About this information

These topics provide guidance information for preparing for an IMS™ installation process and running the IMS installation verification program (IVP). The topics also describe the sample applications that are provided with IMS.

This information is available in IBM® Knowledge Center.

Prerequisite knowledge

Before using this information, you should have knowledge of either IMS Database Manager (DB) or IMS Transaction Manager (TM). You should also understand basic z/OS® and IMS concepts, your installation’s IMS system, and have general knowledge of the tasks involved in project planning.

You can learn more about z/OS by visiting the “z/OS basic skills” topics in IBM Knowledge Center.

You can gain an understanding of basic IMS concepts by reading An Introduction to IMS, an IBM Press publication.

IBM offers a wide variety of classroom and self-study courses to help you learn IMS. For a complete list of courses available, go to the Resources section of the IMS home page at ibm.com/ims and link to the Training and Certification page.

IMS function names used in this information

In this information, the term HALDB Online Reorganization refers to the integrated HALDB Online Reorganization function that is part of IMS Version 13, unless otherwise indicated.

How new and changed information is identified

New and changed information in most IMS library PDF publications is denoted by a character (revision marker) in the left margin. The first edition (-00) of Release Planning, as well as the Program Directory and Licensed Program Specifications, do not include revision markers.

Revision markers follow these general conventions:

• Only technical changes are marked; style and grammatical changes are not marked.

• If part of an element, such as a paragraph, syntax diagram, list item, task step, or figure is changed, the entire element is marked with revision markers, even though only part of the element might have changed.

• If a topic is changed by more than 50%, the entire topic is marked with revision markers (so it might seem to be a new topic, even though it is not).

Revision markers do not necessarily indicate all the changes made to the information because deleted text and graphics cannot be marked with revision markers.
How to read syntax diagrams

The following rules apply to the syntax diagrams that are used in this information:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line. The following conventions are used:
  - The >>--- symbol indicates the beginning of a syntax diagram.
  - The ---> symbol indicates that the syntax diagram is continued on the next line.
  - The >--- symbol indicates that a syntax diagram is continued from the previous line.
  - The --->< symbol indicates the end of a syntax diagram.
- Required items appear on the horizontal line (the main path).

```
---required_item-->
```

- Optional items appear below the main path.

```
---required_item<optional_item>-->
```

If an optional item appears above the main path, that item has no effect on the execution of the syntax element and is used only for readability.

```
---required_item<optional_item>-->
```

- If you can choose from two or more items, they appear vertically, in a stack.
  If you must choose one of the items, one item of the stack appears on the main path.

```
---required_item(required_choice1
(required_choice2)
```

If choosing one of the items is optional, the entire stack appears below the main path.

```
---required_item<optional_choice1
(optional_choice2)
```

If one of the items is the default, it appears above the main path, and the remaining choices are shown below.

```
---required_item(default_choice
(optional_choice)
```

- An arrow returning to the left, above the main line, indicates an item that can be repeated.
If the repeat arrow contains a comma, you must separate repeated items with a comma.

A repeat arrow above a stack indicates that you can repeat the items in the stack.

- Sometimes a diagram must be split into fragments. The syntax fragment is shown separately from the main syntax diagram, but the contents of the fragment should be read as if they are on the main path of the diagram.

- In IMS, a b symbol indicates one blank position.
- Keywords, and their minimum abbreviations if applicable, appear in uppercase. They must be spelled exactly as shown. Variables appear in all lowercase italic letters (for example, column-name). They represent user-supplied names or values.
- Separate keywords and parameters by at least one space if no intervening punctuation is shown in the diagram.
- Enter punctuation marks, parentheses, arithmetic operators, and other symbols, exactly as shown in the diagram.
- Footnotes are shown by a number in parentheses, for example (1).

**Accessibility features for IMS Version 13**

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

**Accessibility features**

The following list includes the major accessibility features in z/OS products, including IMS Version 13. These features support:

- Keyboard-only operation.
- Interfaces that are commonly used by screen readers and screen magnifiers.
- Customization of display attributes such as color, contrast, and font size.

**Keyboard navigation**

You can access IMS Version 13 ISPF panel functions by using a keyboard or keyboard shortcut keys.
For information about navigating the IMS Version 13 ISPF panels using TSO/E or ISPF, refer to the z/OS TSO/E Primer, the z/OS TSO/E User’s Guide, and the z/OS ISPF User’s Guide Volume 1. These guides describe how to navigate each interface, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Related accessibility information

Online documentation for IMS Version 13 is available in IBM Knowledge Center.

IBM and accessibility

See the IBM Human Ability and Accessibility Center at www.ibm.com/able for more information about the commitment that IBM has to accessibility.

How to send your comments

Your feedback is important in helping us provide the most accurate and highest quality information. If you have any comments about this or any other IMS information, you can take one of the following actions:

- Click the Feedback link at the bottom of any IBM Knowledge Center topic.
- Send an email to imspubs@us.ibm.com. Be sure to include the book title and the publication number.
Chapter 1. IMS installation overview

Installing IMS includes planning steps, ordering hardware and software, and running the installation verification program (IVP).

Prerequisites

It is assumed that you have experience working with the following products or environments:

- Product installation and service using SMP/E
- The z/OS environment:
  - Job Entry Subsystem (JES2 or JES3)
  - Job Control Language (JCL)
  - Utilities
  - Operations
  - System Display and Search Facility (SDSF)
- The Time Sharing Option (TSO) environment:
  - CLISTs and REXX EXECs
  - Interactive Systems Productivity Facility (ISPF)
- The Virtual Storage Access Method (VSAM) and the Integrated Catalog Facility (ICF)

Installation process

The following categories provide the end-to-end steps and processes that are recommended in order to install IMS and migrate the new version into production.

1. Release planning

   There are several things to consider before you order the software and hardware that is appropriate for a particular business. Most companies have a business plan that is used to address these issues and answer important questions. Some of these questions include:

   - Which release of IMS are you upgrading to?
   - Which release provides enough value to your company to warrant a migration?
   - When do you upgrade to the next release?
   - What are the hardware and personnel requirements that you need in order to upgrade?

   For help with these business decisions, consult the edition of IMS Release Planning specific to the version of IMS that you are considering for your migration. For the IMS and DB2® Tools requirements, go to z Systems software website.

2. Ordering the hardware and software

   After you determine your particular needs, you can order the products specific to your business plan. IMS Version 13 Release Planning, the product announcement letter, and Program Directory for Information Management System Transaction and Database Servers provide the hardware and software requirements specific to each release of IMS. You can order IMS by using the following distribution media:
• Custom-Built Product Delivery Offering (CBPDO)
  The CBPDO product package consists of one logical tape (multiple volumes). A CBPDO package that includes IMS can also include other products in the same System Release (SREL). CBPDO also provides service for the products included with the product order.
  The service includes all PTFs available within one week of order fulfillment. All PTFs are identified by one or more SOURCEIDs, including PUTyymm, RSUyymm, SMCREC, HIPER, and SMCCOR.
  See the CBPDO “DBS Memo to User Extensions” (shipped with the CBPDO package) for more information.

• ServerPac
  ServerPac is an entitled software delivery package. It consists of products and service for which IBM performed the SMP/E installation steps and some of the post-SMP/E installation steps. To install the package on your system, you need to install the software. It includes the CustomPac Installation dialog, which is the same dialog that is used for all CustomPac offerings, including SystemPac (dump-by-data-set format), ProductPac®, and RefreshPac.
  ServerPac provides the following:
  - Allocates, catalogs, and loads all the data sets
  - Sets up the SMP/E environment
  - Supplies a job to update PARMLIB (IEFSSNxx, PROGxx, and IEASVCxx)
  - Directs you to start the IVP
  Your ServerPac order includes the latest unintegrated service that is available at the time your order is created. Read the accompanying ServerPac: Installing Your Order document for information about the service included in your order and any preventive maintenance that you should perform after the installation. You must review Appendix C, “Using the Package Reports” in the document for the SMP/E reports. You might need to resolve FMIDs that are not included in your order, or PTF-in-errors (PEs) that cannot be integrated in your order because no fixes are currently available. Check to see whether the errors affect your system and if fixes are available. If fixes are not available, contact IBM Software Support for assistance.

3. Installation planning
   Before you install IMS, keep in mind the following considerations that are specific to each IMS customer. Determining these items are important to ensure successful installation and subsequent administration of IMS. The installation and planning tasks include:
   • Hardware requirements for the IMS product
   • Software requirements for the IMS product
   • Tools requirements for both IBM and non-IBM tools
   • Migration and compatibility requirements for the current release
   The following lists sources of installation and release planning information:
   • IBM IMS announcement letters (RFAs) on the IMS website
   • IMS Version 13 Release Planning
   • Preventative Service Planning (PSP bucket)
   • Program Directory for Information Management System Transaction and Database Servers

4. Installing the IMS product
Installation of IMS and any preventive maintenance uses the SMP/E APPLY and ACCEPT processes. You then run the IVP to define and validate a sample IMS system by specifying your environment options and testing the sample applications.

Multiple sources of documentation are available that describe installation procedures and currency of IMS maintenance. Some of this information is more current than others. The recommended order to obtain the most current information, from least to most current, is:

a. CBPDO and ServerPac documentation
   You can get this information from:
   - IBM Software Support: 1-800-879-2755
   - Shopz website

b. Preventive Service Planning (PSP bucket) information
   You can get this information from:
   - IBM Software Support: 1-800-879-2755
   - Shopz website
   - Preventive Service Planning buckets for mainframe operating environments website

c. Program Directory for Information Management System Transaction and Database Servers
   You can get this information from:
   - CBPDO or ServerPac documentation
   - EMEA Order Support website

d. IMS Version 13 Installation
   It is important to install the available IMS service, which is packaged in SMP/E format, for any new installation of IMS.

5. Running the IVP.
   The installation verification program is provided by IBM to test the product installation of IMS and verify that the major functions and features are working. The jobs and tasks of the IVP build a sample IMS system and provide several sample applications that verify specific components of IMS.

6. Deployment of your own system for test or production.
   After you install IMS and verify the installation by using the IVP, consider how to upgrade the new IMS system into a test system and eventually into production. Each customer has individual requirements and plans for rolling out their new IMS systems.

7. Testing the new test or production system.
   After the new version of the IMS product is implemented, test various functions to verify that the implementation is successful. The specific testing varies for each customer, but should include testing in both online and batch systems (as appropriate).

Chapter 2. IMS installation verification program (IVP) overview

The installation verification program (IVP) is provided by IBM to test the product installation of IMS and verify that the major functions and features are working.

The jobs and tasks of the IVP build a sample IMS system and provide several sample applications that are used to verify specific components of IMS. Use the IVP to verify that IMS was installed properly and that the major functions and features of IMS are working.

During the IVP process, you run a combination of jobs and perform a set of tasks to create a fully executable sample IMS system. After the jobs and tasks of the IVP are run and completed successfully, you exercise the system by using the sample applications that are either provided by the IVP or downloaded from the IMS website. You submit the IVP jobs and tasks manually, verify the jobs, and perform the tasks that make up the IVP process.

An IVP job is JCL that you run. An IVP task is something that you need to manually perform. The IVP provides online help with step-by-step instructions for these jobs and tasks. It also provides customized JCL, IMS stage 1 system definition input, database descriptions (DBDs), program specification blocks (PSBs), Message Format Services (MFSs), and application programs. Some of these application programs are run through the IVP jobs and tasks.

Related concepts:

- [IMS Syntax Checker (System Definition)]

The IVP as an educational tool

In addition to an installation verification program, the IVP can assist you in learning the IMS system.

After the IVP jobs and tasks specific to your environment are completed, system programmers, application developers, and computer operators can use the IVP sample system, the sample applications, and the jobs and tasks as a training vehicle. In addition, you can use the IVP jobs and tasks to determine the steps that are needed for the deployment of an IMS application development environment, test, or production system.

The IVP can be used as a repeatable training environment and to provide guidance for performing the following types of jobs and tasks:

- Performing an IMS system definition (SYSDEF).
- Establishing IMS interfaces to z/OS and VTAM®.
- Preparing an IMS application system.
- Operating an IMS online system (for example, DBCTL, DB/DC, DB/DC with XRF, and DCCTL).
- Operating sequences that demonstrate both normal and emergency restarts.
- Demonstrating the conversion of a non-HALDB database to a HALDB database.
- Demonstrating the use of TSO Single Point of Control (SPOC).
- Demonstrating that the database resource adapter (DRA) interface module was assembled and placed in the IMS.SDFSRESL data set.
• Providing and demonstrating the setup and use of sample JMP and JBP applications.
• Providing and demonstrating the setup and use of parallel RECON access.
• Providing and demonstrating the setup and use of IMS Connect.
• Providing and demonstrating the setup and use of IMS Open Database.
• Providing and demonstrating the setup and use of Dynamic Resource Definition (DRD).
• Providing and demonstrating the setup and use of the IMSRSC repository.
• Providing and demonstrating the setup and use of the IMS Catalog.

Phases of the IVP process

The IVP process consists of four phases: initialization, variable-gathering, file-tailoring, and execution.

To verify that the new functions and features of IMS are working properly, you must complete all four of these phases. Initially, you must proceed through the phases sequentially. After you complete the variable-gathering and file-tailoring phases, however, you can move back and forth between these two phases out of sequence.

Initialization phase

The initialization phase begins each time you start the IVP dialog or change an option or suboption.

The IVP is driven from a set of ISPF tables that contain information about the variables, jobs, tasks, and the sequence of those jobs and tasks you need to execute. Because the tables are updated by the IVP dialog, working copies must be made the first time you use the IVP or when you change options later. This process is known as a table merge.

During the initialization phase, you can:
• Restart the dialog
• Select environment options
• Select suboptions
• Merge tables
• Select another phase (variable-gathering, file-tailoring, or execution)

Table merge process

A table merge is necessary the first time you run the IVP and any time you change existing environment options or suboptions that was not previously selected, and whenever the installation of service requires it.

The IVP is shipped with master tables in the IMS target and distribution libraries. The master tables contain all the possible IVP variables that can be used to create jobs and tasks. You select the environment and suboptions that are appropriate for your environment. The table merge process populates a set of customized tables from the master tables with the IVP variables, jobs, and tasks that are necessary for you to run the IVP based on your selected environment option and suboptions. Because the dialog updates these tables during its processing, the master tables must be copied into a user data set, INSTATBL. The table merge process performs this copy.
The table merge process is also used to update the INSTATBL data set with updates introduced with PTF service. The service contains a ++HOLD with a reason of ACTION when you must rerun the table merge process.

Optionally, you can run a table merge to reset the I indicator that is displayed on the phase panels, such as the Execution phase (LST mode) panel. The table merge process does not change variable values that were changed by the copy-startup-variables process or by the CHG action in the variable-gathering phase.

**Copy-startup-variable process**

After the table-merge process is complete or bypassed, the dialog compares the startup variables with their corresponding table values.

If the table value is different and was not changed by a prior copy-startup-variables process or by the CHG action in the variable-gathering phase, the table value is updated with the startup value. This process is provided so you do not need to enter the same information several times.

The variables affected by this process are:
- The IVP data set high-level qualifier (HLQ) passed to the startup CLIST
- The DLB data set HLQ passed to the startup CLIST
- The SYS data set HLQ passed to the startup CLIST
- The current TSO user ID
  This user ID is used for the USER and NOTIFY job statement parameters.

**Variable-gathering phase**

In the variable-gathering phase, you choose the options that are used to produce the jobs and tasks necessary in the subsequent phases of the IVP, such as file-tailoring.

The user-modifiable variables that you use during customization (done in the next file-tailoring phase) of the installation materials are presented for review and modification. In this phase, you can perform the following functions:
- Modify the value that is associated with each variable.
- Refresh a variable to its distributed default value.
- View the online descriptions of the variables.
- Print the online help for variables to the ISPF list data set.
- Import variables from a previous release of IMS or another copy of IMS Version 13.
- Export variables from an installed release of IMS to either the same or the next release of IMS to be installed, to ease migration. For example, if you are currently using IMS Version 10, and want to migrate to IMS Version 13, you can export the variables from IMS Version 10 for use in IMS Version 13.

**File-tailoring phase**

The file-tailoring phase uses the ISPF file-tailoring services to combine the variables from the variable-gathering phase with skeletons from SDFSSLIB to create members (JCL and other materials) in INSTALIB.

The jobs, tasks, and INDEX items that are presented during the file-tailoring phase are specific to the selections that you made during initialization. The jobs and tasks
are presented in the order in which they are to be performed. In addition to creating INSTALIB members, this phase serves as a directory for the various members of INSTALIB, SDFSSLIB, and SDFSISRC.

During the file-tailoring phase, you can perform the following functions:
- File tailor all or selected items.
- Browse INSTALIB, SDFSSLIB, or SDFSISRC members.
- Edit INSTALIB members.
- View the online help of the members.
- Print the online help for jobs, tasks, and INDEX items to the ISPF list data set.

**Execution phase**

The execution phase guides you step by step through the jobs and tasks that are necessary to complete the building and running of the IVP system that is based on options that you chose.

Only the jobs and tasks specific to the selections that you made during initialization are presented. The jobs and tasks are presented in the order in which they are to be performed.

During the execution phase, you can perform the following functions:
- Browse INSTALIB members.
- Edit INSTALIB members. Jobs can be submitted for execution from within edit mode.
- Submit INSTALIB members for execution. Successful job execution must be manually verified.
- File tailor an individual member.
- View the online help of the jobs and tasks.
- Print the online help for jobs and tasks to the ISPF list data set.
- Perform special processing routine setup for a task.

**IVP output**

The IVP system provides a rich and diverse set of jobs and tasks that, after completion, provide a fully functional IMS system that is integrated into the z/OS environment and tested in the selected environment from the IVP panels.

The IMS environments that you can select include BATCH, DBCTL, DB/DC, DB/DC with XRF, and DCCTL. Most of the major functions of IMS can be demonstrated and tested by using the IVP system. The IVP builds a viable sample IMS system in a controlled manner that is verifiable, robust, and accomplishes the following:
- Verifies that the IMS product itself, the maintenance, or both were successfully installed
- Implements and tests the z/OS and VTAM interfaces
- Builds and integrates IMS application systems
- Tests various IMS application systems
- Tests various functions and features selected
- Assembles the database resource adapter (DRA) interface module, which is used by DBCTL and Open Database Access (ODBA), and places the module in IMS.SDFSRESL
Examples of some of the functions and features that are demonstrated and tested include:

- Syntax Checker
- XRF
- IRLM
- Fast Path
- Shared Queues (Common Queue Server)
- High Availability Large Database (HALDB)
- IMS Connect
- IMS system restart and recovery
- Common Service Layer
- Enhanced Command Environment
- IMS DB resource adapter (previously known as the IMS JDBC Connector)
- Dynamic resource definition (DRD)
- IMS Open Database
- IMSRSC repository
- IMS Catalog

Related concepts:

- Chapter 4, “Sample applications provided by the IVP,” on page 25

Related tasks:

- Chapter 3, “Building a verifiable working sample IMS system by using the IVP,” on page 11

Related reference:

- “IVP jobs and tasks” on page 106
Chapter 3. Building a verifiable working sample IMS system by using the IVP

You can use the IVP to build a verifiable working sample IMS system that helps you verify your installation and confirm that your IMS system is operational. You must complete several steps and processes before you can build a verifiable working sample IMS.

Prerequisites:
- Complete the product installation of IMS by following the instructions that come in the packaging offering that you selected (CBPDO or ServerPac).
- Ensure that the corresponding FMIDs for your environments are installed during IMS product installation using SMP/E. For example, if you use IRLM, ETO feature, or IMS Java™ On Demand features, the corresponding FMIDs must be installed.

Related concepts:
"IVP output" on page 8

Starting the IVP dialog

Start the IVP dialog by issuing an EXEC command from either an ISPF dialog or the IMS application menu.

Starting the IVP by using the EXEC command from within ISPF

You can start the IVP dialog from within ISPF either by using partial syntax with a simple command or by using full syntax.

To start the IVP dialog using partial syntax:
1. Open an ISPF application dialog.
2. Issue the following TSO EXEC command in the ISPF panel, option 6:

```
--- COMMAND PROCESSOR ---
ENTER TSO COMMAND OR CLIST BELOW:
===> EXEC 'qqq.SDFSCLST(DFSIXC01)' 'HLQ(qqq)'
```

Figure 1. Simple command to start the IVP dialog from an ISPF panel

qqq is the high-level qualifier for the IVP, system, and distribution libraries. You might need to use the full syntax invocation to specify additional parameters for your environment. The full syntax method lets you invoke the IVP startup CLIST and use the IVP system parameters, either the full set or a subset. Use the full syntax method, for example, if you need to specify different high-level qualifiers for the tables and other IVP systems data sets, or invoke the DEBUG parameter for diagnostic purposes. The IVP dialog dynamically allocates the data sets that are needed to support dialog processing; therefore, you do not need to put the IMS ISPF data sets in your TSO logon procedure.

After the command is invoked, the IMS welcome panel displays, followed by the IBM copyright panel. Press Enter to go to the IVP Environment Options panel.
Starting the IVP from the IMS Application Menu

You can start the IVP dialog from the IMS Application Menu.

To start the IMS Application Menu:

1. Open an ISPF application dialog.
2. Start the IMS Application Menu by issuing the following TSO EXEC command:
   
   ```
   EXEC 'qqq.SDFSEXEC(DFSAPPL)' 'HLQ(qqq)'
   ```
   
   The IMS Application Menu opens:

   ![IMS Application Menu](image)

   **Figure 2. IMS Application Menu**

   3. In the IMS Application Menu, select Option 6 to start the IVP.

   The IVP Environment Options panel displays.

   Related tasks:
   
   “Selecting the environment options”

   Related reference:
   
   “REXX EXEC command syntax for starting the IMS Application Menu” on page 187

Starting the IVP initialization phase

During the IVP initialization phase, you select the installation option and suboption values that the IVP uses to build customized tables of the specific jobs and tasks that need to be run.

These tables provide the input for the phases that follow. In addition, some variables are initialized in this phase in preparation for the variable-gathering phase.

Selecting the environment options

Select the options that apply to your environment. The IVP provides suboptions and tasks based on your choices to build a sample IMS system for installation verification.
The following figure shows the IVP Environment Options panel. This panel is referred to as the primary option menu for the IVP dialog.

![Figure 3. IVP Environment Options panel](image)

To select an IVP environment option:

1. In the IVP Environment Options panel, type the number of the option you want.
   
   Each option in the environment options panel (except option 5) includes the options listed before it. For example, if you select option 3, you are building the IMS batch, DBCTL, and DB/DC IVP environments. Select the highest number that represents the system you want to build. Option 5 does not build the environments of options 1, 2, 3, and 4.

   The IVP Environment Options panel supports the following primary options:
   
   a. **DBB - IMS batch environment**
      
      This environment supports batch job access of IMS full-function databases. It can also be used to support DB2 for z/OS applications.
   
   b. **DBC - IMS DBCTL environment**
      
      This environment supports the online access of IMS full-function databases and DEDBs with batch-oriented BMPs. It can also be used as the basis for supporting IBM CICS® Transaction Server for z/OS/DBCTL, ODBA, DB2 for z/OS, batch, and other applications. This environment includes all the function of the DBB environment.
   
   c. **DBT - IMS DB/DC environment**
      
      This environment supports the online access of IMS full-function databases, DEDBs, and MSDBs. IMS DB/DC is a full IMS Transaction and Database Management environment supporting both message-driven and batch-oriented applications. It can also be used for supporting the CICS/DBCTL, ODBA, DB2 for z/OS, batch, and other applications. This environment includes all the function of the DBB and DBC environments.
   
   d. **XRF - IMS XRF environment**
      
      This option extends the DBT (DB/DC) environment to include XRF support. A single CPC configuration (active and alternate IMS subsystems on the same CPC) is used. It can also be used to support the IMS TM environment, CICS/DBCTL, ODBA, DB2 for z/OS, and batch applications. This environment includes all the function of the DBB, DBC, and DBT environments.
   
   e. **DCC - IMS DCCTL environment**
      
      IMS DCCTL is a full IMS Transaction Management environment that supports both message-driven and batch-oriented applications. It can be used as the basis for supporting DB2 for z/OS applications.

2. After you select an option, press **Enter** to continue.
If you previously ran the IVP dialog and made a selection in the IVP Environment Options panel, the Environment Option Change Verification panel opens.

If you did not previously run the IVP dialog, the Sub-option Selection panel opens. Skip the next topic on "Verifying an environment option change" and proceed directly to "Selecting suboptions."

**Related tasks:**
- "Starting the IVP from the IMS Application Menu" on page 12

**Related reference:**
- "IVP environment options" on page 162

### Verifying an environment option change

When you select an environment option that you did not select before, the Environment Option Change Verification panel opens.

The following figure shows that the new option XRF is selected and that the last selected option was DBB.

<table>
<thead>
<tr>
<th>Help</th>
</tr>
</thead>
<tbody>
<tr>
<td>IVP -- Environment Option Change Verification - XRF--IMS 13.1</td>
</tr>
<tr>
<td>COMMAND ==&gt;</td>
</tr>
</tbody>
</table>

The Environment Option you have just chosen is not the same as the Option which was last active:

- XRF - Requested Option
- DBB - Previous Option

To confirm your change of Options to XRF: Press ENTER

To return to the Environment Option Selection menu: Press END

*Figure 4. Environment Option Change Verification panel*

To verify an environment option change:

1. Review the panel contents and requested option change.
2. If the requested option change is correct, press **Enter** to confirm your selection.

If the requested option is not correct, press **End** to return to the Environment Option Selection panel.

**Related tasks:**
- "Selecting the environment options" on page 12

### Selecting suboptions

Choose the suboptions that you want to add to your primary option selection.

Suboptions specify whether you want to use IRLM, Fast Path, and other IMS functions and features. Ensure that the corresponding FMIDs for selected suboptions are installed during IMS product installation using SMP/E.

The following figure depicts the IVP Sub-Options Selection panel of the IVP dialog.
To select a suboption:

1. In the panel, type a forward slash (/) next to the suboptions that you want to select. The supported suboptions are:

   - **IRLM - Use IRLM in IVP Applications**
     - If you select IRLM, the IVP creates a configuration for the IRLM.
     - The default is to use this suboption for DB batch, DBCTL, DB/DC, and DB/DC with XRF. This suboption is not available for DCCTL.
     - If you select this suboption, the IRLM is defined during system definition, and the IVP is run using the IRLM for the single-lock manager. If you do not select this suboption, the IRLM is not used, and program isolation (PI) is used as the single-lock manager.
     - Use of IRLM is required only if you plan to use block-level data sharing. The IVP is configured to support block-level data sharing. Optionally, you can elect to use the IRLM, instead of PI, as the single-lock manager.

   - **Use Fast Path in IVP Applications**
     - If you select this option, the IVP adds the necessary jobs and tasks for the Fast Path sample application. The default is to use this suboption for DBCTL, DB/DC, and DB/DC with XRF. This suboption is not available for DCCTL.

   - **ETO Feature Installed**
     - If you select this option, the IVP adds the necessary jobs and tasks for IMS Extended Terminal Option Support (IMS ETO Support).
     - For DB/DC and DB/DC with XRF, the default is to use this suboption. This suboption is not available for DB batch or DBCTL.
     - For DCCTL, the default is not to use this suboption.

   - **Add CQS to CSL Application**
     - If you select this option, the IVP adds the necessary jobs and tasks so that the CSL sample application uses CQS. The default is not to use this suboption.

   - **Use RACF® Transaction Security**
     - If you select this suboption, the IVP builds the necessary jobs and tasks to define resources to RACF and to set up the use of several IMS security user exit routines.

Figure 5. IVP Sub-Option Selection panel

---

Chapter 3. Building a verifiable working sample IMS system by using the IVP
- The default is not to use this suboption.
- This suboption is not available for DB batch.
- You can modify the sample RACF resource definition task.
- The sample user exit routine always authorizes the user to the resources.

• Use Java Applications and Open Database
  If you select this suboption, the IVP adds the necessary jobs and tasks for the following:
  a. The execution of sample applications for the IMS solutions for Java development and for setting up the database used for the Java sample applications.
  b. Starting the sample Open Database application.
  The default is not to use this suboption.
  This suboption is not available for DB batch or DCCTL environments.

• Use Parallel RECON Access
  If you select this suboption, the IVP adds the necessary jobs and tasks for starting, initializing, tailoring, executing, and verifying the related services and components for parallel RECON access.

• Use IMS Connect
  If you select this suboption, the IVP adds the necessary jobs and tasks for starting the sample IMS Connect application.

• Use IMSRSC repository
  If you select this suboption, the IVP adds the necessary jobs and tasks for setting up the environment for running the IMSRSC repository.

• Use Callout Applications
  If you select this suboption, the IVP adds the necessary jobs and tasks for setting up the environment for running the callout samples, including the OTMA destination descriptor that is required to route the callout messages.

2. After you select the appropriate suboptions or accept the default suboptions that are displayed, press **Enter**.

3. The Table Merge Request panel is displayed, and you have the option of performing a table-merge to create a table that contains your selected options and tasks.
   
   If you change the selections that are displayed, the Sub-Option Change Verification panel opens. The dialog asks you to confirm your request for change. If you are changing the selections after you have completed the table-merge, variable gathering, file-tailoring, or execution phases, you must rerun the jobs and tasks in those phases.

**Requesting a table merge**

After you select an environment option and suboptions, the IVP dialog gives you the option of performing a table-merge.

To request a table merge:

1. In the Table Merge Request panel, type 1 and press **Enter**. While the table merge is in progress, the Table Merge in Progress panel opens and the keyboard is locked. This panel is updated as the tables are updated.
   
   The following figure shows an example of the Table Merge Process Indicator panel.
2. After the table merge process completes, the Table Merge Completed panel is displayed. Press Enter to continue.

Related concepts:
“Table merge process” on page 6

Selecting an IVP phase and positioning option

Select an IVP phase and choose to start or restart from either the beginning of an IVP phase or from the last known location within a phase.

The following figure shows the IVP Phase Selection panel of the IVP dialog.
The dialog always preselects a default. If you just completed the initialization phase, the default is to start from the beginning of the variable gathering phase. You can override the dialog's selection with your own by typing over the default selection.

You must perform the variable gathering, file tailoring, and execution phases in sequence. However, you can exit from each phase and return to the IVP Phase Selection panel to select the next phase or return to a prior phase.

To select an IVP phase and position within a phase, in the IVP Phase Selection panel, type the number that is associated with the phase and location that you want to execute.

If you make an invalid phase selection, a notification panel opens to inform you of the error. Press Enter to return to the Phase Selection panel and type the appropriate selection.

---

**Gathering variables**

Gathering variables involves changes to prepare the JCL and other materials that are necessary for further customization in the file-tailoring phase.

When you enter the variable gathering phase, the IVP panel displays the variables based on your selections in the initialization phase. These variables are later used by the file-tailoring phase to customize the IVP to your environment and to create members in the INSTALIB data set. You can import variables from an earlier iteration of the IVP dialog by using the IVP Variable Gathering Export and Import facilities.

To complete variable-gathering:

1. Optional: Import variables from a previous IMS installation and verification with the IVP.
2. In the IVP Phase Selection panel, select option 1 or option 2. Each selection within a phase provides a different positioning option and opens the Variable Gathering panel.
3. In the Variable Gathering (LST mode) panel, review the displayed variables. Use the display modes and action commands to make appropriate updates. You can browse, display variable descriptions, or edit any of the members on this panel. You can scroll multiple pages of variables by pressing PF7 and PF8. However, you cannot search for a particular variable. Press End at any time to return the IVP Phase Selection panel and save your updates.
4. When you are finished, press PF3 and then Enter to exit the phase.

The IVP Phase Selection panel displays and you can progress to the file-tailoring phase.

**Related tasks:**

**Related reference:**

- “Variable gathering dialog options” on page 164

---

**Exporting and importing IVP variables**

Use the IVP Variable Export utility to export previously used IVP variables to a sequential data set so you can later import them.
IVP variables can be exported and imported between IMS releases or between different IVP dialog sessions of the same IMS release. Use the IVP Variable Export utility, shown in Figure 8, to copy or export a set of previously used IVP variables to a sequential data set. This data set can be subsequently imported to the IVP tables data set of the target IVP session.

To export variables from one IVP session and import them to the target IVP session:

1. Launch the IVP Variable Export utility by issuing the DFSIVPEx command from an ISPF panel.

   **Tip:** You can use the ISPF split screen capability to invoke the IVP Variable Export utility without exiting the IVP.
   
a. Open an ISPF application dialog.
   
b. Issue the following TSO EXEC command:

   ```
   EXEC 'qqq.SDFSEEXEC(DFSIVPEx)' 'HLQ(qqq)'
   ```

   *qqq* is the high-level qualifier for the IMS system (SYS) libraries. The default is IVPSYS13. HLQ(qqq) identifies the high-level qualifier for the system libraries.

   The IVP Variable Export Utility panel opens. The following figure shows the IVP Variable Export utility panel.

   **Figure 8. IVP Variable Export utility panel**

   The IVP Variable Export Utility panel opens. The following figure shows the IVP Variable Export utility panel.

   **Command ===>

   Enter the following information, then press enter.

   1. Select the IVP Environment
   - 1. DBB - Database Management (Batch)
   - 2. DBC - Database Management (DBCTL)
   - 3. DBT - Database and Transaction Management (DB/DC)
   - 4. XRF - DB/DC with Extended Recovery Facility (DB/DC with XRF)
   - 5. DCC - Transaction Management (DCCTL)

   2. Specify the IVP High Level Qualifier (HLQ) of the INSTATBL data set

   3. Specify the export data set. For a PDS, include the member name. If the dataset does not exist, you will be prompted to create the dataset.

To export variables from one IVP session and import them to the target IVP session:

1. Launch the IVP Variable Export utility by issuing the DFSIVPEx command from an ISPF panel.

   **Tip:** You can use the ISPF split screen capability to invoke the IVP Variable Export utility without exiting the IVP.
   
a. Open an ISPF application dialog.
   
b. Issue the following TSO EXEC command:

   ```
   EXEC 'qqq.SDFSEEXEC(DFSIVPEx)' 'HLQ(qqq)'
   ```

   *qqq* is the high-level qualifier for the IMS system (SYS) libraries. The default is IVPSYS13. HLQ(qqq) identifies the high-level qualifier for the system libraries.

   The IVP Variable Export Utility panel opens. The following figure shows the IVP Variable Export utility panel.

   **Figure 8. IVP Variable Export utility panel**

   The IVP Variable Export Utility panel opens. The following figure shows the IVP Variable Export utility panel.

   **Command ===>

   Enter the following information, then press enter.

   1. Select the IVP Environment
   - 1. DBB - Database Management (Batch)
   - 2. DBC - Database Management (DBCTL)
   - 3. DBT - Database and Transaction Management (DB/DC)
   - 4. XRF - DB/DC with Extended Recovery Facility (DB/DC with XRF)
   - 5. DCC - Transaction Management (DCCTL)

   2. Specify the IVP High Level Qualifier (HLQ) of the INSTATBL data set

   3. Specify the export data set. For a PDS, include the member name. If the dataset does not exist, you will be prompted to create the dataset.

   **Tip:** You can also launch the IVP Variable Export utility by using one of the following methods:

   - Select the export (Exp) action command on the Variable Gathering (LST mode) panel.
   - Select option A in the Phase Selection panel.
   - Select the IVP Variable Export Utility option from the IMS Application menu.

2. Provide the following information in the IVP Variable Export utility panel:

   a. Select the environment option. Use the same option that you selected during the Initialization phase of the IVP process. The environment option identifies which variables to export because the variables for each environment option are different.
b. Select IVP High Level Qualifier (HLQ), which identifies the IVP table data set (INSTATBL) from which you are exporting the variables.

c. Type the name of the export data set in TSO format.
   Enter the export data set name in the TSO data set format. You should use single quotation marks around the data set name. If the data set is a partitioned data set, include the member name. For example, if XXX.YYY.ZZZ is the partitioned data set and QQQ is the member name, type the following name:
   'XXX.YYY.ZZZ(QQQ)'

   Press Enter to export the variables in the current IVP environment to the target IVP session.

3. Optional: Allocate the export data sets from the IVP Export Data Set Allocation panel. If the export data set does not exist, the IVP Export Data Set Allocation panel opens as shown in the following figure.

   ![Figure 9. IVP Export Data Set Allocation panel](image)

   a. Select one of the following options to allocate the data set:
      1) DSUTIL: If you select the DSUTIL option, the ISPF Utility Data Set Utility panel opens. Specify the following attributes for the export data set:
         * DSORG: Sequential or partitioned
         * RECFM: FB
         * LRECL: 80
         * BLKSIZE: Multiple of 80
      2) ALLOC: If you select the ALLOC option, type the name of the data set in the TSO Allocate Command field. The data set name that you specify on the panel is used to issue the TSO ALLOCATE command to allocate the data set. If the export data set name includes a member name, the TSO ALLOCATE command allocates a PDS data set. You can edit the command on the panel before you select this option.

   b. Press Enter to allocate the data set. The IVP Variable Export Utility panel opens with a message indicating that the data set was successfully allocated.

   c. Press PF3 or End to return to the IVP Variable Gathering panel.

4. Optional: If the current IVP environment does not match the environment in which the variables were exported, the IVP Import Environment Mismatch panel opens. You can choose to continue the import process or cancel it. The exported variables are associated with their specific IVP environment.
The following figure shows the IVP Import Environment Mismatch panel.

![Figure 10. IVP Import Environment Mismatch panel](image)

If a mismatch occurs between the IVP environments or the IMS releases, the following processing occurs:

- Any variable that is not valid in the current IMS release or for the current IVP environment and suboptions being processed is ignored.
- Any variable with a value that is specified in the export data set is replaced with the export value, even if you have modified that variable.
- The value of each of the variables is checked against the valid values for the variable in the release that is being processed.
- After the import process finishes, any variable with a value not specified in the export data set remains unchanged from its value before the import.

5. Import the variables to the target IVP session from the export data set.
   a. In the Variable Gathering (LST mode) panel, issue the import action command (Imp) in the action field of any variable in the panel. This command imports all the variables from an IVP export data set; it does not import a specific variable.
      The IVP Export Data Set Name panel displays to prompt you for the name of the IVP export data set.
   b. Type the name of the export data set name in the TSO data set format. Use single quotation marks around the data set name. If the data set is a partitioned data set, include the member name.

The IVP variables from your previous IVP environment are imported into your new IMS release.

**Making global changes to variables**

Use the export and import process during the variable gathering phase to make global changes to variables (for example, to change the release from "11" to "12") before you import them into a new IMS system.

To make global changes to variables before you import them into a new IMS:

1. Export the variables into an export data set by using the method that is appropriate for your version of IMS. The contents of the export data set might look like this:

   ```
   000001 <ivpenv>OBT</ivpenv>  
   000002 <var>IXUMCP2</var> <val>IMSIVP.IVP11,IMSIVP,DFLT,CYL,3</val>  
   000003 <var>IXUMCP1</var> <val>IMSIVP.IVP11,IMSIVP,DFLT,CYL,3</val>  
   000004 <var>IXUSPL3</var> <val>IMSIVP.IVP11,IMSIVP,DFLT,CYL,1</val>  
   000005 <var>IXUSPL2</var> <val>IMSIVP.IVP11,IMSIVP,DFLT,CYL,1</val>  
   ``

In the export data set:
- The `<ivpenv>` tags indicate the IVP environment.
2. Use the ISPF editor to modify these variables.
3. Import the variables into the target IVP by using the import action command, Imp.

Tailoring files

In the file-tailoring phase, the IVP uses variables that you specified during the variable-gathering phase to prepare a customized set of IVP JCL and tasks to be stored as members of the INSTALIB data set for use in the execution phase.

The ISPF file-tailoring facility creates this input by updating and building members in the INSTALIB data set based on the options you choose in this phase.

The IVP names the INSTALIB members according to the environment option that was chosen:
- IV1ssnnt - DBB - Batch system
- IV2ssnnt - DBC - DBCTL system
- IV3ssnnt - DBT - DB/DC system
- IV4ssnnt - XRF - XRF system
- IV9ssnnt - DCC - DCCTL system

Where:
- ss Step number
- nn JOB/TASK/INDEX item number within the step.
  The item numbers are not guaranteed to be in ascending sequence. Service changes might disrupt the apparent sequence.
- t J for job, T for task, N for Non-job (such as an example)

To perform file-tailoring:
1. In the IVP Phase Selection panel, select a phase. Each selection within a phase provides a different positioning option.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select 3</td>
<td>to start or restart from the beginning of the phase</td>
</tr>
<tr>
<td>Select 4</td>
<td>to restart from the last known position within the phase</td>
</tr>
<tr>
<td>Select 5</td>
<td>to restart from the beginning of a selected step</td>
</tr>
</tbody>
</table>

If you select 3, and you are performing file-tailoring for the first time, or you have selected a new IVP environment option, the File Tailoring All Request panel opens.

a. Select option 1 to perform the File Tailoring ALL action. This action causes all items to be processed. The File Tailoring in Progress panel opens with the Please do not interrupt this process message and the keyboard is locked. When file-tailoring is complete, the FT Complete Verification panel opens.
b. In the FT Complete Verification panel, press Enter to continue to the File Tailoring panel.

2. In the File Tailoring panel, use the various action commands to browse, display a description, or edit any of the members on this panel.

3. Press End or PF3 when you are finished.

The IVP Phase Selection panel opens and you can progress to the IVP execution phase.

Related reference:
“File-tailoring dialog options” on page 168

Executing tailored jobs and tasks

You must process the jobs and tasks that were prepared by the file-tailoring phase individually through the execution phase.

To execute the IVP jobs and tasks:
1. In the IVP Phase Selection panel, select option 6, 7, or 8. Each selection within a phase provides a different positioning option. The Execution panel opens and displays the list of the IVP jobs and tasks.
2. Open each job and task. To view the instructions for each job and task use the ENT action command. Use the appropriate display modes and action commands.
   • For IVP jobs: You can browse, edit, or submit the job. When you are ready to run a job, you can either submit the job using the EXE action or you can edit and submit the job. Each job has a scrollable description that is associated with it to assist you in running the job.
     Some items are nonexecutable examples. For these examples, the submit action is disabled, but the browse and edit actions are available. You can use ISPF split-screen mode to create an executable version of nonexecutable items.
   • For IVP tasks: You are provided a scrollable description to assist you in performing the task.
3. Press End or PF3 when you are done. Then press Enter again if you completed the execution of all jobs and tasks, or press End to save your work if you want to complete the execution phase later. You can return to the same location and run the jobs or tasks from a previous point by using the positioning options on the IVP Phase Selection panel.

Related reference:
“Execution phase dialog options” on page 172

Ending the IVP dialog session

You can end an IVP dialog session from any panel.

To end an IVP dialog session:
1. Press End repeatedly until you have backed out of the dialog. Each time you press End, you return to the last viewed panel.
2. Press Return to back out of the dialog completely.
Chapter 4. Sample applications provided by the IVP

The sample applications provided by the IVP verify the IMS product installation by using an IVP sample system.

Some of the sample applications are fully executed by running the IVP jobs and tasks while others can be executed outside the IVP dialog process. The IVP provides several sample applications that test various components of IMS. The sample applications consist of steps that can be executed using different methods. Most of the sample applications use a combination of batch and online processing. Sample applications executed using the batch method are performed by submitting jobs.

To execute an online sample, consult the IVP dialog’s online help for step-by-step instructions for running the jobs and tasks for the sample. The exceptions are the sample applications provided for IMS solutions for Java development, IMS support for XQuery, and IMS callout.

Related concepts:
“IVP output” on page 8

IVP-executed sample applications

The IVP-executed sample applications include all the steps that are necessary to set up and run the sample applications in the IVP jobs and tasks.

IVP sample application

The IVP sample application is a simple telephone book application that sends a transaction to request information from the IMS Telephone database.

The IVP telephone book application is demonstrated through the H series jobs and tasks of the IVP. After you complete the IVP jobs and tasks during the execution phase, the IVP sample application is fully executed, and the testing of the IMS components associated with the IVP sample application is complete. You can query the database to retrieve customer information such as first name, last name, telephone extension, and zip code. The Telephone database is loaded during the processing of the IVP jobs and tasks.

The functions and features that are tested by running the IVP sample application include several IMS databases and environments.

- The tested IMS databases consist of HIDAM/OSAM, HDAM/VSAM, DEDB/VSAM, MSDB, and GSAM databases.
- The tested IMS environments include non-conversational and conversational MPP, conversational JMP, non-conversational IFP (EMH), DB batch, DLI batch, BMP, JBP, message-driven WFI BMP, non-conversational and conversational message switch, IFP EMH message switch, WFI BMP GSAM, and BMP GSAM.

The IVP application program action is determined by a process code provided with the input data. The process codes are ADD, DELETE, UPDATE, DISPLAY, and TADD. Except for TADD, the process codes are self-explanatory. TADD causes the application program to add a record to the database and issue a WTO request.

Any character string could be used to reply to the WTO issued by the TADD
process. The database is changed, but the change is not committed. The TADD
process code is used during the recovery portions of the IVP scripts.

For the EMH program that accesses the main storage database (MSDB), a TUPD
process code is used instead of the TADD.

The online transactions are executed through an MFS block. For example, the
DFSIVP1 program is executed by entering /FOR IVTNO at an IMS user terminal,
and then entering a process code and data on the formatted screen.

When processing for the DFSIVP1 program is finished, press the Clear key and
enter a new FORMAT command to execute a different application program.

The batch or BMP programs execute by using JCL. In the DCCTL environment, the
IVP database is simulated through the use of a data area within program DFSIVAD
(a message-driven WFI BMP). Programs DFSIVAE, DFSIVAF, and DFSIVAG
perform message switches to send their transaction input to DFSIVAD for
processing. DFSIVAD processes its input under the control of extended
checkpoint/restart and returns its output to the originating terminal.

Two series of programs are included with the IVP sample application: The
DFSIVA3 series and the DFSIVA6 series. The DFSIVA3 series programs test IMS
components online. The DFSIVA6 series programs are executed through a batch
process using JCL. These programs are provided in several different programming
languages. The IVP assembles and tests several of these programs. If you do not
want to use the assembled version, you must compile and bind the IVP execution
outside of the IVP.

The DFSIVA3 series programs constitute a conversational MPP that accesses an
HDAM/VSAM database. The Telephone database is accessed and queried through
transaction input and output using an MFS screen format. Instructions on how to
use the MFS screen are included in the IVP tasks. To display or delete a record,
only the process code and the last name field are required input. To add or replace
a record, all input fields are required.

The following figure shows the MFS screen format for the IVP sample application.
The DFSIV A6 series programs are batch or BMP programs that access an HIDAM/OSAM database. The programs use GSAM to receive their transaction input and to display their transaction output. Instructions on how to run these jobs are included in the IVP online help of the IVP jobs and tasks.

**Related reference:**

- “IVP sample application table” on page 176
- “IVP sample application databases” on page 181
- “Steps Hx for IVP execution - DBT system (DB/DC)” on page 113

### Partitioning sample application

The Partitioning sample application provided by the IVP demonstrates the conversion of a non-partitioning database to a partitioned database.

After you complete the IVP jobs and tasks during the execution phase, the Partitioning sample application is fully executed, and the IMS components that are associated with the Partitioning sample application are tested.

This sample is based on the HIDAM database and applications of the IVP sample application but does not depend on it. This partitioning sample application is stand alone; that is, the IVP sample application does not need to be run.

This sample includes all the steps you need to perform to define, create and verify the partitioned database. These instructions are included in the online help of the IVP N series jobs and tasks. The partitioned database is set up and verified using an MFS screen format.

Defining the partitioned database includes the following processes:

1. Create and initialize a non-partitioned HIDAM database.
2. Unload the database by specifying Migrate = YES.
3. Delete the old database from the RECON data sets.
4. Define the partitioned database using %DFSHALDB.
5. Allocate the partitioned database.

---

*Figure 11. MFS screen format for the IVP sample application*

The transaction type is non-conv (VSAM DB), and the process code is add, delete, update, display, and tack.
6. Initialize the partitioned database.
7. Reload the partitioned database.
8. Create an image copy of the partitioned database.

Verifying that the partitioned database includes initializing IMS and running sample transactions through an MFS screen, terminating IMS, and performing clean-up activities.

**Related concepts:**
- “IVP sample application” on page 25

**Related reference:**
- “Partitioning sample application table” on page 181
- “Partitioning sample application databases” on page 185

## IMS Connect sample application

The IMS Connect sample application demonstrates that IMS Connect is operational by running a full-function MPP transaction using IMS Connect.

Execution of the IMS Connect sample application is performed through the Q series jobs and tasks of the IVP. The Q series jobs and tasks of the IVP contain all the necessary steps that you must perform to verify that IMS Connect is running properly.

The basic message processing flow for the IMS Connect sample application is as follows:

1. The client application sends a message request (input message) through a TCP/IP session to IMS Connect to obtain information about the part named AN960C10.
2. IMS Connect passes the message to the host IMS for processing.
3. The host IMS schedules a program to access the database named PART and to obtain information from the part AN960C10.
4. The host IMS sends the response message or output message to IMS Connect.
5. IMS Connect passes the response back to the application client.

**Related reference:**
- “IMS Connect sample application table” on page 181
- “Steps Qx for execution - full-function MPP transaction using the IMS Connect sample application” on page 125

## Dynamic resource definition sample application with RDDSs

The dynamic resource definition (DRD) sample application demonstrates how to set up and operate DRD with resource definition data sets (RDDSs).

The IVP provides the following steps to create an online IMS execution scenario that exercises DRD functions.

1. The IVP prepares the resources by creating DBD and PSBs for the new resources.
   This step is demonstrated in the E series jobs and tasks.
2. The IVP sets up the environment for DRD by:
   a. Creating the PROCLIB member DFSDF000. The IVP uses the following parameters:
### Dynamic resource definition sample application with the IMSRSC repository

The dynamic resource definition (DRD) sample application demonstrates how to set up and operate DRD with the IMSRSC repository.

The IVP provides the following steps to create an online IMS execution scenario that exercises DRD functions.

1. The IVP prepares the resources by creating a DBD and PSBs for the new resources.
   - This step is demonstrated in the E series jobs and tasks.

2. The IVP sets up the environment for DRD by:
   - a. Creating the PROCLIB member DFSDF000. The IVP uses the following parameters:

**Table:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MODBLKS=DYN</td>
<td>Enables DRD for MODBLKS resources.</td>
</tr>
<tr>
<td>AUTOEXPORT=AUTO</td>
<td>Exports resources automatically to an external data set at a checkpoint time.</td>
</tr>
<tr>
<td>AUTOIMPORT=AUTO</td>
<td>Imports resources automatically from an external data set during an IMS cold start.</td>
</tr>
<tr>
<td>RDDSDSN=(IMS.RDDS1, IMS.RDDS2, IMS.RDDS3)</td>
<td>Defines a set of three BSAM data sets that are used to save IMS resource definitions.</td>
</tr>
</tbody>
</table>

b. Allocating three resource definition data sets (IMS.RDDS1, IMS.RDDS2, and IMS.RDDS3) that are used to save IMS resource definitions.

This step is demonstrated in the E series jobs and tasks.

3. The IVP executes the IMS system online by:
   - a. Allocating database data sets for the new DBD
   - b. Starting the IMS system with a cold start.
   - c. Creating new resources (database, programs, and transactions) by using DRD.
   - d. Executing the new programs and transactions to verify that the new resources are in effect.
     - The program DFSIVPD1 accesses the existing phone book database to update a record and delete it.
     - The program DFSIVPD2 is processed when the transaction IVTND is requested from a user terminal. The program also accesses the phone book database and responds to user terminal based on user action request to display, add, update, or delete a record.
   - e. Shutting down the IMS system normally.

This step is demonstrated in the O series jobs and tasks.

4. The IVP restarts the IMS system by:
   - a. Starting the IMS system with a cold start.
   - b. Executing the new programs and transactions again to verify that the new resources are still in effect.
   - c. Shutting down the IMS system normally.

This step is demonstrated in the O series jobs and tasks.
This step is demonstrated in the E series jobs and tasks.

3. The IVP executes the IMS system online by:
   a. Allocating database data sets for the new DBD.
   b. Allocating the IMSRSC repository data set and the RS catalog repository data set.
   c. Starting the Common Service Layer (CSL), consisting of an Operations Manager (OM), a Resource Manager (RM), and a Structured Call Interface (SCI).
   d. Starting the Repository Server (RS).
   e. Adding an IMSRSC repository to the RS catalog repository, then starting the IMSRSC repository.
   f. Listing the status information for all IMSRSC repositories in the RS catalog repository.
   g. Populating the IMSRSC repository.
   h. Stopping and renaming the IMSRSC repository in the RS catalog repository.
   i. Listing detailed information for a single IMSRSC repository.
   j. Modifying the resource definitions in the IMSRSC repository.
   k. Deleting an IMSRSC repository in the RS catalog repository.
   l. Requesting the RS to start a previously deleted IMSRSC repository.
   m. Shutting down the SCI, OM, RM, and RS.
   n. Deleting the IMSRSC repository data sets and the RS catalog repository data sets.

   This step is demonstrated in the U series jobs and tasks.

   Related reference:
   "Steps Ux for the IMSRSC repository sample application" on page 130

Other sample applications verified by the IVP

The IVP jobs and tasks also verify and demonstrate the setup of several IMS components, such as the Common Service Layer (CSL) and Common Queue Server (CQS) sample application, the type-2 command environment sample application, SPOC display of OM audit trail sample application, and the parallel RECON access sample application.

The sample applications to test IMS components include:

- CSL and CQS sample application
  This sample application demonstrates how to use the Operations manager (OM), Resource manager (RM), Structured Call Interface (SCI), TSO single point of control (SPOC), and CQS. Specifically, this sample application demonstrates:
  - Adding CSL members OM, RM, and SCI to the IMS PROCLIB data set to define an IMSplex
- Adding CQS members to the IMS PROCLIB data set
- Starting and stopping an IMSplex and CQS
- Starting and using the TSO SPOC application, including how to issue IMS type-1 and type-2 commands

The steps for these sample applications are described in the O series jobs and tasks of the IVP.

• Type-2 command environment sample application
  This sample application demonstrates how to use OM, SCI, and the TSO SPOC without RM. In addition, you can inform OM whether to display information from the audit trail.
  Specifically, this sample application demonstrates:
  - Adding OM and SCI members to the IMS PROCLIB data set to define an environment in which RM is not required and type-2 commands can be issued
  - Using the TSO SPOC to issue commands to IMS
  The steps for this sample application are described in the P series jobs and tasks of the IVP.

• SPOC display of OM audit trail sample application
  This sample application demonstrates how to display the OM audit trail information from a TSO SPOC session. You can view an audit trail of command input, associated command response output, and unsolicited output messages by using the TSO SPOC menus.
  The steps for these sample applications are described in the O series jobs and tasks of the IVP.

  Support for the OM audit trail functions is available in the IVP. The OM audit trail records unsolicited messages as well as command input and command responses to a z/OS log stream. The z/OS system logger is required to provide storage for the audit trail. Two jobs, IV_E303J and IV_E307T, are part of the backend preparation for the audit trail functionality.

  The sample job that defines z/OS policies (IV_E307T) names the primary structure as IMSOM2Q01 for the audit trail purposes. This structure is associated with the AUDITLOG= parameter of CSLOIxxx member (the OM initialization IMS PROCLIB data set member) to specify a log stream data set name for storing log records.

  For more information about IMS OM audit trail, see *IMS Version 13 System Administration*.

• Parallel RECON access sample application
  IMS IVP provides instructions on how to configure parallel access to RECON data sets in the sample IMS system and how to verify the new function setup after an IMS installation.

  The steps for these sample applications are described in the R series jobs and tasks of the IVP. For more information about IMS parallel RECON access, see *IMS Version 13 System Administration*.

“Steps Ox for Common Service Layer and Common Queue Server sample application” on page 121

“Steps Px for type-2 command environment sample application” on page 124
Sample applications not tested by the IVP

Two sample applications are set up by the IVP but are not exercised by the IVP: the IMS sample application and the Fast Path sample application.

The IVP jobs and tasks only set up the environment in which you can run these sample applications. These applications are run outside the IVP.

- “IMS sample application”
- “Fast Path sample application” on page 38

IMS sample application

The IVP jobs and tasks create a basic structure to run the IMS sample application.

The structure includes:

- Building all the IMS blocks
- Creating the application programs
- Loading the database

The IMS sample application includes the creation, usage, and maintenance of the Parts database that is needed to run the sample application. You need to perform verification of this database through an IMS terminal user session.

The following figure shows the sample application’s logical view of the Parts database.

![Diagram](image.png)

*Figure 12. IMS sample application's logical view of the parts database*

The application requires five segments of the Parts database:

- One part number description segment for each part within the database.
- A standard data segment for each part that provides additional information of a standard nature about the part.
- Inventory stock status segments for each part. The application is designed with multiple inventory locations permissible, and normally required, for any particular part.
- Cycle count segments (from 0 to n).
- Back-order segments for each inventory location of a particular part.
Running the IMS sample application

To verify the IMS sample application databases, you must run the IMS sample application using the six PSBs with their associated transactions and nine online functions.

- Run the IVP jobs and tasks through the H series to set up the basic infrastructure for the IMS sample application.
- Sign on to an IMS user terminal session.

To run the IMS sample application:

1. Run the PART transaction.
   The transaction PART queries the part number database for information from the part master and standard information segments of a specific part number. Execute the IMS sample application transactions using the following format:
   TRANSACTION_CODE OPERAND, OPERAND, OPERAND, . . .

   Separate the transaction code from the first operand with one blank. Blanks cannot be entered between one operand and another. Most of the transaction codes have been defined as multiple segment transactions and require an EOT (end-of-transmission, for 2740), or equivalent, to complete input.

   The input format is transaction code and part number as illustrated in the following figure.

   ```plaintext
   part AN960C10
   ```

2. Run the DSPALLI transaction.
   The DSPALLI transaction displays all inventory, cycle count, and back-order information for a specific part. The following figure illustrates the input format.
of transaction code and part number.

dspell: AN960C10

Figure 15. DSPELL transaction - entry

The resulting terminal output is shown in the following figure.

Part=AN960C10; Desc=WASHER; Proc Code=74

Figure 16. DSPELL transaction - output

3. Run the DSPINV transaction.

The DSPINV transaction displays inventory information from a specific inventory location. Assume that you want to display only the third inventory entry listed in Figure 16. Obtain the inventory location key by concatenating AREA, INVDEPT, PROJCD, and DIV.

The following figure illustrates the input format of transaction code followed by part number and inventory-location-key.

dspinv AN960C10,28009126

Figure 17. DSPINV transaction - entry

The resulting terminal output is shown in the following figure.

Part........... AN960C10; Desc........... WASHER
Proc............ 74; Area............ 2
Inv Dept........ 80; Prj............ 091
Div............. 26; Price............ 0.000

Total Stock.... 680; Disb Planned... 1053
Disb Unplanned. 104; Stk Ct Variance 0

Figure 18. DSPINV transaction - output

4. Run the ADDPART transaction.

The ADDPART transaction adds a new part and its associated description and procurement code to the database. The input format for this transaction is transaction code, followed by part number, description, and procurement-code, entered as shown in the following figure.

addpart AB960C10,RIVET,74

Figure 19. ADDPART transaction - entry

The resulting terminal output is shown in the following figure.
5. Run the ADDINV transaction.

The ADDINV transaction adds inventory location key information to an existing part in the database. The input format for this transaction is transaction code followed by part number and inventory-location-key, entered as shown in the following figure.

```
addinv AB960C10,80091260
```

*Figure 21. ADDINV transaction - entry*

The resulting terminal output is shown in the following figure.

```
Inventory 80091260 Added To Part Number AB960C10
```

*Figure 22. ADDINV transaction - output*

If you want to display the part's updated inventory information, enter the command shown in the following figure.

```
dspinv AB960C10,80091260
```

*Figure 23. DSPINV transaction - entry*

The resulting terminal output is shown in the following figure.

```
Part............ AB960C10; Desc............ RIVET
Proc............ 74; Area............ 8
Inv Dept........ 60; Prj............ 912
Div............ 60; Price............ 0.000
Stk Ct Date.... ; Unit............
Curr Reqmts.... 0; On Order....... 0
Total Stock.... 0; Disb Planned... 0
Disb Unplanned. 0; Stk Ct Variance 0
```

*Figure 24. DSPINV transaction - output*

6. Run the DLETINV transaction.

The DLETINV transaction code deletes a specific inventory item for a specific part. The input format for this transaction is transaction code, followed by part number and inventory-location-key, entered as shown in the following figure.

```
dletinv AB960C10,80091260
```

*Figure 25. DLETINV transaction - entry*

The resulting terminal output shown in the following figure.
7. Run the DLETPART transaction.
   If all the inventory items are deleted, you can delete a particular part number from the database with the transaction code DLETPART. The input format is transaction code followed by part number, entered as shown in the following figure.

   ```plaintext
   dletpart AB960C10
   ```

   **Figure 27. DLETPART transaction - entry**
   The resulting terminal output is shown in the following figure.

   ```plaintext
   Part Number AB960C10 Deleted From Database
   ```

   **Figure 28. DLETPART transaction - output**

8. Run the CLOSE transaction.
   You can close an open order for a specific part in a specific inventory item by using the CLOSE transaction code. The input format is transaction code, part number, inventory-location-key, on-order-decrement, total-stock increment, entered as shown in the following figure.

   ```plaintext
   close AN960C10,28009126,15,15
   ```

   **Figure 29. CLOSE transaction - entry**
   The resulting terminal output is shown in the following figure.

   ```plaintext
   17:43:38 PN= AN960C10 Invty Key=28009126 Excess Stock On Hand
   ```

   **Figure 30. CLOSE transaction - output**
   Other messages might follow, depending on the sample database update status. You might need to press PA1 first. An example is shown in the following figure.

   ```plaintext
   Update Complete
   ```

   **Figure 31. CLOSE transaction - output (additional)**
   To verify the operation of the CLOSE transaction, you can display inventory item 28009126 for part AN960C10. The input format is transaction code, part number, inventory-location-key, entered as shown in the following figure.
The resulting terminal output is shown in the following figure.

```
Part........... AN960C10; Desc............... WASHER
Proc.............. 74; Area.............. 2
Inv Dept......... 80; Prj.............. 091
Div.............. 26; Price............. 0.000
Stk Ct Date.... 513; Unit............... EACH
Curr Reqmts.... 630; On Order....... 0
Total Stock.... 695; Disb Planned... 1053
Disb Unplanned. 104; Stk Ct Variance 0
```

Figure 33. DSPINV transaction - output

Compare the input and output. Notice that the on-order quantity was reduced by 15 and the total stock quantity has been increased by 15 to 695.

9. Run the DISBURSE transaction.

The DISBURSE transaction code allocates a quantity of a part from an inventory item on a planned or unplanned basis. The input format is transaction code, part number, inventory-location-key, planned or unplanned code, quantity. Enter the command as shown in the following figure.

```
disburse AN960C10,28009126,U,10
```

Figure 34. DISBURSE transaction - entry

The resulting terminal output is shown in the following figure.

```
17:47:40 P现有 AN960C10 Invty Key=28009126 Excess Stock On Hand
```

Figure 35. DISBURSE transaction - output

Other messages might follow, depending upon the sample database update status. You might need to press PA1 first. An example is shown in the following figure.

```
Update Complete
```

Figure 36. DISBURSE transaction - output (additional)

If you want to display the inventory information for key 28009126 and part number AN960C10, enter the command as shown in the following figure. The input is transaction code, part number, inventory-location-key.

```
dspinv AN960C10,28009126
```

Figure 37. DSPINV transaction - entry

The resulting terminal output is shown in the following figure.
Fast Path sample application

The Fast Path sample application demonstrates a banking application.

The IVP jobs and tasks set up the infrastructure that enables you to run the Fast Path sample application, but they do not run the sample application. The Fast Path sample application creates and uses four databases. Data is related to General Ledger (MSDB), Teller (MSDB), Loan (HDAM/VSAM), and Customer Account (DEDB) information for each account. DEDB and HDAM databases are loaded in the IVP offline using IMS-supplied utilities. All four databases are processed online using message processing regions (MPP) and Fast Path regions (IFP).

Two transaction codes are used in the Fast Path sample application:

- FPSAMP1 - Executes in an IFP region
- FPSAMP2 - Executes in an MPP region

The two transaction codes both execute the same application functions. The MOD name of the MFS format that is used by these transactions is DBFSMOUT. Use the IMS /FORMAT DBFSMOUT command to display this format.

The following figure shows the relationship of the four databases in the Fast Path sample application.

![Figure 38. DSPINV transaction - output](image-url)

Related reference:

“IMS sample application PSBs” on page 178
The General Ledger database is a non-terminal-related MSDB. The DBD for the general ledger file contains a segment description that consists of the following items:

- General ledger account number
- General ledger account balance
- Transaction count
- Filler area

The Teller database is a terminal-related MSDB. The DBD for the teller file contains a segment description that consists of the following items:

- Withdrawal amount
- Deposit amount
- Loan payment amount
- Teller balance
- Transaction code
- Key to general ledger
- Filler area

The Customer Account database (a DEDB) includes nine segment types in a three-level hierarchy, as represented in the following figure. The segment types include a root segment type, a sequential dependent segment type, and seven types of direct dependent segments. In addition, subset pointers point to the three account segment types that are represented in the database. This configuration allows the application to demonstrate the use of multiple SSAs and the use of command codes (including subset pointer references) for a DEDB.
The second-level transaction segment is sequential dependent; all other segments are direct dependents.

The Loan database (HDAM) contains customer identification and transaction information. Transaction information includes all aspects of a banking scenario, including loan information, account numbers, and dates and times of transactions.

The hierarchical diagram in the following figure displays the segments (customer root and loan) of the HDAM/VSAM Loan database.

**Figure 40. A hierarchical diagram of the Customer Account database (a DEDB)**

**Figure 41. Segments of the HDAM/VSAM Loan database**

**Running the Fast Path sample transactions**

Run the Fast Path sample transactions from your terminal to verify the proper setup of your Fast Path infrastructure.

Run the IVP jobs and tasks through the H series to set up the infrastructure for the Fast Path sample application.
To run the sample transactions:

1. Sign on to an IMS user terminal session.
2. Press Clear and then press PA2. Repeat this sequence until a blank screen is returned. This sequence causes queued-up messages to be displayed.
3. Enter /FORMAT DBFSMOUT to display the MFS format.
4. Follow the transaction sequence that is described below. The terminal inputs have the following format:
   aaaaaaaa bbbbbbbbbcc def gggggggggg

The general format of the input for these transactions is shown in the following table.

Table 1. Example input format for Fast Path sample application transactions

<table>
<thead>
<tr>
<th>Field</th>
<th>Variables</th>
<th>Description</th>
</tr>
</thead>
</table>
| Transaction code  | aaaaaaa   | • FPSAMP1 - Execute transaction in FP message-driven region  
                   |           | • FPSAMP2 - Execute transaction in IMS MPP region |
| Customer Account  | bbbbbbbbbcc | • bbbbbbb - Eight-character customer number  
                   |           | • cc - Two-character account type                 |
| Transaction type  | def       | • d - One of the following four characters:  
                   |           | – L - Loan  
                   |           | – S - Savings account  
                   |           | – C - Checking account  
                   |           | – U - Current account  
                   |           | • e - One of the following three characters:  
                   |           | – W - Withdrawal  
                   |           | – D - Deposit  
                   |           | – P - Account statement  
                   |           | • f - One of the following five characters:  
                   |           | – P - Passbook  
                   |           | – 1 - Today  
                   |           | – 2 - This week  
                   |           | – 3 - This month  
                   |           | – 4 - This quarter  
| Transaction amount | gggggggggg | Amount ($3000.00, for example, up to nine characters) |

Note:

a. A transaction amount is not required on load transactions or account statement requests. A loan payment amount is predefined in the database.
b. For savings account deposits and withdrawals with a passbook. If no passbook exists, this character is left blank.
c. Valid combinations for statement requests are: SP3, SP4, CP2, CP3, CP4, UP1, UP2, UP3, and UP4.

a. Type the following terminal input: FPSAMP1 BR01-H01M1 L The terminal output displayed is:

BR02-T01U1 UW $11,500.00 $30,000.00

You have completed running the IMS Fast Path sample application and verified the proper setup of your Fast Path infrastructure.

Related reference:
“Fast Path sample application error messages” on page 186

Samples for the IMS catalog

The IVP sets up the IMS catalog and provides sample application programs that verify that the IMS catalog is working as expected.

The IVP job IV_E319J performs the following actions to set up the IMS catalog:
1. Delete any existing IMS catalog data sets
2. Allocate new IMS catalog data sets
3. Load the IMS catalog database
4. Create an image copy of the IMS catalog data sets
During setup, you can define an alias name for the IMS catalog by specifying the IXUCA TAL IVP variable, which sets the alias name on the ALIAS= parameter in the IMS catalog section of the DFSDFxxx member.

After set up is complete, the IVP job IV_O260J runs the DFSDDLT0 test application program, which verifies the content of the IMS catalog by retrieving the first 100 segments in the IMS catalog.

If the Java IVP feature is enabled, several O series jobs in the IVP provide four sample Java application programs that use the IMS catalog to read, insert, update, and delete data in the sample phone book database.

Two of the Java application programs, DFSCATS2 and DFSCATD2, use the type-2 IMS Universal drivers. DFSCATS2 uses SQL. DFSCATD2 uses DL/I.

The sample Java application programs CAT1GO and CAT2GO use the type-4 IMS Universal drivers. The application program CAT1GO uses SQL. The application program CAT2GO uses DL/I.

The following IVP jobs run the sample Java application programs:
- IV_O261J O2 JOB - Run Java Sample (SQL - Type 2)
- IV_O262J O2 JOB - Run Java Sample (DLI - Type 2)
- IV_O275J O2 JOB - Run Java Sample (SQL - Type 4)
- IV_O276J O2 JOB - Run Java Sample (DLI - Type 4)

### Samples for IMS solutions for Java development, IMS support for XQuery, and IMS callout

The IVP contains jobs and tasks that set up an environment in which sample applications that demonstrate the IMS solutions for Java development, IMS support for XQuery, and IMS callout can be executed.

The IVP does not demonstrate these samples through its jobs and tasks.

### Samples for the IMS solutions for Java development

The IVP performs several verifications for the IMS solutions for Java development.
- Runs a JMP application (IVP task IV_H216T - FF JMP Transactions) and a JBP application (IVP job IV_H213J - FF JBP) against the IVP Phone Book database. These applications ensure that the Java dependent regions have been correctly installed and set up, that the JAR files for the classic Java APIs for IMS have been successfully installed, and that OMVS (UNIX System Services) is running correctly.
- In addition to the IVP Phone Book database, the IVP also sets up an environment for the Dealership database in its system definition. This database is used by many of the sample applications for the IMS solutions for Java development. After this environment is set up, the database is ready for use by the sample Java applications.

Sample applications for the IMS solutions for Java development, including sample applications for Open Database Type-2 support, are available under IMS Exchange on the developerWorks® website. Each sample package contains detailed instructions and example code to help you write applications that access and query IMS data.
Samples for IMS support for XQuery

The IVP sets up an environment for the Purchase Order database in its system definition for the sample applications that demonstrate IMS support for XQuery.

After this environment is set up, the sample Purchase Order database is ready for use by the sample XQuery applications. The Purchase Order application is not demonstrated through the IVP jobs and tasks.

These sample applications are available under IMS Exchange on the developerWorks website. The sample package contains detailed instructions and example code to help you write applications that access and query IMS data.

Related reference:

IMS XML DB and XML XQuery samples

Samples for the callout function

The IVP sets up an environment in its system definition and provides samples in assembly, Java, and COBOL languages, and two related XML converters, for the asynchronous and synchronous callout functions. These samples demonstrate how an IMS application can send outbound messages to request services or data from an external web service or Java applications, and, optionally, receive responses in either the same or a different transaction.

The samples are provided in the S series of jobs and tasks, with introduction information in IV_S001T.

Parts DFSACALO and DFSSCALO provide user-supplied IMS Connect client application samples in assembly language. Compile and bind the samples by running the job IV_E206J. Run job IV_S222J to start the asynchronous sample and job IV_S225J to start the synchronous sample.

Two Java samples, available in parts DFSJASMP and DFSJSSMP, provide sample user-supplied IMS Connect client applications in Java for the asynchronous and synchronous callout functions. These samples can run on either distributed or z/OS platforms.

Two COBOL samples, available in parts DFSASCBL and DFSSSCBL, demonstrate the asynchronous and synchronous callout functions as supported by the IMS TM resource adapter. DFSASCBL is located in the SDFSMAC data set. Compile and bind the samples before running the samples through job IV_S227J (for asynchronous) and job IV_S228J (for synchronous).

Two XML converters, DFSACCBL and DFSSCCBL, are provided when the callout requests are routed through the IMS Enterprise Suite SOAP Gateway. DFSACCBL is located in the SDFSISRC data set. Compile and bind the samples before running the samples through job IV_S230J (for asynchronous) and job IV_S231J (for synchronous).

The web service or Java applications that these samples call out to can be downloaded from the IMS TM Resource Adapter and IMS Enterprise Suite SOAP Gateway web pages. Each sample package contains detailed instructions.
Chapter 5. Reference information

This section provides reference information for the IVP.

IMS data sets used by the IVP

Use the data set information to troubleshoot IVP job errors, learn about the IMS data sets, and to enter the correct data set names during the IVP variable-gathering phase.

The attribute values for each data set are provided and include:

**DSORG**

Data set organization

**Restriction:** IMS supports partitioned data sets extended (PDSEs) for only these libraries: PGMLIB, SMPLTS, and SDFSJLIB.

**Note:** The External Subsystem Attach Facility (ESAF) supports PDSE load library data sets.

**DSNTYPE**

Data set name type

**RECFM**

Record format

**LRECL**

Logical record length

**BLKSIZE**

Block size

The DSNAME high-level qualifier for DLIB, SYSTEM, and EXECUTION data sets must be specified on the NODE parameter of the IMSGEN macro. TLIB data sets are included in the NODE parameter for SYSTEM data sets. The IMS online change function requires multiple copies of the system data sets IMS.ACBLIB,
IMS.MODBLKS, and IMS.FORMATT. The base copies of these data sets are called staging libraries, and the copies form active and inactive libraries.

**IVP dialog data sets**

IVP dialog data sets are user data sets (not known to SMP/E) that are needed by the IVP dialog.

**IMS.INSTALIB data set**

The INSTALIB data set contains the IMS installation materials created by the file tailoring phase of the IVP dialog.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **DSNTYPE**
  - PDS
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80

**IMS.INSTATBL data set**

The INSTATBL data set contains the ISPF tables that are read and updated by the IVP dialog.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80

**IMS.IVP.EXPORT data set**

The IMS.IVP.EXPORT data set is the export data set that is used in the process for exporting and importing variables during the IVP variable-gathering phase. The data set can have any name. If the data set does not exist, you can create it during the export process.

- **DSORG**
  - Sequential or partitioned
- **RECFM**
  - FB
SMP/E data sets

SMP/E data sets establish the SMP/E environment for IMS. Do not share these data sets with other products.

One SMP/E Consolidated Software Inventory (CSI) can support multiple zones. Products that have the same SMP/E SREL (P115 for IMS) can share the same SMP/E CSI.

IMS.DLIBZONE.CSI data set

The DLIBZONE (distribution, or DLIB, zone) data set records information about the status and structure of the distribution libraries. You assign each distribution zone a one- to seven-character name when you create the zone. This name appears in the SET BDY command.

The DLIBZONE data set has the following attribute:

DSORG

VSAM KSDS

IMS.GLBLZONE.CSI data set

The GLBLZONE (global zone) data set contains information about SYSMODS and HOLDDATA that have been processed by the SMP/E RECEIVE command. The data set also contains information that allows SMP/E to access the DLIBZONE and TRGTZONE, and information that allows you to tailor parts of SMP/E processing.

The GLBLZONE data set has the following attribute:

DSORG

VSAM KSDS

IMS.SMPLTS data set

The SMPLTS data set is a target library that maintains the base version of a load module. The load module specifies a SYSLIB allocation to implicitly include modules. A base version of a load module includes only the explicitly defined modules for the load module. The data set is maintained in the SMPLTS if the load module is defined to SMP/E with a SYSLIB allocation (that is, its LMOD entry contains a CALLLIBS subentry list). SMP/E uses the load module in the SMPLTS as input when binding the load module into its specified target libraries.

Each target zone must have its own SMPLTS data set. The SMPLTS cannot be shared with any other target zone.

The SMPLTS data set has the following attributes:

DSORG

Partitioned data set extended (PDSE)

DSNTYPE

LIBRARY
RECFM
   U
LRECL
   0
BLKSIZE
   Greater than or equal to 6144

**IMS.SMPPTS data set**

The SMPPTS data set is used as temporary storage for SYSMODs. It contains one member for each SYSMOD that is received.

This data set has the following attributes:
- **DSORG**
  - Partitioned
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80

**IMS.SMPSCDS data set**

The SMPSCDS data set contains backup copies of target zone entries that are changed by inline JCLIN during APPLY processing.

Each target zone must have its own SMPSCDS data set. The SMPSCDS cannot be shared by any other target zone.

This data set has the following attributes:
- **DSORG**
  - Partitioned
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80

**IMS.SMPSTS data set**

The SMPSTS data set is a temporary target source library for source modules that exist only in a distribution library.

Each target zone must have its own SMPSTS data set. The SMPSTS cannot be shared by any other target zone.

This data set has the following attributes:
**DSORG**  
Partitioned

**RECFM**  
FB

**LRECL**  
80

**BLKSIZE**  
Multiple of 80

**IMS.TRGTZONE.CSI data set**

The TRGTZONE (target zone) data set records information about the status and structure of the target libraries. You assign each target zone a one to seven-character name when you create it. This name appears in the SET BDY command.

Each TRGTZONE data set must have its own SMPLTS, SMPMTS, SMPSTS, and SMPSSCDS data sets. Each TRGTZONE can support only one release of a given product. Products having the same SMP/E SREL (P115 for IMS) are eligible for sharing the same SMP/E TRGTZONE. However, this practice is not recommended.

The TRGTZONE data set has the following attribute:

**DSORG**  
VSAM KSDS

**Related concepts:**

- z/OS: SMP/E data sets and files

**Distribution (DLIB) data sets**

IMS distribution libraries (DLIBs) contain the master copy of elements in IMS. They can be used to restore SYSMODs in the target library or to rebuild a target environment. These data sets are maintained by SMP/E.

**System services data sets**

The following DLIBs are used by the System Services component FMID:

- IMS.ADFSBASE
- IMS.ADFSCLST
- IMS.ADFSDATA
- IMS.ADFSEXEC
- IMS.ADFSISRC
- IMS.ADFLOAD
- IMS.ADFSMAC
IMS.ADFSMLIB
IMS.ADFSPLIB
IMS.ADFSRTL
IMS.ADFSPLIB
IMS.ADFSSMPL
IMS.ADFSSRC
IMS.ADFSTLIB

**IMS.ADFSBASE**: The ADFSBASE data set contains SMP/E sample jobs to install IMS.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80.

**IMS.ADFSCLIST**: ADFSCLST contains TSO CLISTs.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80.

**IMS.ADFSDATA**: ADFSDATA contains data.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB
LRECL
80
BLKSIZE
Multiple of 80.

IMS.ADFSEXEC: ADFSEXEC contains TSO REXX EXECs.

This data set has the following attributes:
DSORG
Partitioned
DSNTYPE
PDS
RECFM
FB
LRECL
80
BLKSIZE
Multiple of 80.

IMS.ADFSISRC: ADFSISRC contains DBRC skeletal JCL members, a sample application, and miscellaneous source elements.

This data set has the following attributes:
DSORG
Partitioned
DSNTYPE
PDS
RECFM
FB
LRECL
80
BLKSIZE
Multiple of 80.

IMS.ADFSLOAD: ADFSLOAD contains individually linked load modules.

This data set has the following attributes:
DSORG
Partitioned
DSNTYPE
PDS
RECFM
U
LRECL
0
BLKSIZE
Greater than or equal to 6144.
**IMS.ADFSMAC**: ADFSMAC contains system definition macros, utility macros, and the macros required for IMS module assembly.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80; the block size for this data set should be greater than or equal to the larger of the SYS1.AMACLIB and SYS1.AMODGEN block sizes.

To prevent DCB conflicts during IMS system definition and SMP/E processing, make the block sizes for ADFSMAC and OPTIONS the same.

**IMS.ADFSMLIB**: ADFSMLIB contains ISPF dialog message members.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80.

**IMS.ADFSPLIB**: ADFSPLIB contains ISPF dialog panels.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80.
**IMS.ADFSRTRM**: ADFSRTRM contains description members that are used by the IVP dialog.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80.

**IMS.ADFSSLIB**: ADFSSLIB contains ISPF dialog file-tailoring skeletons.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80.

**IMS.ADFSSMPL**: ADFSSMPL contains sample jobs and exits.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80.

**IMS.ADFSSRC**: ADFSSRC contains source modules for the IMS DB licensed program, the System Services component, and the Transaction Manager licensed program.

This data set has the following attributes:
**DSORG**
  Partitioned

**DSNTYPE**
  PDS

**RECFM**
  FB

**LRECL**
  80

**BLKSIZE**
  Multiple of 80.

**IMS.ADFSTLIB**: ADFSTLIB contains ISPF dialog tables.

This data set has the following attributes:

**DSORG**
  Partitioned

**DSNTYPE**
  PDS

**RECFM**
  FB

**LRECL**
  80

**BLKSIZE**
  Multiple of 80.

---

**RSR Recovery-Level Tracking feature data sets**

The RSR Recovery-Level Tracking feature FMID uses the IMS.ADFSLOAD DLIB.

**RSR Database-Level Tracking feature data sets**

The RSR Database-Level Tracking feature FMID uses the IMS.ADFSLOAD DLIB.

**Database Manager data sets**

The following DLIBs are used by the Database Manager FMID:
  - IMS.ADFSCLST
  - IMS.ADFSLOAD
  - IMS.ADFSPLIB
  - IMS.ADFSSRC
  - IMS.ADFSSMPL

**Transaction Manager data sets**

The following DLIBs are used by the Transaction Manager FMID:
  - IMS.ADFSEXEC
  - IMS.ADFSLOAD
  - IMS.ADFSPLIB
  - IMS.ADFSSMPL
IMS.ADFSSRC

**IMS Extended Terminal Option Support data sets**

The IMS Extended Terminal Option Support FMID uses the IMS.ADFSLOAD DLIB.

**IMS Java On Demand features data sets**

IMS Java On Demand features use the following DLIB data sets:

- IMS.ADFSJLIB
- IMS.ADFSIC4J
- IMS.ADFSJHFS
- IMS.ADFSJRAR
- IMS.ADFSJCIPI
- IMS.ADFSJSAM
- IMS.ADFSJCIC
- IMS.ADFSJCPS

**IMS.ADFSJLIB**: ADFSJLIB contains the C code library that is used by the classic type-2 driver.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDSE
- **RECFM**: U
- **LRECL**: 0
- **BLKSIZE**: 32760

**IMS.ADFSIC4J**: ADFSIC4J contains the IMS TM resource adapter runtime component for the z/OS platform.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: VB
- **LRECL**: 255
- **BLKSIZE**: Greater than or equal to 259.
**IMS.ADFSJHFS:** ADFSJHFS contains the type-2 and type-4 IMS Universal driver Java class libraries used for IMS TM message queue and transaction processing and for IMS DB access through the JDBC and DLI for Java interfaces.

This data set has the following attributes:

- **DSORG:** Partitioned
- **DSNTYPE:** PDS
- **RECFM:** VB
- **LRECL:** 255
- **BLKSIZE:** Greater than or equal to 259.

**IMS.ADFSJRAR:** ADFSJRAR contains the Universal type-2 and type-4 JCA drivers for direct IMS DB access from a Java EE runtime environment (such as WebSphere® Application Server for z/OS).

This data set has the following attributes:

- **DSORG:** Partitioned
- **DSNTYPE:** PDS
- **RECFM:** VB
- **LRECL:** 255
- **BLKSIZE:** Greater than or equal to 259.

**IMS.ADFSJCPI:** ADFSJCPI contains the classic Java drivers used for IMS TM message queue and transaction processing and IMS DB access through the JDBC and DLI for Java interfaces.

This data set has the following attributes:

- **DSORG:** Partitioned
- **DSNTYPE:** PDS
- **RECFM:** VB
- **LRECL:** 255
- **BLKSIZE:** Greater than or equal to 259.
**IMS.ADFSJSAM:** ADFSJSAM contains the Open Database sample (class files only).

This data set has the following attributes:

**DSORG**
- Partitioned

**DSNTYPE**
- PDS

**RECFM**
- VB

**LRECL**
- 255

**BLKSIZE**
- Greater than or equal to 259.

**IMS.ADFSJCIC:** ADFSJCIC contains code that is required to access IMS when using the IMS Database JDBC driver in an IMS Connect environment.

This data set has the following attributes:

**DSORG**
- Partitioned

**DSNTYPE**
- PDS

**RECFM**
- VB

**LRECL**
- 255

**BLKSIZE**
- Greater than or equal to 259.

**IMS.ADFSJCP5:** ADFSJCP5 contains the Open Database sample (class files only).

This data set has the following attributes:

**DSORG**
- Partitioned

**DSNTYPE**
- PDS

**RECFM**
- VB

**LRECL**
- 255

**BLKSIZE**
- Greater than or equal to 259.

**Target (TLIB) data sets**

The TLIB data sets are the IMS SMP/E target libraries (SYSLIBs), and are the libraries that are used to run and use IMS.
**IMS data sets maintained by SMP/E**

The following data sets are maintained by the SMP/E APPLY processing:

- IMS.MODBLKS
- IMS.SDFSBASE
- IMS.SDFSCLST
- IMS.SDFSDATA
- IMS.SDFSEXEC
- IMS.SDFSISRC
- IMS.SDFSJLIB
- IMS.SDFSJSID
- IMS.SDFSMAC
- IMS.SDFSMLIB
- IMS.SDFSPLIB
- IMS.SDFSRESL
- IMS.SDFSRTM
- IMS.SDFSSLIB
- IMS.SDFSSMPL
- IMS.SDFSSRC
- IMS.SDFSTLIB

The following data sets that reside in a UNIX System Services file system are also maintained by the SMP/E APPLY processing:

- SDFSJCPS
- SDFSJTOL
- SDFSIC4J
- SDFSJCIC
- SDFSJCLI
- SDFSJHFS
- SDFSJRAR
- SDFSJSAM

**IMS system definition data sets**

The following data sets are initially loaded or updated by Stage 2 of the IMS system definition process:

- IMS.MODBLKS
- IMS.SDFSRESL

**IMS.MODBLKS**

MODBLKS contains the control block modules that are created by IMS system definition. Its contents are copied by the Online Change utility to either IMS.MODBLKSA or IMS.MODBLKSB.

This data set has the following attributes:

- **DSORG**: Partitioned
DSNTYPE
  PDS
RECFM
  U
LRECL
  0
BLKSIZE
  Greater than or equal to 32. Default 32. IMS.SDFSRESL, MODBLKS, MODBLKSA, and MODBLKSB should have the same BLKSIZE.

IMS.SDFSBASE

SDFSBASE is the target library for ADFSBASE and contains sample jobs.

This data set has the following attributes:

DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  FB
LRECL
  80
BLKSIZE
  Multiple of 80

IMS.SDFSCLST

SDFSCLST is the target library for ADFSCLST and contains TSO CLISTs.

This data set has the following attributes:

DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  FB
LRECL
  80
BLKSIZE
  Multiple of 80

IMS.SDFSDATA

SDFSDATA is the target library for ADFSDATA and contains data.

This data set has the following attributes:
DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  FB
LRECL
  80
BLKSIZE
  Multiple of 80

IMS.SDFSEEXEC

SDFSEEXEC is the target library for ADFSEEXEC and contains TSO REXX EXECs.

This data set has the following attributes:

DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  FB
LRECL
  80
BLKSIZE
  Multiple of 80

IMS.SDFSISRC

SDFSISRC is the target library for ADFSISRC and contains DBRC skeletal JCL members, and sample application and miscellaneous source modules.

This data set has the following attributes:

DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  FB
LRECL
  80
BLKSIZE
  Multiple of 80

IMS.SDFSJLIB

SDFSJLIB contains the bind output for the IMS Java On Demand Features load modules. It must be APF authorized.
This data set has the following attributes:

**DSORG**
- Partitioned data set extended (PDSE)

**DSNTYPE**
- LIBRARY

**RECFM**
- U

**LRECL**
- 0

**BLKSIZE**
- Greater than or equal to 32 760. Default 32 760.

### IMS.SDFSJSID

SDFSJSID is the target library for ADFSJJCL and contains side decks.

This data set has the following attributes:

**DSORG**
- Partitioned

**DSNTYPE**
- PDS

**RECFM**
- FB

**LRECL**
- 80

**BLKSIZE**
- Multiple of 80

### IMS.SDFSMAC

IMS.SDFSMAC is the target library for ADFSMAC, and it contains the IMS macros.

This data set has the following attributes:

**DSORG**
- Partitioned

**DSNTYPE**
- PDS

**RECFM**
- FB

**LRECL**
- 80

**BLKSIZE**
- Multiple of 80: the BLKSIZE for this data set must be greater than or equal to the larger of the SYS1.AMACLIB and SYS1.AMODGEN BLKSIZEs.

The block sizes for SDFSMAC and OPTIONS should be the same to prevent DCB conflicts during IMS system definition and SMP/E processing.
**IMS.SDFSMLIB**

SDFSMLIB is the target library for ADFSMLIB and contains ISPF dialog message members.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80

**IMS.SDFSPLIB**

SDFSPLIB is the target library for ADFSPLIB and contains ISPF dialog panels.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80

**IMS.SDFSRESL**

IMS.SDFSRESL contains the IMS nucleus and required action modules. This data set is built by a combination of system definition and SMP/E APPLY processing.

IMS.SDFSRESL must reside on DASD that supports a maximum record size of 18 KB or greater.

APF-authorize the IMS.SDFSRESL data set and any data set that is concatenated to it on JOBLIB or STEPLIB DD statements.

For IMS batch, APF-authorize the IMS.SDFSRESL data set and any data set concatenated to it on the DFSRESLB DD statement. This DD statement provides an authorized library for the IMS SVC modules. You do not need to authorize the JOBLIB or STEPLIB statement for IMS batch. If you omit the DFSRESLB DD statement, the IMS SVC modules are loaded from JOBLIB or STEPLIB, and JOBLIB or STEPLIB data sets must be APF-authorized.
This data set has the following attributes:

**DSORG**  
Partitioned

**DSNTYPE**  
PDS

**RECFM**  
U

**LRECL**  
0

**BLKSIZE**  
Greater than or equal to 32 760. Default is 32 760. IMS.SDFSRESL, IMS.MODBLKS, IMS.MODBLKSA, and IMS.MODBLKSB must have the same BLKSIZE.

**IMS.SDFSRTRM**

SDFSRTRM is the target library for ADFSRTRM and contains description members used by the IVP dialog.

This data set has the following attributes:

**DSORG**  
Partitioned

**DSNTYPE**  
PDS

**RECFM**  
FB

**LRECL**  
80

**BLKSIZE**  
Multiple of 80

**IMS.SDFSSLIB**

SDFSSLIB is the target library for ADFSSLIB and contains ISPF dialog file tailoring skeletons.

This data set has the following attributes:

**DSORG**  
Partitioned

**DSNTYPE**  
PDS

FB

**LRECL**  
80

**BLKSIZE**  
Multiple of 80
**IMS.SDFSSMPL**

SDFSSMPL is the target library for ADFSSMPL and contains sample jobs and exits.

This data set has the following attributes:

- **DSORG**  
  Partitioned
- **DSNTYPE**  
  PDS
- **RECFM**  
  FB
- **LRECL**  
  80
- **BLKSIZE**  
  Multiple of 80

**IMS.SDFSSRC**

SDFSSRC is the target library for ADFSSRC and contains source programs.

This data set has the following attributes:

- **DSORG**  
  Partitioned
- **DSNTYPE**  
  PDS
- **RECFM**  
  FB
- **LRECL**  
  80
- **BLKSIZE**  
  Multiple of 80

**IMS.SDFSTLIB**

SDFSTLIB is the target library for ADFSTLIB and contains ISPF dialog tables.

This data set has the following attributes:

- **DSORG**  
  Partitioned
- **DSNTYPE**  
  PDS
- **RECFM**  
  FB
- **LRECL**  
  80
- **BLKSIZE**  
  Multiple of 80: INSTATBL and SDFSTLIB must have the same BLKSIZE.
System data sets

The system data sets are IMS system libraries. These data sets are user data sets (not known to SMP/E).

IMS file system path names

IMS uses the following paths that reside in a z/OS file system:

- SDFSJCIC: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/classic/cics/IBM/
- SDFSJHFS: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/IBM/
- SDFSJSAM: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/ivp/IBM/
- SDFSJRAR: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/IBM/
- SDFSJCPI: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/classic/IBM/
- SDFSJTCOL: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/classic/dlimodel/IBM/
- SDFSJCP: Maps to PathPrefix/usr/lpp/ims/ims13/imsjava/classic/classic/ivp/IBM/
- SDFSIC4J: Maps to PathPrefix/usr/lpp/ims/ims13/ico/IBM/

IMS SYSDEF data sets

The following data sets are initially loaded by Stage 2 of the IMS system definition (SYSDEF) process.

- IMS.FORMATT
- IMS.LGENIN
- IMS.LGENOUT
- IMS.OBJDSET
- IMS.OPTIONS
- IMS.PROCLIB
- IMS.REFERAL
- IMS.TFORMAT

JOBS data sets

JOBS data sets include various IMS jobs.

MODBLKS data sets

The IMS control region and the MSVERIFY utility use IMS.MODBLKS data sets that contain the IMS system definition output for the control block modules that are affected by online change. The MODBLKS data sets include:

- IMS.MODBLKS
- IMS.MODBLKSA
- IMS.MODBLKSB

RDDS data sets

Resource definition data sets (RDDS) contain resource definitions and resource descriptor definitions for the MODBLKS data sets. The RDDS data sets include:

- IMS.RDDS
A minimum of 2 RDDSs are required to support the export function.

**TCFSLIB data sets**

TCFSLIB data sets contain TCO SCRIPTS.

**IMS.JOBS data set**

JOBS contains job streams that are submitted for execution by either the IMS operator command: `/START REGION` or the z/OS command `START IMSRDR,MBR=.....`. You must customize any jobs that are stored in this data set with your installation job names, job statement parameters, and other pertinent specifications. This data set also contains the RACF password or user ID (on a job statement), and therefore must be read protected. You can assign a RACF password and user ID to this data set, and optionally code a RACF System Task Authorization exit routine to verify the use of protected data sets. Otherwise, system security cannot be assured.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **DSNTYPE**
  - PDS
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80.

**IMS.LGENIN data set**

The LGENIN data set contains the input for the large system definition Sort/Split function.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **DSNTYPE**
  - PDS
- **RECFM**
  - FB
- **LRECL**
  - 80
- **BLKSIZE**
  - Multiple of 80. The default 11440. A large BLKSIZE enables processing efficiency.
**IMS.LGENOUT data set**

The LGENOUT data set contains the output from the large system definition Sort/Split function. The members of this data set are used as input for conditional assembly steps during stage 2 of system definition.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: FB
- **LRECL**: 80
- **BLKSIZE**: Multiple of 80. The default is 11440. A large BLKSIZE enables processing efficiency.

**IMS.MODBLKSA, IMS.MODBLKSB data sets**

The MODBLKSA and MODBLKSB data sets contain MODBLKS members. When one of these libraries is active (in use by the online system), the contents of IMS.MODBLKS are copied to the other, or inactive, library for use during the next online change process.

IMS.MODBLKSA or IMS.MODBLKSB can be brought online by a sequence of master terminal operator /MODIFY commands.

Before running online, you should APF-authorize these data sets to the z/OS system.

These data sets have the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: U
- **LRECL**: 0
- **BLKSIZE**: Greater than or equal to 32760. Default 32760. IMS.SDFSRESL, MODBLKS, MODBLKSA, and MODBLKSB should have the same BLKSIZE.

**IMS.OBJDSET data set**

The OBJDSET data set contains the assembler output that is created during IMS system definition Stage 2 execution. You specify the name of this data set in the IMMSGEN macro.
This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80 less than or equal to 3200. This BLKSIZE limit of 3200 is a binder-imposed maximum for data sets containing object modules that are referenced by INCLUDE.

**IMS.OPTIONS data set**

The OPTIONS data set contains the configuration-dependent macros that are stored there by Stage 2 processing.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80. The BLKSIZE for this data set should be greater than or equal to the larger of the SYS1.SDFSMAC and SYS1.AMODGEN BLKSIZEs.

The BLKSIZEs for SDFSMAC and OPTIONS should be the same to prevent DCB conflicts during IMS system definition and SMP/E processing.

**IMS PROCLIB data set**

The IMS PROCLIB data set contains the cataloged procedure and control statement members that are created by IMS system definition. It also contains user-created control statement members that are used to tailor IMS. After system definition, you might need to move some procedures to SYS1.PROCLIB.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS
RECFM
FB
LRECL
80
BLKSIZE
Multiple of 80 less than or equal to 3200.

**IMS.TCFSLIB data set**

The TCFSLIB data set contains control statement members (scripts) used by IMS time-controlled operations (TCO).

This data set has the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<tr>
<td>BLKSIZE</td>
<td>80</td>
</tr>
</tbody>
</table>

**Execution data sets**

The execution data sets are used during the execution of the IMS system and its related utilities. These data sets are user data sets which are not known to SMP/E.

**ACBLIB data sets**

The ACBLIB data sets contain the application description and database control blocks. The ACBLIB data sets include:

- IMS.ACBLIB
- IMS.ACBLIBA
- IMS.ACBLIBB

The ACBLIB data sets require space for each PSB and all unique physical DBDs.

In systems that share data, the ACBLIBs in both systems must be identical, or the systems must share the same ACBLIB.

**DBDLIB data set**

The IMS.DBDLIB data set contains the database description blocks (DBDs) that are created by the Database Description Generation (DBDGEN) utility.

**DBRC RECON data sets**

The RECON data sets contain system restart and recovery information. The RECON data sets include:

- IMS.RECON1
IMS.RECON2
IMS.RECON3

**FORMAT data sets**

The FORMAT data sets contain MFS definitions. The FORMAT data sets include:
- IMS.FORMAT
- IMS.FORMATA
- IMS.FORMATB
- IMS.REFERAL
- IMS.TFORMAT

IMS.REFERAL, IMS.FORMAT, and IMS.TFORMAT are initialized during stage 2 of IMS system definition. IMS.FORMATA and IMS.FORMATB are created by copying the staging library, IMS.FORMAT. You must allocate one additional track for each user-defined format/message descriptor set for the IMS.FORMAT, IMS.REFERAL, and IMS.TFORMAT data sets.

**Log data sets**

The log data sets include:
- IMS.DFSOLPnn
- IMS.DFSOLSnn
- IMS.DFSWADSn
- IMS.IEFRDER
- IMS.IEFRDER2
- IMS.IMSMON
- IMS.MSDBCP1
- IMS.MSDBCP2
- IMS.MSDBCP3
- IMS.MSDBCP4
- IMS.RDS
- IMS.RDS2

**Message queue data sets**

The message queue data sets are used for message queuing. The message queue data sets include:
- IMS.LGMSG
- IMS.LGMSG1-LGMSG9
- IMS.LGMSGL
- IMS.MODSTAT
- IMS.QBLKS
- IMS.QBLK5L
- IMS.SHMSG
- IMS.SHMSG1-SHMSG9
- IMS.SHMSGL
**MSDB data sets**

MSDB data sets contain information associated with MSDB databases. The MSDB data sets include:

- IMS.MSDBC01
- IMS.MSDBC02
- IMS.MSDBC03
- IMS.MSDBC04
- IMS.MSDBDUMP
- IMS.MSDBINIT

**Online change data sets**

The online change data sets include:

- IMS.MODSTAT
- IMS.MODSTAT2
- IMSPLEX.OLCSTAT

**PGMLIB data sets**

The IMS.PGMLIB data set contains user-written application programs. This dataset can be a PDS or a PDSE.

Restriction: COBOL5 requires all load modules to be in a PDSE.

**PSBLIB data sets**

The IMS.PSBLIB data set contains the program specification blocks (PSBs) created by the Program Specification Block Generation (PSBGEN) utility.

**SYSOUT data sets**

SYSOUT data sets include:

- IMS.SYSO\textit{nnn} data set
- Direct output data sets

**Trace data sets**

Trace data sets contain output from IMS internal tracing. The trace data sets include:

- IMS.DFSTRA01
- IMS.DFSTRA02
- IMS.DFSTRA0T

**IMS.ACBLIB**

ACBLIB contains the application control blocks (ACBs) that are created by the Application Control Blocks Maintenance (ACBGEN) utility. Its contents are copied by the Online Change Copy utility to either the IMS.ACBLIABA data set or the IMS.ACBLIBB data set.

This data set has the following attributes:
IMS.ACBLIBA, IMS.ACBLIBB

ACBLIBA and ACBLIBB contain ACLIB members. When one of these libraries is active (in use by the online system), the contents of IMS.ACBLIB are copied to the other, or inactive, library for use in the next online change run.

IMS.ACBLIBA or IMS.ACBLIBB can be brought online by a sequence of master terminal operator /MODIFY commands.

If you specify DOPT in the APPLCTN macro, concatenate the library that contains these PSBs after the library that contains the non-DOPT PSBs (that is, after the library pointed to by the IMS.ACBLIBA or IMS.ACBLIBB DD statements). The order of concatenation must be the same for the IMS.ACBLIBA and IMS.ACBLIBB data sets.

These data sets have the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
U

**LRECL**
0

**BLKSIZE**
User choice. The default is 6144.

IMS.DBDLIB

DBDLIB contains the database description blocks (DBDs) that are created by the Database Description Generation (DBDGEN) utility. Each DBD (one per database) requires approximately 1500 bytes to 2500 bytes of direct-access storage. Exact requirements depend on the number of data set groups, segments, fields, and hierarchic levels.

This data set has the following attributes:

**DSORG**
Partitioned
DSNTYPE
  PDS
RECFM
  U
LRECL
  0
BLKSIZE
  User choice. The default is 6144.

**IMS.DFSOLPnn, v.DFSOLSnn**

DFSOLPnn and DFSOLSnn are the online log data sets (OLDS) that are used by the IMS online systems. OLDSs can occur singly (SNGL) or in pairs (DUAL). DFSOLPnn is the primary (or SNGL) OLDS. DFSOLSnn is the secondary OLDS. The nn suffix can range from 00 to 99. A minimum of 3 OLDSs (SNGL or DUAL) must be available to start IMS.

These data sets have the following attributes:

**DSORG**
  Sequential
**RECFM**
  VB
**LRECL**
  BLKSIZE=4
**BLKSIZE**
  Multiple of 2048 greater than or equal to 6144. These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified. Choose a block size that results in from 1 to 4 blocks per track.

**IMS.DFSTRA01, IMS.DFSTRA02**

DFSTRA01 and DFSTRA02 are the external trace data sets that are used by the IMS online systems. The two data sets are used when the trace table OUT parameter is used in the DFSVSMxx OPTIONS statement or when the /TRACE SET ON TABLE nnn OPTION LOG command is used. When DFSTRA01 fills, DFSTRA02 is used; when DFSTRA02 fills, DFSTRA01 is used.

These data sets have the following attributes:

**DSORG**
  Sequential
**RECFM**
  VB
**LRECL**
  4016
**BLKSIZE**
  \((LRECL \times n) + 4\). The block size must be a multiple of the LRECL (4016), with an additional 4 bytes for the block descriptor word.
**Recommendation:** Use a BLKSIZE of 20,084, which is 5 logical records (4016 x 5) plus the block descriptor word (4). The BLKSIZE of 20,084 is recommended for current DASD, because it is 1/2 track.

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.DFSTRA0T**

If you use tape for the external trace data set, you must use DFSTRA0T instead of DFSTRA01 and DFSTRA02.

DFSTRA0T must be dynamically allocated.

This data set has the following attributes:

- **DSORG**: Sequential
- **RECFM**: VB
- **LRECL**: 4016
- **BLKSIZE**: \((LRECL \times n) + 4\)

**IMS.DFSWADSn**

DFSWADSn are the write-ahead data sets (WADS) used by the IMS online systems. WADS can occur singly (SNGL) or in pairs (DUAL), but primary or secondary concepts do not apply as they do with OLDS. The \(n\) suffix can range from 0 to 9. To start IMS, a minimum of 1 WADS must be available.

These data sets have the following attributes:

- **DSORG**: Sequential
- **RECFM**: F
- **LRECL**: 4096
- **BLKSIZE**: 4096

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.FORMAT**

FORMAT contains the Message Format Service (MFS) blocks created by the MFS Language utility. Its contents are copied by the Online Change Utility to either IMS.FORMATA or IMS.FORMATB.

This data set has the following attributes:
DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  U
LRECL
  0
BLKSIZE
  User choice. Default 6144. The FORMATA, FORMATB, and TFORMAT data sets must all have the same BLKSIZE.

IMS.FORMATA, IMS.FORMATB

FORMATA and FORMATB contain FORMAT members. When one of these libraries is active (in use by the online system), the contents of IMS.FORMAT are copied to the other, or inactive, library for use in the next online change run.

IMS.FORMATA or IMS.FORMATB can be brought online by a sequence of master terminal operator /MODIFY commands.

These data sets have the following attributes:

DSORG
  Partitioned
DSNTYPE
  PDS
RECFM
  U
LRECL
  0
BLKSIZE
  User choice. The default is 6144. The FORMAT, FORMATA, FORMATB, and TFORMAT data sets must all have the same BLKSIZE.

IMS.IEFRDER, IMS.IEFRDER2

IEFRDER typically refers to the primary IMS batch log. IEFRDER2 typically refers to the secondary IMS batch log. They can also refer to the input data set in the IMSRDR procedure.

In batch logging, these data sets have the following attributes:

DSORG
  Sequential
RECFM
  VB
LRECL
  BLKSIZE=4
BLKSIZE
  User choice between 4 KB and 32 KB
**Recommendation:** Choose a block size that is a 2 KB multiple greater than or equal to 6 KB.

**IMS.IMSDLIB**

IMSDLIB defines the non-authorized partitioned data set (PDS) in which members to be dynamically allocated can be stored. Examples include RECON definitions, database definitions, and anything that is in a DFSMDA member.

This data set has the following attributes:

- **DSORG**: Partitioned
- **DSNTYPE**: PDS
- **RECFM**: U
- **LRECL**: 0
- **BLKSIZE**: User choice

**Note:** The default is 6144.

**IMS.IMSMON**

IMSMON contains the trace records for either the DB Monitor or IMS (System) Monitor if the trace records are not routed to the IMS log.

This data set has the following attributes:

- **DSORG**: Sequential
- **RECFM**: VB
- **LRECL**: BLKSIZE-4
- **BLKSIZE**: User choice

**Recommendation:** Choose a block size that is a 2 KB multiple greater than or equal to 6 KB.

**IMS.MODSTAT**

MODSTAT contains information to indicate which of the following suffixed data sets the IMS online system must use at initialization time. MODSTAT must be the ddname for these data sets.

- ACBLIBA or ACBLIBB
- FORMATA or FORMATB
- MODBLKSA or MODBLKSB

This data set has the following attributes:
DSORG
Sequential
RECFM
F
LRECL
80
BLKSIZE
80

This data set is a single-record BSAM data set and requires one track of storage.

Before the IMS system can be run, you need to initialize IMS.MODSTAT.

**IMS.MODSTAT2**

MODSTAT2 is used only in an XRF complex; this data set is identical in function to IMS.MODSTAT. Its ddname must be MODSTAT2. As with MODSTAT, you need to initialize this data set before the IMS system can run.

This data set has the following attributes:

**DSORG**
Sequential

**RECFM**
F

**LRECL**
80

**BLKSIZE**
80

This data set is a single-record BSAM data set and requires one track of storage.

**IMS.MSDBCP1, IMS.MSDBCP2**

MSDBCP1 and MSDBCP2 are required if MSDBs are defined to the system. During each IMS checkpoint, a control record followed by the contents of the contiguous block of virtual storage occupied by the MSDBs is written to one of these data sets. The data sets are used alternately by successive checkpoints, with each subsequent checkpoint overlaying a previous one.

These data sets have the following attributes:

**DSORG**
Sequential

**RECFM**
Determined by IMS

**LRECL**
Determined by IMS

**BLKSIZE**
Determined by IMS
These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.MSDBCP3, IMS.MSDBCP4**

MSDBCP3 and MSDBCP4 are used only in an XRF complex; these data sets are identical in function to MSDBCP1 and MSDBCP2. With XRF, any two of the four data sets can contain the latest MSDB checkpoint. Although an active subsystem can select the data set containing the latest MSDB checkpoint and any other, the alternate subsystem must select the two data sets not used by the active subsystem.

These data sets have the following attributes:

- **DSORG**: Sequential
- **RECFM**: Determined by IMS
- **LRECL**: Determined by IMS
- **BLKSIZE**: Determined by IMS

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.MSDBDUMP**

MSDBDUMP is required when the command /DBDUMP specifies database MSDB. This command causes a dump of all MSDBs to be written to this data set. The contents are identical to that of MSDBCPx. Successive executions of the command cause the previous contents to be overlaid.

This data set has the following attributes:

- **DSORG**: Sequential
- **RECFM**: Determined by IMS
- **LRECL**: Determined by IMS
- **BLKSIZE**: Determined by IMS

This data set must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.MSDBINIT**

MSDBINIT is required for an IMS system that includes MSDBs. This data set contains a record for each MSDB segment. It is read during all cold starts and during a normal restart if the MSDBLOAD parameter is specified for the /NRESTART command. It is produced by executing the MSDB Dump Recovery or MSDB Maintenance utility. MSDBINIT can contain one, several, or all MSDBs defined.
This data set has the following attributes:

**DSORG**  
Sequential

**RECFM**  
VBT

**LRECL**  
BLKSIZE-4

**BLKSIZE**  
User choice

This data set must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.PGMLIB**

PGMLIB contains user-written application programs.

This data set has the following attributes:

**DSORG**  
Partitioned or Partitioned Extended (PDSE)

**RECFM**  
U

**LRECL**  
0

**BLKSIZE**  
User choice. Default 6144.

**IMSPLEX.OLCSTAT**

OLCSTAT is an optional data set that contains global online change information and status. OLCSTAT is a global data set that is dynamically allocated by IMS. The MODSTAT and MODSTAT2 data sets do not need to be defined in the IMS control region JCL when OLCSTAT is used.

To enable global online change, OLCSTAT must be defined instead of the local MODSTAT data set. All IMS systems in an IMSplex must define the same physical OLCSTAT data set. Otherwise, IMS initialization fails. OLCSTAT is required if OLC=GLOBAL is defined.

To initialize the OLCSTAT data set, run the Global Online Change utility, DFSUOLC0.

This data set has the following attributes:

**DSORG**  
Sequential

**RECFM**  
V

**LRECL**  
5204
**BLKSIZE**

Default 5208

**IMS.PSBLIB**

PSBLIB contains the program specification blocks (PSBs) created by the PSBGEN utility. Each PSB (one per program) requires approximately 250 bytes to 500 bytes of direct-access storage. Exact requirements depend on the number of I/O PCBs and databases (PCBs) in the PSB and the number of sensitive segments. This data set is required in DB and DB/DC systems.

This data set has the following attributes:

**DSORG**

Partitioned

**DSNTYPE**

PDS

**RECFM**

U

**LRECL**

0

**BLKSIZE**

User choice. Default 6144.

**IMS.QBLKS, IMS.SHMSG/1-9, IMS.LGMSG/1-9**

QBLKS, SHMSG, and LGMSG are required by the IMS DB/DC system for message queuing. Space requirements for message queue data sets vary with the system environment.

These data sets have the following attributes:

**DSORG**

Sequential

**RECFM**

Determined by IMS

**LRECL**

Determined by IMS

**BLKSIZE**

Determined by IMS

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

For SHMSG and LGMSG, up to 10 data sets can be provided for each. Multiple message queue data sets provide for configuration flexibility and performance.

If you use multiple data sets, you must do the following:

- Add the data sets in sequence, with SHMSG or LGMSG specified first.
- Specify the same space allocation for all data sets. Even if you allocate different amounts for multiple data sets, the smallest amount specified is the amount used for all data sets. For example, if four data sets are allocated with 600, 600, 500, and 400 cylinders respectively, the actual total available space is 1600 cylinders.
cylinders (4 X 400), rather than 2100 cylinders (the sum of the allocated amounts). Records are assigned to the data sets cyclically; thus, the smallest space allocated controls the amount of space for all, which in turn determines the total space available and the highest valid record number.

The DD names for the data sets must be:

- For SHMSG:
  - SHMSG
  - SHMSG1
  - SHMSG2
  - SHMSG3
  - SHMSG4
  - SHMSG5
  - SHMSG6
  - SHMSG7
  - SHMSG8
  - SHMSG9

- For LGMSG:
  - LGMSG
  - LGMSG1
  - LGMSG2
  - LGMSG3
  - LGMSG4
  - LGMSG5
  - LGMSG6
  - LGMSG7
  - LGMSG8
  - LGMSG9

**IMS.QBLKSL, IMS.SHMSGL, IMS.LGMSGL**

QBLKSL, SHMSGL, and LGMSGL are used only in an XRF complex; these data sets are similar in function to the regular message queue data sets. These data sets are always cold started and used as local message queues on an XRF alternate subsystem, from startup until completion of takeover, when the regular message queues become available. The DCB specification for the local message queue data sets must match the regular message queue data sets. However, the local message queues can be much smaller. The local message queues must be large enough to hold the shutdown message margin, plus primary and secondary IMS master terminal messages until they are dequeued.

These data sets have the following attributes:

**DSORG**
- Sequential

**RECFM**
- Determined by IMS

**LRECL**
- Determined by IMS
BLKSIZE
Determined by IMS

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IMS.RDS**

The restart data set (RDS) contains information required for recovery, including the checkpoint ID table required for restarting IMS. The RDS also contains OSAM and VSAM buffer pool definition changes made by the UPDATE POOL TYPE(DBAS) command to be retained across emergency restart. However, RDS does not contain any log records.

This data set has the following attributes:

- **DSORG**
  Sequential
- **RECFM**
  Determined by IMS
- **LRECL**
  Determined by IMS
- **BLKSIZE**
  Determined by IMS
  The BLKSIZE value is set to the buffer size as specified on the RDS= parameter on the IMSCTF macro. The default is 4 KB.

You should allocate a minimum of one cylinder of contiguous tracks to this data set. The data set must be allocated large enough to contain at least 90 blocks reserved for RDS1 components BCPT, RRE, SIDX, and LCRE.

**IMS.RDS2**

RDS2 is used only in an XRF complex; this data set is identical in function to IMS.RDS.

This data set has the following attributes:

- **DSORG**
  Sequential
- **RECFM**
  Determined by IMS
- **LRECL**
  Determined by IMS
- **BLKSIZE**
  Determined by IMS
  The BLKSIZE value is set to the buffer size as specified on the RDS= parameter on the IMSCTF macro. The default is 4 KB.

You should allocate a minimum of one cylinder of contiguous tracks to this data set. The data set must be allocated large enough to contain at least 90 blocks reserved for RDS1 components BCPT, RRE, SIDX, and LCRE.
Do not manage either RDS with a migration or recall system that might recall the data set to a volume other than the one to which it was originally allocated. If you do so, IMS might be unable to warm start or emergency start the system.

**IMS.RECON1, IMS.RECON2, IMS.RECON3**

RECON1, RECON2, and RECON3 data sets contain system restart and recovery information managed by the Database Recovery Control (DBRC) function.

These data sets have the following attribute:

**DSORG**

VSAM KSDS

**IMS.REFERAL**

REFERAL contains intermediate text copies of descriptions supplied to the MFS Language utility.

This data set has the following attributes:

**DSORG**

Partitioned

**DSNrtype**

PDS

**RECFm**

FB

**LRECL**

80

**BLKSIZE**

Multiple of 80

**IMS.SYSOnnn**

The SYSOnnn DASD data sets are used to store spool SYSOUT data. The contents of these data sets can be printed using the SPOOL SYSOUT Print utility. This utility is either scheduled automatically or must be submitted manually, depending upon an option in the LINEGRP system definition macro. *nnn* is a one- to three-digit suffix assigned sequentially by IMS during system definition.

This data set has the following attributes:

**DSORG**

Sequential

**RECFM**

UM

These data sets must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

These data sets must be initialized before they are used by IMS. For example, these data sets can be allocated on the SYSUT2 DD statement for the IEBGENER utility. Use DD DUMMY for SYSUT1. Specify DCB attributes for both SYSUT1 and SYSUT2.
**IMS.TFORMAT**

TFORMAT contains the online MFS descriptors, created by the MFS Language utility, for MFSTEST (test mode) online execution.

This data set must be concatenated in front of FORMATA or FORMATB in the IMSTFMTA or IMSTFMTB DD statements in the IMS execution procedure.

If you change MFS formats online, two DD statements must point to this TFORMAT data set, or the DD statements can point to two separate TFORMAT data sets.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **DSNTYPE**
  - PDS
- **RECFM**
  - U
- **LRECL**
  - 0
- **BLKSIZE**
  - User Choice. Default 6144. The FORMAT, FORMATA, FORMATB, and TFORMAT data sets must all have the same BLKSIZE.

This data set must be allocated as a single extent (contiguous tracks). Secondary allocation must not be specified.

**IRLM data sets**

The IRLM data sets are the distribution and target libraries associated with the IRLM.

**IMS.ADXRLOAD**

ADXRLOAD is the IRLM distribution library that contains object modules.

This data set has the following attributes:

- **DSORG**
  - Partitioned
- **DSNTYPE**
  - PDS
- **RECFM**
  - U
- **LRECL**
  - 0
- **BLKSIZE**
  - User choice. Greater than or equal to 6144.
**IMS.ADXRSAMP**

ADXRSAMP is the IRLM distribution library that contains JCL.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80.

**IMS.SDXRSAMP**

SDXRSAMP is the IRLM target library that contains load modules.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80.

**IMS.SDXRRESL**

IMS.SDXRRESL is the IRLM target library that contains load modules.

Prior to running online, you should APF authorize IMS.SDXRRESL to the z/OS system.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
U

**LRECL**
0
Optional source data set (IMS.ADFSOPSC)

ADFSOPSC is not installed by SMP/E.

ADFSOPSC contains optional machine-readable material (assembler language source output from the PL/X compiler) for the IMS System Services and IMS Database Manager (IMS DB) licensed program product and its dependent features and functions.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80

User data set (USER.ISPTABL)

These data sets can be allocated by the user.

Some IMS features use ISPF as a dialog manager and might require the use of a user table data set. The user data set might be required to use some of the features of DFSSPOC, DFSSHALDB, and Syntax Checker. The USER.ISPTABL data set must be the only data set allocated to file ISPTABL and must also be in the SPTLIB concatenation before the IMS.SDFSTLIB data set.

Multiple users cannot use the same USER.ISPTABL data set at the same time. A user can have more than one USER.ISPTABL data set, but can use only one data set at a time.

This data set has the following attributes:

**DSORG**
Partitioned

**DSNTYPE**
PDS

**RECFM**
FB

**LRECL**
80

**BLKSIZE**
Multiple of 80
IVP variables

The IVP dialog uses user modifiable variables when creating the JOBs and supporting materials used for the IVP process.

The variables that are presented by the IVP dialog are determined by the environment options you select during the Initialization phase. You can print additional documentation for the IVP variables using the DOC action during the variable-gathering phase of the IVP Dialog.

Use the IVP dialog to obtain current information regarding IVP variables. In the lists in these topics, the variables are presented in the same sequence in which they are used by the IVP dialog.

- “General variables”
- “Data set allocation variables” on page 102

General variables

The IVP dialog uses these variables for jobs and tasks other than data set allocation.

MSDBDUMP allocation parameters - HLQ,VOL,BLK,TYP,PRM

IXUMDM2
MSDBDMP2 allocation parameters - HLQ,VOL,BLK,TYP,PRM - XRF

IXUODBM
IVP - ODBM JOBNAME

IXUODNM
IVP - ODBM NAME

IXUCSLD
CSLD suffix

IXUBPEC
BPE configuration file used for OPDB

IXUDRDA
DRDA® Port ID

IXUCSLC
The suffix of the member CSLDCXXX in the PROCLIB
IXUMCRE
The maximum communication retry

IXUCORM
The maximum amount, in kilobytes, of in-core storage

IXUSAFC
The SAF security class name

IXUVBFS
The number of VSAM buffers in the VSAM LSR pool

IXUVBFS
The size in kilobytes of the VSAM LSR pool buffer

IXUXCFT
The number of XCF listener threads available

IXURCFN
The name of the configuration file for the repository server

IXURSPN
  IVP - The name of the repository server

IXUBPER
  IVP - The BPE configuration name used for the repository server

IXURCGN
  IVP - The XCF group name for repository

IXUIMRN
  IVP - The IMS repository name

IXUAUDI
  IVP - The audit

IXUAUID
  IVP - The audit ID

IXUAFAI
  IVP - Start or cancel RS if log stream is unavailable

IXUALOG
  IVP - The MVS™ log stream name

IXUALVL
  IVP - The audit level

IXUADEFI
  IVP - The audit default

IXURPNM
  IVP - IMSplex group name for the repository

IXURLRI
  IVP - The CSLRIxxx suffix used by RM in the repository

IXURRMN
  IVP - The name of the RM used in the repository

IXURLSI
  IVP - The CSLSIxxx suffix used by SCI in the repository

IXURCSN
  IVP - The name of the SCI used in the repository
### IXUROI
- IVP - The CSLOIxxx suffix used by OM in the repository

### IXUACVTN
- IVP - The asynchronous callout converter name

### IXUSCVTN
- IVP - The synchronous callout converter name

### IXUCATAL
- IVP - The alias name to use for the IMS catalog

**Related reference:**

- FRPCFG member of the IMS PROCLIB data set (System Definition)

### Data set allocation variables

The IVP uses these variables for data set allocation.

**IVP jobs and tasks**

This section identifies all the jobs and tasks that can be used during the IVP process.

The jobs and tasks that are presented by the IVP dialog are determined by your choice of environment options and IVP suboptions. The final list in this group, Steps Zx for index of additional PDS members does not identify jobs or tasks in the IVP process. It identifies members of SDFSSLIB and SDFSISRC that support the IVP process. Additional documentation for the IVP jobs and tasks can be printed using the DOC action during either the File Tailoring phase or the Execution phase of the IVP dialog.

Use the IVP dialog to obtain current information regarding IVP jobs and tasks.

In these lists, the jobs and tasks are presented in the same sequence that is used by the IVP dialog. The naming convention used for jobs and tasks is:

`IV_ssnnt`

Where:

- `_` - (underscore) identifies the selected environment option:
  - 1 - DBB - Batch
  - 2 - DBC - DBCTL
  - 3 - DBT - DB/DC
  - 4 - XRF - DB/DC with XRF
  - 9 - DCC - DCCTL

- `ss` - identifies the IVP step
- `nn` - a number assigned by IVP that provides a unique name
- `t` - identifies the item type:
  - `J` - JOB
    A PDS member with the same name is placed into INSTALIB during the file-tailoring phase. Items of type J are intended to be submitted for execution.
  - `T` - task
    Tasks represent items of work that must be prepared by the user. For some tasks, an example is provided in the INSTALIB data set. These examples are not intended for execution.
  - `N` - Supporting materials
    The INSTALIB data set can also contain members that support other jobs (such as CLISTS and control statements).

**Related concepts:**
Steps Ax for IVP preparation

The items within the A series of steps are used to perform initialization for the IVP dialog.

**IVP system definition stage 1 input streams**

Use the sample source deck or input source for the IVP as an educational tool. This information is important during problem determination and troubleshooting.

The IMS system definition stage 1 input streams in this section are generated by the IVP dialog. The samples are not members of SDFSISRC.

**DBB - DB Batch (batch) stage 1**

This topic contains the stage 1 source for a DB batch system.

During the initialization phase of the IVP process, you select the environment options specific to the needs of your business.

Each environment option uses different IMS components and facilities. The following table shows the IVP environment option followed by the IMS components and facilities that are specific to that environment.

### Variable gathering dialog options

Use the action commands and modes available for the variable-gathering phase.

#### Variable-gathering action commands

Two modes are used to display the variables:

- **LST**  
  Variables are presented as a scrollable list of items. One or more items can be modified at a time, but minimal information is displayed for each item. LST is the default.

- **ENT**  
  Variables are presented one at a time. Scrollable descriptive information is provided for each variable.

Action commands are provided to support the IVP dialog during the variable-gathering phase. Action commands are also referred to as action verbs.

The following table contains the action commands, accepted modes, and command descriptions. Mode indicates whether the commands are accepted in:

- **LST**  
  LST mode

- **ENT**  
  ENT mode

- **Both**  
  LST mode and ENT mode

In the following table, the capitalized letters in the action column indicate the shortest allowable abbreviation for each command.

*Table 3. Variable-gathering action commands *

<table>
<thead>
<tr>
<th>Action</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Exp</td>
<td>Both</td>
<td>Exports the IVP variables.</td>
</tr>
</tbody>
</table>

In LST mode, you can either change one item at a time or make changes to many items before pressing ENTER. Whenever two or more changes are made before pressing Enter, the dialog attempts to process all change requests before returning control.

If errors occur during the variable-gathering phase, the item is updated with the supplied information and the character string “ERR” is placed into the action field. If errors exist after all requests have been processed, a single error message is displayed and the screen is positioned at the first item containing the string “ERR” in the action field. Correct all errors before the dialog allows you to enter the file-tailoring or execution phases. If you cannot tell what is wrong with a given item, type CHG in the action field for that item, and change one item at a time. When you press Enter, the dialog reruns variable edit for that item and produces an appropriate error message.

**Variable gathering—LST mode**

When you enter the variable-gathering phase, you are in LST mode. The following figure depicts the LST mode panel of the variable gathering phase. This mode provides the greatest visibility of the variables available for the selected option.
If you are not sure what a variable is, you can use the ENT action to switch to ENT mode, read the variable description, and use the LST action to return to LST Mode. You can also use the ENT action to switch to ENT mode, and then progress through the variables one at a time.

Special characters in the action field indicate changes to variables:

! Indicates that either a variable was added to the table (due to service) or that the RFR action has restored the master table default value. You can remove the ! indicator by running the table-merge process.

* Indicates that the variable was changed, either by the CHG action or by the copy-startup variables process.

@ Indicates that the variable has been changed, either by the CHG action or by the copy-startup variables process, as the result of propagating the change of a global variable to the affected data set allocation variables.

Try the ENT action for the first item. Type ENT (or N) into the action field next to the item you want. The command line cannot be used for action commands on the LST mode panels.

To switch modes, press Enter.

**Variable gathering—ENT mode**

The following figure depicts the ENT mode panel corresponding to the item you selected in the LST mode panel.
ENT mode provides more information for each variable:

- Whether the variable can be blank.
- Membership in the global variable groups. These fields are blank for all variables except those variables that used for data set allocation.
- A scrollable description of the variable.

You can view all the items in the variable table by using the NXT and PRV actions.

Use the DOC action to print a copy of the online help. Type DOC into the action field and press Enter.

**Variable gathering—DOC action**

The following figure shows the DOC action panel for the variable-gathering phase.
In this panel, select the type of output listing you want:

1. LST mode equivalent
2. ENT mode equivalent

Then select the variables you want to print and press Enter. The requested documentation prints to the ISPF LIST data set. Even though the DOC action is entered against a single item, the resulting documentation is for all the selected types of items.

For the example in the above figure, no documentation is printed. Press End twice to return to LST mode, and then press End again to exit from the variable-gathering phase.

**Help**

---

**IVP Variables Documentation - XRF IMS 13.1**

**COMMAND ==>>**

Select (1 or 2) the type of output:
- 1 - LST Mode equivalent containing names, titles, and current values
- 2 - ENT Mode equivalent containing full descriptions

Select (/) the types of variables to be documented:
- General variables (HLQ, VOL, BLK, JOB, SMP, SYSDEF, etc.)
- Data set allocation variables

Press END to return to Variable Gathering.
Press ENTER to initiate the documentation request.

**NOTE:** Output will be printed to the ISPF List data set.
Maximum output (for XRF/ISD) is about 2K lines for Type 1 and 12K lines for Type 2.

**Figure 44. Variable gathering (DOC action) panel**

In this panel, select the type of output listing you want:

1. LST mode equivalent
2. ENT mode equivalent

Press END twice to return to LST mode, and then press End again to exit from the variable-gathering phase.

Related tasks:
“Gathering variables” on page 18

<td>Move forward to the next item.</td>
</tr>
<tr>
<td>Prv</td>
<td>ENT</td>
<td>Move backward to the previous item.</td>
</tr>
</tbody>
</table>

**File-tailoring—LST mode**

The following figure shows the LST mode panel of the file-tailoring phase. When you enter the file-tailoring phase, you are placed in LST Mode. This mode provides the greatest visibility of the jobs and tasks available for the selected option. Except when you are browsing index items, this mode is the only mode that you need for the file-tailoring phase, because the item descriptions that are displayed in ENT mode are intended for use during the execution phase.
If you scroll towards the bottom of the list, you can see file-tailoring items that belong to the Z series of steps. These are INDEX entries. The “Z1” items are members of SDFSSLIB (file-tailoring skeletons), which are embedded by the earlier items. The “Z2” items are members of SDFSISRC (DBDs, PSBs, MFSs, PGMs, for example). Use the BRS action to browse these members.

Special characters are used in the action field as described below:

`!` Indicate that an item was added to the table (due to service). You can remove the indicator by running the table-merge process again.

`*` Indicates that the item was processed by either the ALL action or the FTL action.

Try the ENT action for the first item. You must type ENT (or N) into the action field next to the item you want to select. The command line cannot be used for action commands on LST mode panels.

Press Enter to switch modes.

**File-tailoring—ENT mode**

The following table shows the ENT mode panel that corresponds to the item you selected on the LST mode panel.
The only additional information provided by ENT Mode is the scrollable item description. Except for the INDEX items, these descriptions are intended for the execution phase and have no meaning for the file-tailoring phase.

The NXT and PRV actions can be used to view all the items in the file-tailoring table.

Use the DOC action to print a copy of the online help. Type DOC into the action field and press Enter.

**File-tailoring—DOC action**

The following table depicts the DOC action panel for the file-tailoring phase.
In this panel, select the type of output listing you want:

1. LST mode equivalent
2. ENT mode equivalent

Then select which items you want to print and press Enter. The requested documentation prints to the ISPF LIST data set.

Even though the DOC action is entered against a single item, the resulting documentation is for all the selected types of items.

You can print the documentation for jobs and tasks during either the file-tailoring phase or the execution phase. The documentation for index items prints only from the file-tailoring phase.

For the example in the file-tailoring (DOC action) panel, no documentation is printed. Press END twice to return to LST mode and then press END again to exit from the file-tailoring phase.

**Execution phase dialog options**

Use the action commands and modes available for the Execution phase.

**Execution action commands**

Action commands are provided to support the IVP dialog during the execution phase. The table below contains the action commands, accepted modes, and command descriptions.

Two modes are used to display the jobs and tasks:

- **LST** The items are presented in a scrollable list. Each item represents one job or task. LST is the default.
- **ENT** The job and task members are presented one at a time in sequence. Scrollable information is provided to describe each item.
In the following table, the capital letters in the action column indicate the shortest allowable abbreviation for each command. The entries in the mode column indicate whether the commands are accepted in:

- **LST**  
  LST mode

- **ENT**  
  ENT mode

- **Both**  
  Both LST mode and ENT mode

### Table 5. Execution action commands

<table>
<thead>
<tr>

<td>ENT</td>
<td>Move backward to the previous item.</td>
</tr>
<tr>
<td>spR</td>
<td>Both</td>
<td>Execute a special processing routine that has been provided to assist with the performance of a task.</td>
</tr>
</tbody>
</table>

**Execution phase—LST mode**

When you enter the execution phase, you are in LST mode. The following depicts the LST mode panel of the execution phase.
LST Mode provides the greatest visibility of the items that make up the IVP process. However, only minimal descriptive information is provided. Do not use LST mode for the execution phase until you are familiar with the requirements for each job and task. Use ENT mode instead.

Special characters in the action field indicate changes to variables:

! Indicates that an item was added to the table (due to service).

* Indicates that the item was processed by either the SUB action or EDM action. (The dialog assumes that if you edited an item, you have also submitted that item.)

You can remove the ! and * indicators by running the table-merge process again.

Try the ENT action for the second item. Type ENT (or N) in the action field.

To switch modes, press Enter.

Execution phase—ENT mode

The following figure shows the ENT mode panel of the execution phase. The item displayed is the item for which you requested the ENT action on the LST mode panel.
The NXT and PRV actions can be used to progress through the items in the execution table.

When you are familiar with the requirements for each job and task (possibly by browsing the entire process before you actually begin submitting jobs), you can switch back to LST mode.

For this example, press End to return to LST mode and then press End again to exit from the execution phase.

**Related tasks:**

---

**Sample application parts tables and PSBs**

The sample application parts tables describe the parts of the sample applications. For example, the parts tables tell you the language in which a particular part of the sample application is written, the name of the databases that use that part, and a description of the database. In some cases, program specification blocks (PSBs) are provided to process the database that is used by the sample application.
**IVP sample application table**

The SDFSISRC target library contains the source for programs, PSBs, DBDs, and MFSs, and other supporting materials that are used by the application.

The following table provides information about the parts that are used by the IVP sample application. It includes the language, PSB, MFS, transaction code, DBD, JCL, and description that are associated with those parts (where applicable).

\(^1\) These parts are installed by the IVP.
\(^2\) After being compiled and bound, programs DFSIVA31/32/34 are executable from any 24x80 (3270) MFS device. You must add runtime libraries for either PL/I or Pascal to the IVP execution JCL.
\(^3\) Programs DFSIVA35 and DFSIVA65 are fully installed by the IVP. DFSIVA35 can be executed from any 24x80 (3270) MFS device. DFSIVA65 can be executed by modifying the IVP execution JCL for DFSIVA6.
\(^4\) After being compiled and bound, programs DFSIVA61/62/64 can be execute by modifying the IVP execution JCL for DFSIVA6. You must add runtime libraries for either PL/I or Pascal to the IVP execution JCL.
\(^5\) These transaction codes are provided only in a DCCTL system.
\(^6\) DFSIVG20 and DFSIVG30 are assembler subroutines that provide WTOR support for the Pascal and C programs.

**IMS sample application PSBs**

These PSBs are provided to process the Parts database that is used by the IMS sample application.

The following figure shows the PSBs that are provided for you to run the IMS sample application from an IMS user terminal.
The six PSBs and their associated transactions enable you to perform the following nine online functions:

<table>
<thead>
<tr>
<th>MPP transaction</th>
<th>Online function</th>
</tr>
</thead>
<tbody>
<tr>
<td>PART</td>
<td>Inquire about a part and its description.</td>
</tr>
<tr>
<td>DSPALLI</td>
<td>Inquire about a part's inventory, cycle count, and back-order information.</td>
</tr>
<tr>
<td>DSPINV</td>
<td>Inquire about a part's total inventory in all locations or by specific inventory location.</td>
</tr>
<tr>
<td>ADDPART</td>
<td>Add a new part and its description.</td>
</tr>
<tr>
<td>ADDINV</td>
<td>Add part inventory information, by location, to an existing part description.</td>
</tr>
<tr>
<td>DLETINV</td>
<td>Delete part inventory information, by location.</td>
</tr>
</tbody>
</table>

### Fast Path sample application databases

The transactions that are described in the following tables can help you become familiar with the Fast Path sample application databases. Along with the following customer account information, the tables provide you the resources that you can use to prepare online training exercises for operators and programmers.

The following table shows customer account numbers for the Customer Savings Account database that is loaded into the DEDB, which can be used to run the Fast Path sample application.

### Table 16. Customer Savings Account database – root segment (DEDB)

<table>
<thead>
<tr>
<th>Customer account number</th>
<th>Customer name</th>
<th>Customer address</th>
<th>Account type</th>
<th>Account balance $</th>

---

**Fast Path sample application error messages**

Use the following information to diagnose Fast Path sample application errors.

**Error message format**

REQUEST CAN NOT BE SERVICED:
PROCSP ERROR xx yy zz...

Where:

xx: Error code set by application program
yy: PCB status code, if applicable
zz: Input data

**ERROR CODES**

IE - Invalid input data
LM - Missing loan segment (HDAM)
LU - Error in updating loan segment (HDAM)
MA - Missing customer account segment (DEDB)
MR - Missing customer root segment (DEDB)
MT - Missing teller segment (MSDB)
MX - Missing transaction segment (DEDB)
OD - Transaction amount on withdrawal greater than customer account balance
RB - Error in processing and rollback
TR - Terminal transmission error on input
UA - Error in updating account segment (DEDB)
UG - Error in updating general ledger (MSDB)
UI - Error in adding sequential dependent (DEDB)
UT - Error in updating teller database (MSDB)
UX - Error in adding account transaction segment (DEDB)

**Related tasks:**

**TSO EXEC command syntax for invoking the IVP start-up CLIST**

The following syntax diagram illustrates how to invoke the IVP start-up CLIST using the TSO EXEC command.

```
EXEC 'sss.SDFSCLST(DFSIXC01)' HLQ(qqq) HLQIV(iii) HLQDL(ddd) HLQSY(sss)
```

- **sss** The IMS system (SYS) data sets. The default is IVPDL13.
- **EXEC** TSO command to run CLISTs and REXX EXECs.
- **HLQ(qqq)** The keyword that identifies the high-level qualifier for the IVP, system, and distribution libraries data set (qqq).
- **HLQIV(iii)** The keyword that identifies the high-level qualifier for the IVP data sets, INSTALIB and INSTATBL (iii). The default is IVPIVP13.
- **HLQDL(ddd)** The keyword that identifies the high-level qualifier for the IMS distribution library (DLB) data sets (ddd). The default is IVPDL13.
- **HLQSY(sss)** The keyword that identifies the high-level qualifier for the IMS system (SYS) data sets (sss). The default is IVPSYS13.
- **DEBUG** A parameter that sets diagnostic options and causes trace information to be displayed; each line of the ISPF code is displayed as it is processed.

**Related tasks:**
“Starting the IVP by using the EXEC command from within ISPF” on page 11

**REXX EXEC command syntax for starting the IMS Application Menu**

The following syntax applies to the REXX EXEC command for starting the IMS Application Menu.
EXEC—’qqq.SDFSEXEC(DFSAPPL)’

HLQ(imshlq)-ALTRESL(‘myhlq.data_set_name1’,‘myhlq.data_set_name2’)

Rights

Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

IBM Online Privacy Statement

IBM Software products, including software as a service solutions, (“Software Offerings”) may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

Bibliography

This bibliography lists all of the publications in the IMS Version 13 library, supplemental publications, publication collections, and accessibility titles cited in the IMS Version 13 library.
