptor as a model, by specifying the CREATE LIKE(DESC(descriptor_name)) command. Any descriptor or resource that was already created using this descriptor is not updated.

Chapter 30. UPDATE commands
Syntax

```plaintext
UPDATE
  RTCDESC
  NAME(name)
  SET(DEFAULT(Y))
  INQ(N)
  PGM(name)
  OPTION(ALLRSP)
```

Keywords

The following keywords are valid for the UPDATE RTCDESC command:

**NAME**

Specifies the 1-8 character name of the routing code descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the descriptor names that are processed. For NAME(*), command responses are returned only for the descriptor names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the descriptor names that are processed.

**OPTION**

Specifies additional functions to be performed along with the command.

**ALLRSP**

Indicates that the response lines are to be returned for all descriptors that are processed on the command. The default action is to return response lines only for the descriptors that resulted in an error. It is valid with NAME(*) only. ALLRSP is ignored for other NAME values.

**SET**

Specifies the attribute values to be changed.

**DEFAULT(Y)**

Specifies this descriptor as the default, which resets the existing default descriptor to DEFAULT(N). When a descriptor or resource is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type. IMS defines a routing code descriptor called DBFDSRT1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor. Because only one routing code descriptor can be the default at one time, only one routing code descriptor name can be specified with DEFAULT(Y).

**INQ**

Specifies the inquiry option.

**N**

This is not an inquiry routing code.

**Y**

This is an inquiry routing code. Any message associated with the routing code is an inquiry transaction. This should be specified only for programs that do not cause a change to a database. Programs are
prohibited from issuing Insert, Delete, or Replace calls to a database when processing an inquiry transaction.

**PGM**

The name of the application program associated with the routing code. The program must exist and be defined with a BMPTYPE of N.

**Usage notes**

If all the attributes specified by the UPDATE command are already defined for the descriptor, no update is actually made, no descriptors are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

Descriptors exist for the life of the IMS unless they are deleted using a DELETE command. The descriptors are recoverable across an IMS warm start or emergency restart. Descriptors are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

The UPDATE RTCDESC command can be issued only through the OM API. Fast Path must be installed on the system. This command applies to DB/DC and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE RTCDESC commands are not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). These commands are recoverable.

If the descriptor is the IMS-defined routing code descriptor (DBFDSRT1), the only attribute that can be updated is the DEFAULT attribute.

Each descriptor is updated individually. Individual updating does not work like online change where either all descriptors are updated or no descriptors are updated.

**Output fields**

The following table shows the UPDATE RTCDESC output fields. The columns in the table are as follows:

**Short label**

Contains the short label generated in the XML output.

**Keyword**

Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Meaning**

Provides a brief description of the output field.

<table>

</rsp>
<rsp>DESC(DESC005) MBR(IMS1) CC(7A) CCTXT(RTC/FP=N PGM CONFLICT)
</rsp>
Explanation: The UPDATE RTCDESC command is issued to update all routing code descriptors to reference program BMPFPE01. The update fails for all routing codes with completion code 7A because a routing code cannot be associated with a non-Fast Path program.

TRACE

C:
```
Chapter 30. UPDATE commands
Keywords

The following keywords are valid for the UPDATE TRAN command:

CLASS()
Selects the transactions associated with the specified class or classes to be updated.

NAME(tranname)
Specifies the 1-8 character name of the transaction. Wildcards can be specified for the tranname. The tranname is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the resource names that are processed. For NAME(*) command responses are returned only for the resource names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the resource names that are processed.

OPTION()
Specifies the additional functions to be performed. Following is a list of additional functions:

AFFIN
AFFIN is valid with START(SCHD) or STOP(SCHD).

When used with START(SCHD), OPTION(AFFIN) indicates that the command should issue an inform for the transaction with affinity to the local IMSID. This option is used to start a local affinity transaction queue in a shared-queues environment.

When used with STOP(SCHD), OPTION(AFFIN) indicates that the command should unregister a transaction for local affinity processing.

The UPDATE TRAN START(SCHD) OPTION(AFFIN) command does not support generic transaction names or ALL in the NAME() filter.

You can use the UPDATE TRAN NAME(tranname) START(SCHD) OPTION(AFFIN) command to start a local affinity transaction queue in a shared-queues environment. Starting a local affinity transaction queue in a shared-queues environment causes this IMS to be notified when transactions with an affinity name of this IMSs IMSID or RENAME (XRF) appended to the transaction name, are on the shared queues for processing. This affinity registration is in addition to the normal transaction registration (that is, registration with the transaction name appended with blanks). When a transaction is started with affinity, then affinity registration status cannot be removed and the QUERY TRAN NAME(tranname) SHOW(ALL) command will always show the AFFIN status. The following UPDATE TRAN NAME(tranname) STOP(SCHD) command will therefore stop both normal and affinity registration.

Note: Because there is no OPTION(AFFIN) keyword for STOP(SCHD), subsequent UPDATE TRAN START(SCHD) commands, with or without the OPTION(AFFIN) keyword, will perform both normal and affinity registration.

The AFFIN status is lost across IMS cold starts. If the DFSMSCE0 user message routing exit is used to set local affinity for an input transaction message in a shared-queues (SQ) environment and the IMS control region is stopped, and subsequently cold started, you will need to issue the
UPDATE TRAN NAME(tranname) START(SCHD) OPTION(AFFIN) command for the transaction to be registered with affinity status so the messages will be scheduled.

At the end of cold start processing, when shared-queues informs are completed, the inform for the transaction is done without affinity to the local IMSID because local affinity is set by the exit. Because the inform for the transaction is not part of the transaction definition, it is not maintained across a cold start. As a result, the message with local affinity cannot be scheduled. The UPDATE TRAN START(SCHD) OPTION(AFFIN) command corrects this situation by issuing an inform for the transaction with affinity to the local IMSID.

**ALLRSP**

Indicates that the response lines are to be returned for all resources that are processed on the command. The default action is to return response lines only for the resources that resulted in an error. It is only valid with NAME(*). ALLRSP is ignored for other NAME values.

**SCOPE()**

Specifies where IMS should apply the change. The default is ALL.

**ALL**

Changes are applied to the active IMS systems to which the command is routed. If you specify that global area status is to be maintained, changes are also applied globally by updating the value maintained by RM. The RM status is updated only by the command master IMS. If global area status is not maintained, the command action is same as the SCOPE(ACTIVE) command.

**ACTIVE**

Changes are applied to the active IMS systems to which the command is routed.

RM maintains global status information for some transactions. IMS updates that information in RM based on commands. When SCOPE(ALL) is specified, every IMS system that processes the command updates information in its local control blocks. Only the IMS command master calls RM to update the information globally.

**SET()**

Specifies the attribute values to be changed. A transaction must have the same characteristics in all systems where it is defined when it is shared. These characteristics include:

- Nonconversational or conversational
- SPA size if conversational
- Single-segment or multisegment messages
- Non-inquiry or inquiry
- Recoverable or nonrecoverable

**AOCMD**

Specifies the AOI option that you want to change, which indicates whether the transaction can issue the type-1 AOI CMD call or the type-2 AOI ICMD call. If AOCMD is defined as CMD, TRAN, or Y, and the AOI1 execute parameter is defined as AOI1=N, no authorization checking is done and the transaction is permitted to issue CMD and ICMD calls.

**CMD**

Indicates that the transaction is permitted to issue type-1 AOI CMD
calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, authorization checking is based on which transactions can issue a particular command. In this case, the commands (or the first three characters of the commands) need to be defined to RACF or an equivalent product as a user. The type-1 AOI transactions must be defined as profiles under the TIMS class, and for each transaction, the commands it can issue must be specified. Defining AOCMD(CMD) requires you to create fewer user IDs than you need to create for the AOCMD(TRAN) definition. However, defining AOCMD(CMD) requires you to create or modify a larger number of resource profiles.

N Indicates that the transaction is not permitted to issue type-1 AOI CMD calls. The transaction is permitted to issue type-2 AOI ICMD calls.

TRAN Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, the transaction code is used for authorization. The first authorization check results in the accessor environment element (ACEE) being built. This environment is kept for use by future authorization checks. The type-1 AOI transaction needs to be defined to RACF or an equivalent product as a user. The transactions will then be specified on RACF PERMIT statements for each command they are allowed to issue from a type-1 AOI transaction. Specifying AOI transactions as users to RACF might conflict with the name of a user already defined to RACF. If this occurs, then either the transaction name or the existing user name needs to be changed.

Y Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, the user ID or the program name is used for authorization. For some environments, if a Get Unique call has not yet occurred, the program name is used for authorization. Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

CLASS Specifies the transaction class, which is an attribute used to select a transaction for scheduling. A transaction can be scheduled if there is a message processing region available for that class. The value can be a number from 1 to 999. This value must not exceed the value given (by specification or default) on the MAXCLAS= keyword of the IMSCTRL macro.

Define CPI-C transactions with a different message class from that used for non-CPI-C transactions. IMS handles all CPI-C transactions as priority zero within the transaction class.

CMTMODE Specifies when database updates and non-express output messages are committed. This operand affects emergency restart.
MULT

Database updates and non-express output messages are committed only when the application program terminates normally, when the processing limit count has been reached, or, in the case of a pseudo-WFI dependent region, when there are no more messages on the queue. For example, if five transactions are processed during a single schedule of a program, all five are committed only when the fifth one is completed and the program terminates. Until a transaction has been committed, locks for updated database records are not released and non-express output messages are not queued for output. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing.

If the transaction results in the application calling an external subsystem, such as DB2, the Commit Verify exit provided by the external subsystem can determine whether CMTMODE(MULT) is supported. See documentation under the Commit Verify exit routine in IMS Version 14 Exit Routines.

SNGL

Database updates and non-express output messages are committed when the application program completes processing each transaction. IMS invokes commit processing either when the application program requests the next message (issues a GU to the IO-PCB), or when the application program terminates. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing. If an application ends abnormally before committing its message, emergency restart requeues the message that was in process before the abend and makes it available for reprocessing.

Keyword combination rules include the following:
- CONV(Y) and CMTMODE(MULT) are mutually exclusive.
- WFI(Y) and CMTMODE(MULT) are mutually exclusive.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

CONV

Specifies the conversation option.

N  The transaction is not conversational.

Y  The transaction is conversational. The transaction message is destined for a conversational program. A conversational program processes transactions made up of several steps. A conversational program receives a message from a terminal, replies to the terminal, but saves the data from the transaction in a scratchpad area (SPA). When the person at the terminal enters more data, the program has the data it saved from the last message in the SPA, so it can continue processing the request without the person at the terminal having to enter the data again.
Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
- CONV(Y) requires SPASZ and SPATRUNC.
- CMTMODE(MULT) and CONV(Y) are mutually exclusive.
- FP(E) and CONV(Y) are mutually exclusive.
- RECOVER(N) and CONV(Y) are mutually exclusive.
- SPASZ and CONV(N) are mutually exclusive.
- SPATRUNC and CONV(N) are mutually exclusive.

CPRI
Specifies a new value for the current priority of a transaction. The CPRI keyword is not allowed for BMP transactions, because BMP transactions should always have a priority of 0. The new CPRI value takes effect the next time the transaction is scheduled. Valid CPRI parameters are numeric values from 0 to 14.

DCLWA
Specifies the log write-ahead option.

N  IMS should not perform log write-ahead. Specify N if input message integrity and the consistency of output messages with associated database updates is not required. DCLWA does not apply to response mode or Fast Path input processing, and is ignored during IMS execution.

Y  IMS should perform log write-ahead for recoverable, nonresponse input messages and transaction output messages. This ensures the following:
  - A nonresponse input transaction is made recoverable across IMS failures, prior to IMS acknowledging receipt of the input.
  - Database changes are made recoverable prior to IMS sending associated output reply messages.
  - Information in the log buffers is written to the IMS log, before the associated input acknowledgment or output reply is sent to the terminal.

Define DCLWA(Y) for all VTAM terminal types.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

DIRROUTE
Specifies the MSC directed routing option.

N  The application program processing a transaction is not informed of the system which originated the transaction. The name of the originating LTERM is placed in the I/O PCB.
The application program processing a transaction is informed of the system which originated the transaction, if MSC directed routing is used in a multiple IMS system configuration. An MSNAME corresponding to a logical path back to the originating system is placed in the I/O PCB.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

**EDITRTN**

Specifies the 1- to 8-character name of your transaction input edit routine that edits messages before the program receives the message. This name must begin with an alphabetic character. The specified edit routine (load module) must reside on the USERLIB data set before IMS system definition stage 2 execution. This routine cannot be the same one defined by the system definition TYPE EDIT= parameter.

EDITRTN is used for a Fast Path potential transaction when the transaction is routed to IMS.

For input from LU 6.2 devices, the user edit exit routine DFSLUEE0 is called instead of the transaction input edit routine specified in EDIT.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

To remove an edit routine name from a transaction definition, specify EDITRTN(0).

FP(E) and EDITRTN are mutually exclusive.

**EDITUC**

Specifies the edit to uppercase option.

N The input data is not translated to uppercase. It can consist of uppercase and lowercase characters as entered from the terminal.

Y The input data is to be translated to uppercase before it is presented to the processing program. If FP(E) or FP(P), the transaction is to be translated to uppercase before being presented to the edit/routing exit routine.

Specifying EDITUC(Y) for VTAM terminals prevents the transmission of embedded device control characters.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.
EMHBSZ

Specifies the EMH buffer size required to run the Fast Path transaction. This overrides the EMHL execution parameter. If EMHBSZ is not specified, the EMHL execution parameter value is used. The value can be a number from 0 to 30,720.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- EMHBSZ > 0 requires Fast Path to be defined.
- FP(N) and EMHBSZ > 0 are mutually exclusive.

EXPRTIME

Specifies the elapsed time in seconds that IMS can use to cancel the input transaction. After a transaction is submitted to IMS, the transaction could be delayed for processing because of a stopped transaction or a potential system slow down. In that case, the user or client application could time out before the transaction is processed. When IMS eventually schedules and processes the transaction, the response message is no longer wanted. With the elapsed time specified for the transaction, IMS can flag the input transaction as expired so that the system does not waste CPU cycles to process the unwanted transaction.

The value can be a number, in seconds, which can range from 0 to 65,535. The default is 0, which means that no expiration time is set for this transaction. The transaction expiration attribute is supported by all of the IMS TM interfaces.

Restriction: The transaction expiration checking is not performed at the GU time for Fast Path transactions, IMS conversational transactions, and program-to-program switch transactions.

FP

Specifies the Fast Path option.

- E The transaction is processed exclusively as Fast Path. The program must be defined as Fast Path exclusive.
- N The transaction is not a candidate for Fast Path processing. The program must be defined as not Fast Path. When FP(N) is specified, any attempt to use Fast Path resources or commands might yield unpredictable results.
- P The transaction is a potential candidate for Fast Path processing. Fast Path-potential transactions must be able to run under two applications: a Fast Path exclusive application and a non-Fast Path application. A Fast Path exclusive application should be defined to which this transaction can be routed. Fast Path–potential transactions must be processed by a user edit/routing exit to determine whether the transaction is actually to be processed by IMS Fast Path. If it is to be processed by IMS Fast Path, the edit/routing exit routine associates the transaction with a routing code. This routing code identifies which Fast Path application program is to process the transaction.
The program defined by PGM() must not be defined as Fast Path exclusive.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

In order to update a transaction from FP(E) to FP(N) or from FP(N) to FP(E) you must also update the transaction to point to a program that has the same FP() attribute. If you do not update the program attribute, the command will fail because of a program conflict.

If a Fast Path exclusive FP(E) transaction is being updated to Fast Path potential FP(P) or non-Fast Path FP(N) transaction and no limit count is specified, a limit count of 65535 is set.

Keyword combination rules include the following:
- CONV(Y) and FP(E) are mutually exclusive.
- EDITRTN and FP(E) are mutually exclusive.
- EMHBSZ>0 and FP(N) are mutually exclusive.
- FP(E) and FP(P) require Fast Path to be defined.
- MSGTYPE(MULTSEG) and FP(E) are mutually exclusive.
- MSGTYPE(MULTSEG) and FP(P) are mutually exclusive.
- MSNAME and FP(E) are mutually exclusive.
- RECOVER(N) and FP(E) are mutually exclusive.
- RECOVER(N) and FP(P) are mutually exclusive.
- RESP(N) and FP(E) are mutually exclusive.
- RESP(N) and FP(P) are mutually exclusive.
- SIDL and FP(E) are mutually exclusive.
- SIDR and FP(E) are mutually exclusive.

INQ

Specifies the inquiry option.

N  This is not an inquiry transaction.

Y  This is an inquiry transaction. If INQ(Y) is specified, you can also specify whether this transaction should be recovered during an IMS emergency or normal restart using the RECOVER() parameter.

This should be specified only for those transactions that, when entered, do not cause a change in any database. Programs are prohibited from issuing ISRT, DLET, or REPL calls to a database when scheduled to process a transaction defined as INQ(Y).

An application program cannot do an SQL INSERT, DELETE, or UPDATE when the IMS transaction is defined with INQ(Y).

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There
must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- RECOVER(N) and INQ(N) are mutually exclusive.

**LCT**

Specifies the limit count. This is the number that, when compared to the number of input transactions queued and waiting to be processed, determines whether the normal or limit priority value is assigned to this transaction. The value can be a number from 1 to 65535. The default is 65535.

The limit count value is ignored for a transaction processed by a BMP.

The limit count value is ignored in a shared-queues environment.

The limit count value does not apply to FP exclusive transactions and is ignored.

**LOCK**

Specifies that the LOCK status is to be set on or off. SET(LOCK(ON | OFF)) cannot be specified with any other SET attribute. SET(LOCK(ON | OFF)) can be specified with the START or STOP keyword.

- **ON**
  - Locks the transaction and prevents it from being scheduled.
  - LOCK(ON) cannot be specified for Fast Path exclusive transactions, but can be specified for Fast Path potential transactions. LOCK(ON) cannot be specified for transactions for CPI Communications driven programs.

- **OFF**
  - Unlocks the transaction and allows it to be scheduled.

**LPRI**

Specifies the limit priority. This is the scheduling priority to which this transaction is raised when the number of input transactions enqued and waiting to be processed is equal to or greater than the limit count value.

The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class. The value can be a number from 0 through 14.

When the limit priority is used and the scheduling priority is raised to the limit priority, the priority is not reduced to the normal priority until all messages enqueued for this transaction name are processed. If you do not want the limit priority for this transaction, define equal values for the normal priority and limit priority, and a limit count of 65535.

When a transaction is processed exclusively by a batch message program (BMP), define the limit priority as 0. If the program specified by PGM() is defined with a program type of batch, the current priority is forced to be 0. However, a batch message processing region (BMP) can process transactions with current scheduling priorities other than 0.

This priority also controls the priority of messages created by this transaction and sent to a destination in a remote system. See also the discussion on MSC priorities under the NPRI definition.

The limit priority value is ignored for a transaction processed by a BMP.

The limit priority value is ignored in a shared-queues environment.
MAXRGN
Specifies a new value for the maximum number of regions that can be simultaneously scheduled for a given transaction. The transaction must be eligible for parallel scheduling (load balancing). The value of the MAXRGN parameter must be between 0 and the number specified on the MAXPST=control region parameter.

The keyword limits the number of message processing program (MPP) regions that can be concurrently scheduled to process a transaction. When the number of MPP regions is not limited, one transaction might monopolize all available regions. The value can be a number from 0 to the value specified on the MAXPST= control region parameter. MAXRGN(0) means that no limit is imposed.

If you define the application program with a scheduling type of SERIAL, omit the MAXRGN keyword or define it as 0.

The following keyword combinations are mutually exclusive:
- PARLIM(65535) and MAXRGN value greater than 0
- SERIAL(Y) and MAXRGN value greater than 0

MSGTYPE
Specifies the message type (single segment or multiple segment). It specifies the time at which an incoming message is considered complete and available to be routed to an application program for subsequent processing.

If MSC-directed routing is used in a multiple IMS system configuration, IMS does not ensure that both the message and the transaction destined to process that message are either single segment or multiple segments.

MULTSEG
The incoming message can be more than one segment in length. It is not eligible for scheduling to an application program until an end-of-message indication is received, or a complete message is created by MFS.

SNGLSEG
The incoming message is one segment in length. It becomes eligible for scheduling when the terminal operator indicates end-of-segment.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
- FP(E) and MSGTYPE(MULTSEG) are mutually exclusive.
- FP(P) and MSGTYPE(MULTSEG) are mutually exclusive.

MSNAME
Specifies the one- to eight-character name of the logical link path in a multiple IMS system configuration (MSC). A logical link path is a path between any two IMS systems. The IMS systems are identified by the remote system ID and the local system ID associated with the logical link path. The remote system ID identifies the system in which messages using
this path are to be processed. The local system ID identifies this system. For an UPDATE TRAN command that is changing a transaction to a remote transaction, or changing the MSC path, the new MSNAME must already be defined.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- FP(E) and MSNAME are mutually exclusive.
- SIDL and MSNAME are mutually exclusive.
- SIDR and MSNAME are mutually exclusive.

**NPRI**

Specifies the normal scheduling priority. The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class. The normal priority is assigned to the transaction as the scheduling priority when the number of input transactions enqueued and waiting to be processed is less than the limit count value. The value can be a number from 0 through 14. The default is 1.

This priority also controls the priority of messages created by this transaction and sent to a destination in a remote system.

When a transaction is processed exclusively by a batch message program (BMP), code the normal priority as 0.

When a transaction is processed exclusively by a batch message program (BMP), define the limit priority as 0. If the application program specified by PGM() is defined with a program type of batch, the current priority is forced to be 0. However, a batch message processing region (BMP) can process transactions with current scheduling priorities other than 0.

For remote transactions, the priority used to send the transaction to the processing system, which is termed the **MSC link message priority**. The three MSC link message priority groups are:

- Low
- Medium
- High

The low priority group consists of primary requests in the input terminal system. This group is assigned remote transaction priorities from 0 to 6.

The medium group consists of secondary requests, responses, primary requests in an intermediate system, and primary requests in the input terminal system. This group is assigned a remote transaction priority of 7.

The high group consists of primary requests in the input terminal system. Messages in this group are assigned remote transaction priorities from 8 to 14. Within each group, messages have a priority based on the current priority value of the transaction or remote transaction in the input terminal system for primary requests, and on the latest processing system for secondary requests and responses.
In an MSC configuration, the transaction priority determines the priority used to send messages inserted by this transaction across an MSC link. If the transaction inserts multiple messages to the same destination (for example, pages to a printer) and these messages must be sent in the order inserted, the normal and limit priority values should be the same. If the normal and limit priority values are not identical, messages inserted at a higher priority than previously inserted messages could arrive at their destination first. (This restriction does not apply to multiple segments of the same message.)

The normal priority value is ignored for a transaction processed by a BMP.

**PARLIM**

Specifies the parallel processing limit count. This is the maximum number of messages that can currently be queued, but not yet processed, by each active message region currently scheduled for this transaction. This is the threshold value to be used when the associated application is defined with a scheduling type of parallel. An additional region is scheduled whenever the current transaction enqueue count exceeds the PARLIM value multiplied by the number of regions currently scheduled for this transaction.

The value can be a number from 0 to 32767 or 65535. PARLIM(0) indicates that any input message can cause a new region to be scheduled because the scheduling condition is always met (the number of messages is greater than zero). If you specify PARLIM(0), you should specify a MAXRGN value to limit the number of regions that can be scheduled to process a particular transaction. PARLIM(65535) means that parallel processing is disabled and IMS allows the transaction to be scheduled in only one region at a time.

The value specified for PARLIM applies to message processing programs (MPPs) only; it is not supported for batch message processing programs (BMPs).

If you define the application as SERIAL or the scheduling type as SERIAL, define PARLIM(65535).

In a shared-queues environment (when the scheduling type is PARALLEL), any PARLIM value other than 65535 causes a new region to be scheduled whenever the successful consecutive GU count exceeds the PARLIM value multiplied by the number of regions currently scheduled for this transaction. For shared-queues environments, the successful consecutive GU count is used instead of the queue count. New regions continue to be scheduled up to the maximum number of regions specified on MAXRGN.

**Note:** In a shared-queues environment, the PARLIM value behaves differently than it does in a non-shared-queues environment. In a non-shared-queues environment, the queue depth (the number of messages that are currently enqueued) for the transaction is used as the value that is compared with the PARLIM value to determine when to schedule another region. IMS responds to a growing queue of input transactions by scheduling more regions as the queue grows.

In a shared-queues environment, each individual IMS does not know the depth of the queue, because the queue is in the shared-queues coupling facility structure that is managed by Common Queue Server (CQS). The transaction queue might be added to by many different IMS systems. IMS
is notified only when the first message is put in a queue (that is, when the queue becomes not empty). IMS is not notified for every subsequent message that is placed on the queue after that first message. In a shared-queues environment, the PARLIM comparison is done against a counter that each IMS keeps of the number of successful consecutive GU calls for the transaction by that IMS, rather than queue depth. IMS schedules more regions when it consistently gets messages from CQS when it asks for them. Thus, in a shared-queues environment, IMS infers the depth of the queue of messages based on processing activity, but it does not know the actual depth of the queue.

A PARLIM value of 0 in a shared-queues environment is the most responsive setting. PARLIM(0) ensures that message regions are scheduled until all messages are processed from the transaction queue, or until the maximum region value (MAXRGN) limit is reached. PARLIM(0) might, however, result in many unnecessary schedules (or false schedules). A false schedule occurs when a message region is scheduled and finds no more messages on the queue. This occurs particularly with PARLIM(0) because after each successful get unique (GU), IMS must always schedule an additional region to try to read the queue to see if there are more messages. This process continues for each successful GU until the queue becomes empty, at which time the successive GU count is reset to 0. This is a consequence of IMS not knowing how many messages are queued on the transaction queue.

Setting the PARLIM to a value greater than 0 can reduce the number of false schedules, because IMS then schedules a new message region only after a number of messages have been obtained consecutively without the queue becoming empty. Setting the PARLIM to a value of 2 or greater is useful for reducing false schedules for transactions that are low-volume and that run relatively quickly (such that the queue depth is typically 1), because it avoids scheduling a second region until the first region has obtained at least two messages in a row. However, be aware that while a PARLIM value greater than 0 can reduce unnecessary schedules, it is also less responsive. If a transaction is long running, or if its processing is delayed (for example, because of locking contention), the consecutive GU count does not change while the transaction is executing, and no additional message regions are scheduled. This can result in delayed processing of other messages for this same transaction until a currently-scheduled message completes. This delay can occur even if message regions are available to process the transaction.

Keyword combination rules include the following:

- MAXRGN>0 and PARLIM(65535) are mutually exclusive.
- SERIAL(Y) and PARLIM between 0 and 32767 are mutually exclusive.

**PGM**

Specifies the name of the application program associated with the transaction. The program must exist unless the transaction is defined as REMOTE(Y).

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There
must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

**PLCT**

Specifies the processing limit count. This is maximum number of messages sent to the application program by the IMS for processing without reloading the application program. The value must be a number from 0 through 65535. PLCT(0) means the maximum number of messages sent to the application is one and the application program is reloaded before receiving a subsequent message. PLCT(65535) means that no limit is to be placed upon the number of messages processed at a single program load. Values 1 through 65535 are eligible for quick reschedule processing.

The value is used to determine how many messages an application program is allowed to process in a single scheduling cycle. When the application program requests, and receives, the number of messages indicated, any subsequent requests result in one of two things.

1. IMS indicates “no more messages exist” if any of the following conditions is true.
   - The region is not an MPP.
   - The currently scheduled mode is not CMTMODE(SNGL).
   - Equal or higher priority transactions are enqueued for the region.

   IMS might, in fact, have other messages enqueued for the application program. It is the responsibility of the application program to terminate when it receives an indicator that no more messages are available. Termination of the application program makes the region it occupied available for rescheduling. This feature makes it possible for IMS to enable scheduling of higher priority transactions that entered the system while the previous transactions were in process. In addition, if any equal-priority transactions are enqueued, they become eligible for scheduling on a first-in, first-out (FIFO) basis.

2. The region goes through quick reschedule and returns the next message to the application of all of the following conditions are true.
   - The region is an MPP.
   - The transaction is CMTMODE(SNGL).
   - No equal or higher transactions are enqueued.
   - Messages are still enqueued for the application.

**PLCTTIME**

Specifies the processing limit count time. This is the amount of time (in hundredths of seconds) allowable to process a single transaction (or message). The number specifies the maximum CPU time allowed for each message to be processed in the message processing region.

Batch Message Programs (BMPs) are not affected by this setting.

The value can be a number, in hundredths of seconds, that can range from 1 to 6553500. A value of 6553500 means no time limit is placed on the application program.

If Fast Path is used, this keyword specifies, for a given transaction name, the amount of time (in hundredths of seconds) the program is allowed to process a single transaction message. The time represents real time that elapses during transaction processing (not accumulated task time).
time is used because the input terminal is in response mode and cannot enter another transaction until the response is sent. In this case PLCT() is ignored.

The value controls application program looping. You are not required to optimize the value for program-transaction execution time. However, the time value assigned should not be less than the expected per-transaction execution time. If the scheduled application program exceeds the product of PLCTTIME() and PLCT(), the application program ends abnormally. If an IMS STIMER value of 2 is specified on the DFSMPR procedure, the region does not abend until completion of the DL/I call.

**Important:** The application program must not use STIMER timer services. IMS uses STIMER timer services to time the execution of transactions. If an application program issues an MVS STIMER macro, it cancels the STIMER timer services set by IMS. Use the STIMERM macro instead for application program timer requests.

**RECOVER**

Specifies the recovery option.

- **N** The transaction should not be recovered.
- **Y** The transaction should be recovered during an IMS emergency or normal restart.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
- CONV(Y) and RECOVER(N) are mutually exclusive.
- FP(E) and RECOVER(N) are mutually exclusive.
- FP(P) and RECOVER(N) are mutually exclusive.
- INQ(N) and RECOVER(N) are mutually exclusive.

**REMOTE**

Specifies the remote option.

- **N** The transaction is not remote. The transaction is local and runs on the local system.
- **Y** The transaction is remote. The transaction runs on a remote system.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Local transactions must have the SIDR value set equal to the SIDL value. When updating a transaction from remote to local, the SIDR and SIDL keywords must be specified, along with REMOTE(N), to set the remote SYSID equal to the local SYSID.

Keyword combination rules include the following:
REMOTE(Y) requires MSNAME or SIDR and SIDL.

RESP
Specifies the response mode option.

N  The transaction is not response mode. For terminals specifying or accepting a default of OPTIONS=TRANRESP, input should not stop after this transaction is entered.

Y  The transaction is response mode. The terminal from which the transaction is entered is held and prevents further input until a response is received. For terminals specifying or accepting a default of OPTIONS=TRANRESP, no additional messages are to be allowed after this transaction is entered until this transaction sends a response message back to the terminal. Response mode can be forced or negated by individual terminal definition. RESP(Y) is ignored during online processing for all terminals that do not operate in response mode.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
•  FP(E) and RESP(N) are mutually exclusive.
•  FP(P) and RESP(N) are mutually exclusive.

SEGNO
Specifies the segment number. This is the maximum number of application program output segments that are allowed into the message queues per Get Unique (GU) call from the application program. The value can be a number from 0 through 65535. If SEGNO(0) is defined, the number of segments is not checked by the online system at execution time.

SEGNO cannot be specified for CPI Communications driven transactions.

SEGSZ
Specifies the segment size. This is the maximum number of bytes allowed in any one output segment. The value can be a number from 0 through 65535. If SEGSZ(0) is defined, the segment size is not checked by the online system at execution time.

The maximum output message segment to an LU 6.2 device is 32767. If a transaction is expected to send output to an LU 6.2 device, the SEGSIZE parameter should be no greater than 32767. However, this is not enforced during processing of the command, because IMS cannot determine the device type for the message destination until output time.

SEGSZ cannot be specified for CPI Communications driven transactions.

SERIAL
Specifies the serial option.

N  Messages for the transaction are not processed serially. Message processing can be processed in parallel. Messages are placed on the suspend queue after a U3303 pseudoabend. Scheduling continues until repeated failures result in the transaction being stopped with a USTOP.

Y  Messages for the transaction are processed serially. U3303
pseudoabends do not cause the message to be placed on the suspend queue but rather on the front of the transaction message queue, and the transaction is stopped with a USTOP. The USTOP of the transaction is removed when the transaction or the class is started with a /START or UPD TRAN command.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- MAXRGN>0 and SERIAL(Y) are mutually exclusive.
- PARLIM value 0 - 32767 and SERIAL(Y) are mutually exclusive.

**SIDL**

Specifies the system identification (SYSID) of the local system in a multiple-IMS system (MSC) configuration. The local system is the originating system to which responses are returned. The value can be a number from 1 to 2036, if MSC is enabled, or 0, if MSC is not enabled. The local SYSID can be defined in any or all of the MSNAMEs or transactions.

The SIDL parameter is independent of the link type (CTC, MTM, TCP/IP, VTAM) specified on the TYPE= keyword of the MSPLINK macro statement.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- FP(E) and SIDL are mutually exclusive, unless SIDL and SIDR are specified as a pair and are equal to the local system ID of this IMS.
- MSNAME and SIDL are mutually exclusive.
- SIDL value must be defined to this IMS.

**SIDR**

Specifies the system identification (SYSID) of the remote system in a multiple-IMS system (MSC) configuration. The remote system is the system on which the application program executes. The value can be a number from 1 to 2036, if MSC is enabled, or 0, if MSC is not enabled. The remote SYSID specified must also be defined for an MSNAME.

The SIDR parameter is independent of the link type (CTC, MTM, TCP/IP, VTAM) specified on the TYPE= keyword of the MSPLINK macro statement.

Local transactions must have the SIDR value set equal to the SIDL value. When updating a transaction from remote to local, the remote SYSID must be set to the local SYSID.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a
message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
- FP(E) and SIDR are mutually exclusive, unless SIDL and SIDR are specified as a pair and are equal to the local system ID of this IMS.
- MSNAME and SIDR are mutually exclusive.
- SIDR value must be defined to this IMS.

**SPASZ**

Specifies the scratchpad area (SPA) size, in bytes, for a conversational transaction. The value can be a number from 16 and 32767.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:
- CONV(N) and SPASZ are mutually exclusive.
- FP(E) and SPASZ are mutually exclusive.

**SPATRUNC**

Specifies the scratchpad area (SPA) truncation option of a conversational transaction. This defines whether the SPA data should be truncated or preserved across a program switch to a transaction that is defined with a smaller SPA.

When a conversation initially starts, and when a program is switched, the SPATRUNC option is checked and set or reset as specified. When the option is set, it remains set for the life of the conversation, or until a program switch occurs to a transaction that specifies the option is to be Reset.

When a program switch occurs, the truncated data option for the new transaction is first checked, and that specification is set for the conversation and is used for the SPA inserted into the output message. If the option is not specified for the new transaction, the option currently in effect for the conversation is used.

**S** IMS preserves all of the data in the SPA, even when a program switch is made to a transaction that is defined with a smaller SPA. The transaction with the smaller SPA does not see the truncated data, but when the transaction switches to a transaction with a larger SPA, the truncated data is used.

**R** The truncated data is not preserved.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.
Keyword combination rules include the following:

- CONV(N) and SPATRUNC are mutually exclusive.
- FP(E) and SPATRUNC are mutually exclusive.

**TRANSTAT**

Specifies whether transaction level statistics should be logged for message driven programs. If Y is specified, transaction level statistics are written to the log in a X'56FA' log record.

N  Transaction level statistics should not be logged.
Y  Transaction level statistics should be logged.

The TRANSTAT keyword on the UPDATE TRAN command gives the user the ability to override the system default or the current value of the TRANSTAT parameter. If the TRANSTAT keyword is omitted on the UPDATE TRAN command, the current transaction level statistics setting is unchanged.

**WFI**

Specifies the wait-for input option. This attribute does not apply to Fast Path transactions, which always behave as wait-for-input transactions.

N  This is not a wait-for-input transaction.
Y  This is a wait-for-input transaction.

A message processing or batch processing application program that processes WFI transactions are scheduled and invoked normally. If the transaction to be processed is defined as WFI, the program is allowed to remain in main storage after it has processed the available input messages. The QC status code (no more messages) is returned to the program if the PROCLIM count (PLCT) is reached; a command is entered to change the status of the scheduled transaction, database, program, or class; commands relating to the databases used by the transaction are entered, or IMS is terminated with a checkpoint shutdown.

Updating this attribute stops messages from being queued to the transaction while the command is in progress. Any attempt to queue a message to the transaction is rejected. Updating this attribute also stops the transaction from being scheduled while the command is in progress. There must be no work in progress and no messages queued (non-shared queues) for the command to complete successfully.

Keyword combination rules include the following:

- MODE(MULT) and WFI(Y) are mutually exclusive.

**START()**

Specifies the attributes to be started.

Q  Updates local and global status to start queuing transactions. This change applies to transactions that are entered either from a network or terminal, or using the QUEUE TRAN command, to DB/DC or DCCTL environments.

**SCHD**

Updates local and global status to start transactions from being scheduled. This change applies to transactions scheduled in DB/DC or DCCTL environments.
In a shared-queues environment, the UPD TRAN START(SCHD) command will result in IMS registering interest for the transaction, which indicates that the transaction can be scheduled at that IMS. An UPDATE TRAN NAME(*) START(SCHD) command does not register transactions that are already registered to CQS.

**SUSPEND**

If the transaction has messages on the suspend queue, that suspend queue is automatically transferred to the ready queue.

**TRACE**

Starts the transaction trace, which captures the DL/I portion of Data Communications (DC) for the specified transaction. The information is written as a 6701 log record to the IMS log.

**STOP()**

Specifies the attributes to be stopped.

- **Q** Updates local and global status to stop transactions from being queued. This change applies to transactions that are entered either from a network or terminal, or using the QUEUE TRAN command, to DB/DC or DCCTL environments.

- **SCHD** Updates local and global status to stop transactions from being scheduled. This change applies to transactions scheduled in DB/DC or DCCTL environments.

  The UPDATE TRAN STOP(SCHD) command stops the scheduling of transactions; however, the transactions will continue to be processed until the limit count is reached. If the limit count is large, the processing interval will be long.

  In a shared-queues environment, the UPD TRAN STOP(SCHD) command results in IMS deregistering interest for the transaction, which indicates that the transaction cannot be scheduled at the IMS.

  **TRACE**

  Stops the transaction trace.

**Usage notes**

Resources exist for the life of the IMS unless they are deleted using a DELETE command. Resources are recoverable across an IMS warm start or emergency restart. Resources are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up.

The UPDATE TRAN command is recoverable across an IMS warm start or emergency restart, except for START(TRACE) and STOP(TRACE). Updates to the definitional attributes of a transaction are lost if IMS is cold started, unless the transaction definitions are exported to an RDDS and then imported from the RDDS at the cold start.

The UPDATE TRAN command can be issued only through the OM API. This command applies to DB/DC and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region.

The UPDATE TRAN command changes a MODBLKS transaction to dynamic, if the AOCMD, CMTMODE, CONV, DCLWA, DIRROUTE, EDITRTN, EDITUC,
Each transaction is updated individually, unlike the online change process where either all transactions are updated or no transactions are updated. Some runtime resource definition values for a transaction can be updated only if the transaction is not in use.

You can update the status of a transaction (LOCK, START, STOP) while the transaction is in use.

The following transaction attributes cannot be updated if online change for MODBLKS is enabled: AOCMD, CMTMODE, CONV, DCLWA, DEFAULT, DIRROUTE, EDITRN, EDITUC, EMHBSZ, FP, INQ, MSGTYPE, MSNAME, PGM, PLCTTIME, RECOVER, REMOTE, RESP, SERIAL, SIDL, SIDR, SPASZ, SPATRUNC, WFI.

If all the attributes specified by the UPDATE command are already defined for the resource, no update is actually made, no resources are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

In a shared message queues environment, the UPDATE TRAN command updates the transaction even if there are messages on the shared messages queues for the transaction. If the messages were placed on the shared message queues using conversation, Fast Path, response mode, or serial transaction attributes that differ from the transaction being updated on this IMS, this IMS will not be able to access the messages on the shared message queues.

The UPDATE TRAN NAME(trannname) SET(REMOTE(N),SIDR(localsysid),SIDL(localsysid)) command sets the remote system ID to be the same as the local system ID. It is equivalent to the command /MSASSIGN TRAN trannname TO LOCAL. The UPDATE TRAN NAME(trannname) SET(REMOTE(N)) command specified without SIDR/SIDL or MSNAME does not change the local and remote system IDs, therefore it is not equivalent to the /MSASSIGN TRAN trannname TO LOCAL command.

Equivalent IMS type-1 commands

The following table shows variations of the UPDATE TRAN command and the type-1 IMS commands that perform similar functions.

<table>
<thead>
<tr>
<th>UPDATE command</th>
<th>Similar IMS type-1 command</th>
</tr>

Output fields

The following table shows the UPDATE TRAN output fields. The columns in the table are as follows:

**Short label**

- Contains the short label generated in the XML output.

**Keyword**

- Identifies the keyword on the command that caused the field to be generated.
- N/A appears for output fields that are always returned.
- *error* appears for output fields that are returned only in case of an error.

**Meaning**

- Provides a brief description of the output field.

Table 538. Output fields for the UPDATE TRAN command

<table>
<thead>
<tr>
<th>Short label</th>
<th>Keyword</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CC</td>
<td>N/A</td>
<td>Completion code.</td>
</tr>
<tr>
<td>CCTXT</td>
<td><em>error</em></td>
<td>Completion code text that briefly explains the meaning of the nonzero completion code.</td>
</tr>
<tr>
<td>Short label</td>
<td>Keyword</td>
<td>Meaning</td>
</tr>
<tr>
<td>-------------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>CONVID</td>
<td>TRAN</td>
<td>Conversation ID of conversation associated with transaction that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
<tr>
<td>ERR</td>
<td>error</td>
<td>Error text with diagnostic information. Error text can be returned for a nonzero completion code and contains information that further explains the completion code.</td>
</tr>
<tr>
<td>GBL</td>
<td>SCOPE(ALL)</td>
<td>Indicates that the response line is for the global update.</td>
</tr>
<tr>
<td>LU</td>
<td>TRAN</td>
<td>APPC LU name associated with the transaction conversation that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
<tr>
<td>MBR</td>
<td>N/A</td>
<td>The IMSplex member that built the output line. The IMS identifier of the IMS for which the transaction information is displayed. The IMS identifier is always returned.</td>
</tr>
<tr>
<td>NODE</td>
<td>TRAN</td>
<td>Node name of static node associated with the transaction conversation that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
<tr>
<td>TMEM</td>
<td>TRAN</td>
<td>OTMA tmember name associated with the transaction conversation that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
<tr>
<td>TPIP</td>
<td>TRAN</td>
<td>OTMA tpipe name associated with the transaction conversation that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
<tr>
<td>TRAN</td>
<td>N/A</td>
<td>The transaction name. The transaction name is always displayed.</td>
</tr>
<tr>
<td>USER</td>
<td>TRAN</td>
<td>User name of dynamic user associated with the transaction conversation that caused the update to fail with a completion code of C'1A'. This information can be used to exit the conversation, before attempting the update again.</td>
</tr>
</tbody>
</table>

Return, reason, and completion codes

The following table includes the return and reason codes and a brief explanation of the codes. The return or reason code returned for the command might also indicate an error from a CSL request.
Table 539. Return and reason codes for the UPDATE TRAN command

<table>
<thead>
<tr>
<th>Return code</th>
<th>Reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000000'</td>
<td>X'00000000'</td>
<td>Command completed successfully. The command output contains a line for each resource, accompanied by its completion code. If NAME(*) is specified without OPTION(ALLRSP), no output lines are returned. See Table 540 on page 1291 for details.</td>
</tr>

**Explanation:** Update several transactions to be wait-for-input. The update succeeded for several transactions, as shown by the completion code 0. The update failed for transaction APOL17 with completion code 19, since the WFI(Y) attribute conflicts with the CMTMODE(MULT) attribute already defined for APOL17. The update fails for transaction BADNAME and for parameter BAD* with completion code 10, since transaction BADNAME does not exist and no transaction name starts with BAD.

**Example 2 for UPDATE TRAN command**

**TSO SPOC input:**

UPDATE TRAN NAME(APOL12) START(SCHD) OPTION(AFFIN)

**TSO SPOC output:**
Trancode MbrName  CC
APOL12  IMS1  0

Explanation: Transaction APOL12 is started with affinity.

**UPDATE TRANDESC command**

Use the UPDATE TRANDESC command to update transaction descriptors. A descriptor is a model that can be used to create descriptors or resources.

Updating a descriptor changes only those attributes explicitly specified on the UPDATE command. Attributes not specified retain their existing values. Any transaction resource or descriptor can be created using this descriptor as a model, by specifying the CREATE LIKE(DESC(descriptor_name)) command. Any descriptor or resource that was already created using this descriptor is not updated.

Syntax

```
UPDATE TRANDESC NAME('name') SET ('A', 'B') OPTION(ALLRSP)
```

A:
Keywords

The following keywords are valid for the UPDATE TRANDESC command:

**NAME**
Specifies the 1-8 character name of the transaction descriptor. Wildcards can be specified in the name. The name is a repeatable parameter. If the NAME parameter specified is a specific or wildcard name, command responses are returned for all the descriptor names that are processed. For NAME(*), command responses are returned only for the descriptor names that resulted in an error. OPTION(ALLRSP) can be specified with NAME(*) to obtain the command responses for all the descriptor names that are processed.

**OPTION**
Specifies additional functions to be performed along with the command.

**ALLRSP**
Indicates that the response lines are to be returned for all descriptors that are processed on the command. The default action is to return response lines only for the descriptors that resulted in an error. It is only valid with NAME(*). ALLRSP is ignored for other NAME values.

**SET**
Specifies the attribute values to be changed. A transaction must have the same characteristics in all systems where it is defined when it is shared. These characteristics include:

- Nonconversational or conversational
- SPA size if Conversational
- Single-segment or multi-segment messages
- Non-inquiry or inquiry
- Recoverable or nonrecoverable

**AOCMD**
Specifies that the AOI option indicating whether the transaction can issue the type-1 AOI CMD call or the type-2 AOI ICMD call. If AOCMD is defined as CMD, TRAN, or Y, and the AOI1 execute parameter is defined as AOI1=N, no authorization checking is done, and the transaction is permitted to issue CMD and ICMD calls.

**CMD**
Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, authorization checking is based on which transactions can issue a particular command. In this case, the commands (or first three characters of the commands) need to be defined to RACF or equivalent product as a user. The type-1 AOI transactions must be defined as profiles under the TIMS class, and for each transaction, the commands it can issue must be specified. Defining AOCMD(CMD) requires you to create fewer user IDs than you need to create for the AOCMD(TRAN) definition. However, defining AOCMD(CMD) requires you to create or modify a larger number of resource profiles.

**N**
Indicates that the transaction is not permitted to issue AOI type-1 CMD calls. The transaction is permitted to issue AOI type-2 ICMD calls.

**TRAN**
Indicates that the transaction is permitted to issue type-1 AOI CMD calls.
calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, the transaction code is used for authorization. The first authorization check results in the accessor environment element (ACEE) being built. This environment is kept for use by future authorization checks. The type-1 AOI transaction needs to be defined to RACF or equivalent product as a user. The transactions will then be specified on RACF PERMIT statements for each command they are allowed to issue from a type-1 AOI transaction. Specifying AOI transactions as users to RACF might conflict with the name of a user already defined to RACF. If this occurs, then either the transaction name or the existing user name needs to be changed.

Y Indicates that the transaction is permitted to issue type-1 AOI CMD calls and type-2 AOI ICMD calls. If the AOI1 execute parameter is defined as C, R, or A, the user ID or program name is used for authorization. For some environments, if a Get Unique call has not yet happened, then the program name is used for authorization. For some environments, if a Get Unique call has not yet happened, then the program name is used for authorization.

CLASS
Specifies the transaction class, which is an attribute used to select a transaction for scheduling. A transaction can be scheduled if there is a message processing region available for that class. The value can be a number from 1 to 999. This value must not exceed the value given (by specification or default) on the MAXCLAS= keyword of the IMSCTRL macro.

Define CPI-C transactions with a different message class from that used for non-CPI-C transactions. IMS handles all CPI-C transactions as priority zero within the transaction class.

CMTMODE
Specifies when database updates and non-express output messages are committed. This operand affects emergency restart.

MULT
Database updates and non-express output messages are committed only when the application program terminates normally, when the processing limit count has been reached, or, in the case of a pseudo-WFI dependent region, when there are no more messages on the queue. For example, if five transactions are processed during a single schedule of a program, all five are committed only when the fifth one is completed and the program terminates. Until a transaction has been committed, locks for updated database records are not released and non-express output messages are not queued for output. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing.

If the transaction results in the application calling an external subsystem, such as DB2, the Commit Verify exit provided by the external subsystem can determine whether CMTMODE(MULT) is supported. See documentation under the Commit Verify exit routine in IMS Version 14 Exit Routines.

SNGL
Database updates and non-express output messages are committed when the application program completes processing each transaction. IMS invokes commit processing either when the application program
requests the next message (issues a GU to the IO-PCB), or when the application program terminates. If an application ends abnormally before committing its messages, emergency restart requeues all the messages that were processed within the commit scope and makes them available for reprocessing. If an application ends abnormally before committing its message, emergency restart requeues the message that was in process before the abend and makes it available for reprocessing.

Keyword combination rules include the following:
- CONV(Y) and CMTMODE(MULT) are mutually exclusive.
- WFI(Y) and CMTMODE(MULT) are mutually exclusive.

**CONV**
Specifies the conversation option.

N The transaction is not conversational.

Y The transaction is conversational. The transaction message is destined for a conversational program. A conversational program processes transactions made up of several steps. A conversational program receives a message from a terminal, replies to the terminal, but saves the data from the transaction in a scratchpad area (SPA). When the person at the terminal enters more data, the program has the data it saved from the last message in the SPA, so it can continue processing the request without the person at the terminal having to enter the data again.

Keyword combination rules include the following:
- CONV(Y) requires SPASZ and SPATRUNC.
- CMTMODE(MULT) and CONV(Y) are mutually exclusive.
- INQ(Y) and CONV(Y) are mutually exclusive.
- RECOVER(N) and CONV(Y) are mutually exclusive.
- SPASZ and CONV(N) are mutually exclusive.
- SPATRUNC and CONV(N) are mutually exclusive.

**DCLWA**
Specifies the log write-ahead option.

N If N is specified, IMS does not perform log write-ahead. Specify N if input message integrity and the consistency of output messages with associated database updates is not required. DCLWA does not apply to response mode or Fast Path input processing, and is ignored during IMS execution.

Y If Y is specified, IMS performs log write-ahead for recoverable, nonresponse input messages and transaction output messages. This ensures the following:
- A nonresponse input transaction is made recoverable across IMS failures, before IMS acknowledges receipt of the input.
- Database changes are made recoverable before IMS sends associated output reply messages.
- Information in the log buffers is written to the IMS log, before the associated input acknowledgment or output reply is sent to the terminal.

Define DCLWA(Y) for all VTAM terminal types.
DEFAULT(Y)
Specifies this descriptor as the default, which resets the existing default descriptor to DEFAULT(N). When a descriptor is created without the LIKE keyword, any attribute not specified on the CREATE command takes the value defined in the default descriptor. Only one descriptor can be defined as the default for a resource type. IMS defines transaction descriptor called DFSDDSTR1, where all attributes are defined with the default value. Defining a user-defined descriptor to be the default overrides the current default descriptor. Since only one transaction descriptor can be the default at one time, only one transaction descriptor name can be specified with DEFAULT(Y).

DIRROUTE
Specifies the MSC directed routing option.

  N  The application program processing a transaction is not informed of the system which originated the transaction. The name of the originating LTERM is placed in the I/O PCB.

  Y  The application program processing a transaction is informed of the system which originated the transaction, if MSC directed routing is used in a multiple IMS system configuration. An MSNAME corresponding to a logical path back to the originating system is placed in the I/O PCB.

EDITRTN
Specifies the 1- to 8-character name of your transaction input edit routine that edits messages before the program receives the message. This name must be alphanumeric (A through Z, 0 through 9, #, $, and @). It must begin with an alphabetic character (A through Z, #, $, @). It cannot include a blank, comma, period, hyphen, or equal. It cannot include wildcard characters * or %.

The specified edit routine can either be an edit routine defined during the system definition process with the EDIT= parameter on the TRANSACT macro or it can be a new routine. If the routine is a new routine, the routine must reside in one of the RESLIB concatenated data sets. A maximum of 255 input edit routines are supported.

If the edit routine specified on the command is new to IMS, IMS attempts to load the routine from RESLIB. If the load fails, the command is rejected. If the edit routine specified is already defined to IMS, a decision is made whether to load a new copy of the routine or to use the existing copy. If the routine was generated into the system, but there are no transactions referencing the routine, IMS first attempts to load a new copy of the module from RESLIB. If the load is successful, the dynamic copy of the edit routine is used. The generated copy cannot be used again unless IMS is cold started. If the load of the dynamic routine fails, the generated copy is used. If the edit routine was generated into the system and other transactions reference it, the generated copy of the module is used.

EDITRTN is used for a Fast Path potential transaction when the transaction is routed to IMS.

For input from LU 6.2 devices, the user edit exit routine DFSLUEE0 is called instead of the transaction input edit routine specified in EDITRTN.

FP(E) and EDITRTN are mutually exclusive.
A zero value can be specified for the EDITRTN() parm (EDITRTN(0)) to remove an edit routine name from a transaction definition.

**EDITUC**

Specifies the edit to uppercase option.

- **N** The input data is not translated to uppercase. It can consist of uppercase and lowercase characters as entered from the terminal.
- **Y** The input data is to be translated to uppercase before it is presented to the processing program. If FP(E) or FP(P), the transaction is to be translated to uppercase before being presented to the edit/routing exit routine.

Specifying EDITUC(Y) for VTAM terminals prevents the transmission of embedded device control characters.

**EMHBSZ**

Specifies the EMH buffer size required to run the Fast Path transaction. This overrides the EMHL execution parameter. If EMHBSZ is not specified, the EMHL execution parameter value is used. The value can be a number from 12 to 30720.

Keyword combination rules include the following:

- EMHBSZ > 0 requires Fast Path to be defined.
- FP(N) and EMHBSZ>0 are mutually exclusive.

**EXPRTIME**

Specifies the elapsed time in seconds that IMS can use to cancel the input transaction. After a transaction is submitted to IMS, the transaction could be delayed for processing because of a stopped transaction or a potential system slow down. In that case, the user or client application could time out before the transaction is processed. When IMS eventually schedules and processes the transaction, the response message is no longer wanted. With the elapsed time specified for the transaction, IMS can flag the input transaction as expired so that the system does not waste CPU cycles to process the unwanted transaction.

The value can be a number, in seconds, which can range from 0 to 65535. The default is 0, which means that no expiration time is set for this transaction. The transaction expiration attribute is supported by all of the IMS TM interfaces.

**Restriction:** The transaction expiration checking is not performed at the GU time for Fast Path transactions, IMS conversational transactions, and program-to-program switch transactions.

**FP**

Specifies the Fast Path option.

- **E** The transaction is processed exclusively as Fast Path. The program must be defined as Fast Path exclusive.
- **N** The transaction is not a candidate for Fast Path processing. The program must be defined as not Fast Path. When FP(N) is specified, any attempt to use Fast Path resources or commands might yield unpredictable results.
- **P** The transaction is a potential candidate for Fast Path processing. Fast Path-potential transactions must be able to run under two applications: a Fast Path exclusive application and a non-Fast Path application. A Fast Path exclusive application should be defined to which this
transaction can be routed. Fast Path–potential transactions must be processed by a user edit/routing exit to determine whether the transaction is actually to be processed by IMS Fast Path. If it is to be processed by IMS Fast Path, the edit/routing exit routine associates the transaction with a routing code. This routing code identifies which Fast Path application program is to process the transaction.

The program defined by PGM() must not be defined as Fast Path exclusive.

In order to update a transaction from FP(E) to FP(N) or from FP(N) to FP(E) you must also update the transaction to point to a program that has the same FP() attribute. If you do not update the program attribute, the command fails because of a program conflict.

Keyword combination rules include the following:
- EDITRTN and FP(E) are mutually exclusive.
- EMHBSZ>0 and FP(N) are mutually exclusive.
- FP(E) and FP(P) require Fast Path to be defined.
- MSGTYPE(MULTSEG) and FP(E) are mutually exclusive.
- MSGTYPE(MULTSEG) and FP(P) are mutually exclusive.
- MSNAME and FP(E) are mutually exclusive.
- RECOVER(N) and FP(E) are mutually exclusive.
- RECOVER(N) and FP(P) are mutually exclusive.
- RESP(N) and FP(E) are mutually exclusive.
- RESP(N) and FP(P) are mutually exclusive.
- SIDL and FP(E) are mutually exclusive.
- SIDR and FP(E) are mutually exclusive.

INQ
Specifies the inquiry option.
N  This is not an inquiry transaction.
Y  This is an inquiry transaction. If INQ(Y) is specified, you can also specify whether this transaction should be recovered during an IMS emergency or normal restart using the RECOVER() parameter.

This option should be specified only for those transactions that, when entered, do not cause a change in any database. Programs are prohibited from issuing ISRT, DLET, or REPL calls to a database when scheduled to process a transaction defined as INQ(Y).

An application program cannot do an SQL INSERT, DELETE, or UPDATE when the IMS transaction is defined with INQ(Y).

Keyword combination rules include the following:
- CONV(Y) and INQ(Y) are mutually exclusive.
- RECOVER(N) and INQ(N) are mutually exclusive.

LCT
Specifies the limit count. This is the number that, when compared to the number of input transactions queued and waiting to be processed, determines whether the normal or limit priority value is assigned to this transaction. The value can be a number from 1 to 65 535. The default is 65 535.
The limit count value is ignored for a transaction processed by a BMP.
The limit count value is ignored in a shared queues environment.

LPRI

Specifies the limit priority. This is the scheduling priority to which this
transaction is raised when the number of input transactions enqueued and
waiting to be processed is equal to or greater than the limit count value.
The scheduling priority is an attribute used to select a transaction for
scheduling. A transaction of higher priority is scheduled before a lower
priority one, if they are defined with the same class. The value can be a
number from 0 through 14.

When the limit priority is used and the scheduling priority is raised to the
limit priority, the priority is not reduced to the normal priority until all
messages enqueued for this transaction name are processed. If you do not
want the limit priority for this transaction, define equal values for the
normal priority and limit priority, and a limit count of 65535.

When a transaction is processed exclusively by a batch message program
(BMP), define the limit priority as 0. If the program specified by PGM() is
defined with a program type of batch, the current priority is forced to be 0.
However, a batch message processing region (BMP) can process
transactions with current scheduling priorities other than 0.

This priority also controls the priority of messages created by this
transaction and sent to a destination in a remote system. See also the
discussion on MSC priorities under the NPRI definition.

The limit priority value is ignored for a transaction processed by a BMP.
The limit priority value is ignored in a shared-queues environment.

MAXRGN

 Specifies the maximum region count. This limits the number of message
 processing program (MPP) regions that can be concurrently scheduled to
 process a transaction. When the number of MPP regions is not limited, one
 transaction might monopolize all available regions. The value can be a
 number from 0 to the value specified on the MAXPST= control region
 parameter. MAXRGN(0) means that no limit is imposed.

 If you define the application program with a scheduling type of SERIAL,
 omit the MAXRGN keyword or define it as 0.

 The following keyword combinations are mutually exclusive:
 • PARLIM(65535) and MAXRGN value greater than 0
 • SERIAL(Y) and MAXRGN value greater than 0

MSGTYPE

 Specifies the message type (single segment or multiple segment). It
 specifies the time at which an incoming message is considered complete
 and available to be routed to an application program for subsequent
 processing.

 If MSC-directed routing is used in a multiple IMS system configuration,
 IMS does not ensure that both the message and the transaction destined to
 process that message are either single segment or multiple segments.

MULTSEG

 The incoming message can be more than one segment in length. It is
not eligible for scheduling to an application program until an end-of-message indication is received, or a complete message is created by MFS.

**SNGLSEG**

The incoming message is one segment in length. It becomes eligible for scheduling when the terminal operator indicates end-of-segment.

Keyword combination rules include the following:

- FP(E) and MSGTYPE(MULTSEG) are mutually exclusive.
- FP(P) and MSGTYPE(MULTSEG) are mutually exclusive.
- RESP(Y) and MSGTYPE(MULTSEG) are mutually exclusive.

**MSNAME**

Specifies the one- to eight-character name of the logical link path in a multiple IMS system configuration (MSC). A logical link path is a path between any two IMS systems. The IMS systems are identified by the remote system ID and the local system ID associated with the logical link path. The remote system ID identifies the system in which messages using this path are to be processed. The local system ID identifies this system. For an UPDATE TRAN command that is changing a transaction to a remote transaction, or changing the MSC path, the new MSNAME must already be defined.

Keyword combination rules include the following:

- FP(E) and MSNAME are mutually exclusive.
- SIDL and MSNAME are mutually exclusive.
- SIDR and MSNAME are mutually exclusive.

**NPRI**

Specifies the normal scheduling priority. The scheduling priority is an attribute used to select a transaction for scheduling. A transaction of higher priority is scheduled before a lower priority one, if they are defined with the same class. The normal priority is assigned to the transaction as the scheduling priority when the number of input transactions enqueued and waiting to be processed is less than the limit count value. The value can be a number from 0 through 14. The default is 1.

This priority also controls the priority of messages created by this transaction and sent to a destination in a remote system.

When a transaction is processed exclusively by a batch message program (BMP), code the normal priority as 0.

When a transaction is processed exclusively by a batch message program (BMP), define the limit priority as 0. If the application program specified by PGM() is defined with a program type of batch, the current priority is forced to be 0. However, a batch message processing region (BMP) can process transactions with current scheduling priorities other than 0.

For remote transactions, the priority used to send the transaction to the processing system, which is termed the **MSC link message priority**. The three MSC link message priority groups are:

- Low
- Medium
- High
The low priority group consists of primary requests in the input terminal system. This group is assigned remote transaction priorities from 0 to 6. The medium group consists of secondary requests, responses, primary requests in an intermediate system, and primary requests in the input terminal system. This group is assigned a remote transaction priority of 7. The high group consists of primary requests in the input terminal system. Messages in this group are assigned remote transaction priorities from 8 to 14. Within each group, messages have a priority based on the current priority value of the transaction or remote transaction in the input terminal system for primary requests, and on the latest processing system for secondary requests and responses.

In an MSC configuration, the transaction priority determines the priority used to send messages inserted by this transaction across an MSC link. If the transaction inserts multiple messages to the same destination (for example, pages to a printer) and these messages must be sent in the order inserted, the normal and limit priority values should be the same. If the normal and limit priority values are not identical, messages inserted at a higher priority than previously inserted messages could arrive at their destination first. (This restriction does not apply to multiple segments of the same message.)

The normal priority value is ignored for a transaction processed by a BMP.

**PARLIN**

Specifies the parallel processing limit count. This is the maximum number of messages that can currently be queued, but not yet processed, by each active message region currently scheduled for this transaction. This is the threshold value to be used when the associated application is defined with a scheduling type of parallel. An additional region is scheduled whenever the current transaction enqueue count exceeds the PARLIN value multiplied by the number of regions currently scheduled for this transaction.

The value can be a number from 0 to 32767 or 65535. PARLIN(0) indicates that any input message can cause a new region to be scheduled because the scheduling condition is always met (the number of messages is greater than zero). If you specify PARLIN(0), you should specify a MAXRGN value to limit the number of regions that can be scheduled to process a particular transaction. PARLIN(65535) means that parallel processing is disabled and IMS allows the transaction to be scheduled in only one region at a time.

The value specified for PARLIN applies to message processing programs (MPPs) only; it is not supported for batch message processing programs (BMPs).

If you define the application as SERIAL or the scheduling type as SERIAL, define PARLIN(65535).

In a shared-queues environment (when the scheduling type is PARALLEL), any PARLIN value other than 65535 causes a new region to be scheduled whenever the successful consecutive GU count exceeds the PARLIN value multiplied by the number of regions currently scheduled for this transaction. For shared queues environments, the successful consecutive GU count is used instead of the queue count. New regions continue to be scheduled up to the maximum number of regions specified on MAXRGN.

Keyword combination rules include the following:
- MAXRGN>0 and PARLIM(65535) are mutually exclusive.
- SERIAL(Y) and PARLIM value 0 - 32767 are mutually exclusive.

**PGM**

Specifies the name of the application program associated with the transaction. The program must exist unless the transaction is defined as REMOTE(Y).

**PLCT**

Specifies the processing limit count. This is maximum number of messages sent to the application program by the IMS for processing without reloading the application program. The value must be a number from 0 through 65535. PLCT(0) means the maximum number of messages sent to the application is one and the application program is reloaded before receiving a subsequent message. PLCT(65535) means that no limit is to be placed upon the number of messages processed at a single program load. Values 1 through 65535 are eligible for quick reschedule processing.

The value is used to determine how many messages an application program is allowed to process in a single scheduling cycle. When the application program requests, and receives, the number of messages indicated, any subsequent requests result in one of two things.

1. IMS indicates “no more messages exist” if any of the following conditions is true
   - The region is not an MPP.
   - The currently scheduled mode is not CMTMODE(SNGL).
   - Equal or higher priority transactions are enqueued for the region.

IMS might, in fact, have other messages enqueued for the application program. It is the responsibility of the application program to terminate when it receives an indicator that no more messages are available. Termination of the application program makes the region it occupied available for rescheduling. This feature makes it possible for IMS to enable scheduling of higher priority transactions that entered the system while the previous transactions were in process. In addition, if any equal-priority transactions are enqueued, they become eligible for scheduling on a first-in, first-out (FIFO) basis.

2. The region goes through quick reschedule and returns the next message to the application of all of the following conditions are true.
   - The region is an MPP.
   - The transaction is CMTMODE(SNGL).
   - No equal or higher transactions are enqueued.
   - Messages are still enqueued for the application.

**PLCTTIME**

Specifies the processing limit count time. This is the amount of time (in hundredths of seconds) allowable to process a single transaction (or message). The number specifies the maximum CPU time allowed for each message to be processed in the message processing region.

Batch Message Programs (BMPs) are not affected by this setting.

The value can be a number, in hundredths of seconds, that can range from 1 to 6553500. A value of 6553500 means no time limit is placed on the application program.
If Fast Path is used this specifies, for a given transaction name, the amount of time (in hundredths of seconds) the program is allowed to process a single transaction message. The time represents real time that elapses during transaction processing (not accumulated task time). Real time is used because the input terminal is in response mode and cannot enter another transaction until the response is sent. In this case PLCT() is ignored.

The value controls application program looping. You are not required to optimize the value for program-transaction execution time. However, the time value assigned should not be less than the expected per-transaction execution time. If the scheduled application program exceeds the product of PLCTTIME() and PLCT(), the application program ends abnormally. If an IMS STIMER value of 2 is specified on the DFSMPR procedure, the region does not end abnormally until completion of the DL/I call.

The application program must not use STIMER timer services. IMS uses STIMER timer services to time the execution of transactions. If an application program issues an MVS STIMER macro, it cancels the STIMER timer services set by IMS. Use the STIMERM macro instead for application program timer requests.

**RECOVER**

Specifies the recovery option.

- **N** The transaction should not be recovered.
- **Y** The transaction should be recovered during an IMS emergency or normal restart.

Keyword combination rules include the following:

- CONV(Y) and RECOVER(N) are mutually exclusive.
- FP(E) and RECOVER(N) are mutually exclusive.
- FP(P) and RECOVER(N) are mutually exclusive.
- INQ(N) and RECOVER(N) are mutually exclusive.

**REMOTE**

Specifies the remote option.

- **N** The transaction is not remote. The transaction is local and runs on the local system.
- **Y** The transaction is remote. The transaction runs on a remote system.

REMOTE(Y) requires MSNAME or SIDR and SIDL.

**RESP**

Specifies the response mode option.

- **N** The transaction is not response mode. For terminals specifying or accepting a default of OPTIONS=TRANRESP, input should not stop after this transaction is entered.
- **Y** The transaction is response mode. The terminal from which the transaction is entered is held and prevents further input until a response is received. For terminals specifying or accepting a default of OPTIONS=TRANRESP, no additional messages are to be allowed after this transaction is entered until this transaction sends a response message back to the terminal. Response mode can be forced or negated.
by individual terminal definition. RESP(Y) is ignored during online processing for all terminals that do not operate in response mode.

Keyword combination rules include the following:
• FP(E) and RESP(N) are mutually exclusive.
• FP(P) and RESP(N) are mutually exclusive.
• MSGTYPE(MULTISEG) and RESP(Y) are mutually exclusive

**SEGNO**

Specifies the segment number. This is the maximum number of application program output segments that are allowed into the message queues per Get Unique (GU) call from the application program. The value can be a number from 0 through 65535. If SEGNO(0) is defined, the number of segments is not checked by the online system at execution time.

**SEGSZ**

Specifies the segment size. This is the maximum number of bytes allowed in any one output segment. The value can be a number from 0 through 65535. If SEGSZ(0) is defined, the segment size is not checked by the online system at execution time.

The maximum output message segment to an LU 6.2 device is 32767. If a transaction is expected to send output to an LU 6.2 device, the SEGSIZE parameter should be no greater than 32767. However, this is not enforced during processing of the command, because IMS cannot determine the device type for the message destination until output time.

**SERIAL**

Specifies the serial option.

N  Messages for the transaction are not processed serially. Message processing can be processed in parallel. Messages are placed on the suspend queue after a U3303 pseudoabend. Scheduling continues until repeated failures result in the transaction being stopped with a USTOP.

Y  Messages for the transaction are processed serially. U3303 pseudoabends do not cause the message to be placed on the suspend queue but rather on the front of the transaction message queue, and the transaction is stopped with a USTOP. The USTOP of the transaction is removed when the transaction or the class is started with a /START or UPD TRAN command.

Keyword combination rules include the following:
• MAXRGN>0 and SERIAL(Y) are mutually exclusive.
• PARLIM value 0 - 32767 and SERIAL(Y) are mutually exclusive.

**SIDL**

Specifies the system identification (SYSID) of the local system in a multiple-IMS system (MSC) configuration. The local system is the originating system to which responses are returned. The value can be a number from 1 to 2036. The local SYSID can be defined in any or all of the MSNAMEs or transactions.

The SIDL parameter is independent of the link type (CTC, MTM, TCP/IP, VTAM) specified on the TYPE= keyword of the MSPLINK macro statement.

Keyword combination rules include the following:
• FP(E) and SIDL are mutually exclusive, unless SIDL and SIDR are specified as a pair and are equal to the local system ID of this IMS.
• MSNAME and SIDL are mutually exclusive.
• SIDL value must be defined to this IMS.

**SIDR**

Specifies the system identification (SYSID) of the remote system in a multiple-IMS system (MSC) configuration. The remote system is the system on which the application program executes. The value can be a number from 1 to 2036. The remote SYSID specified must also be defined for an MSNAME.

The SIDR parameter is independent of the link type (CTC, MTM, TCP/IP, VTAM) specified on the TYPE= keyword of the MSPLINK macro statement.

Keyword combination rules include the following:

• FP(E) and SIDR are mutually exclusive, unless SIDL and SIDR are specified as a pair and are equal to the local system ID of this IMS.
• MSNAME and SIDR are mutually exclusive.
• SIDR value must be defined to this IMS.

**SPASZ**

Specifies the scratchpad area (SPA) size, in bytes, for a conversational transaction. The value can be a number from 16 and 32767.

Keyword combination rules include the following:

• CONV(N) and SPASZ are mutually exclusive.

**SPATRUNC**

Specifies the scratchpad area (SPA) truncation option of a conversational transaction. This defines whether the SPA data should be truncated or preserved across a program switch to a transaction that is defined with a smaller SPA.

When a conversation initially starts, and when a program is switched, the SPATRUNC option is checked and set or reset as specified. When the option is set, it remains set for the life of the conversation, or until a program switch occurs to a transaction that specifies the option is to be Reset.

When a program switch occurs, the truncated data option for the new transaction is first checked, and that specification is set for the conversation and is used for the SPA inserted into the output message. If the option is not specified for the new transaction, the option currently in effect for the conversation is used.

S IMS preserves all of the data in the SPA, even when a program switch is made to a transaction that is defined with a smaller SPA. The transaction with the smaller SPA does not see the truncated data, but when the transaction switches to a transaction with a larger SPA, the truncated data is used.

R The truncated data is not preserved.

Keyword combination rules include the following:

• CONV(N) and SPATRUNC are mutually exclusive.
TRANSTAT

Specifies whether transaction level statistics should be logged for message driven programs. If Y is specified, transaction level statistics are written to the log in a X'56FA' log record.

N  Transaction level statistics should not be logged.

Y  Transaction level statistics should be logged.

The TRANSTAT keyword on the UPDATE TRAN or UPDATE TRANDESC command gives the user the ability to override the system default or the current value of the TRANSTAT parameter. If the TRANSTAT keyword is omitted on the UPDATE TRAN or UPDATE TRANDESC command, the current transaction level statistics setting is unchanged.

WFI

Specifies the wait-for input option. This attribute does not apply to Fast Path transactions, which always behave as wait-for-input transactions.

N  This is not a wait-for-input transaction.

Y  This is a wait-for-input transaction. A message processing or batch processing application program that processes WFI transactions are scheduled and invoked normally. If the transaction to be processed is defined as WFI, the program is allowed to remain in main storage after it has processed the available input messages. The QC status code (no more messages) is returned to the program if the PROCLIM count (PLCT) is reached; a command is entered to change the status of the scheduled transaction, database, program, or class; commands relating to the databases used by the transaction are entered, or IMS is terminated with a checkpoint shutdown.

Keyword combination rules include the following:
• MODE(MULT) and WFI(Y) are mutually exclusive.

Usage notes

If all the attributes specified by the UPDATE command are already defined for the descriptor, no update is actually made, no descriptors are quiesced, no log record is created, and a completion code of zero is returned. This avoids unnecessary overhead when no action needs to be taken.

Descriptors exist for the life of the IMS unless they are deleted using a DELETE command. The descriptors are recoverable across an IMS warm start or emergency restart. Descriptors are lost if IMS is cold started, unless cold start imports definitions that were exported while IMS was up. Each descriptor is updated individually. Individual updating does not work like online change where either all descriptors are updated or no descriptors are updated.

The UPDATE TRANDESC command can be issued only through the OM API. This command applies to DB/DC and DCCTL systems. This command is not valid on the XRF alternate, RSR tracker, or FDBR region. The UPDATE TRANDESC commands are not valid if online change for MODBLKS is enabled (DFSDFxxx or DFSCGxxx defined with MODBLKS=OLC, or MODBLKS not defined). This command is recoverable. If the descriptor being updated is the IMS-defined transaction descriptor (DFSDSTR1) the only attribute that can be changed is the DEFAULT attribute.
Output fields

The following table shows the UPDATE TRANDESC output fields. The columns in the table are as follows:

**Short label**
Contains the short label generated in the XML output.

**Keyword**
Identifies keyword on the command that caused the field to be generated. N/A appears for output fields that are always returned. error appears for output fields that are returned only in case of an error.

**Meaning**
Provides a brief description of the output field.

### Table 542. Output fields for the UPDATE TRANDESC command

<table>
<thead>
<tr>
<th>Short label</th>

Chapter 30. UPDATE commands
Explanation: The UPDATE TRANDESC command is issued to update all transaction descriptors to be Fast Path exclusive. The update succeeded for some transaction descriptors and failed for others. The update succeeded for some transaction descriptors as shown by the completion code 0. The update failed for transaction descriptor FPPDESC with completion code 36, which indicates that the FP(E) attribute conflicts with the FP(N) attribute defined for the program referred to by FPPDESC. The update failed for transaction descriptor MSCDESC with completion code 3A, which indicates that the FP(E) attribute conflicts with the MSC settings already defined for descriptor MSCDESC. The update failed for some transaction descriptors with completion code 3B, which indicates that the FP(E) attribute conflicts with the MSGTYPE(MULTSEG) already defined for the transaction.

Chapter 31. /VUNLOAD command

The /VUNLOAD AREA command removes the specified areas from the z/OS data space or coupling facility.

All of the updated CIs for the area are written to DASD. All subsequent I/O for the area is from DASD. /VUNLOAD processing occurs concurrently with application processing.

Subsections:
- “Environment”
- “Syntax”
- “Usage notes”
- “Example” on page 1322

Environment

The following table lists the environments (DB/DC, DBCTL, and DCCTL) from which the command and keyword can be issued.

<table>
<thead>
<tr>
<th>Command / Keyword</th>
<th>DB/DC</th>
<th>DBCTL</th>
<th>DCCTL</th>
</tr>
</thead>
<tbody>
<tr>
<td>/VUNLOAD</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>AREA</td>

<td>X</td>
<td></td>
</tr>
</tbody>
</table>

Syntax

![Syntax Diagram]

Usage notes

In a data-sharing environment, in order to maintain data integrity, IMS requests IRLM to lock the first control interval (CI) in exclusive mode before IMS unloads the area from the coupling facility. This lock causes those IMS subsystems sharing the area to complete any synchronization point processing. When all sharing subsystems are no longer using the area, IMS requests IRLM to release the CI locks and IMS unloads the area. All subsequent I/O for the area is from DASD.

The /VUNLOAD command does not change any of the VSO options set in the RECON data set. Therefore, at the next IMS restart or /START AREA command, the VSO options again take effect. Any changes to VSO definitions must be made through DBRC commands. For Shared VSO areas however, the /VUNLOAD command is persistent across IMS restarts and can be reset only by a /START AREA command. This is true for shared VSO areas for consistency across all sharing partners. This prevents one system from accessing data from DASD while others are accessing from the coupling facility.
For multiple VSO DEDB areas that share a single coupling facility structure, when the /VUNLOAD AREA command is issued, one of the following actions may occur:

- If there is only one area in the structure (either a single-area structure or a multi-area structure with one area), the area is taken out of VSO and the structure is deleted. The IMS issuing the /VUNLOAD AREA command notifies the other IMS systems sharing the area to disconnect from the structure.
- If there are multiple areas in the structure, when one area is taken out of VSO, the area is disassociated and its CIs are deleted in the structure. The IMS issuing the /VUNLOAD AREA notifies the other IMS systems sharing the area to either disassociate or disconnect from the structure depending on if the IMS is still sharing or not sharing other areas in the structure.

The /VUNLOAD command is not valid for an RSR tracking subsystem.

This command can be issued to an IMSplex using the Batch SPOC utility.

**Example**

Entry ET:

/VUNLOAD

Response ET:

```
R 8400000 FPEC 03070 09:58:03.52 01 00000290 R 14 ,/VUNLOAD AREA DD01AR0
M 8400000 FPEC 03070 09:58:03.52 01 00000090 FPEC 03070 09:58:03.52 01 00000090 IMS READY SYS03
W 8400000 FPEC 03070 09:58:03.52 01 00000090 DFS058I 09:58:03 VUNLOAD COMMAND IN PROGRESS SYS3
N 8400000 FPEC 03070 09:58:03.52 01 00000090 DFS058I 09:58:03 VUNLOAD COMMAND IN PROGRESS SYS3
```

The /VUNLOAD command is not valid for an RSR tracking subsystem.

This command can be issued to an IMSplex using the Batch SPOC utility.

**Example**

Entry ET:

/VUNLOAD

Response ET:

```

- example 411
- keywords 409
- output fields 410
- reason codes 411

X-8 Commands, Volume 2: IMS Commands N - V
QUERY command (continued)

ODBM TYPE(CONFIG) keyword

- completion codes 415
- description 412
- environment 413
- example 416
- keywords 413
- output fields 414
- reason codes 415
- return codes 415
- syntax 413
- usage notes 414

ODBM TYPE(SCIMEMBER) keyword

- completion codes 418
- description 417
- environment 417
- example 419
- keywords 417
- output fields 418
- reason codes 418
- return codes 418
- syntax 417
- usage notes 418

ODBM TYPE(THREAD) keyword

- completion codes 424
- description 420
- environment 420
- example 425
- keywords 421
- output fields 423
- reason codes 424
- return codes 424
- syntax 420
- usage notes 423

ODBM TYPE(TRACE) keyword

- completion codes 429
- description 427
- environment 428
- example 430
- keywords 428
- output fields 428
- reason codes 429
- return codes 429
- syntax 428
- usage notes 428

OLC keyword

- completion codes 434
- description 430
- environment 430
- examples 435
- keywords 431
- output fields 432
- reason codes 434
- return codes 434
- syntax 430
- usage notes 431

OLREORG keyword

- completion codes 443
- description 439
- environment 439
- examples 444
- keywords 440

OLREORG keyword (continued)

- completion codes 446
- description 446
- environment 446
- examples 455
- keywords 448
- output fields 454
- reason codes 454
- return codes 454
- syntax 446
- usage notes 453

PM keyword

- completion codes 482
- description 467
- environment 468
- examples 484
- keywords 469
- output fields 474
- reason codes 482
- return codes 482
- syntax 468
- usage notes 474

PMDESC keyword

- completion codes 502
- description 492
- environment 492
- examples 504
- keywords 493
- output fields 497
- reason codes 502
- return codes 502
- usage notes 497

POOL keyword

- completion codes 519
- description 509
- environment 509
- examples 520
- keywords 510
- output fields 512
- reason codes 519
- return codes 519
- syntax 509
- usage notes 512

RTC keyword

- completion codes 547
- description 538
- environment 538
- examples 549
- keywords 539
- output fields 544
- reason codes 547
- return codes 547
- syntax 539
- usage notes 543

RTCDESC keyword

- completion codes 562
- description 555
- environment 555
- examples 564
- keywords 556
- output fields 560
- reason codes 562
- return codes 562
- syntax 555
- usage notes 559

STRUCTURE keyword

- completion codes 569
- description 567
- environment 567
- keywords 568
- output fields 568
- reason codes 569
- return codes 569
- syntax 568
- usage notes 568

TRAN keyword

- completion codes 606
- description 572
- environment 572
- output 586
- reason codes 606
- return codes 606
- similar to other IMS commands 586
- syntax 573
- usage notes 585

TRANDESC keyword

- completion codes 643
- description 621
- environment 621
- examples 644
- keywords 622
- output fields 630
- reason codes 643
- return codes 643
- usage notes 629

USER keyword

- command comparison 656
- completion codes 662
- description 650
- environment 650
- examples 664
- keywords 651
QUERY command (continued)
USER keyword (continued)

reason codes 1117
return codes 1117
syntax 1117
usage notes 1117

IMSCON TYPE(RMTIMSCON) keyword
completion codes 1123
description 1123
environment 1123
equivalent WTOR and z/OS commands 1125
elementary example 1123
keywords 1123
output fields 1123
reason codes 1123
return codes 1123
syntax 1123
usage notes 1123

IMSCON TYPE(SENDCLNT) keyword
completion codes 1130
description 1130
environment 1130
equivalent WTOR and z/OS commands 1132
elementary example 1130
keywords 1130
output fields 1130
reason codes 1130
return codes 1130
syntax 1130
usage notes 1130

MSLINK keyword
completion codes 1150
description 1142
environment 1142
equivalent example 1152
keywords 1144
output fields 1150
reason codes 1150
return codes 1150
syntax 1143
usage notes 1149

MSNAME keyword
completion codes 1157
description 1153
environment 1154
equivalent example 1159
keywords 1154
output fields 1157
reason codes 1157
return codes 1157
syntax 1154

ODBM keyword
description 1170

ODBM START(CONNECTION) keyword
completion codes 1172
description 1171
environment 1171
equivalent example 1173
keywords 1171
output fields 1172
reason codes 1172
return codes 1172
syntax 1171
usage notes 1172

ODBM START(TRACE) keyword
completion codes 1175
description 1174
environment 1174
equivalent example 1176
keywords 1174
output fields 1175
reason codes 1175
return codes 1175

UPDATE command (continued)

LE keyword
completion codes 1139, 1140
description 1137
environment 1137
equivalent example 1140
keywords 1138
output fields 1139
reason codes 1139
return codes 1139
syntax 1137
usage notes 1139

MSLINK keyword
completion codes 1150
description 1142
environment 1142
equivalent example 1152
keywords 1144
output fields 1150
reason codes 1150
return codes 1150
syntax 1143
usage notes 1149

MSNAME keyword
completion codes 1157
description 1153
environment 1154
equivalent example 1159
keywords 1154
output fields 1157
reason codes 1157
return codes 1157
syntax 1154

X-16 Commands, Volume 2: IMS Commands N - V
### UPDATE command (continued)

**ODBM START(TRACE) keyword**
- **syntax**: 1174
- **usage notes**: 1174

**ODBM STOP(CONNECTION) keyword**
- **completion codes**: 1178
- **description**: 1176
- **environment**: 1177
- **example**: 1179
- **keywords**: 1177
- **output fields**: 1178
- **reason codes**: 1178
- **return codes**: 1178
- **syntax**: 1177
- **usage notes**: 1177

**ODBM STOP(TRACE) keyword**
- **completion codes**: 1181
- **description**: 1180
- **environment**: 1180
- **example**: 1182
- **keywords**: 1180
- **output fields**: 1180
- **reason codes**: 1181
- **return codes**: 1181
- **syntax**: 1180
- **usage notes**: 1180

**ODBM TYPE(CONFIG) keyword**
- **completion codes**: 1184
- **description**: 1182
- **environment**: 1182
- **example**: 1186
- **keywords**: 1183
- **output fields**: 1184
- **reason codes**: 1184
- **return codes**: 1184
- **syntax**: 1182
- **usage notes**: 1183

**OLREORG keyword**
- **command responses**: 1189
- **completion codes**: 1190
- **description**: 1186
- **environment**: 1187
- **examples**: 1191
- **keywords**: 1187
- **output fields**: 1189
- **reason codes**: 1190
- **return codes**: 1190
- **syntax**: 1187
- **usage notes**: 1189

**OTMADESC keyword**
- **completion codes**: 1198
- **description**: 1192
- **environment**: 1192
- **examples**: 1200
- **keywords**: 1194
- **output fields**: 1198
- **reason codes**: 1198
- **return codes**: 1198
- **syntax**: 1193
- **usage notes**: 1198

**PGM keyword**
- **completion codes**: 1211
- **description**: 1201
- **environment**: 1201
- **equivalent IMS commands**: 1210

**PGM keyword (continued)**
- **examples**: 1215
- **keywords**: 1202
- **output fields**: 1210
- **reason codes**: 1211
- **return codes**: 1211
- **syntax** 1202
- **usage notes**: 1209

**PGMDESC keyword**
- **completion codes**: 1224
- **description**: 1218
- **environment**: 1218
- **examples**: 1226
- **keywords**: 1219
- **output fields**: 1223
- **reason codes**: 1224
- **return codes**: 1224
- **syntax**: 1219
- **usage notes**: 1223

**POOL keyword**
- **completion codes**: 1233
- **description**: 1228
- **environment**: 1228
- **examples**: 1235
- **keywords**: 1229
- **output fields**: 1232
- **reason codes**: 1233
- **return codes**: 1233
- **syntax**: 1229
- **usage notes**: 1230

**RM keyword**
- **completion codes**: 1243
- **description**: 1240
- **environment**: 1240
- **examples**: 1246
- **keywords**: 1240
- **output fields**: 1243
- **reason codes**: 1243
- **return codes**: 1243
- **syntax**: 1240
- **usage notes**: 1242

**RTC keyword**
- **completion codes**: 1253
- **description**: 1250
- **environment**: 1251
- **examples**: 1255
- **keywords**: 1251
- **output fields**: 1253
- **reason codes**: 1253
- **return codes**: 1253
- **syntax**: 1251
- **usage notes**: 1252

**RTCDESC keyword**
- **completion codes**: 1260
- **description**: 1257
- **environment**: 1257
- **examples**: 1261
- **keywords**: 1258
- **output fields**: 1259
- **reason codes**: 1260
- **return codes**: 1260
- **syntax**: 1258
- **usage notes**: 1259

**TRAN keyword (continued)**
- **environment**: 1263
- **equivalent IMS commands**: 1286
- **examples**: 1295
- **keywords**: 1266
- **output fields**: 1287
- **reason codes**: 1283
- **return codes**: 1288
- **syntax**: 1264
- **usage notes**: 868, 1285

**TRANDESC keyword**
- **completion codes**: 1314
- **description**: 1297
- **environment**: 1297
- **examples**: 1318
- **keywords**: 1300
- **output fields**: 1314
- **reason codes**: 1314
- **return codes**: 1314
- **syntax**: 1298
- **usage notes**: 1313

**type-2 976**

**UPDATE DATAGRP command**
- **similar IMS commands**: 976

**UPDATE DB command**
- **equivalent IMS commands**: 1000
- **parameters**: 990

**UPDATE LE command**
- **parameters**: 1138

**UPDATE OLREORG command**
- **examples**: 1191

**UPDATE PGM command**
- **equivalent IMS commands**: 1210

**UPDATE POOL command**
- **dynamic database buffer pools, monitoring**: 1228

**UPDATE TRAN command**
- **equivalent IMS commands**: 1286
- **parameters**: 1266

**USEAREA keyword**
- **/RECOVER command**
- **ADD** 707

**USERkeyword**
- **RECOVER command**
- **ADD keyword**: 707

**V**

**VTAM (Virtual Telecommunications Access Method)**
- **link**
  - RSTART command: 750
  - MSC links
  - PSTOP MSPLINK command: 22

Index X-17
VTAM (Virtual Telecommunications Access Method) (continued)
   terminal
      disconnecting  699
      initiating a session  15
      ready/not ready state  702
VUNLOAD command
   description  1321
   entry format  1321
   environment  1321
   syntax  1321
   usage notes  1321

W
   WADS keyword
      SWITCH command  884
   wait-for-input mode
      stopping message processing  859

X
   XRF (Extended Recovery Facility)
      alternate system
         START REGION command  812
