IMS
Version 13

Messages and Codes, Volume 2: Non-DFS Messages

IBM
Note

Before you use this information and the product it supports, read the information in “Notices” on page 557.

This edition applies to IMS Version 13 (program number 5635-A04), IMS Database Value Unit Edition, V13.1 (program number 5655-DSM), IMS Transaction Manager Value Unit Edition, V13.1 (program number 5655-TM2), and to all subsequent releases and modifications until otherwise indicated in new editions.

About this information

This information provides reference information for the abend codes, messages, status codes, and return codes that are produced by IMS™.

This information provides reference information for the abend codes, messages, status codes, and return codes that are produced by IMS.

Volume 1 provides reference information for the IMS messages that have the DFS prefix, along with their associated return codes. It also provides diagnostic information that helps programmers, operators, and system-support personnel diagnose problems in IMS.

Volume 2 provides reference information for non-DFS prefixed IMS messages that are associated with IMS Base Primitive Environment (BPE); IMS Common Queue Server (CQS); IMS Common Service Layer (CSL); Database Recovery Control (DBRC) facility; IMS Connect; IBM® Resource Lock Manager (IRLM), and so on. It provides diagnostic reference information that helps programmers, operators, and system-support personnel diagnose problems in IMS.

Volume 3 provides reference information for all IMS abnormal termination (abend) codes, including analysis, explanation, possible causes, and APAR processing instructions.

Volume 4 provides return, reason, sense, function, and status codes for IMS Base Primitive Environment (BPE); IMS Common Queue Server (CQS); IMS Common Service Layer (CSL); Database Recovery Control (DBRC) facility; IMS Connect; IBM Resource Lock Manager (IRLM), and so on. It also provides diagnostic reference information that helps programmers, operators, and system-support personnel diagnose problems in IMS.

This information is available as part of IBM Knowledge Center at www.ibm.com/support/knowledgecenter.

Prerequisite knowledge

Before using this information, you should have knowledge of either IMS Database Manager (DB) or IMS Transaction Manager (TM). You should also understand basic z/OS® and IMS concepts, the IMS system for your installation, and have general knowledge of the tasks involved in project planning.

Before using this book, you should have knowledge of either IMS Database Manager (DB) or IMS Transaction Manager (TM). You should also understand basic z/OS and IMS concepts, the IMS system for your installation, and have general knowledge of the tasks involved in project planning.

You should be familiar with z/OS, its system generation, and telecommunications, and the access methods used by IMS. Related publications are listed in the Bibliography.

You can learn more about z/OS by visiting the “z/OS basic skills” topics in IBM Knowledge Center.
You can gain an understanding of basic IMS concepts by reading *An Introduction to IMS*, an IBM Press publication.

IBM offers a wide variety of classroom and self-study courses to help you learn IMS. For a complete list of courses available, go to the Resources section of the IMS home page at [ibm.com/ims] and link to the Training and Certification page.

**IMS function names used in this information**

In this information, the term HALDB Online Reorganization refers to the integrated HALDB Online Reorganization function that is part of IMS Version 13, unless otherwise indicated.

**How new and changed information is identified**

New and changed information in most IMS library PDF publications is denoted by a character (revision marker) in the left margin. The first edition (-00) of *Release Planning*, as well as the *Program Directory* and *Licensed Program Specifications*, do not include revision markers.

Revision markers follow these general conventions:

• Only technical changes are marked; style and grammatical changes are not marked.

• If part of an element, such as a paragraph, syntax diagram, list item, task step, or figure is changed, the entire element is marked with revision markers, even though only part of the element might have changed.

• If a topic is changed by more than 50%, the entire topic is marked with revision markers (so it might seem to be a new topic, even though it is not).

Revision markers do not necessarily indicate all the changes made to the information because deleted text and graphics cannot be marked with revision markers.

**Accessibility features for IMS Version 13**

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

**Accessibility features**

The following list includes the major accessibility features in z/OS products, including IMS Version 13. These features support:

• Keyboard-only operation.

• Interfaces that are commonly used by screen readers and screen magnifiers.

• Customization of display attributes such as color, contrast, and font size.

**Keyboard navigation**

You can access IMS Version 13 ISPF panel functions by using a keyboard or keyboard shortcut keys.

For information about navigating the IMS Version 13 ISPF panels using TSO/E or ISPF, refer to the *z/OS TSO/E Primer*, the *z/OS TSO/E User’s Guide*, and the *z/OS ISPF User’s Guide Volume 1*. These guides describe how to navigate each interface,
including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

**Related accessibility information**

Online documentation for IMS Version 13 is available in IBM Knowledge Center.

**IBM and accessibility**

See the *IBM Human Ability and Accessibility Center* at [www.ibm.com/able](http://www.ibm.com/able) for more information about the commitment that IBM has to accessibility.

---

**How to send your comments**

Your feedback is important in helping us provide the most accurate and highest quality information. If you have any comments about this or any other IMS information, you can take one of the following actions:

- Click the Feedback link at the bottom of any IBM Knowledge Center topic.
- Send an email to imspubs@us.ibm.com. Be sure to include the book title and the publication number.
Chapter 1. New, changed, and deleted messages and codes for IMS Version 13

A number of messages and codes are new, changed, or deleted in IMS Version 13.

New messages and codes for Version 13

IMS Version 13 includes new BPE, CQS, CSL, DFS, DSP, G, HWS, and XDFLD messages, as well as new abend, DL/I, AIB, and SQL codes.

New BPE messages

The following messages are new:
- BPE0048E
- BPE0049I
- BPE0050I
- BPE0051E
- BPE0052E
- BPE0053E
- BPE0054I

New CQS messages

The following messages are new:
- CQS0012I
- CQS0034A
- CQS0247W
- CQS0248I
- CQS0301I
- CSL2504I
- CSL3070I
- CSL4115E

New CSL messages

The following messages are new:
- CSL4113E
- CSL4114E

New DFS messages

The following messages are new:
- DFS0006E
- DFS0095I
- DFS0123E
- DFS0904I
- DFS1849E
- DFS1853I
- DFS1937I
- DFS3187I
- DFS3197I
- DFS3198I
Chapter 1. New, changed, and deleted messages and codes for IMS Version 13
New DSP messages

The following messages are new:
- DSP0397E
- DSP0398E
- DSP0399E
- DSP1074E
- DSP1075E
- DSP1097E
- DSP1206E
- DSP1249E
- DSP1250E
- DSP1251E
- DSP1256E
- DSP1262I
- DSP1267E
- DSP1268E

New G messages

The following messages are new:
- G115

New HWS messages

The following messages are new:
- HWSG4000I
- HWSG4005I
- HWSG4010I
- HWSG4015E
- HWSG4020W
- HWSG4025W
- HWSG4030W
- HWSG4040W
- HWSG4045W
- HWSG4060I
- HWSG4065E
- HWSG4080W
- HWSG4100E
- HWSG4105W
- HWSG4230W
- HWSG4235W
- HWSG4255W
- HWSI1610W
- HWSS0776W
- HWSU3900E
New XDFLD messages

The following messages are new:

- XDFLD600
- XDFLD601
- XDFLD602
- XDFLD603
- XDFLD604

New abend, DL/I, AIB, and utility codes

The following codes are new:

- 0055
- 0841
- 1002
- 1143
Fast Path utility status codes

**New SQL codes**

The following codes are new:

- 000
- +098
- +100
- -010
- -101
- -104
- -117
- -122
- -158
- -198
- -199
- -203
- -204
- -205
- -206
- -208
- -301
- -302
- -303
- -305
- -313
- -350
- -404
- -407
- -408
- -413
- -420
- -490

- -531
- -840
- -904
- -5001
- -8001
- -8002
- -8003
- -8004
- -8005
- -8006
Changed messages and codes for Version 13

IMS Version 13 includes changed BPE, CQS, CSL, DBD, DFS, DSP, FLD, G, HWS, and SEG messages, as well as changed abend codes and component codes.

The following messages and codes are changed. An asterisk (*) indicates that the message text is changed.

**Changed BPE messages**

The following messages are changed:
- BPE0001E
- BPE0006I
- BPE0010I
- BPE0014E
- BPE0017I
- BPE0028I
- BPE0029I
- BPE0037E

**Changed CQS messages**

The following messages are changed:
- CQS0034A
- CQS0300I
- CQS0222E
- CQS0350W
- CQS0354E

**Changed CSL messages**

The following messages are changed:
- CSL0001E
- CSL0012I
- CSL2501I

**Changed DBD messages**

The following messages are changed:
- DBD760

**Changed DFS messages**

The following messages are changed:
- DFS047A
- DFS0123E
- DFS0430I
Changed DSP messages

The following messages are changed:
DSP0012I
DSP0141I
DSP0222I
DSP0224I
DSP1076I
DSP1095A

Changed FLD messages

The following messages are changed:
FLD180

Changed G messages

The following messages are changed:
G430
G449
G561

Changed HWS messages

The following messages are changed:
HWSC0001I
HWSC0114W
HWSN1940W
HWSS0714E
HW5V4425I
HWSX0905E
HWSX0907E

Changed SEGM messages

The following messages are changed:
SEGM760

Changed abend codes

The following abend codes are changed:
0029
0071
0073
Changed component codes

The following component codes are changed:
BPEATTCH codes
BPELOAD codes
BPERRPDPS codes
AIB 0108/0308
BPE 3400
BPE 3401
BPE 4095
ODBM 0010
Fast Path utility: UR
AC
BA
FM

Deleted messages and codes for Version 13

A number of messages and codes were removed from IMS in Version 13.

Deleted messages

The following messages were removed from IMS Version 13:
CSL0010E
DFS3187W
DFS3253I
DFS4147E
DFS4149W
Deleted codes

The following codes were removed from IMS Version 13:

0062
Chapter 2. IMS problem determination

IMS messages and codes problem determination is accomplished by using procedures established by IBM.

Problem determination is accomplished by using procedures for identifying a failing module or program and determining whether the user or IBM is responsible for resolution of a given problem.

Problem determination information is included, as appropriate, for all messages and codes. In most instances, one or more numbers (for example, "4,6") appear after the heading Problem Determination for a given message or code. These numbers are cross-references to the numbered items that appear in the following list of standard problem determination actions to be taken by the user.

1. Save the console sheet from the z/OS console.
2. Save the input associated with the job.
3. Save the SYSOUT (system output) associated with the job.
4. Save the storage memory dump at time of failure of the IMS control region, and save the memory dump of all associated message regions. (If SYS1.DUMP is used, print, and save it.)
5. Save the IMS log printout.
6. Save the IMS master terminal printout.
7. Save the local or remote terminal printout.
8. Save the JCL listings.
9. Save the ACB generation output.
10. Save the IMSGEN listing.
11. Save the SYSABEND memory dump. (If SYS1.DUMP is used, print, and save it.)
12. Save the assembly listing of any user-modified IMS modules.
13. Save the bind map.
14. Save the LOG trace.
15. Save the IMS log printout starting with the records that were written just before abnormal termination.
16. Save the output listing from the MFS Language Utility execution.
17. Collect the following problem-related data:
   a. System memory dump if running batch.
   b. If running online, print log records type X'67', sub-record type X'FF' (Pseudoabend). Use the File Select and Formatting Print program to print these records. The OPTION PRINT control statement must specify EXITR=DFSERA30.
   c. Run the DL/I test program (DFSDDLTO) with SNAP statements before and after the failing call.
   d. Save the PSB and DBD listings or statements, or both, related to the failure.
   e. Create a memory dump of log records type X'67', sub-record type X'FE' (program isolation trace). Use the File Select and Formatting print program to print the records. Program isolation trace must be enabled when the log is created. The OPTION PRINT control statement must specify EXITR=DFSERA40.
f. If online, a snap from the log of the online region.
g. A history of the database backout, recovery, and reorganization activity.

18. Save the assembly listing for the associated DBDs.
19. Save the assembly listing for the associated PSBs.
20. Save a listing of the VSAM catalog entries for the associated data sets at the time of failure.
21. Reserved for future use
22. Reserved for future use
23. Contact IBM for hardware support.
24. Create a memory dump of the 3270 diagnostic error log records off the IMS log: Record type X'67': sub-record type X'03'.
25. Submit a copy of the IMS log.

26. Determine the CCB involved from the SPACCB field of the scratch pad area or from the CTBCCBPT field. Determine the associated (a) source and output CNT, and (b) the line and PTERM (CTB).

Determine from log records 01, 02, 03, 07, 08, 11, 12 and 13 the status of the conversation:

a. The message was ready, but the application was not scheduled. A 01 destination is a conversational SMB.

b. The application was scheduled and a 08 record was produced.

c. The application inserted a segment to a conversational terminal. If the destination of the message is CNT, 03 and 13 records are produced.

d. The application inserted a segment to a conversational program. SPA is the first segment of a message in the 03 records.

e. The application finished normally or terminated abnormally. The 07 record contains the completion code of a conversational application. The DLRFLAG2 area (the last word of the 07 log record) contains synchronization point information.

f. A 12 record indicates that the conversation was terminated.

g. Determine if 02 records, produced for the following commands, affected the terminal in conversation: /EX1, /HOLD, /REL, or /START LINE (no PTERM).

h. Does restarting IMS affect the conversation? For details, see the input to and output logs from restart.

27. Save the z/OS hardcopy message log output.

28. Determine the status of z/OS and IRLM operating in the other system with which this system is connected during normal operations.

29. Save the IRLM address space dump generated at the time of the failure.

30. Save the memory dump of any IMS online or batch address space that failed near the time of the IRLM failure. Follow IMS problem determination procedures relative to the IMS memory dump. The IMS failure might be related to the IRLM failure.

31. Save a listing of the IRLM start procedure JCL.

32. Save a listing of the IMSGEN performed to install the IRLM.

33. Save listings of the VTAM® definitions performed to install the IRLM.

34. Save the GTF trace output, if any is available showing activity at the time of the failure.

35. Refer to the following manuals for further assistance to resolve your problem:
   • IMS Version 13 Messages and Codes, Volume 1: DFS Messages
• IMS Version 13 Messages and Codes, Volume 2: Non-DFS Messages
• IMS Version 13 Messages and Codes, Volume 3: IMS Abend Codes
• IMS Version 13 Messages and Codes, Volume 4: IMS Component Codes
• IMS Version 13 Diagnosis

Check all input for accuracy and analyze any memory dumps.
If you are still unable to solve your problem, contact IBM Software Support for further assistance.

36. If you are unable to solve the problem, contact IBM Software Support for assistance.
37. Submit a copy of the type X'02' log records.
38. Save the CCTL SNAP or SDUMP data set.
39. Save the output from the Security Maintenance utility. This step is not applicable to IMS Version 12 and later.
40. Save a listing of the DBRC RECON.
41. Take an SVC memory dump and contact IBM Software Support for further assistance.
Chapter 3. BPE messages (Base Primitive Environment)

Messages issued by the Base Primitive Environment (BPE) begin with BPE.

BPE0000I  displayoutput

Explanation: This message provides output generated by the DISPLAY command verb for BPE resources.

In the message text, displayoutput is output text from the display verb. Typically, when a display command is issued against a resource, the output consists of header lines, and then one or more data lines containing information about the resources being displayed.

System action: Processing continues.

System programmer response: No action is required.

Module: BPECTRA0, BPECURF0, BPEHT100

BPE0001E  BPE INITIALIZATION ERROR IN MODULE module details

Explanation: An error occurred in early BPE initialization. This message contains two-lines. Each line begins with the message number.

In the message text:
module The module that detected the error
details A one-line explanation of the type of error that was detected

The details line of this message further explains the error detected, and can be one of the following:

ERROR LOADING MODULE module BPELOAD
RC=rc Load failed for a module. In the message text:
module The name of a module that could not be loaded
rc The return code from the BPE load service, BPELOAD

ERROR LOADING MODULES module... BPELOAD
RC=rc Load failed for several modules. In the message text:
module The name of the first of several modules that could not be loaded
rc The return code from the BPE load service, BPELOAD

ERROR PARSEING datasettype, BPEPARSE RC=rc
An error was detected while trying to parse a configuration data set. This message follows message BPE0003E, which provides further details on the error. In the message text:
datasettype A description of the type of data set that was being parsed. This can be one of the following:

- BPE CONFIG MEMBER: The main BPE configuration PROCLIB member that is specified on the BPECFG parameter of the startup JCL or procedure.
- component USER EXIT LIST MEMBER: The user exit list PROCLIB member for the indicated IMS component (for example, BPE, CQS, OM, RM, or SCI). This is the user exit list member that is specified on the EXITMBR statement in the BPE configuration PROCLIB member.
- ERROR READING PROCLIB DATA SET, BPERDPDS RC=rc BPE could not read a PROCLIB DD data set. This message follows message BPE0002E, which provides further details on the specific data set and member that could not be read. In the message text:
rc The return code from the BPE partitioned data set reading service, BPERDPDS

INITIALIZATION FAILED FOR service, RC=rc BPE was unable to initialize a BPE system service. In the message text:
service The name of the BPE service that failed initialization. Values for this field include:
- BPE RESMGR: An error occurred when BPE tried to establish a resource manager routine to clean up global resources that are used by BPE. The return code in this message is the return code from the MVS™ RESMGR macro call that failed.
- USER EXITS: An error occurred while trying to load user exit modules. This message might be preceded by other error messages that indicate the problem. The return code from the module that loads the user exits (BPEUXRF0) is in the rc field in this message.
- BPE SVC: An error occurred when BPE tried to initialize the BPE SVC routine. BPE provides an internal SVC routine for use by BPE and IMS components. The SVC is installed dynamically when a BPE
address space is started. This error message is issued when the BPE SVC could not be installed. If the rc field in the message is X'00000020', you are probably trying to start the address space on a z/OS system that is not at the required maintenance level. The MVS system must be at least at MVS SP 4.3.0 or higher. If the MVS system is at MVS SP 5.2.0 or below, you must have MVS APARs OW13312 and OW13315 applied.

**INVALID CALLABLE SERVICE CODE** code IN MODULE

BPE detected an invalid user exit callable service code in the indicated module. Both BPE and IMS components that run with BPE can define callable services that user exits can use. Each callable service has a callable service code used to request the service. This error indicates that there is a definition error in the specified module. In the message text:

- **code**: The callable service code in error, in hexadecimal.
- **module**: The name of the callable service module that had the invalid callable service code defined.

**MODULE module HAS AN INVALID VERSION NUMBER** version

A BPE definition module had an invalid version number. BPE uses version numbers as a consistency check to ensure that the definition modules being loaded match the version of BPE that is running. In the message text:

- **module**: The BPE definition module in which the invalid version was detected
- **version**: The hexadecimal invalid version number from the definition module

**MODULE module IS LINKED REENTRANT - IT MUST BE NON-REENTRANT**

A BPE definition module was loaded into key zero storage. BPE definition modules are modules that contain data (control blocks), and thus must be loaded into storage that is in the same storage key in which BPE is running. The most common cause for this error message is linking a definition module as reentrant, which loads it into key zero storage. BPE definition modules should be bound as non-reentrant. In the message text:

- **module**: The BPE definition module that was loaded in key zero storage

**MODULE module IS NOT A VALID type DEFINITION MODULE**

BPE encountered an error with an internal BPE definition module. BPE uses definition modules to construct its execution environment. If a definition module is not correct, BPE cannot build the appropriate environment. In the message text:

- **module**: The name of a BPE definition module that is in error
- **type**: The type of definition module in error

**NAME-TOKEN CREATE ERROR, RC=rc**

A z/OS name-token service create call failed. In the message text:

- **rc**: The return code from the z/OS name-token create call. For details, see the IEANTCR service return codes in z/OS MVS Programming: Authorized Assembler Services Reference, Volume 2 (EDT-IXG).

**NAME-TOKEN RETRIEVE ERROR, RC=rc**

A z/OS name-token service retrieve call failed. In the message text:

- **rc**: The return code from the z/OS name-token retrieve call. For details, see the IEANTTR service return codes in z/OS MVS Programming: Authorized Assembler Services Reference, Volume 2 (EDT-IXG).

**STORAGE OBTAIN ERROR, STORAGE RC=rc**

A z/OS STORAGE OBTAIN call to get storage failed. In the message text:

- **rc**: The return code from the z/OS STORAGE OBTAIN call. For details, see the STORAGE OBTAIN return codes in z/OS MVS Programming: Authorized Assembler Services Reference, Volume 4 (SET-WT).

**UNABLE TO CREATE threadtype THREAD, BPETHDCR RC=rc**

A request to create a BPE thread (internal unit of work) failed. In the message text:

- **threadtype**: A 4-character name of the thread type that could not be created
- **rc**: The return code from the thread create service, BPETHDCR

**UNABLE TO GET NECESSARY STORAGE, BPEGETM RC=rc**

BPE could not obtain the required storage. In the message text:

- **rc**: The return code from the BPE GETMAIN service, BPEGETM

**UNABLE TO GET STORAGE FOR blocktype BLOCK, BPECTBGET RC=rc**

BPE could not obtain storage for a required control block. In the message text:

- **blocktype**: A 4-character name of an internal BPE control block that could not be obtained
- **rc**: The return code from the BPE control block get service, BPECTBGET
UNKNOWN ERROR, MODULE RC=rc

An internal error occurred that BPE does not recognize. In the message text:
rc The return code from the failing module

System action: IMS abend 3400 with subcode 05 follows this message. The address space terminates.

System programmer response: If the error described in this message is caused by environmental conditions (for example, insufficient storage or modules missing from IMS.SDFSRESL), correct the indicated problem and restart the address space. Otherwise, save any memory dump and SYSLOG information, and contact IBM Software Support.

Module: PEAWI100, BPECBI100, BPECMDI10, BPEEDSI100, BPEHTI100, BPEINITI0, BPEMSGI0, BPEPCFG0, BPERV110, BPETRI100, BPEUXI100

BPE0002E ERROR READING ddnname MEMBER member
details

Explanation: An error occurred trying to read a partitioned data set member. This message contains two-lines. Each line begins with the message number.

In the message text:
- ddnname The DD name of the data set being read
- member The member name of the data set being read
- details A one-line explanation of the type of error detected

The details line of the BPE0002E message further explains the error detected, and can be one of the following:

OPEN FAILED FOR DATA SET
The BPE PDS read service could not open the data set for reading.

DATA SET RECORDS ARE NOT FIXED FORMAT
The data set specified records that were not in fixed format. The BPE PDS read service requires fixed-format data sets.

MEMBER NOT FOUND IN DATA SET
The indicated member was not in the partitioned data set.

BSAM READ FAILED READING MEMBER
An error occurred during the reading of the data set member.

UNABLE TO OBTAIN SUFFICIENT STORAGE FOR MEMBER TO BE READ
The PDS read service could not obtain the storage necessary to read the data set member.

System action: The BPE PDS read service does not take any further action after issuing this message. The caller of the service might provide additional diagnostic messages or terminate the address space.

System programmer response: Correct the error as indicated in this message.

Module: BPERDPD0

BPE0003E AN ERROR OCCURRED PARSING
description

AT LINE line, CHARACTER char
FAILING TEXT: "text"
details

Explanation: An error occurred in the BPE parsing service. This message is a four-line message. Each line begins with the message number.

In the message text:
- description A text description of what was being parsed.
- line The line number of the data where the error occurred. For data that is not line-oriented, the line number is omitted.
- char The position of the character on the line where the error was detected. For data that is not line-oriented, char identifies the position of the character within the input data.
- text Up to 16 characters of the text where the error was detected.
- details A one-line explanation of the type of error detected.

The details line of the BPE0003E message further explains the error detected, and can be one of the following values:

INVALID KEYWORD DETECTED
The parser found an unknown keyword in the input data.

UNKNOWN POSITIONAL PARAMETER
The parser found a positional parameter in the input data when one was not expected.
BPE0004I • BPE0005I

"=" ENCLOSED WHEN "(" EXPECTED
The parser found an equal sign in the input data when a left parenthesis was expected.

EARLY END OF INPUT DATA
The input data ended before all levels of parentheses were closed.

KEYWORD ENCOUNTERED WHEN VALUE EXPECTED
The input data contained a keyword when the parser expected a value.

NUMERIC VALUE OUTSIDE OF LEGAL RANGE
A numeric value was outside the allowed range for the parameter.

DECIMAL NUMBER CONTAINED NONDECIMAL DIGITS
A decimal number contained a non-decimal character.

HEXADECIMAL NUMBER CONTAINED NONHEX DIGITS
A hexadecimal number contained a non-hexadecimal character.

UNKNOWN KEYWORD VALUE DETECTED
The parser found a parameter that could be one of a set of keyword values. The parameter was not one of the values in the set.

DUPLICATE KEYWORD PARAMETER DETECTED
The parser found an unrepeatable keyword more than once in the input data.

A REQUIRED PARAMETER WAS OMITTED
A required parameter was not found in the input data.

CHARACTER VALUE WAS TOO LONG FOR PARAMETER
The character value specified was too long for the parameter field.

A REQUIRED VALUE WAS OMITTED
A keyword was coded without specifying a value. A value is required.

UNEXPECTED RIGHT PARENTHESIS ENCOUNTERED
The parentheses in the input data did not match. There were too many closing (right) parentheses.

PARSER DIRECTIVE IMBEDDED IN A SUBLIST
The parser encountered a parser directive while processing a sublist, that is parser input data enclosed in parentheses. A parser directive is parser metadata, and is delimited by angle brackets (< and >); for example, <SECTION=section_name>. Parser directives are not allowed within parser data sublists.

INVALID PARSER DIRECTIVE VALUE
The right-hand side of a parser directive was not valid. Parser directives must be of the form <directive=value>. The value must be a single word, and you must include the closing angle bracket (>).

PARSER DIRECTIVE ENCOUNTERED WHEN VALUE EXPECTED
The parser encountered a parser directive when it was expecting the right-hand side value of a keyword=value parameter.

AN EXPECTED RIGHT PARENTHESIS WAS NOT FOUND
The parser did not find the closing parenthesis in the input data to match an opening parenthesis.

System action: The BPE parsing service does not take any further action after issuing this message. The caller of the service can provide additional diagnostic messages or terminate the address space.

System programmer response: Correct the error as indicated in the BPE0003E message.

Module: BPEPARS0

BPE0004I  BPECFG= NOT SPECIFIED ON STARTUP PARMS - DEFAULTS BEING USED

Explanation: BPE could not find the specification for the BPE configuration data set in the startup parameters.

System action: The address space continues initialization. BPE runs with defaults for all parameters in the BPE configuration data set.

System programmer response: If the BPE configuration parameter defaults are acceptable, no action is required. Otherwise, create a BPE configuration member in the data set pointed to by the PROCLIB DD statement and specify BPECFG=member_name in the startup parameters of the job that starts the address space.

Module: BPEPCFG0

BPE0005I  UNKNOWN component TRACE TYPE type IN PROCLIB MEMBER member-IGNORED

Explanation: A TRCLEV= statement was found in the BPE configuration PROCLIB data set member for an unknown trace table type.

In the message text:

component
The name of the IMS component that was specified on the TRCLEV statement (for example, BPE, CQS, OM, RM, or SCI) being parsed

type
The type of the trace table that was unknown

member
The member name of the PROCLIB DD data set that was being processed

System action: The address space initialization continues. BPE ignores the invalid trace specification.

System programmer response: Correct the TRCLEV statement.

Module: BPEPCFG0
The abend reason code, or the value in R15 at the time of abend if the abend reason code is not available.

The 4-character name of the BPE thread (internal unit of work) that was running when the abend occurred. The THD=fff text is only printed for the BPE0006I message issued for the first TCB that abends. It is omitted for BPE0006I messages issued for subsequent TCBs that are abended as a result of the initial abend. THD=fff is also omitted on the first BPE0006I message if BPE cannot determine the type of thread that abended.

Diagnostic data.

lllllll is the value of the 4-byte field SDWFLAG5 from the SDWA passed to the BPE recovery routine, in hex. Several of the flag bits in this word control IMS BPE recovery processing. The word is provided as diagnostic data to assist with problem determination in the BPE recovery routine. This field is not displayed when the recovery process is not passed an SDWA from the operating system.

mm Additional diagnostic data.

mm is the value of the 1-byte field SDWACMPF from the SDWA passed to the BPE recovery routine, in hex.

retrystatus Indicates whether the system is attempting to recover from the abend. If the system is trying to recover, the character string *(RETRYING)* is appended at the end of the message at the position indicated by retrystatus. If the abend is not being retried, there is no retrystatus data, and the message ends with DIAG=1llllllllmm.

lllllll The name of the abending module name from its module ID, if it can be determined.

hhhhhhhh The entry point address of the abending module, if it can be determined.

iiiiiii iiii The PSW (program status word) contents at the time of abend.

jjjjjjj The offset within the abending module in which the abend occurred, if it can be determined.

kkkkkk The contents of the registers at the time of abend.

System action: If the abend is being retried (retrystatus is *(RETRYING)* in the first line of the message), the system attempts to recover from the abend and the address space continues to work.

If the abend is not being retried, the action taken after this message depends on whether the abending TCB or SRB is considered a critical dispatchable unit to the address space. If it is not critical, the dispatchable unit is terminated, but the address space continues.
execution. If it is critical, the address space is terminated abnormally.

**System programmer response:** Save any memory dump and SYSLOG information, and contact IBM Software Support.

**Module:** BPEINIT0, BPESYES0, BPESRFR0

---

**BPE0007I**

**component BEGINNING PHASE 1 OF SHUTDOWN**

**Explanation:** BPE is beginning the first phase of shutting down the address space.

In the message text:

*component*

The name of the IMS component being shut down.

**System action:** The address space enters the first phase of termination, in which all of the IMS component TCBS are terminated.

**Module:** BPESYTR0

---

**BPE0008I**

**component BEGINNING PHASE 2 OF SHUTDOWN**

**Explanation:** BPE is beginning the second phase of shutting down the address space.

In the message text:

*component*

The name of the IMS component being shut down.

**System action:** The address space enters the second phase of termination, in which all of the BPE system TCBS are terminated.

**Module:** BPESYTR0

---

**BPE0009I**

**component SHUTDOWN COMPLETE**

**Explanation:** Shutdown of the address space completed. BPE is returning to z/OS.

In the message text:

*component*

The name of the IMS component being shut down.

**System action:** The address space terminates normally.

**Module:** PESYET0

---

**BPE0010I**

**PSW AND REGISTERS AT ABEND ARE NOT AVAILABLE**

**Explanation:** An abnormal termination occurred and a BPE system recovery routine (ESTAE or FRR) received control. Diagnostic information such as the program status word (PSW) and register contents at abend was not provided to the recovery routine by z/OS.

**System action:** BPE continues to process the abend with limited capability because of the lack of the diagnostic information.

**Module:** BPESYES0, BPESRFR0

---

**BPE0011E**

**ABEND IN BPE SYSTEM ESTAE ROUTINE (BPESYES0)**

**Explanation:** An abnormal termination occurred in the BPE system ESTAE module itself while it was processing a prior abend.

**System action:** This message should be followed by a z/OS symptom memory dump on the z/OS console. Additionally, a SYS1.LOGREC entry is generated for the abend. The BPE ESTAE module attempts to recover from the abend and continues processing the original abend.

**Module:** BPESYES0

---

**BPE0012E**

**BPE ETXR UNABLE TO FIND block BLOCK FOR TCB AT address**

**Explanation:** The BPE end of task exit routine (ETXR) was called when a task control block (TCB) in the address space terminated. The routine tried to process the task termination, but was not able to locate a required BPE control block. This problem is probably caused by internal control block errors or overlays within the address space.

In the message text:

*block*  The name of the BPE control block that could not be found

*address*  The address of the terminating TCB

**System action:** BPE attempts to clean up the TCB. However, without the required control blocks, the cleanup might not be successful, and other TCBs in the address space might not terminate.

**System programmer response:** If the address space appears hung (is not processing or does not terminate), cancel the address space with a memory dump, and contact IBM Software Support.

**Module:** BPESYET0

---

**BPE0013E**

**VERSION MISMATCH BETWEEN BPE AND component**

**BPE MODULE VERSION IS**

*boer.brel.pptr*  component WAS ASSEMBLED AT BPE VERSION *pver.prel.pptr*

**Explanation:** The BPE version on which the identified IMS component was built does not match the version of the BPE modules that were loaded. This situation can occur, for example, if the starting IMS component was assembled at one BPE version and the IMS.SDFSRESL contained BPE modules at a different BPE level.
This message contains three-lines. Each line begins with the message number.

In the message text:

**component**

- An up-to-4 character name of the IMS component being started.
- The version number of BPE modules.
- The release number of BPE modules.
- The point-release number of BPE modules.
- The version number of BPE macros at which the IMS component was assembled.
- The release number of BPE macros at which the IMS component was assembled.
- The point-release number of BPE macros at which the IMS component was assembled.

**System action:** BPE terminates abnormally during early initialization with abend 3400, subcode X’09’.

**System programmer response:** This problem is probably caused by a IMS.SDFSRESL mismatch. Ensure that the IMS component being started is using the correct version of the IMS.SDFSRESL.

**Module:** BPEINIT0

**Related information:**

- [BPE abend 3400](#)

---

**BPE0014E** ABEND IN RECOVERY ROUTINE

**Explanation:** A BPE recovery routine (BRR) that was intended to provide recovery for abnormal terminations in a section of code itself encountered an abend. A BRR is an internal recovery routine established by either BPE or the IMS component using BPE to protect a functional area. BRRs run in either a z/OS ESTAE or FRR environment and attempt to recover from abnormal terminations that occur in mainline code.

**System action:** The BPE ESTAE or FRR treats this abend as if the recovery routine indicated that it could not recover, and continues abend processing. Usually, this results in the abnormal termination of the address space. However, other BRRs were established when the abend occurred, recovery of the original abend still might occur.

**System programmer response:** Save any memory dump and SYSLOG information, and contact IBM Software Support.

**Module:** BPESYES0, BPESRFR0

---

**BPE0015I** UNKNOWN component EXIT TYPE type IN EXIT LIST PROCLIB MEMBER member- IGNORED

**Explanation:** While processing a user exit list PROCLIB member, BPE encountered an EXITDEF statement that specified a user exit type that was not defined to BPE. The exit definition for the indicated type is ignored.

In the message text:

**component**

The name of the owning IMS component of the user exit list member that was being processed (for example, BPE, CQS, OM, RM, or SCI).

**type**

The up-to-8 character exit type name that was undefined.

**module**

The user exit list PROCLIB member name.

**System action:** The user exit definition is ignored. Processing of the user exit list PROCLIB member continues.

**System programmer response:** Examine the indicated user exit list PROCLIB member and correct the EXITDEF statement for the indicated user exit type.

**Module:** BPEUXRF0
BPE0017I • BPE0019E

Module: BPEUXRF0

BPE0017I    MULTIPLE type STATEMENTS IN member PROCLIB MEMBER - LAST WILL BE USED

Explanation: While processing a PROCIB member, BPE encountered multiple statements of a specific type when only one was expected. BPE uses the last statement of the duplicated type; the others are ignored.

In the message text:
  * type  A short description of the type of statement that was duplicated.
  * member  The PROCIB member name.

System action: Processing continues.

System programmer response: No action is required.

You might want to examine the indicated PROCIB member to ensure that the values specified on the final statement are correct.

Module: BPETRI00, BPEUXRF0, BPEDSI00

BPE0018I    DUPLICATE EXIT module SPECIFIED FOR component type EXIT - IGNORED

Explanation: While processing a PROCIB member for a user exit list, BPE found the same user exit module specified more than once in a single exit list (EXITS parameter) on an EXITDEF statement. Only the first instance of the module is in effect; all subsequent specifications of the module are ignored.

In the message text:
  * module  The name of the user exit module that was specified more than once.
  * component  The name of the owning IMS component of the user exit list member that was being processed (for example, BPE, CQS, OM, RM, or SCI).
  * type  The up-to-8 character exit type name of the exit being processed.

System action: The duplicate user exits after the first occurrence are ignored. Processing of the user exit PROCIB continues.

System programmer response: No response is required. However, you might want to examine the EXITDEF statement to ensure that the exits specified are listed in the correct order for your installation. User exits are called in the order they are listed on the EXITS statement.

Module: BPEUXRF0

BPE0019E  component type USER EXIT MODULE module ABEND code

Explanation: An abend occurred while a user exit module was in control. In control means that BPE gave control to the exit. However, the abend does not have to be in the exit module itself. This message is also issued if the exit called another module, which then terminated abnormally.

In the message text:
  * component  The name of the owning IMS component of the user exit type being called (for example, CQS, OM, RM, or SCI).
  * type  The up-to-8 character exit type name of the exit that terminated abnormally.
  * module  The load module name of the exit that terminated abnormally.
  * code  The abend code. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where dddd is the 4-digit abend code in decimal.

System action: BPE protects all user exits with a recovery routine. When a user exit terminates abnormally, BPE attempts to recover from the abend and continue processing. Recovery actions include the following:

- The first time a specific user exit module abends after it is loaded, BPE issues an SDUMP to dump the address space for the abend. For abends after the first abend, BPE does not dump the address space again; however, it does generate a SYS1.LOGREC entry for each abend occurrence.
- If the number of abends for a specific user exit module reaches or exceeds the abend limit value for the user exit type of the exit, no further calls are made to the exit until it is refreshed. The abend limit for an exit type is specified by the ABLIM parameter on the EXITDEF statement.

After a user exit abends, BPE attempts to call any other exit modules that were specified after the failing exit in the EXITS exit list.

System programmer response: Examine the SDUMP, the SYS1.LOGREC entries, or both to determine the problem with the user exit. Correct the problem with the exit, rebind the exit to the libraries of the job, and issue the REFRESH USEREXIT command. The REFRESH USEREXIT command loads a copy of the corrected exit and causes BPE to resume calling the exit module whenever exits of its type are started.

Module: BPEUXCL0

24  Messages and Codes, Volume 2: Non-DFS Messages
**BPE0020I**  
**ABEND LIMIT REACHED FOR**  
**component type USER EXIT MODULE module**

*Explanation:* The indicated user exit module reached the abend limit for the exit type as specified in the ABLIM parameter on the EXITDEF statement.

In the message text:

- **component**
  The name of the owning IMS component of the user exit type being called (for example, BPE, CQS, OM, RM, or SCI).
- **type**
  The up-to-8 character exit type name of the exit that terminated abnormally.
- **module**
  The load module name of the exit that terminated abnormally.

*System action:* No further calls are made to the indicated user exit module until the next refresh of the exit. Refreshing the user exit resets the abend count for the exit to zero, allowing it to be called again.

*System programmer response:* Examine the SDUMP, the SYS1.LOGREC entries, or both to determine the problem with the user exit. Correct the problem with the exit, rebind the exit to the libraries of the job, and issue the REFRESH USEREXIT command. The REFRESH USEREXIT command loads a copy of the corrected exit and causes BPE to resume calling the exit module whenever exits of its type are started.

*Module:* BPEUXCL0

---

**BPE0021E**  
**ABEND code IN BPE SVC INIT MODULE BPESVC0, PSW=psw1 psw2**

*Explanation:* An abnormal termination occurred while module BPESVC0 was in control. Module BPESVC0 is the module that initializes the BPE SVC routine (an internal SVC used by BPE and other IMS components). BPESVC0 processing is protected by an internal ESTAE, which attempts to retry from the abend and clean up any global resources (common storage, MVS Enqueues) that BPESVC0 obtained. This message is issued to alert the operator that a termination occurred.

In the message text:

- **code**
  The abend code. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where dddd is the 4-digit abend code in decimal.
- **psw1**
  The first word of the PSW (program status word) at abend.
- **psw2**
  The second word of the PSW at abend.

*System action:* BPE collects diagnostic data about the abend, and then resumes execution in a cleanup routine within BPESVC0. This routine attempts to release any global resources that BPESVC0 obtained as a part of its processing, and returns to the caller of BPESVC0, which can choose to continue processing or to terminate abnormally.

The first time that BPESVC0 abends, its ESTAE creates an SDUMP of the address space, and causes a record to be written to the SYS1.LOGREC data set to document the abend. If BPESVC0 abends a second time or more, its ESTAE does not create another SDUMP. However, it writes a record to SYS1.LOGREC.

*System programmer response:* Save any memory dump, SYSLOG, and SYS1.LOGREC information and contact IBM Software Support.

*Module:* BPESVC0

---

**BPE0022E**  
**ABEND code IN BPE SVC PROCESSING, PSW=psw1 psw2**

*Explanation:* An abnormal termination occurred during BPE SVC processing. The BPE SVC module (BPESVC0) establishes an ESTAE to protect its processing. This ESTAE attempts to retry from the abend and clean up any global resources (common storage, MVS Enqueues) that BPESVC0 obtained. This message is issued to alert the operator that a termination occurred.

In the message text:

- **code**
  The abend code. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where dddd is the 4-digit abend code in decimal.
- **psw1**
  The first word of the PSW (program status word) at abend.
- **psw2**
  The second word of the PSW at abend.

*System action:* BPE collects diagnostic data about the abend, and then resumes execution in a cleanup routine within BPESVC0. This routine attempts to release any global resources that BPESVC0 obtained as a part of its processing, and returns to the caller of BPESVC0, which can choose to continue processing or to terminate abnormally.

The first time that BPESVC0 abends, its ESTAE creates an SDUMP of the address space, and causes a record to be written to the SYS1.LOGREC data set to document the abend. If BPESVC0 terminates a second time or more for the same SVC call, its ESTAE does not create another SDUMP. However, it writes a record to SYS1.LOGREC.

*System programmer response:* Save any memory dump, SYSLOG, and SYS1.LOGREC information and contact IBM Software Support.

*Module:* BPESVC0

---

**BPE0023I**  
**command COMMAND REJECTED**

*Explanation:* A command was issued, but could not be processed. The command was rejected Depending on the IMS component, this message might not be issued when a command is rejected. The IMS component using BPE might choose to issue its own
BPE0024E • BPE0027E

**message rejecting the command, and might request that BPE not issue this message.**

In the message text:

```
command

The command that was rejected. If the command that was entered was the MVS STOP command (P jobname), then MVS STOP displays as the command. For all other commands, the command verb and resource type are displayed (for example, UPDATE TRACETABLE or REFRESH USEREXIT).
```

**System action:** The command is not processed.

**Module:** BPEMOD00, BPECMD10

---

**BPE0024E**  
**command** COMMAND FAILED

**Explanation:** The processing for a command failed. Depending on the IMS component, this message might not be issued when a command fails. The IMS component using BPE might choose to issue its own message about a command failure, and might request that BPE not issue the BPE0024E message.

In the message text:

```
command

The command that failed. If the command that was entered was the MVS STOP command (P jobname), then MVS STOP displays as the command. For all other commands, the command verb and resource type are displayed (for example, UPDATE TRACETABLE or REFRESH USEREXIT).
```

**System action:** The command failed.

**Module:** BPEMOD00, BPECMD10

---

**BPE0025I**  
STOP OF component IS IN PROGRESS

**Explanation:** An MVS STOP command was issued for a IMS component that is running with BPE. BPE is processing the stop request. Depending on the IMS component, this message might not be issued when the address space is stopped. The IMS component using BPE might choose to issue its own shutdown messages and might request that BPE not issue this message.

In the message text:

```
component

The name of the IMS component that is being stopped (for example, BPE, CQS, OM, RM, or SCI).
```

**System action:** BPE initiates a shutdown of the address space.

**Module:** BPEMOD00

---

**BPE0026E**  
CLEANUP FAILURE RCSR=rsh component

**Explanation:** An error occurred during BPE resource cleanup processing. Some resources might not be properly cleaned up. BPE establishes a resource manager routine to clean up global resources when an address space using BPE services terminates. If the resource manager cannot clean up a particular resource, it issues this message.

In the message text:

```
rc
The return code, if applicable, from the failing service. This code might help to identify the cause of the failure.

rsn
The reason code, if applicable, from the failing service.

component
A short text string that identifies the component or resource that could not be cleaned up. Possible components are:

- **BPESVC:** Clean up failed for the BPE SVC service. The return code and reason code in the message are from the BPE SVC EOMCLEANUP function. This error indicates that some of the SVC functions registered by the terminating address space might not have been properly deregistered.
- **ALESERV:** A call to the MVS ALESERV service to obtain the current address space STOKEN failed. The return code in the message is the return code from the ALESERV macro; the reason code is always zero.

**System action:** BPE resource cleanup processing continues with the next resource, and the address space terminates.

**User response:** Depending on the cause of the cleanup failure, BPE might have created an SDUMP. If so, save the memory dump, SYSLOG, and SYS1.LOGREC information and contact IBM Software Support. If BPE did not create an SDUMP, obtain the return code, reason code, and component from the BPE0026E message and contact IBM Software Support with this information.

**Module:** BPERSM00

---

**BPE0027E**  
ABEND code IN BPE RESMGR PROCESSING, PSW=psw1 psw2

**Explanation:** An abnormal termination occurred during BPE resource manager processing while terminating an address space running with BPE services. The BPE resource manager module (BPERSM00) establishes an ESTAE to protect its processing. This ESTAE attempts to retry from the abend and to continue cleaning up global resources. This message is issued to alert the operator that an abend occurred.
In the message text:

**code**  The abend code. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where ddd is the 4-digit abend code in decimal.

**psw1**  The first word of the PSW (program status word) at abend.

**psw2**  The second word of the PSW at abend.

**System action:**  BPE collects diagnostic data about the termination and then resumes execution in the main BPERSM00 routine, which attempts to continue cleanup with the next resource after the one that was being processed when the abend occurred.

The first time that BPERSM00 abends, its ESTAE creates an SDUMP of the address space, and causes a record to be written to the SYSLGREC data set to document the abend. If BPERSM00 abends a second time or more, its ESTAE does not create another SDUMP. However, it writes a record to SYSLGREC.

**System programmer response:**  Save any memory dump, SYSLOG, and SYSLGREC information and contact IBM Software Support.

**Module:**  BPERSM00

---

**BPE0028I**  SDUMP FAILED FOR abend ABEND, RC=rc, RSN=rsn

**Explanation:**  BPE issued an SDUMP call to z/OS to produce a memory dump of the address space after an abnormal termination, but the SDUMP was not successful.

In the message text:

**abend**  The abend code for which the storage dump was created. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where ddd is the 4-digit abend code in decimal.

**rc**  The return code from the MVS SDUMP macro.

**rsn**  The reason code from the MVS SDUMP macro.

**System action:**  The SDUMP is skipped.

**System programmer response:**  Use the return and reason codes from the MVS SDUMP macro to determine the cause of the SDUMP failure. If appropriate, correct the cause of the failure so that future memory dumps are not lost.

**Module:**  BPEINIT0, BPERSM00, BPESVC10, BPESVC00, BPESYES0, BPESRFR0

**Related reference:**

- [z/OS: Statements/parameters for ADYSETxx](#)

---

**BPE0029I**  DAE SUPPRESSED DUMP FOR abend ABEND

**Explanation:**  BPE issued an SDUMP call to z/OS to produce a memory dump of the address space after an abnormal termination, but the SDUMP was suppressed by z/OS dump analysis and elimination (DAE).

BPE recovery routines gather symptom string data related to an abend, and provide this data to z/OS when an SDUMP is requested. If DAE is enabled, z/OS suppresses duplicate memory dumps, for example, dumps that have symptom strings identical to previously captured memory dumps. DAE is controlled through the MVS ADYSETxx PARMLIB member and the MVS SET DAE command.

In the message text:

**abend**  The abend code for which the storage dump was created. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where ddd is the 4-digit abend code in decimal.

**System action:**  The SDUMP is skipped. A BPE-generated memory dump is suppressed if its symptom string matches a previous dump, and if the current DAE setting in ADYSETxx is either SUPPRESS OR SUPPRESSALL.

**System programmer response:**  No action is required.

**Module:**  BPEINIT0, BPERSM00, BPESVC10, BPESVC00, BPESYES0, BPESRFR0

**Related reference:**

- [z/OS: Statements/parameters for ADYSETxx](#)

---

**BPE0030I**  displayheader

**Explanation:**  This message displays the header line or lines generated by the DISPLAY command for BPE resources.

In the message text, **displayheader** is one or more lines of header information associated with the output from a DISPLAY command.

---

**BPE0031E**  verb COMMAND IS INVALID

**or**

**verb resourcetype COMMAND IS INVALID

**Explanation:**  A command was issued that BPE did not recognize. Even if you entered a valid command verb, this message might be generated if you omitted a required resource type or specified a resource type to which the verb does not apply. For example, if you entered DISPLAY NAME(DISP), you would receive the error message:

**BPE0031E DISPLAY COMMAND IS INVALID**
This error occurs because the DISPLAY command requires a resource type on which it is to operate.

Similarly, if you entered REFRESH TRACETABLE NAME(AWE), you would receive the error message: BPE0031E REFRESH TRACETABLE COMMAND IS INVALID

This error occurs because the REFRESH command applies to the USEREXIT resource type, not the TRACETABLE resource type.

In the message text:
verb The command verb from the command that was issued
resource The resource type from the command that was issued, if present

System action: The command is ignored.
System programmer response: Reenter the command with the correct verb, or verb and resource type.
Module: BPECMD00, BPECMD10

BPE0032I verb COMMAND COMPLETED
or
verb resource COMMAND COMPLETED

Explanation: A command completed processing. This message is issued in two cases:
• For commands that generate a variable number of lines of output, such as DISPLAY commands. This message indicates the end of the command output.
• For commands that generate no other messages. This message provides feedback that command processing is complete.

This message is not issued when a command generates a fixed number of lines of output, such as a single response line or error message line.

In the message text:
verb The command verb from the command that was issued
resource The resource type from the command that was issued, if present

System action: Processing continues.
System programmer response: No action is required.
Module: BPECMD10

BPE0033E MISSING COMMAND VERB

Explanation: A command was entered that is missing a command verb, which is the first word of the command string. You receive this message only if you enter a command that consists of only keyword(value) parameters. For example, if you enter NAME(DISP) OWNER(BPE), this message is issued. This command does not contain a non-keyword parameter to act as the command verb.

System action: The command is ignored.
System programmer response: Reenter the command with the appropriate value on the indicated keyword.
Module: BPECTRA0, BPECURF0

BPE0034E NO MATCH FOUND FOR resource WITH NAME name

Explanation: A name or wildcard pattern on the NAME parameter of a command did not match any instances of the requested resource type. For example, the command DISPLAY TRACETABLE NAME(ZZZZ,QQ*) generates the following response:
BPE0034E NO MATCH FOUND FOR TRACETABLE

In the message text:
resource The resource type specified in the command
name The name or wildcard pattern specified on the NAME parameter that did not match any instance of the resource type

System action: If some of the names listed on the NAME parameter of the command matched existing resource instances, the command processes against those instances. If none of the names listed on the NAME parameter matched existing resource instances, the command is ignored.
System programmer response: Reenter the command with the appropriate resource type names.
Module: BPECTRA0, BPECURF0

BPE0035E INVALID VALUE "value" FOR KEYWORD keyword

Explanation: The value specified on the indicated keyword was not valid. For example, the command UPDATE TRACETABLE NAME(DISPLAY) OWNER(ABCD) LEVEL(GROUND) would generate the following response:
BPE0035E INVALID VALUE "ABCD" FOR KEYWORD OWNER
BPE0035E INVALID VALUE "GROUND" FOR KEYWORD LEVEL

In the message text:
value The keyword parameter value that is in error
keyword The keyword whose value is in error

System action: The command is ignored.
System programmer response: Reenter the command with the appropriate value on the indicated keyword.
Module: BPECTRA0, BPECURF0
BPE0036E  INTERNAL COMMAND PROCESSING ERROR, service RC=rc

Explanation: An internal error in BPE occurred while processing the command. For details on the failure, see the service return code, as indicated by service and rc, in the BPE service return codes information.

In the message text:

service  Is the name of the failing service that prevented the command from processing.
rc       Is the return code from the failing service call.

System action: The command is ignored.

System programmer response: Some internal errors that result in this message could be due to temporary conditions, such as a temporary lack of storage. Other errors indicate possible logic errors within product code. Reenter the command and see if the error recurs. If it does, issue a console memory dump of the address space immediately after entering the command and contact the IBM support center. To ensure that trace information necessary to the resolution of the problem is available, you can turn on the following BPE traces at LEVEL(HIGH): CMD, SSRV, STG, DISP.

Module: BPECMD00, BPECMD10, BPECTRA0, BPECURF0

BPE service return codes (Messages and Codes)

BPE0037E  UNABLE TO START BPE: details

| Explaination: A BPE address space startup module (BPEINI00 or BPEINIT0) encountered an error that prevented a BPE address space from starting.

In the message text:

details  A description of the problem that prevented the address space from starting. details is one of the following situations:

NOT APF AUTHORIZED
The address space being started is not APF-authorized. All BPE and IMS component modules must be in data sets that are APF-authorized. In addition, module BPEINI00 must be bound with authorization code 1: SETCODE AC(1)

NOT RUNNING IN KEY 7
BPE initialization received control in a key other than key 7. BPE must run in key 7. Ensure that the module specified on the PGM= parameter of your address space JCL EXEC statement is correctly added to the MVS PPT and specifies KEY(7).

BPEINIT= PARM MISSING OR INVALID
Either module BPEINI00 could not find the BPEINIT= keyword on the JCL startup parameters (PARM=), or the specified module name was missing or invalid. The BPEINIT= parameter is required and identifies the name of the BPE startup parameter module. The parameter module defines the type of IMS component address space to start.

ERROR LOADING BPEINIT= MODULE module
The module specified by the BPEINIT= keyword on the JCL startup parameters (PARM=) could not be loaded. In the message text:

module  The name of the module specified in the BPEINIT= keywor that could not be loaded.

BPEINIT= MODULE module LINKED AS REENTRANT
The module specified by the BPEINIT= keyword on the JCL startup parameters (PARM=) was loaded into key 0 storage. This situation probably occurred because the module was bound as reentrant. This module must be bound as non-reentrant. In the message text:

module  The name of the module specified in the BPEINIT= keyword that was linked as reentrant.

MISSING OR INVALID PARMS IN BPEINIT= MODULE module
The BPEINI00 module could not find a valid startup parameter data area (UCDB block) in the module specified by the BPEINIT= keyword on the JCL startup parameters. In the message text:

module  The name of the module specified in the BPEINIT= keyword.

UNABLE TO GET STORAGE FOR COPY OF MVS PARAMETERS
The BPEINI00 module could not get storage for a copy of the z/OS input parameters.

UNKNOWN ERROR
The BPEINI00 module encountered an unknown error.

System action: The starting address space is abnormally terminated with either BPE abend 3401 or 3403.

Operator response: If the error described in this message is due to environmental conditions (for example, incorrect authorization or invalid parameters), correct the indicated problem and restart the address space. Otherwise, save any job log and system log information and contact IBM Software Support.

Module: BPEINI00, BPEINIT0
BPE0038E • BPE0041E

Related information:
- BPE abend 3401
- BPE abend 3403

BPE0038E  BPE STACK MANAGER INTERNAL ERROR

Explanation:  The BPE stack storage manager was unable to obtain storage for a new stack block.

System action:  The BPE stack storage manager issues an SDUMP the first time this condition arises to gather diagnostic data about the problem. The stack manager then suspends the caller until a stack block is eventually freed by another thread.

System programmer response:  This message is issued when storage is unavailable to satisfy an internal request for stack storage within the address space. BPE suspends the unit of work that is requesting additional stack storage until storage becomes available. However, this suspension could lead to reduced function and performance in the product that is running in the address space. You should increase the available region size for the address space and shut it down and restart it as soon as possible. If you continue to get this message, save the SDUMP produced by BPE and contact IBM Software Support.

Module:  BPESTKM0

BPE0039E  BPE STACK MANAGER MULTIPLE INTERNAL ERRORS

Explanation:  The BPE stack storage manager encountered multiple cases where it could not obtain storage for a new stack block.

System action:  The BPE stack storage manager issues message BPE0038E the first time it is not able to get a new stack block when one is needed. Subsequent failures do not generate additional BPE0038E messages. However, if the stack manager repeatedly cannot get storage, it eventually issues this message indicating that the storage problem is likely a chronic one, and that action should be taken quickly to resolve the storage shortage. In addition to issuing this message, BPE also creates a second SDUMP after the repeated failures to capture additional diagnostic steps.

System programmer response:  This message is issued by the BPE stack manager after repeated failures to obtain storage. It is unlikely that the address space will function well at this point. You should increase the available region size for the address space and immediately shut it down and restart it. If you continue to get this message, save the SDUMP produced by BPE and contact IBM Software Support.

Module:  BPESTKM0

BPE0040E  DYN type FAILED FOR dstype, RC=rc rsn dsn

Explanation:  Dynamic allocation or unallocation of a data set failed.

In the message text:
- type  The type of service that failed.
  - ALLOC for dynamic allocation
  - UNALLOC for dynamic unallocation
- dstype  The data set type or DD name of the data set that BPE could not allocate or deallocate.
- rc  The return code from the MVS DYNALLOC call.
- rsn  The reason code from the MVS DYNALLOC call.
- dsn  The name of the data set that BPE was trying to allocate or deallocate.

System action:  The BPE dynamic allocation service returns to its caller. The caller might take some additional action based on the failure, such as issue an additional message or an abend.

System programmer response:  Analyze the state of the data set that failed dynamic allocation or unallocation. The data set must be cataloged. For information about the dynamic allocation or unallocation return codes and reason codes, see z/OS MVS Programming Authorized Assembler Services Guide (SA22-7608).

Module:  BPEDYA00

Related reference:
- z/OS: Interpreting error reason codes from DYNALLOC

BPE0041E  UNABLE TO ALLOCATE REQUESTED STORAGE

Explanation:  The BPE storage allocation service, BPEGETM, could not allocate the storage requested by its caller. This message is only issued the first time that BPEGETM could not obtain storage.

System action:  BPEGETM returns an error return code to its caller.

System programmer response:  The storage shortage which lead to this message being issued might be due to the region size for the address space being set too small. Increase the region size by changing the REGION= parameter on the address space JCL, and restart the address space.

If the problem persists, save any memory dumps and contact IBM Software Support. If no memory dumps were produced, create a console memory dump of the address space that is causing this message to be issued.

Module:  BPESTG00
**BPE0042E**  ERROR INITIALIZING BPE LIMITED FUNCTION SERVICES: details

**Explanation:** The initialization of BPE limited function services (LFS) failed. BPE LFS is used in certain address spaces (such as the IMS control region) that do not otherwise use BPE services. If BPE is unable to successfully initialize the LFS environment, it issues this message to document the error.

In the message text:

---

**details**  The type of error that was detected.

The details portion of the BPE0042E message further explains the error detected, and can be one of the following:

**UNABLE TO GET STORAGE**  A STORAGE OBTAIN call failed to get storage necessary to initialize the BPE LFS environment.

**UNABLE TO LOAD BPEZLFS0**  BPE could not load the main BPE LFS module, BPEZLFS0.

**INVALID BPEZLFS0 VECTOR TABLE**  The vector table at the beginning of module BPEZLFS0 was invalid. This table is used to locate all of the functional routines contained within the BPEZLFS0 load module. When processing the table, BPE detected an invalid entry.

**UNABLE TO CREATE NAME-TOKEN**  BPE attempted to create an z/OS name-token for use later by BPE LFS. The create call failed.

**UNKNOWN ERROR**  An unexpected error occurred during BPE LFS initialization.

---

**System action:** BPE LFS initialization fails, and a non-zero return code is passed back to the caller. BPE LFS services are unavailable. When the caller is the IMS control region, IMS initialization fails. IMS issue messages DFS2930I, followed by an abend 0071.

**System programmer response:** If the error described in this message is caused by environmental conditions (for example, insufficient storage or modules missing from IMS.SDFSRESL), correct the indicated problem and restart the address space. Otherwise, save any memory dump and SYSLOG information, and contact the IBM Software Support.

**Module:** BPEZIN10

INTERNAL PROCESSING ERROR, service RC=rc
An internal error within BPE, as indicated by the service included in the text. In the message text:

- service: The BPE internal service returning the error return code.
- rc: The return code from the failing BPE internal service.

EXTERNAL PROCESSING ERROR, service RC=rc/rns
An external error was encountered as indicated by the service included in the text. In the message text:

- service: The name of the external service
- rc: The return code returned by the failing service
- rsn: The reason code returned by the failing service, if any is supplied

System programmer response: Messages that further explain the reason for the error might precede this message. Refer to the job log output from the failed job for explanatory messages.

If you cannot determine and correct an environmental cause for the problem, save any storage memory dump and SYSLOG information. Then contact IBM Software Support.

Module: BPETR8G0, BPETRFO0, BPETR0C0

BPE0044I BPE EXTERNAL TRACE FUNCTION NOT ACTIVE

Explanation: An error occurred during external trace processing and external trace functionality is no longer active. This message is also issued if the external trace function is stopped by using a BPE UPDATE TRTAB command.

System action: BPE external trace functionality is no longer available.

System programmer response: Messages that further explain the reason for the error might precede this message. Refer to the job log output from the failed job for explanatory messages.

Issue UPD TRTABLE command to restart the external trace functionality.

If you cannot determine and correct an environmental cause for the problem, save any storage memory dump and SYSLOG information, and contact IBM Software Support.

Module: BPETRFO0, BPEXTF0

BPE0045E BPE ver.rel REQUIRES facility

Explanation: An address space using BPE could not be started because BPE required a system facility that was not available. Facilities that prevent BPE from starting can include hardware (including not having a particular hardware level or facility) and software (including not having a required software component installed or at the correct level).

Information in the message text is as follows:

- ver.rel: The BPE internal version and release levels. For example, 1.6 is the internal BPE version and release for IMS Version 10.
- facility: The facility that BPE needed but was not available. The value of facility can be one of the following:

Z/ARCHITECTURE MODE
BPE 1.6 or later can run only on processors running in z/Architecture® mode. ESA and below is no longer supported. You must either re-IPL your z/OS system in z/Architecture mode, or you must move the address space you are trying to start to a
different machine that is running in z/Architecture mode.

**64-BIT VIRTUAL SUPPORT**
You can run BPE 1.6 or later only under a z/OS release that has 64-bit virtual storage support. If you receive this message, then you are running BPE under a non-supported z/OS level that does not allow 64-bit virtual storage. You must upgrade your z/OS to the minimum level for the current release of BPE. For the minimum supported z/OS release, see Software requirements (Release Planning).

**LONG DISPLACEMENT FACILITY**
BPE 1.8 or later can run only on processors that have the Long Displacement Facility hardware. If you are running IMS on an IBM eServer™ zSeries 900 (z900, machine type 2064), the machine must be at a GA2 level (microcode level 3G or later) to enable the Long Displacement Facility. For all other zSeries machine types, the Long Displacement Facility is always present.

**System action:** The address space terminates with a 3400 abend.

**System programmer response:** Make the facility indicated available on the machine on which you run the BPE address space. As an alternative, run the BPE address space on a different machine that has the indicated facility.

**Module:** BPEINIT0
**Related information:**

[3400 (Messages and Codes)]

---

**BPE0046I** EXTERNAL TRACE DATA SET dsn OPENED (or CLOSED) ON VOL vol

**Explanation:** A BPE external trace data set, indicated by dsn, was opened or closed.

**System action:** An external trace data set is opened if the current data set becomes full, or if the external trace functionality is started. An external data set is closed when it becomes full or when the external trace functionality is stopped.

**System programmer response:** No action is required.

**Module:** BPETROC0

---

**BPE0047E** ERROR DURING UPDATE TRACETABLE REREAD PROCESSING details

**Explanation:** An error occurred when processing the OPTION(REREAD) option of the UPDATE TRACETABLE command. The UPDATE command is not processed.

The details of the message provides more information about the error detected, and can be one of the following:

**UNABLE TO GET NECESSARY STORAGE**
BPE was not able to obtain the storage required to reprocess the BPE configuration PROCLIB member when trying to obtain any updated value for the EXTTRACE parameter.

**ERROR READING BPE CONFIGURATION PROCLIB MEMBER member**
An error occurred reading the BPE configuration PROCLIB member. This message is preceded by message BPE0002E, which provides details about the error. In the details text, member identifies the name of the BPE configuration PROCLIB member that could not be read.

**ERROR PARSING BPE CONFIGURATION PROCLIB MEMBER membername**
An error occurred parsing the BPE configuration PROCLIB member. If this is due to a syntactical error within the data being parsed, then this message is preceded by message BPE0003E describing the error. In the details text, membername is the name of the BPE configuration PROCLIB member that could not be parsed.

**UNKNOWN ERROR rc FROM PARSING MODULE BPEPCF10**
Module BPEPCF10 returned an unexpected return code to the UPDATE TRACETABLE command processor. BPEPCF10 is the module that reads and parses the BPE configuration PROCLIB member. In the details text, rc is the unknown return code from module BPEPCF10.

**LOAD FAILED FOR BPEPCF10, BPELOADDC RC=rc**
Module BPEPCF10 could not be loaded. BPEPCF10 is the module that reads and parses the BPE configuration PROCLIB member. In the details text, rc is the return code from the BPELOADDC service used to load and call BPEPCF10.

**BPE CONFIG PROCLIB MEMBER NAME WAS NOT CODED ON STARTUP PARMS**
The BPE configuration PROCLIB member could not be reread because no member name was specified on the startup parameters for the address space. You must include the BPECFG= parameter in the job parameters and must specify a valid BPE configuration PROCLIB member name for the OPTION(REREAD) parameter to be usable on the UPDATE TRACETABLE command.
OPTION(REREAD) is not applicable for this execution of the address space.

**PREVIOUS UPDATE COMMAND REREAD PROCESSING IN PROGRESS**
A previous UPDATE TRACETABLE command specified OPTION(REREAD). The reprocessing of the EXTRACT command for this previous UPDATE command has not yet completed. A second UPDATE TRACETABLE command with OPTION(REREAD) cannot be processed until the processing of the first command has completed.

**NO MATCHING EXTRACT STATEMENT FOUND FOR ADDRESS SPACE**
The BPE configuration PROCLIB member did not contain an EXTRACT statement that applies to this address space. In order to apply, an EXTRACT statement must either contain the COMP= parameter specifying the component type for the current address space, or else must have no COMP= parameter specified (so that the EXTRACT statement applies to all address spaces).

**System action:** The UPDATE TRACETABLE command fails, and no change is made to the trace table settings.

**System programmer response:** For errors that are correctable (for example: parsing errors, incorrect parameters, incorrectly named PROCLIB members), correct the error and reissue the UPDATE TRACETABLE command.

Some internal errors that result in message BPE0047E could be due to transient conditions, such as a temporary lack of storage. Enter the command again and check whether the error recurs. If it does, issue a console memory dump of the address space immediately after entering the command, and contact the IBM Software Support. To ensure that trace information necessary to the resolution of the problem is available, you can turn on the following BPE traces at LEVEL(HIGH): CMD, SSR, STG, DISP

**Module:** BPESRPG0

**Explanation:** During abnormal termination of a BPE address space, BPE requests all SRBs managed by BPE to terminate before continuing with address space termination. This informational message indicates that BPE has started the SRB termination process.

**System action:** After issuing this message, BPE terminates all BPE-managed SRBs.

**System programmer response:** No action is required.

**Module:** BPESRPG0

**Explanation:** During abnormal termination of a BPE address space, BPE requests all SRBs managed by BPE to terminate before continuing with address space termination. This informational message indicates that BPE completed SRB termination.

**System action:** After issuing this message, BPE continues with address space abnormal termination.

**System programmer response:** No action is required.

**Module:** BPESRPG0

**Explanation:** During abnormal termination of a BPE address space, BPE requests all SRBs managed by BPE to terminate before continuing with address space termination. However, one or more SRBs did not terminate. BPE abends such SRBs with ABENDU3405 before continuing with abnormal termination. BPE issues the BPE0051E message for each SRB that does not successfully terminate, before abnormally terminating it with ABENDU3405.

**In the message text:**

- **type** The 4-character type of the SRB being terminated.
- **diag1** The address of the internal BPE TCBT control block that represents the SRB being abnormally terminated. This data and the **diag2** data is diagnostic information that might be useful for problem determination by IBM Software Support.
- **diag2** Four flag bytes from internal BPE TCBT and DWA control blocks that represent the SRB being abnormally terminated. The first two bytes of this value are flags TCBT_FLG and TCBT_FLG2 from the BPE TCBT block. The second two bytes of this value are flags DWA_FLG1 and DWA_FLG2 from the BPE DWA block. This data and the **diag1** data is
diagnostic information that might be useful for problem determination by IBM Software Support.

**System action:** After issuing this message, BPE abends the indicated SRB with ABENDU3405 reason code X'01'.

**System programmer response:** Save any dumps, the job log, and the console log, and contact IBM Software Support.

**Module:** BPESRPG0

---

**BPE0052E**  
**BPE SRB FRR WAS ENTERED**  
**HOLDING A CPU LOCK**

**ABEND abendcode RSN reasoncode PSW psw1 psw2**  
**DIAG diag1 diag2 diag3 diag4**

**Explanation:** A functional recovery routine (FRR) protecting a BPE-managed SRB received control holding a z/OS CPU lock. Holding a CPU lock indicates that the FRR is running disabled for interrupts. This is a restrictive mode that limits what processing the FRR can perform to either recover from or gather diagnostics for the abend. BPE issues message BPE0052E to document the abend, and then terminates the address space with ABENDU3405 reason code X'02'.

In the message text:

**abendcode**  
The abend code that caused the FRR to be driven.

**reasoncode**  
The reason code, if any, associated with the abend. This field is "????????" if no reason code is available.

**psw1 psw2**  
The two words of the program status word (PSW) at time of abend. These fields is "????????" if the abend PSW is not available.

**diag1**  
The address of the internal BPE TCBT control block that represents the SRB being abnormally terminated. This data and the **diag2**, **diag3**, and **diag4** data is diagnostic information that might be useful for problem determination by IBM Software Support.

**diag2**  
The address of the internal BPE DDB control block that represents the SRB being abnormally terminated.

**diag3**  
Flag bytes from the BPE SRB FRR parameter area, FRPL_FLGWD.

**diag4**  
Flag bytes from the BPE CSCD flag word CSCD_STAFLGS. This field is "????????" if the BPE CSCD address is not available to the FRR.

**System action:** After issuing this message, if the BPE CSCD address is available to the FRR, the FRR abends the BPE job step (JSTP) TCB with ABENDU3405 reason code X'02' to terminate the address space.

**System programmer response:** Save any dumps, the job log, the console log, and SYS1.LOGREC, and contact IBM Software Support.

**Module:** BPESRF0

---

**BPE0053E**  
**BPE rcvrtntype IS UNABLE TO GET STORAGE FOR AN SDUMP SRB**

**Explanation:** During ABEND processing, a BPE recovery routine attempted to get storage for an SRB in order to generate a dump. The storage was not available.

In the message text:

**rcvrtntype**  
Specifies the type of BPE recovery routine that encountered the storage error: "ESTAE" (for TCBs) or "FRR" (for SRBs).

**System action:** BPE continues ABEND processing. However, no dump is generated.

**System programmer response:** No action is required. However, this message might indicate that your system has limited common storage.

**Module:** BPESRF0

---

**BPE0054I**  
**BPE rcvrtntype PROCESSING COMPLETE FOR dumname dutype = DIAG**  
**diag1 diag2 diag3**

**Explanation:** BPE recovery routine processing is complete for the indicated dispatchable unit (TCB or SRB). This message is issued for the initial TCB or SRB that abends, and for the BPE job step TCB (type JSTP). The message is issued to provide diagnostic information about the DU termination, and does not indicate any specific problem.

In the message text:

**rcvrtntype**  
Specifies the type of BPE recovery routine that encountered the storage error: "ESTAE" (for TCBs) or "FRR" (for SRBs).

**dumname**  
4-character name of dispatchable unit (TCB or SRB) that abended.

**dutype**  
Type of dispatchable unit that abended: "TCB" or "SRB".

**diag1**  
The address of the internal BPE TCBT control block that represents BPE TCB or SRB that abended. This data and the **diag2** and **diag3** data is diagnostic information that might be useful for problem determination by IBM Software Support.

**diag2**  
Internal ESTAE or FRR work area flags.
diag3  Contents of a doubleword internal trace
       (EWRKNYTR or FWRKNYTR).

System action: The BPE recovery routine returns to
z/OS.

System programmer response: No action is required.
This is a diagnostic message.

Module: BPESRFR0, BPESYES0
Chapter 4. CQS messages (Common Queue Server)

Messages issued by the Common Queue Server (CQS) have the prefix CQS.

For information about the return and reason codes for CSL services, see information about Structured Call Interface. Also see information about the CQS control list entries.

Related concepts:
- Overview of the CSL Structured Call Interface (System Administration)

Related reference:
- CQS control list entries (Messages and Codes)

**CQS0001E** CQS INITIALIZATION ERROR IN module, message text

**Explanation:** An error occurred during CQS address space initialization in the identified module. In the message, message text can be one of the following:

- *service name* RC=rc RSN=rsn
- *service name* RC=rc text

The information in these forms of message text includes:

- *service name* The name of the failing service.
- *rc* The return code from the failing service. Refer to the information about CQS service return codes for a description of these codes and on BPE service return codes for a description of BPE service codes.
- *rsn* The reason code from the failing service.
- *text* Additional information to describe the error.

The values of *service name* and explanations of the problem are as follows:

- **BPELOAD** CQS was attempting to load a module. The text that appears in the message is the name of the module that could not be loaded. Ensure that the module is linked into IMS.SDFSRESL.

- **CSLSCREG** SCI registration request. RC= and RSN= values for this request are described in "CSLSCREG: registration request."

- **CQSIXCF0, with RC=X’28’** Two different CQS address spaces specified the same value in the SSN parameter in the execution

Parameters or the CQSIPxxx PROCLIB member. Change the SSN value of one of the CQS address spaces.

- **ENFREQ** RC= is the return code from the MVS ENFREQ service.

- **PARM VALIDATION ERROR** *parmname* *parmname* is the execution or PROCLIB parameter being validated and can be one of the following:

  - **SSN** This parameter was not specified in the execute parameters or in the CQSIPxxx PROCLIB member.
  - **CQSGROUP** This parameter was not specified in the execute parameters or in the CQSIPxxx PROCLIB member.
  - **ARMRST** An invalid value was specified for the ARMRST keyword in the execute parameters or in the CQSIPxxx PROCLIB member.
  - **STRNAM SL** This parameter was not specified in a structure definition in the CQSIPxxx PROCLIB member.

- **CHKPTDSN** This parameter was not specified in a structure definition in the CQSIPxxx PROCLIB member.

- **SYSCHKPT** An invalid value was specified for the SYSCHKPT keyword in a structure definition in the CQSIPxxx PROCLIB member.

- **CK/CK DSN** Two different structure definitions specified the same value for the checkpoint data set name (CHKPTDSN) in the CQSIPxxx PROCLIB member.
STRNAME Sg
This parameter was not specified in a structure definition in the CQSSGxxx PROCLIB member.

ST/OV DEF
A single structure definition specified the same value for the primary structure name (STRNAME) and the overflow structure name (OVFLWSTR) in the CQSSGxxx PROCLIB member.

SRDSDSN1
This parameter was not specified in a structure definition in the CQSSGxxx PROCLIB member.

SRDSDSN2
This parameter was not specified in a structure definition in the CQSSGxxx PROCLIB member.

S1/S2 DEF
A single structure definition specified the same value for structure recovery data set name 1 (SRDSDSN1) and structure recovery data set name 2 (SRDSDSN2) in the CQSSGxxx PROCLIB member.

LOGNAME
This parameter was not specified in a structure definition in the CQSSGxxx PROCLIB member.

OVFLWMAX=
An invalid value was specified for the OVFLWMAX keyword in a structure definition in the CQSSGxxx PROCLIB member.

STRMIN
An invalid value was specified for the STRMIN keyword in a structure definition in the CQSSGxxx PROCLIB member.

ST/OV SG
Two different structure definitions specified the same value for the primary structure name (STRNAME) and the overflow structure name (OVFLWSTR) in the CQSSGxxx PROCLIB member.

OVFSTR SG
Two different structure definitions specified the same value for the overflow structure name (OVFLWSTR) in the CQSSGxxx PROCLIB member.

LOGNAM SG
Two different structure definitions specified the same value for the log stream name (LOGNAME) in the CQSSGxxx PROCLIB member.

S1/S2 SG
Two different structure definitions specified the same value for structure recovery data set name 1 (SRDSDSN1) or structure recovery data set name 2 (SRDSDSN2), or both, in the CQSSGxxx PROCLIB member.

CQSSL STR
A structure name specified in a structure definition in the CQSSLxxx PROCLIB member was not found in the CQSSGxxx PROCLIB member or there was a duplicate structure name in the CQSSLxxx PROCLIB member.

CQSSG STR
A structure name specified in a structure definition in the CQSSGxxx PROCLIB member was not found in the CQSSLxxx PROCLIB member or there was a duplicate structure name in the CQSSGxxx PROCLIB member.

CK/SR DSN
A structure definition in the CQSSLxxx PROCLIB member specified a checkpoint data set name (CHKPTDSN) that is the same name used for structure recovery data set name 1 (SRDSDSN1), structure recovery data set name 2 (SRDSDSN2), or both, in a structure definition in the CQSSGxxx PROCLIB member.

UNKNOWN TCB TYPE tcbname
_tcbname is the name of the TCB.

System action: CQS terminates abnormally with abend code 0010 or 0014.

System programmer response: If you are unable to resolve the problem, save the SYSLOG and dump, and call IBM Software Support for help.

Programmer response: For errors not described, save the message text, abend code, abend subcode, and dump, and contact IBM Software Support.

Module: CQSICHK0, CQSICQS0, CQSIENF0, CQSIIOFL0, CQSIIRQS0, CQSIIST00, CQSIIST10, CQSIIST20, CQSIIST30, CQSIIST40, CQSIITCB0

CQS0007I  CQS cqsname INITIALIZATION WAITING FOR REBUILD TO COMPLETE.

Explanation: CQS is waiting for a structure to rebuild before it can connect to the structure and continue initialization.

In the message text:
cqsname

The name of the CQS that is waiting

System action: CQS processing continues.

System programmer response: Wait for the rebuild to complete.

Module: CQSSTS10

CQS0008W  STRUCTURE structurename IS VOLATILE; CONSIDER STRUCTURE CHECKPOINT

or

STRUCTURE structurename IS VOLATILE

Explanation:
The structure identified by structurename is volatile. If the structure does not support structure checkpoint, such as a resource structure, the second form of the message is issued.

System action: CQS processing continues.

System programmer response: For a structure that supports structure checkpoint, consider taking a structure checkpoint in case the structure is lost because of structure volatility.

Module: CQSSTE00, CQSSTS10

CQS0009W  STRUCTURE structurename REQUIRES STRUCTURE CHECKPOINT FOR RECOVERY

Explanation: During CQS initialization, CQS detected that a structure contained client data, but the data was unavailable from another source should structure recovery be required. Neither the structure recovery data sets (SRDS) nor the CQS log stream are valid for structure recovery, and neither of the SRDS contains valid client data. The CQS log stream does not contain the beginning of the log X'4001' record. In the message text structurename is the name of the structure that CQS is processing.

System action: CQS processing continues.

System programmer response: When all CQS address spaces have completed restart, initiate a structure checkpoint for the specified structure. For IMS users, when an IMS control region is connected to the CQS address space, you can enter the IMS command

/CQCHKPT SHAREDQ to start a structure checkpoint.

Module: CQSIST30

CQS0010I  STRUCTURE structurename function
RC=rc RSN=rsn DIAG=diag1 diag2

Explanation: CQS has connected to, disconnected from, or deleted a structure. This message provides diagnostic information related to this event.

In the message text:
structurename

The name of the structure.

function

The function being performed against the structure. Possible functions are:

CONNECT

CQS connected to a structure using the IXLCONN macro

CONNECT REBUILD

CQS connected to a rebuild structure using the IXLCONN macro. It is normal to see a nonzero return code (RC=00000004 RSN=xxxx0407) for this function. This return code indicates that there is a rebuild in progress for the structure

DISCONNECT

CQS disconnected from a structure using the IXLDISC macro.

DISCONNECT-FP

CQS disconnected from a structure as a failed-persistent connection using the IXLDISC macro.

DELETE

CQS deleted a structure using the IXLFORCE macro

DELETE ALLCONNS

CQS deleted all failed persistent connections to a structure using the IXLFORCE macro. It is normal to see a nonzero return code (RC=0000000C RSN=xxxx0C2A) for this function. This return code indicates that there were no connections to delete.

rc

The return code from the IXL macro.

rsn

The reason code from the IXL macro.

diag1

The current four-byte hexadecimal value in field STRRBLWD in the structure block of the structure involved. This data and the diag2 data is diagnostic information that might be useful for problem determination by IBM Software Support.

diag2

Additional four-byte hexadecimal diagnostic data. The value of diag2 depends on the structure type and function.

• For queue structures, diag2 is the value in field STRSTAT1W in the resource structure block.

• For resource structures, diag2 is the value in field STRSTAT1W in the resource structure block.

Chapter 4. CQS messages (Common Queue Server)  39
Additionally, when function is either CONNECT or CONNECT REBUILD, the low byte of the diag2 field is replaced with the value returned by IXLCONN in field CONAFLAGS in the connect answer area.

**System action:** CQS processing continues.

**System programmer response:** No action is required.

This message provides data about CQS connections to structures. This data might be helpful to IBM service in certain diagnostic situations.

**Module:** CQSSTS10

---

**CQS0013E**

**STRUCTURE structurename ALLOC ERROR; CFNAME=cfname RSN=rsncode SIZE NEEDED(4K BLOCKS)=4kblocks**

**Explanation:** CQS initialization attempted to allocate a structure, but the structure allocation failed because no suitable Coupling Facility was found for the allocation. One CQS0013E message is issued for each Coupling Facility (in the CFRM policy preference list) that CQS attempted to allocate the structure upon.

The allocation of the structure might have failed for one of the following reasons:
- The structure size might be too small to accommodate the z/OS control space and the CQS structure attributes (for example, EMCs for queue structures). The structure size is defined in the CFRM policy with the INITSIZE or SIZE parameter.
- No Coupling Facility in the CFRM policy preference list could accommodate the structure size defined in the CFRM policy.

In the message text:
- **structurename** Structure name that failed allocation.
- **cfname** Coupling Facility name where the structure allocation was attempted.
- **rsncode** Structure allocate failure reason. If the structure allocation succeeded, the reason code is zero, but the structure attributes were unacceptable to CQS (for example, there were no EMCs defined for a queue structure).
- **4kblocks** The minimum structure size in 4 K blocks (hexadecimal) needed to accommodate the z/OS control space and the CQS structure attributes for the structure INITSIZE or SIZE defined in the CFRM policy.

**System action:** CQS terminates abnormally with 0014-00000200.

**System programmer response:** If no Coupling Facility has enough storage to accommodate the structure, free storage on a constrained Coupling Facility so that the structure allocation can succeed.

If the structure size is smaller than the minimum size needed, activate a new CFRM policy that defines the SIZE or INITSIZE that at least meets the minimum size required for the structure. Calculate the minimum size needed by converting the 4Kblocks hexadecimal value to decimal and then multiply the resulting number by 4.

**Module:** CQSSTS10

**Related information:**
- [CQS abend 0014](#)

---

**CQS0014E**

**STRUCTURE structurename INIT FAILURE; failure reason.**

**Explanation:** CQS initialization or structure rebuild was unable to initialize a structure. Structure initialization failed for structurename on structure connect, structure disconnect, or an access of the structure.

This message is issued for every CQSGLOBAL mismatch error that is detected. A CQSGLOBAL mismatch can be one or more of the following:
- OVERFLOW STRUCTURE MISMATCH
- SRDS1 MISMATCH
- SRDS2 MISMATCH
- LOG STREAM MISMATCH
- QTYPE COUNT MISMATCH
- XCF GROUP NAME MISMATCH

The **failure reason** is one of the following:

**REQUEST=func XES RC=returncode RSN=rsncode**

An MVS IXL request to connect to the structure, disconnect from the structure, read a control list entry, write a control list entry, lock the control list header, or unlock the control list header failed. The possible functions and their meanings are:

- **CONN**
  - [IXLCONN](#) (For codes, see [z/OS: IXLCONN return and reason codes](#))

- **DISC**
  - [IXLDISC](#) (For codes, see [z/OS: IXLDISC return and reason codes](#))

- **EVENQ**
  - [IXLLIST](#) FUNC=MONITOR (For codes, see [z/OS: IXLLIST return and reason codes](#))

- **LOCK**
  - [IXLLIST](#) FUNC=LOCK (For codes, see [z/OS: IXLLIST return and reason codes](#))

- **UNL**
  - [IXLLIST](#) REQUEST=LOCK (unlock)

- **CRT**
  - [IXLLIST](#) FUNC=READ OR WRITE (to create a control-list entry)

- **READ**
  - [IXLLIST](#) FUNC=READ (For codes, see [z/OS: IXLLIST return and reason codes](#))

- **RBLD**
  - [IXLREBLD](#) (For codes, see [z/OS: IXLREBLD return and reason codes](#))
The return code is the z/OS cross-system extended services (XES) return code; rsncode is the XES reason code. The XES return and reason codes are documented in z/OS MVS Programming: Sysplex Services Reference (SA22-7618).

STRUCTURE NOT DEFINED IN POLICY
The structure connection failed because the structure is not defined in the coupling facility resource management (CFRM) policy.

STRUCTURE TOO SMALL
The shared queues structure is smaller than the minimum structure size defined in the coupling facility resource management (CFRM) policy. CQS abends only if the structure is empty.

Check the STRMIN value specified in the CQSSGxxx member of PROCLIB to compare the STRMIN value with the structure size specified in the CFRM policy. Determine if the CFRM policy must be changed so CQS can allocate a larger shared queues structure. A policy change and a structure rebuild might be necessary to increase the size of the structure.

OVERFLOW STRUCTURE MISMATCH
The overflow structure name specified in the OVFLWSTR parameter in PROCLIB member CQSSGxxx does not match the value in the CQSGLOBAL control list entry for the structure. The structure was already allocated when this CQS connected to the structure.

SRDS1 MISMATCH
The SRDS1 data set name specified in the SRDSDSN1 parameter in PROCLIB member CQSSGxxx does not match the value in the CQSGLOBAL control list entry for the structure. The structure was already allocated when this CQS connected to the structure.

SRDS2 MISMATCH
The SRDS2 data set name specified in the SRDSDSN2 parameter in PROCLIB member CQSSGxxx does not match the value in the CQSGLOBAL control list entry for the structure. The structure was already allocated when this CQS connected to the structure.

LOG STREAM MISMATCH
The log stream name specified in the LOGNAME parameter in the CQSSGxxx member of PROCLIB does not match the value in the CQSGLOBAL control list entry for the structure. The structure was already allocated when this CQS connected to the structure.

QTYPE COUNT MISMATCH
The QTYPE count values defined locally to this CQS do not match the values in the CQSGLOBAL control list entry for the structure. (QTYPE is an internal value.) This CQS version might be out of sync with the version of the CQS that allocated the structure.

BPEGETM ERROR
A request for storage to read the CQSOVERFLOWQNAME control list entry failed.

BACKLEVEL CF LEVEL
The coupling-facility level required by this CQS is earlier than the coupling-facility level at which the structure was allocated. This CQS version might be out of synchronization with the version of the CQS that allocated the structure.

UNACCEPTABLE STRUCTURE ATTRIBUTE
The connection to the structure succeeded, but one of the structure attributes is not acceptable to CQS. Some examples of unacceptable attributes are:
- The structure is not persistent.
- The number of list headers does not match.
- The structure does not support keys.
- The structure does not support adjunct areas.
- The structure does not support data elements.
- The data element size does not match.

When CQS detects this error, it disconnects from the structure before terminating abnormally.

NO EMCS ALLOCATED
The connect to the structure succeeded, but no event monitoring controls (EMCs) were allocated because the minimum structure size needed to enable EMCS was greater than the size of the structure allocated. EMCs are required for CQS to notify clients of work on queues. The structure defined in the CFRM policy probably is not large enough to support EMCS. When CQS detects this error, it disconnects from the structure before terminating abnormally.

XCF GROUP NAME MISMATCH
The CQSGROUPE parameter defining the XCF group name as a CQS execution parameter or in the CQSGxxx PROCLIB member does not match the value in the CQSGLOBAL control list entry for the structure. The structure was already allocated when this CQS connected to the structure.

IXLUSYNC SET IN PROGRESS
The connection to the structure succeeded, but an IXLUSYNC SET event was in progress. CQS was unable to confirm the IXLUSYNC event because of an internal error. When CQS detects this error, it disconnects from the structure before abending. Restart the CQS address space.

System action: If CQS is initializing when the structure initialization error occurs, CQS terminates with abend 0014. If the structure is being rebuilt when the structure initialization error occurs, the structure rebuild is terminated abnormally.
CQS0015E • CQS0017E

System programmer response: If the connection was due to a structure rebuild, analyze the abend subcode or rebuild failure return code in message CQS0242E.

The CQS that first connects to a structure allocates the structure using the parameters defined to that CQS. Those values are then remembered and must be the same for any other CQS that later connects to the same structure. If the parameter values are different then a MISMATCH error occurs. If the parameter is specified incorrectly on the abended CQS, correct the parameter and restart the CQS.

If the parameter was specified incorrectly on the CQS that allocated the structure, the structure must be deleted and reallocated in order to change the values. To delete a structure, see IMS Version 13 System Administration.

The next time CQS initializes, it reallocates the structure and initiates a structure recovery if necessary.

Module: CQSIST20, CQSIST30, CQSSTS10, CQSSTS30

- CQS0017E
- CQS0242E on page 56

CQS0015E STRUCTURE strname1 INIT FAILURE;
CHKPTDSN
DSN=dsn
IS FOR CQS cqsname, STRUCTURE strname2

Explanation: The checkpoint data set that CQS was using for this structure contains information for another CQS, another structure, or both. The checkpoint data set must either be initialized for this CQS and structure, or it must be empty.

This message might be issued during CQS initialization or during a CQS system checkpoint if system checkpoint allocates the checkpoint data set and date set validation fails. This situation occurs only if a prior system checkpoint encountered a data set error that deallocated the checkpoint data set.

This message contains three lines. Each line begins with the message number and ends with the CQS identifier (cqsid) of the CQS being initialized or that is processing the system checkpoint.

In the message text:
- strname1
  Name of the structure. The structure is being initialized or a system checkpoint is being processed for it.
- dsn
  Name of the checkpoint data set
- cqsname
  CQS identifier in the checkpoint data set

System action: If CQS is initializing when the error occurs, CQS terminates with abend 0014. If a system checkpoint is being performed when the error occurs, the system checkpoint is terminated and CQS processing continues.

System programmer response: Specify the correct checkpoint data set in the CQSLSxxx PROCLIB member. If necessary, delete and reallocate the specified data set. If the error occurs during a system checkpoint, initiate a CQS system checkpoint immediately after the data set problem is corrected to ensure that CQS has a checkpoint available if a restart is required.

Module: CQSHK10, CQSIST30

Related information:

CQS0017E CQSREAD RESYNC ERROR,
CQSMOV10 RC = rc
LOCK KEY hex_lock_key
QNAME hex_qname (char_qname)
UOW1 = first_half_uow
UOW2 = second_half_uow

Explanation: During the CQSREAD resynchronization process, an error was encountered while moving a data object from the lock queue to the cold queue. The data object is left on the lock queue.

In the message text:
- rc
  The return code from CQSMOV10.
- hex_lock_key
  The lock key of the data object in hexadecimal.
- hex_qname
  The queue name of the data object in hexadecimal.
- char_qname
  The queue name of the data object in character.
- first_half_uow
  The first half of the UOW of the data object.
- second_half_uow
  The second half of the UOW of the data object.

System action: CQS processing continues.

System programmer response: See module CQSMOV10 in the CQS service return codes information, and correct any error based on the return code in the message. For rc = 28, the data object is moved from the lock queue to the cold queue during the next resynchronization process.

Module: CQSRD030

CQS0018E  CQS RESTART FAILED FOR STRUCTURE structurename

Explanation: An error occurred during CQS restart processing. The structurename is the name of the structure that encountered the error. For certain errors, message CQS0001E is also issued to provide additional information.

System action: CQS terminates abnormally with abend code 0018.

Module: CQSIST40

Related information:

- CQS0018E on page 37
- CQS abend 0018

CQS0019E  CQS RESTART INTERNAL ERROR FOR STRUCTURE structurename

RC=lssrrrr

Explanation: An error during CQS restart processing might have left one or more unit of work (UOW) in an indoubt state. Data objects for the affected UOWs might not have been copied to the coupling facility.

In the message text:

- structurename: The name of the structure
- lssrrrr: The error reason code. See the CQS service return codes information.

System action: CQS processing continues.

System programmer response: If you are unable to resolve the problem, copy the SYSLOG and dump of the CQS address space, and call IBM Software Support for help.

Related reference:

CQS0020I  CQS READY

Explanation: CQS initialization completed.

Module: CQSIST00

CQS0021I  CQS SHUTDOWN COMPLETE

Explanation: CQS shutdown completed.

Module: CQSTRM00

CQS0030I  SYSTEM CHECKPOINT COMPLETE, STRUCTURE structurename LOGTOKEN logtoken

Explanation: CQS took a system checkpoint.

In the message text:

- structurename: The name of the structure
- logtoken: The log token required by CQS to restart from this checkpoint

System action: CQS processing continues.

System programmer response: The operator must use the log token displayed in this message for CQS restart in case of checkpoint data set and coupling facility structure failures. If CQS cannot read the log token from another source, the operator must respond to the CQS0032A message with the log token from the most recent system checkpoint during CQS restart.

Module: CQSCHK10

Related information:

- CQS0032A

CQS0031A  CONFIRM CQS RESTART FOR STRUCTURE structurename, FROM CHECKPOINT LOGTOKEN logtoken

Explanation: CQS could not read the system checkpoint log token from the checkpoint data set, but found a system checkpoint log token in the control entry in the shared queues structure. The system programmer must enter a response.

In the message text:

- structurename: The name of the structure CQS restart is processing
- logtoken: The log token from the control entry

If a system error occurs while formatting this message, the log token is not present in the message text.

System action: CQS waits for a reply.

System programmer response: Enter one of the following responses:

- CONFIRM: CQS uses the log token in this message for restart processing.
- COLD: CQS begins cold start processing.
- CANCEL: CQS terminates restart processing with CQS abend 0020, reason code X’00000004’.
- logtoken: CQS uses the log token you entered for restart processing for this structure. (Obtain the log token from message CQS0030L.)

Module: CQSIST40

Related information:

CQS0032A  ENTER CHECKPOINT LOGTOKEN FOR CQS RESTART FOR STRUCTURE structurename

Explanation: CQS could not read the system checkpoint log token from either the checkpoint data set or the control entry.

In the message text:

- structurename: The name of the structure

System action: CQS processing continues.

System programmer response: The operator must use the log token displayed in this message for CQS restart in case of checkpoint data set and coupling facility structure failures. If CQS cannot read the log token from another source, the operator must respond to the CQS0032A message with the log token from the most recent system checkpoint during CQS restart.

Module: CQSCHK10

Related information:

- CQS0032A
CQS0033A • CQS0034A

set or from the control entry in the shared queues structure. CQS does not know where to start reading from the log without the log token. The system programmer must enter a response.

In the message text, structurename is the name of the structure CQS is processing.

This message is also issued if the required system checkpoint log record was deleted from the log because a structure checkpoint was successful. A log record that is older than the structure checkpoint log record is deleted during a structure checkpoint. In this case, reply COLD.

If this message is issued the first time CQS is started, reply COLD to perform the initial cold start.

System action: CQS waits for a reply.

System programmer response: Enter one of the following responses:
COLD CQS begins cold start processing.
CANCEL CQS terminates restart processing with CQS abend 0020, reason code X'00000008'.

logtoken CQS uses the log token you entered for restart processing for this structure. (Obtain the log token from message CQS0030L)

Module: CSQST40
Related information:
CQS0030I

CQS0033A ENTER CHECKPOINT LOGTOKEN FOR STRUCTURE structurename
CLIENT clientname CQS cqsname

Explanation: One of the following errors occurred:
• CQS could not read the system checkpoint log token for the CQS that was connected to the failed client from the control entry in the shared queues structure. CQS does not know where to start reading from the log without the log token.
• While reading log records for client connect restart processing, CQS encountered an error which prevents CQS from accessing all the required log records.

The system programmer must enter a response.

In the message text:
structurename The name of the structure that client takeover restart is processing
clientname The name of the client
cqsname The CQS identifier of the CQS that was connected to the failed client

System action: CQS waits for a reply.

System programmer response: Enter one of the following responses:
COLD CQS begins client takeover cold start processing.
REJECT CQS rejects the CQSCONN request with a completion code of X'00000018'.

Module: CQSST30
Related information:
CQS0030I

CQS0034A CANNOT REBUILD STRUCTURE structurename FROM LOGTOKEN,
ENTER options

Explanation: CQS was unable to perform structure recovery

In the message text:
structurename The name of the structure
options One of the following: COLD, CONTINUE, or CANCEL

During CQS initialization, CQS detected that a structure recovery is required. However, neither structure recovery data sets (SRDS) nor the CQS log stream are valid for structure recovery, and neither SRDS contain valid client data. The CQS log stream does not contain the beginning record of the X’4001’ log record. This means that a structure checkpoint had been performed and log records were deleted at that time. Structure recovery cannot be performed with only the log stream because log records that are required for recovery are missing.

COLD CQS performs a cold start of the structure. All the log records and the overflow structure, if one exists, are deleted. CQS is cold started.

CANCEL CQS ends restart processing with CQS abend 0020, reason code X'0000000C'.
CONTINUE

CONTINUE is not currently available; CONTINUE performs the same action as COLD. Enter COLD.

ABEND or CONTINUE

During structure recovery process, a call to CQSLRR00 to read and process CQS log records failed. The rebuild master issued this message to indicate that the structure recovery process could not continue.

ABEND

The rebuild master CQS and all other CQSs sharing the structure that failed rebuild abend with CQS abend 0104, reason code X'00000008'.

CONTINUE

The rebuild master aborts the current recovery process and continues with the rebuild stop event. It's possible that another structure recovery are initiated or skipped depending on the current status of the structure.

System action: CQS waits for a reply.

System programmer response: Enter one of the options from the WTOR message.

If the rebuild of a shared queues structure failed because of lost or damaged log data, then the structure is not recoverable. In this case, reply ABEND to the CQS0034A message to terminate all CQS address spaces that are connected to the structure. Then, delete the log streams and initialize the SRDSs again to force CQS to cold start the failed structure.

If the rebuild of a shared queues structure failed for a reason other than lost or damaged log data, the structure might be recoverable by renaming the structure recovery data set as indicated in the DSN= field of the CQS0246I message, and initiating a new structure rebuild. This structure rebuild will use the other older structure recovery data set and might be able to successfully complete the rebuild in some cases. Ensure that the renamed SRDS is renamed back to its original name at the end of structure rebuild.

CQS0035E  CQS SYSTEM CHECKPOINT FAILED,
STRUCTURE structurename,
RC=nnnnnnnn

Explanation: CQS system checkpoint processing failed.

In the message text:
structurename

The name of the structure.

nnnnnnnn

The return code for the system checkpoint. 
nnnnnnn indicates the reason for the error:

X'00000004'

CQS was unable to perform a system checkpoint because the restart has not yet completed. A system checkpoint is initiated upon completion of the restart.

X'00000008'

CQS was unable to perform a system checkpoint because a CQS system checkpoint is already in progress. No action is necessary.

X'0000000C'

CQS was unable to obtain the structure quiesce latch.

X'00000010'

CQS was unable to write the System Checkpoint Begin log record.

X'00000014'

System checkpoint processing for CQSPut requests failed.

X'00000018'

System checkpoint processing for CQSRead requests failed.

X'0000001C'

CQS was unable to write the System Checkpoint End log record.

X'00000020'

CQS was unable to open the system checkpoint data set. Refer to CQS0054E to determine why opening the system checkpoint failed. Correct the data set error and initiate a system checkpoint.

X'00000024'

CQS was unable to read the system checkpoint data set. Refer to CQS0054E to determine why reading the system checkpoint failed. Correct the data set error and initiate a system checkpoint.

X'00000028'

CQS was unable to write to the system checkpoint data set. Refer to CQS0054E to determine why writing to the system checkpoint failed. Correct the data set error and initiate a system checkpoint.

X'0000002C'

CQS was unable to close the system checkpoint.
checkpoint data set. Refer to CQS0054E to determine why closing the system checkpoint failed. Correct the data set error and initiate a system checkpoint.

X'00000030'

CQS was unable to obtain the lock on the control list header.

X'00000034'

CQS was unable to write the CQSLOCAL control list entry.

X'00000038'

CQS was unable to release the lock on the control list header.

X'0000003C'

CQS was unable to allocate the system checkpoint data set. Refer to CQS0050E to determine why the data set allocation failed. Correct the data set error and initiate a system checkpoint.

X'00000040'

CQS was not able to deallocate the system checkpoint data set. Refer to CQS0050E to determine why the data set allocation failed. Correct the data set error and initiate a system checkpoint.

System action: CQS processing continues.

System programmer response: If you cannot resolve the problem, copy the SYSLOG and the memory dump of the CQS address space and call IBM Software Support for help.

Module: CQSCHK10

Related information:

“CQS0050E”

“CQS0054E”

CQS0050E  DYN type FAILED FOR ds_type,
RC=rrrrrrrr/ssssssss
DSN=dsn

Explanation: Dynamic allocation or deallocation failed. This message contains two lines. Each line begins with the message number and ends with the CQS identifier (cqsid).

type ALLOC for dynamic allocation; UNALLOC for dynamic deallocation

ds_type The data set type is one of the following:

<table>
<thead>
<tr>
<th>CHKPNTDSN</th>
<th>Identifies the data set as the checkpoint data set in the CQSSLxxx PROCLIB member.</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRDSDNS1</td>
<td>Identifies the data set as the first structure recovery data set in the CQSSGxxx PROCLIB member.</td>
</tr>
<tr>
<td>SRDSDNS2</td>
<td>Identifies the data set as the second structure recovery data set in the CQSSGxxx PROCLIB member.</td>
</tr>
</tbody>
</table>

rrrrrrrr The return code from the MVS/DFP service.

ssssssss The reason code from the MVS/DFP service.

dsn The data set name.

System action: If this error occurs during initialization, CQS terminates abnormally. Otherwise, CQS continues processing.

System programmer response: Analyze the status of the data set in question. The data set must be a cataloged VSAM data set. For a description of the dynamic allocation or deallocation return and reason codes, see z/OS MVS Programming Authorized Assembler Services Guide (SA22-7608).

Module: CQSDYNA0

Related reference:

z/OS: Interpreting error reason codes from DYNALLOC
The CQS global interface block (CGIB) was being cleaned up.

CQSLOGP0 LOAD
Module CQSLOGP0 (log record purge processor) was being loaded.

CQSLOGP0 PURGE
Module CQSLOGP0 was in the process of purging CQS log records.

SRB CPOOL FREE
The global SRB cell pool was being freed.

ENF DELETE
The ENF LISTENs were being deleted.

System action: Resource cleanup processing continues with the next resource type. Cleanup for the resource indicated in the status field might be only partially done or might be totally skipped.

System programmer response: Save the job log and console log output and contact IBM Software Support.

If the module name in this message is CQSRSM00, and if CQS abnormally terminated, you should perform one of the following actions:

- If the terminating CQS was the only CQS that was running for its set of structures, then immediately restart the CQS.
- If there are other CQSs running, then either immediately restart the terminated CQS, or initiate a structure checkpoint on one of the surviving CQSs.

Successfully restarting the failed CQS, taking a structure checkpoint, or both is necessary to preserve the state of the data on the shared queues when a structure rebuild is needed. There might be log records that were not purged to the log from the terminating CQS.

System programmer response: This error message indicates that CSA storage might not be available. Contact IBM Software Support.

Module: CQSRSM00

Chapter 4. CQS messages (Common Queue Server)  47
CQS0105I  INTF CLEANUP SUCCESSFUL:
CLIENT=cccccccc
Explanation: The CQS resource manager was able to drive the client event exit and post or resume all outstanding CQS requests from the client.
In the message text:
cccccccc  Client name
Module:  CQSRSRM10

CQS0106W  INTF CLEANUP FAILED:
CLIENT=cccccccc, RSN=rrr
Explanation: When the CQS address space terminated, the CQS resource manager monitoring CQS for the client failed in a phase of its cleanup. The reason code indicates the problem that was encountered.
In the message text:
cccccccc  Client name
rrr  One of the following reason codes:
104  The resource manager was unable to obtain common storage for a CXSH block to notify the client that CQS terminated.
108  The resource manager was unable to schedule an SRB to the client address space to notify the client that CQS terminated.
10C  The resource manager was unable to schedule an SRB to the client address space to clean up the CQS interface blocks.
110  An abend occurred in the resource manager (CQSRSRM10).
System programmer response: If the client address space terminates before the CQS resource manager completes processing, you might receive this message with reason code 108 or 10C. In this case, other CQS resource managers have cleaned up CQS interface storage, and no action is required.
In all other cases, contact IBM Software Support. If you receive reason code 110, print the records in SYS1.LOGREC for information about the abend.
Module:  CQSRSRM10

CQS0110W  CLIENT client_id EXIT SRB ABEND
abend_code PSW=psw R15=r15
CQSSRB10=srb10_addr
EXIT=exit_addr
status
Explanation: CQS scheduled an SRB to the address space of client client_id to drive a CQS client exit. Either the CQS SRB routine or the client exit terminated abnormally.
In the message text:
client_id  The 8-character CQS client ID of the client that terminated.
abend_code  The abend that occurred (Sxxx for system abends and Uxxxx for user abends).
psw  The PSW (program status word) contents at the time of abend.
r15  The contents of register 15 at the time of the termination. For some abends, this is the abend subcode.
srb10_addr  The address of CQS module CQSSRB10. CQSSRB10 is the CQS SRB routine that is scheduled into the client address space.
exit_addr  The address of the client exit being called.
status  A text string that indicates where the abend occurred during client exit processing. The status field can have one of the following values:
BEFORE EXIT  The abend occurred before the client exit was called.
IN EXIT  The abend occurred while the client exit was in control.
AFTER EXIT  The abend occurred after the client exit returned.
This message is issued in the client address space.
System action: When the client-exit SRB terminates abnormally, CQS does not terminate either the client or the CQS address space, nor does it create a memory dump. The SRB functional recovery routine (FRR) takes the following actions before returning to z/OS:
• Issues this message
• Produces an SDUMP of the client and CQS address spaces
• Attempts to clean up a CQS and client storage associated with the request
The FRR records diagnostic information about the abend in the LOGREC data set.
System programmer response: Save a copy of the memory dump produced and save or print a copy of the LOGREC records pertaining to this abend. If the status field in this message is a value other than IN EXIT and the client is an IBM product, for example, IMS, contact IBM Software Support. If the status field is IN EXIT and the client is not an IBM product, contact the supplier of the client.
Module:  CQSRSRM10
CQS INTERFACE ABEND abend_code
PSW=psw
R15=r15

Explanation: An abnormal termination occurred in the interface between the client and CQS during the processing of a CQS request.

In the message text:

abend_code
The abend that occurred (Sxxx for system abends and Uxxx for user abends).

psw
The PSW (program status word) contents at the time of abend.

r15
The contents of register 15 at the time of abend. For some abends, this is the abend subcode.

module
The name of the CQS interface module that detected the abend. This is not necessarily the module that terminated; it is the module whose recovery routine (ESTAE or FRR) was driven because of the abend. Possible values of this field are:

CQSREG00
The termination occurred during registration with CQS.

CQSREG20
The termination occurred during registration with CQS.

CQSRQS00
The termination occurred on the input side of the interface. The input side of the interface sends the request to the CQS address space.

CQSSRB00
The termination occurred on the output side of the interface. The output side of the interface returns the result of a CQS request back from CQS to the client.

module_addr
The address of the detecting module.

status
A text string that indicates where the abend occurred during client exit processing. This status field is not present for all modules issuing this message.

If module is CQSREG00 or CQSREG20, status is blank. If module is CQSRQS00, status can have the following values:

BEFORE COPY
The termination occurred before the request data was copied to the CQS address space.

IN COPY
The termination occurred during the process of copying the request data to the CQS address space. The abend is likely due to bad data passed from the client.

IN ENQUEUE
The termination occurred while the request was being enqueued to the CQS address space.

AFTER COPY
The termination occurred after the copy and enqueue of the request to the CQS address space.

STATUS UNKWN
The FRR could not determine the status of the request when the abend occurred.

If module is CQSSRB00, status can have the following values:

BEFORE COPY
The termination occurred before the request data was copied to the client address space.

IN COPY
The termination occurred during the process of copying the request data to the client address space. The abend is likely due to bad data passed from the client.

AFTER COPY
The termination occurred after the request data was copied to the client address space.

IN POST
The termination occurred while the client was being posted (or resumed) to wake it up after a request had completed.

STATUS UNKWN
The FRR could not determine the status of the request when the abend occurred.

System action: When an abend occurs in the request interface, the interface functional recovery routine receives control from z/OS. The FRR analyzes the abend, takes appropriate recovery action, and gathers diagnostic data.

CQS interface abnormal terminations can have several causes:
• Invalid data passed by the client program
• Errors in the interface modules
• Environmental errors (such as overlaid control blocks or storage problems)
• Problems in CQS resource cleanup for a terminated CQS, or timing conditions for a CQS that is currently going through termination

The last cause in the list above can occur when a CQS address space is forced to terminate, and certain CQS resources were not cleaned up. It can also occur when a CQS is terminating at the same time a request is being issued. In these cases, terminations can occur because the interface is attempting to call the CQS address space when it no longer exists. For these types of abends, the interface FRR recovers and returns a return
code that indicates that CQS is unavailable, and does not issue a CQS0111W message or SDUMP.

For all other abend cases, the interface FRR issues this message and produces an SDUMP of the client, and the CQS address space, if possible. The FRR also logs diagnostic information to the LOGREC data set, and attempts to clean up resources associated with the request.

If the termination occurred at a point where the FRR can safely retry, it retries and return a nonzero return code to the client. If the abend occurred at a point where recovery is not possible because the status of the request is unknown or because retrying could cause loss of data integrity, the abend is not retried. In these cases, the client might be terminated, or the request might never complete.

**System programmer response:** Save a copy of the memory dump produced and save or print a copy of the LOGREC records pertaining to this abend. If the client is an IBM product (for example, IMS), contact IBM Software Support. If the client is not an IBM product, contact the supplier of the client.

**Module:** CQSREG00, CQSREG20, CQSRQS00, CQSSRB00

---

**CQS0112I**  SDUMP FAILED FOR abend ABEND, 
RC=rc, RSN=rsh

**Explanation:** CQS issued an SDUMP call to z/OS to produce a memory dump of the address space after an abend, but the SDUMP was not successful.

In the message text:

- **abend** The abend code for which the storage memory dump was created. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where dddd is the 4-digit abend code in decimal.
- **rc** The return code from the MVS SDUMP macro.
- **rsh** The reason code from the MVS SDUMP macro.

**System action:** The SDUMP is skipped.

**System programmer response:** Use the return and reason codes from the MVS SDUMP macro to determine the cause of the SDUMP failure. If appropriate, correct the cause of the failure so that future memory dumps are not lost.

**Module:** CQSRQS00, CQSRSM00, CQSSRB00, CQSSRB10

**Related reference:**

- [z/OS: Statements/parameters for ADYSETxx](#)
- [z/OS: ADYSETxx (dump suppression)](#)

---

**CQS0113I**  DAE SUPPRESSED DUMP FOR abend ABEND

**Explanation:** CQS issued an SDUMP call to z/OS to produce a memory dump of the address space after an abend, but the SDUMP was suppressed by z/OS memory dump analysis and elimination (DAE).

CQS recovery routines gather symptom string data related to an abend, and provide this data to z/OS when an SDUMP is requested. If DAE is enabled, CQS suppresses duplicate memory dumps, for example, dumps that have symptom strings identical to previously captured memory dumps. DAE is controlled through the MVS ADYSETxx PARMLIB member and the MVS SET DAE command.

In the message text:

- **abend** The abend code for which the memory dump was created. For system abends, the format of code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of code is Udddd, where dddd is the 4-digit abend code in decimal.

**System action:** The SDUMP is skipped. A CQS-generated memory dump is suppressed if its symptom string matches a previous dump, and if the current DAE setting in ADYSETxx is either SUPPRESS OR SUPPRESSALL.

**System programmer response:** No action is required.

**Module:** CQSRQS00, CQSRSM00, CQSSRB00, CQSSRB10

**Related reference:**

- [z/OS: ADYSETxx (dump suppression)](#)
- [z/OS: Statements/parameters for ADYSETxx](#)

---

**CQS0114E**  CQS RESMGR ABEND abend_code
PSW=psw RSN=reason module=modaddr
status

**Explanation:** An abnormal termination occurred in a CQS resource manager cleanup module during resource cleanup processing.

In the message text:

- **abend_code** The abend that occurred (Sxxx for system abends, Uxxxx for user abends).
- **psw** The PSW (program status word) contents at the time of termination.
- **reason** The abend reason code, or N/A if no reason code is available.
- **module** The name of the CQS resource module that detected the abend. This is not necessarily the module that terminated; it is the module whose recovery routine (ESTAE) was driven because of the abend.
- **modaddr** The address of the detecting module.
status A text string that indicates the resource cleanup processing that was being done when the termination occurred. If the resource is module CQSRSM00, status is one of the following values:

UNKNOWN
The resource that was being cleaned up could not be determined.

CGIB CLEANUP
The CQS global interface block (CGIB) was being cleaned up.

CQSLOGP0 LOAD
Module CQSLOGP0 (log record purge processor) was being loaded.

CQSLOGP0 PURGE
Module CQSLOGP0 was in the process of purging CQS log records.

SRB CPOOL FREE
The global SRB cell pool was being freed.

ENF DELETE
The ENF LISTENs were being deleted.

If the module is CQSRSM10, status is one of the following values:

UNKNOWN
The resource that was being cleaned up could not be determined.

REQUEST CLEANUP
CQSRSM10 was in the process of cleaning up in-flight requests after CQS terminated. The abnormal termination occurred during general cleanup processing (as opposed to the cleanup for a specific request). Request cleanup processing is terminated.

CLNT RQST POST
CQSRSM10 was posting a waiting request when the termination occurred. Processing continues with the next in-flight request.

CLNT RQST RESUME
CQSRSM10 was resuming the TCB of a suspended request when the abend occurred. Processing continues with the next in-flight request.

System action: The recovery routine of the resource manager cleanup routine saves data in SYS1.LOGREC. In some situations, a memory dump is also created to capture problem diagnostic data. When recovery from the abend is possible, the recovery routine then gives control back to the resource manager so that it can continue resource cleanup processing.

Programmer response: Save the memory dump produced, if one was generated, and save or print a copy of the SYS1.LOGREC records pertaining to this abend. Then contact IBM Software Support.

---

Module: CQSRSM00, CQSRSM10

CQS015E ABEND RECURSION DETECTED IN module - RETRY WILL BE SKIPPED

Explanation: A CQS recovery routine detected abend recursion (terminating abnormally in the same location over and over, or an excessive number of abends within the same routine). The recovery routine no longer retries the abend to prevent this recursion from continuing.

In the message text, module is the name of the CQS module with the recovery routine that detected the abend recursion.

System action: The recovery routine does not attempt to retry (recover from) the current abend. Instead, it moves the abend to the next recovery routine (if any), which might result in the termination of the address space.

Programmer response: Save any memory dump produced and save or print a copy of the data in SYS1.LOGREC, and contact IBM Software Support.

Module: CQSRSM00, CQSRSM10

CQS016I INTERNAL ABNORMAL DISCONNECT PROCESSED FOR CLIENT client REASON rr

Explanation: CQS detected that a previously-connected client address space has terminated without disconnecting and deregistering from CQS. CQS internally disconnects the client from all structures to which it had been connected. This situation can occur for the following reasons:

• When a CQS client does not code the CQSDISC macro to disconnect from CQS structures when it terminates normally.
• When a CQS client does not code the CQSDISC macro to disconnect from CQS structures during ESTAE processing when it terminates abnormally.
• When a CQS client suffers a catastrophic failure that prevents its recovery routines from getting control (such as an MVS FORCE command or a MEMTERM).

In the message text:
client The name of the client for whom the internal abnormal disconnect was processed.
rr The reason code indicating the CQS module that detected the terminated client and initiated the internal abnormal disconnect. This reason code can be one of the following:

 01 CQS015E - Connect processing for a new instance of the client detected that a previous instance of the client was still connected.
 02 CQS016I - The CQS resource manager monitoring the client was driven at client termination.
CQS0200I • CQS0205E

CQS0200I STRUCTURE structurename QUIESCED FOR quiesce reason

Explanation: CQS quiesced the structure because a structure process was started. CQS does not permit activity on a quiesced structure.

In the message text:
structurename

The name of the structure CQS quiesced

quiesce reason

One of the following structure processes:
OVERFLOW THRESHOLD PHASE 1
OVERFLOW THRESHOLD PHASE 2
OVERFLOW SCAN START
OVERFLOW SCAN END
STRUCTURE CHECKPOINT
STRUCTURE DUXPLEXING
STRUCTURE REBUILD
STRUCTURE DUXPLEXING

System action: CQS processing continues, but activity on the structure is not permitted.

Module: CQSST00, CQSST10, CQSST20

CQS0200I STRUCTURE structurename RESUMED AFTER quiesce reason

Explanation: CQS resumed the quiesced structure after a structure process completed.

In the message text:
structurename

The name of the structure CQS resumed

quiesce reason

One of the following structure processes:
OVERFLOW THRESHOLD PHASE 1
OVERFLOW THRESHOLD PHASE 2
OVERFLOW SCAN START
OVERFLOW SCAN END
STRUCTURE CHECKPOINT
STRUCTURE DUXPLEXING

System action: CQS processing continues.

Module: CQSST00, CQSST10, CQSST20

CQS0205E STRUCTURE structurename IS FULL

Explanation: The specified structure is full. No new data objects can be placed on the structure until some data objects are removed. This message is issued the first time CQS reaches the structure-full condition. It is only issued again if CQS goes out of overflow mode, goes back into overflow mode, and again reaches a structure-full condition.

In the message text:
structurename

The name of the structure that is full

For a resource structure, this message is issued if a CQSUPD request of a resource list entry failed because the resource structure is full. Only the first such failure within the resource update list causes this message to be displayed. The system issues at most one CQS0205E message for a resource update list.

System action: CQS processing continues.

System programmer response: Take an action that removes data objects from the structure. Also, consider running with an overflow structure, if you are not already doing so.

Module: CQSUPD00, CQSUPD20, CQSMOV10, CQSSTS20, CQSUPD00
CQS0206I  CQS structurename percentage BELOW THRESHOLD LEVEL

Explanation: The CQS structure space utilization fell the stated percentage below the threshold level. The structure was not eligible for overflow processing because the previous threshold process did not move any queues to the overflow structure. When this message is issued, the structure becomes eligible for threshold processing.

In the message text:
structurename
  The name of the structure for which space utilization has fallen below the threshold level.
percentage
  The percentage below the threshold level for which this structure space utilization has fallen.

System action: CQS processing continues. The named structure is now eligible for threshold processing.

Module: CQSDEL10, CQSMOV10

CQS0210I  STRUCTURE strname REPOPULATION REQUESTED

Explanation: The resource structure failed. CQS successfully allocated a new structure and requested that its clients repopulate the structure.

In the message text, strname is the resource structure name.

System action: CQS notified its clients to repopulate the structure in their structure vent exits.

Programmer response: No action is required.

Module: CQSSTE30

CQS0220I  CQS csqname STARTED STRUCTURE CHECKPOINT FOR STRUCTURE structurename

Explanation: A structure checkpoint is being taken. All of the CQSs connected to the structure issue this message if a structure checkpoint is started.

In the message text:
structurename
  The name of the structure that CQS will checkpoint
csqname
  The name of the CQS that is master of the structure checkpoint

System action: CQS processing continues.

Module: CQSSTE10

CQS0221I  CQS csqname COMPLETED STRUCTURE CHECKPOINT FOR STRUCTURE structurename

Explanation: Structure checkpoint processing completed. All of the CQSs connected to the structure issue this message if the structure checkpoint succeeds.

In the message text:
structurename
  The name of the structure that CQS checkpointed
csqname
  The name of the CQS that is master of the structure checkpoint

System action: CQS processing continues.

Module: CQSSTE10

CQS0222E  CQS csqname FAILED STRUCTURE CHECKPOINT FOR STRUCTURE structurename RC=xxnnnnnn

Explanation: The structure checkpoint failed. All CQSs connected to the structure issue this message.

In the message text:
csqname
  The name of the CQS that is master of the structure checkpoint
structurename
  The name of the structure that CQS attempted to checkpoint
xxnnnnnn
  The return code for the structure checkpoint, where xx indicates one of the following modules that detected the error, and nnnnn indicates the reason for the error:
    X'10'  CQSSTE10
    X'30'  CQSCHK30
    X'40'  CQSCHK40
    X'60'  CQSCHK60
    X'FF'  CQSSTE00

The xxnnnnnn can be one of the following:
X'10020000'
  The CQS structure checkpoint process in this CQS was unable to obtain the structure quiesce latch. Structure checkpoint processing for this CQS ends.
  If unable to obtain the latch, the master CQS handles the error in one of the following ways:
    • CQS0222E RC=10020000 and abends U0100-00000004
    • CQS0222E RC=10020000 and CQS0222E RC=30000098, and ends the structure checkpoint process.
  If a participant CQS is unable to obtain the latch and it abends U0100-00000004, the master CQS continues with structure
checkpoint processing. If this CQS does not
abend, the master CQS ends the structure
checkpoint process.

See related reason codes 10220000 and
30000098.

X'10220000'

The CQS structure checkpoint process in
another CQS was unable to obtain the
structure quiesce latch. This is a propagated
error. Structure checkpoint processing for this
CQS ends. If the error is propagated to the
master CQS, it does not issue a CQS0222E
RC=10220000; the master CQS ends the
structure checkpoint process and issues
CQS0222E RC=30000098.

See related reason codes 10020000 and
30000098.

X'30000004'

The CQS was unable to perform a structure
checkpoint because another CQS is already
performing structure checkpoint processing.
This attempt at a structure checkpoint is
terminated since the structure will be
checkpointed by another CQS. No action is
necessary. The CQS0220 message is not issued
before this error message.

X'30000008'

The CQS was unable to perform a structure
checkpoint because a structure recovery is
required. This attempt at a structure
checkpoint is terminated. A structure
checkpoint will be initiated by CQS after
structure recovery is complete. No action is
necessary.

X'3000000C'

The CQS structure checkpoint was unable to
obtain CQS termination latch. Structure
checkpoint processing ends. The CQS0220
message is not issued before this error message.

X'30000010'

The CQS structure checkpoint was unable to
obtain structure quiesce latch. Structure
checkpoint processing ends. The CQS0220
message is not issued before this error message.

X'30000020'

The CQS structure checkpoint was unable to
obtain lock on control list header. Structure
checkpoint processing ends. The CQS0220
message might not have been issued before
this error message.

X'30000024'

The CQS structure checkpoint was unable to
read CQSSTRCHKTNPNGR control list entry.
Structure checkpoint processing ends.

X'30000028'

The CQS structure checkpoint was unable to
read CQSOVERFLOW control list entry.
Structure checkpoint processing ends.

X'30000002C'

The CQS is currently in overflow threshold or
overflow scan processing. This attempt at a
structure checkpoint is terminated. A structure
checkpoint will be initiated by CQS after
overflow processing is complete. No action is
necessary.

X'300000030'

The CQS structure checkpoint was unable to
write CQSOVERFLOW control list entry.
Structure checkpoint processing ends. The
CQS0220 message is not issued before this
error message.

X'300000034'

The CQS structure checkpoint was unable to
write CQSSTRCHKTNPNGR control list entry.
Structure checkpoint processing ends.

X'300000038'

The CQS structure checkpoint was unable to
delete CQSSTRCHKTNPNGR control list entry.
Structure checkpoint processing ends.

X'300000040'

The CQS structure checkpoint was unable to
release lock on control list header. Structure
checkpoint processing ends. The CQS0220
message might not have been issued before
this error message.

X'300000050'

The CQS structure checkpoint was unable to
allocate a structure recovery data set. Structure
checkpoint processing ends. Refer to the
CQS0050E message to determine why the data
allocation failed.

X'300000054'

The CQS structure checkpoint was unable to
open a structure recovery data set. Structure
checkpoint processing ends. Refer to the
CQS0054E message to determine why the open
failed. Correct the data set error and initiate a
new structure checkpoint.

X'300000058'

The CQS structure checkpoint was unable to
allocate a buffer (using BPEGETM) to
read/write the SRDS control record. Structure
checkpoint processing ends.

X'30000005C'

The CQS structure checkpoint was unable to
read the structure recovery data set control
record. Structure checkpoint processing ends.
Refer to the CQS0054E message to determine
why the open failed. Correct the data set error
and initiate a new structure checkpoint.
The CQS structure checkpoint was unable to write the structure recovery data set control record. Structure checkpoint processing ends. Refer to the CQS0054E message to determine why the open failed. Correct the data set error and initiate a new structure checkpoint.

The CQS structure checkpoint was unable to close a structure recovery data set. Structure checkpoint processing ends. Refer to the CQS0054E message to determine why the close failed. Correct the data set error and initiate a new structure checkpoint.

The CQS structure checkpoint was unable to delete a structure recovery data set. Structure checkpoint processing ends. Refer to the CQS0050E message to determine why the data allocation failed. Correct the data set error and initiate a new structure checkpoint.

The CQS structure checkpoint was unable to initialize the data space. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to write the Structure Checkpoint Begin log record. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to write the Structure Checkpoint End log record. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to allocate an AWE (using BPECBGET). Structure checkpoint processing ends.

The CQS structure checkpoint was unable to enqueue an AWE (using BPEAWSRV) to the IXLUSYNCP processor. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to enqueue an AWE (using BPEAWSRV) to the CQSCHK60. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to quiesce the structure. One or more CQSs were unable to obtain the structure quiesce latch. Structure checkpoint processing ends. The CQSs that could not obtain the latch issue message CQS0222E RC=10020000. See related reason codes 10020000 and 10220000.

The CQS structure checkpoint was unable to create thread for CQSCHK40. Structure checkpoint processing ends.

The CQS is terminating and a structure checkpoint was requested. This attempt at a structure checkpoint is terminated since the structure will be checkpointed by another CQS.

The CQS structure checkpoint was unable to quiesce the structure. An internal serialization error occurred, and the structure was not correctly quiesced when the CQS checkpoint process began to copy the structure checkpoint data. Issue a structure checkpoint manually to attempt another structure checkpoint.

The CQS structure checkpoint encountered an error when it attempted to read from the structure. The IXLLIST request failed because CQS is not connected to the structure. This error might occur when the connection fails and CQS is unable to rebuild the structure. In this case CQS might have disconnected from the structure and the structure is inaccessible. Structure checkpoint processing ends.

The CQS structure checkpoint encountered an error when it attempted to read from the structure. The IXLLIST request failed because the structure failed. Structure checkpoint processing ends.

The CQS structure checkpoint called CQSCHK50 to perform a GETBUF request. The request was unsuccessful. Structure checkpoint processing ends.

The CQS structure checkpoint called CQSCHK50 to perform a BUFCMPLT request. The request was unsuccessful. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to allocate a buffer (using BPEGETM) to write data to the structure recovery data set. Structure checkpoint processing ends.

The CQS structure checkpoint was unable to release a buffer (using BPEFREEM). Structure checkpoint processing ends.

The CQS structure checkpoint was unable to write to the structure recovery data set. Structure checkpoint processing ends. Refer to the CQS0054E message to determine why the
put failed. Correct the data set error and initiate a new structure checkpoint.

X'60000010'  The CQS structure checkpoint encountered an error processing a TERMWRT request from module CQSCHK60. The module found an extent block that needed to be written, however, the sequence number in the extent block was not the correct sequence number.

X'60000014'  The CQS structure checkpoint encountered an error processing a TERMWRT request from module CQSCHK60. The module found that extent blocks that should have been written to the SRDS were still on an internal WRITE PENDING queue.

X'FF000004'  The CQS structure checkpoint master failed between phase 1 and 2. The master \texttt{cqsname} is the CQS that took over the structure checkpoint. This attempt at a structure checkpoint is unsuccessfully ended and a new one is initiated. No action is necessary.

X'FF000008'  The CQS structure checkpoint master failed between phase 2 and 3. The master \texttt{cqsname} is the CQS that took over the structure checkpoint. This attempt at a structure checkpoint is unsuccessfully ended and a new one is initiated. No action is necessary.

X'FF00000C'  The CQS structure checkpoint master failed between phase 1 and 2. No CQS was connected to the structure at the time, so the structure checkpoint could not be taken over. The \texttt{cqsname} in the message is the identifier of the CQS that detected the failure after it reconnected the structure. This attempt at a structure checkpoint is unsuccessfully ended. No new structure checkpoint is initiated.

X'FF000020'  This CQS lost connectivity to the structure between phase 1 and 2 of structure checkpoint. \texttt{cqsname} is the identifier of the CQS that lost connectivity. Structure checkpoint unsuccessfully ended for this CQS. If this CQS was not the structure checkpoint master, structure checkpoint continues for all CQSs that still have connectivity to the structure.

\textbf{System action:} CQS processing continues.

\textbf{System programmer response:} If you are unable to resolve the problem, copy the SYSLOG and dump of the master CQS address space, and call IBM Software Support for help.

\textbf{Module:} CQSCHK30, CQST0E10

\textbf{Related information:}

\begin{tabular}{|l|l|}
\hline
\textbf{CQS0240I} & \textbf{CQS \texttt{cqsname} STARTED STRUCTURE} \\
 & \textbf{rebuildtype FOR STRUCTURE} \\
 & \textbf{structurename} \\
\hline
\textbf{Explanation:} CQS started a z/OS cross-system extended services (XES) structure rebuild to recover or copy queues. The master CQS determines the type of rebuild and performs the rebuild. Other CQSs connected to the structure participate in the structure rebuild, but do not actually recover or copy the queues. All of the CQSs connected to the structure issue this message if a structure rebuild is started.

Structure recovery entails recovering the queues from the structure recovery data set and z/OS system log. Structure copy entails copying the queues from one list structure to another.

In the message text:
- \texttt{cqsname} Name of the CQS that is master of the structure rebuild
- \texttt{structurename} The name of the structure CQS will rebuild
- \texttt{rebuildtype} The type of structure rebuild being performed, either RECOVERY, COLDSTART, or COPY

\textbf{System action:} CQS processing continues.

\textbf{Module:} CQSSTR00

\begin{tabular}{|l|l|}
\hline
\textbf{CQS0241I} & \textbf{CQS \texttt{cqsname} COMPLETED} \\
 & \textbf{STRUCTURE rebuildtype FOR STRUCTURE} \\
 & \textbf{structurename} \\
\hline
\textbf{Explanation:} CQS completed an z/OS cross-system extended services (XES) structure rebuild to recover or copy queues. All of the CQSs connected to the structure issue this message if a structure rebuild completes.

In the message text:
- \texttt{structurename} The name of the structure CQS rebuilt
- \texttt{rebuildtype} Type of structure rebuild that failed, either COPY, COLDSTART, or RECOVERY
- \texttt{cqsname} The name of CQS that is master of the structure rebuild process

\textbf{System action:} CQS processing continues.

\textbf{Module:} CQSSTR00

\begin{tabular}{|l|l|}
\hline
\textbf{CQS0242E} & \textbf{CQS \texttt{cqsname} FAILED STRUCTURE} \\
 & \textbf{rebuildtype FOR STRUCTURE} \\
 & \textbf{structurename \texttt{RC=tssrrrrr}} \\
\hline
\textbf{Explanation:} The rebuild failed for the list structure to either copy the queues to a new structure or recover the queues from a structure recovery data set and the z/OS system log. All of the CQSs connected to the structure issue this message if a structure rebuild fails.

\end{tabular}
In the message text:

**cqname**
Name of the CQS that was master of the structure rebuild. This field is blank when CQS does not yet know the master of the rebuild.

**structurename**
The name of the structure CQS attempted to rebuild.

**rebuildtype**
The type of structure rebuild that failed, either COPY, COLDSTART, or RECOVERY.

| ttssrrrr | Refer to CQS code information for a description of these reason codes.

**System action:** CQS processing continues.

**System programmer response:** The structure must be recovered before work can be processed on the structure. Correct the problem and initiate another rebuild by entering the SETXCF START,REBUILD command on the z/OS console.

If the new structure was full or failed, analyze the use of the coupling facility to determine if the coupling facility resource management (CFRM) policy needs to be changed so CQS can allocate a large enough shared queues structure on a coupling facility that can accommodate it. A policy change and a structure rebuild might be necessary to recover the structure.

If the rebuild structure initialization failed, correct the problem documented in message CQS0014E and initiate another rebuild.

If you are unable to resolve the problem, copy the SYSLOG and dump of the master CQS address space, and call IBM Software Support for help.

**Module:** CQSSTR00

- [CQS0014E](CQS0243E • CQS0245E) on page 40

---

**CQS0243E** UNABLE TO PARTICIPATE IN REBUILD FOR STRUCTURE **structurename**

**Explanation:** CQS is unable to participate in a rebuild of the structure because it is unable to connect to the rebuild structure. CQS does not know the master of the rebuild process or the type of rebuild being done (structure recovery or structure copy). This CQS issues this message instead of messages CQS0240I and CQS0241I or CQS0242E. If the structure is successfully rebuilt, this CQS does not have access to it.

**System action:** CQS processing continues.

**System programmer response:** If the rebuild is successful, consider initiating another rebuild if you want this CQS to have access to the structure.

---

**Module:** CQSSTE00

**CQS0244E** STRUCTURE RECOVERY REQUIRED AFTER RECOVERY FAILURE FOR STRUCTURE **structurename**

**Explanation:** Recovery failed for the identified structure.

**System action:** CQS processing continues.

**System programmer response:** Try another rebuild to recover the structure by issuing the SETXCF START,REBUILD request on the z/OS console. Work is permitted on the structure, but some or all of the work that occurred before the rebuild is unavailable until the structure is recovered. Structure processes such as structure checkpoint and structure overflow processing are not permitted until the structure is successfully recovered.

**Module:** CQSSTR00

**CQS0245E** STRUCTURE **structurename** REBUILD ERROR

erorder detail RC=rc RSN=rsn

**Explanation:** Structure rebuild encountered an error processing a data object. This message provides details about the error and the data object that rebuild was processing. CQS0245E contains five lines.

In the message text:

**structurename**
The name of the structure being rebuilt.

**erorderetail**
Detail about the error. The details can be up to 15 characters. One possible error detail might be CQSUNLCK FAILED (a CQSUNLCK request failed).

**rc**
Return Code. One possible return code might be XLISTREQUEST=MOVE.

**rsn**
Reason code. One possible reason code might be XLISTREQUEST=MOVE.

**client_queue_name**
Name of the client queue associated with the data object.

**first_half_uow**
First half of the UOW of the data object.

**second_half_uow**
Second half of the UOW of the data object.

**System action:** CQS continues performing structure rebuild.

**System programmer response:** Report this error to IBM. Copy the SYSLOG, IMS log records, CQS log records and the memory dump of the CQS address space, and call IBM Software Support for help.

**Module:** CQSMOV20
CQS0246I  CQS SRDS READ STARTED,
   DSN=structure_recovery_data_set_name

Explanation: The message indicates that CQS is reading the more current one of the structure recovery data sets for structure rebuild. In the case of a structure rebuild failure, the structure may be able to be recovered by renaming the structure recovery data set as indicated in the DSN= field of the CQS0246I message, and initiating a new structure rebuild. This structure rebuild will use the other older structure recovery data set, and may be able to successfully complete the rebuild in some cases. Ensure that the renamed SRDS is renamed back to its original name at the end of structure rebuild.

In the message text:
structure_recovery_data_set_name
   The name of the structure recovery data set that is currently used for structure rebuild.

System action: CQS processing continues.
Module: CQSSTR00
Related information:

CQS0247W OPERATOR-INITIATED REBUILD FOR STRUCTURE structure name WAS REJECTED DUE TO AN ACTIVE OVERFLOW PROCESS

Explanation: The message indicates that CQS rejected an operator-initiated rebuild because an overflow threshold or scan process was in progress. The operator can re-issue the rebuild command after the overflow process completes.

In the message text:
structure name
   The name of the structure that is currently used for structure rebuild.

System action: CQS processing continues.
System programmer response: Re-issue the rebuild command after the overflow process has completed.
Module: CQSSTE20

CQS0248I OVERFLOW MOVE variable text FOR STRUCTURE structure name, OBJECTS MOVED COUNT movecount

Explanation: The message indicates the progress of data object movement between the primary and overflow structures during overflow move processing.

The IN PROGRESS message is issued approximately once per minute while data objects are being moved. The movecount value indicates the total number of objects that have been moved to or from the overflow structure at that point in time. Note that the movecount value may include both the count of objects moved to the overflow structure, as well as objects moved back from the overflow structure to the primary structure.

(This could happen if the overflow structure becomes full during the move process. In this case, CQS backs out the moves to overflow and returns the object to the primary structure.)

The COMPLETED message is issued when all objects from the selected queue names have been moved. When the overflow structure did not fill during the move to overflow process, this value is equal to the number of objects on the queues selected for overflow at the time the overflow threshold was crossed. It does not include objects that were put to the structure after the threshold was crossed. Such CQSPUTs are deferred until the move process completes.

When the overflow structure filled during the move process, such that no more objects could be moved to overflow, then the count on the COMPLETED message will equal twice the number of objects that were moved to, and then later back from, the overflow structure (the total number of object moves between structures).

In the message text:
variable text
   IN PROGRESS or COMPLETED.
structure name
   Name of the primary structure.
movecount
   The count of the number of objects moved so far between the primary and overflow structures.

System action: CQS processing continues.
Module: CQSOFL10, CQSOFL50

CQS0260I CQS cdbname STARTED OVERFLOW THRESHOLD PROCESSING FOR STRUCTURE structure name

Explanation: CQS started overflow threshold processing, because the structure reached the overflow threshold specified by the installation. Queues are selected to enter overflow mode. All of the CQSs connected to the structure issue this message if structure overflow processing completes.

In the message text:
cdbname
   Name of the CQS that is master of the overflow threshold process
structure name
   The name of the structure undergoing overflow threshold processing

System action: CQS processing continues. The structure is quiesced until overflow threshold processing completes or fails.
Module: CQSSTE10, CQSSTR00

58 Messages and Codes, Volume 2: Non-DFS Messages
CQS0261I CQS cqsname COMPLETED OVERFLOW THRESHOLD PHASE 1 FOR STRUCTURE structurename

Explanation: CQS completed overflow threshold phase 1 for the structure. Structure activity for the primary structure is resumed. Queue names that are in overflow or were selected for overflow are still quiesced. All of the CQSs connected to the structure issue this message.

In the message text:

cqsname
   The name of CQS that is master of the overflow threshold process
structurename
   The name of the structure that completed overflow threshold phase 1

System action: CQS processing continues. Primary structure activity can be resumed. Overflow activity is still quiesced.

Module: CQSSTE10

CQS0262I CQS cqsname COMPLETED OVERFLOW THRESHOLD PHASE 2 FOR STRUCTURE structurename

Explanation: CQS completed overflow threshold phase 2 for the structure. Structure activity for queue names that are in overflow or were selected for overflow are resumed. All of the CQSs connected to the structure issue this message.

In the message text:

cqsname
   The name of CQS that is master of the overflow threshold process
structurename
   The name of the structure that completed overflow threshold phase 2

System action: CQS processing continues. Overflow structure activity can be resumed.

Module: CQSSTE10

CQS0263E CQS cqsname FAILED OVERFLOW THRESHOLD PROCESSING FOR STRUCTURE structurename RC=xxxxxxx

Explanation: Overflow threshold processing failed for the structure.

In the message text:

cqsname
   Name of the CQS that was master of overflow threshold processing.
structurename
   The name of the structure for which CQS attempted overflow threshold processing.
xxxxxxx
   The reason code.
obtain the structure quiesce latch.
Overflow threshold processing ends.

\textbf{X'00000024'}
No queue names were selected for overflow. This could happen because the Queue Overflow exit routine did not allow any queue names to be selected for overflow. It could also happen if all the data objects on the structure are in CQS private queues or client queue types that are not eligible for overflow. Overflow threshold processing ends and will not be allowed to occur until the structure size is 20% below the overflow threshold.

\textbf{X'00000028'}
The CQS overflow threshold process encountered an error while attempting to obtain a resource latch during Phase 1. Overflow threshold processing ends.

\textbf{X'0000002C'}
This CQS lost connectivity to the structure between overflow threshold IXLUSYNCE 1 and 2. The 	extit{cjsid} in the message is the identifier of the overflow master CQS. Structure overflow threshold processing unsuccessfully ends for this CQS. If this CQS was the overflow master, another CQS that has connectivity to the structure, if any exist, will take over the overflow process. If this CQS was not the overflow master, overflow threshold continues for all CQSs that still have connectivity to the structure.

\textbf{X'00000040'}
The CQS overflow threshold process in this CQS could not obtain the structure quiesce latch. The overflow threshold process for this CQS ends.

If it cannot obtain the structure quiesce latch, the master CQS issues either:
- CQS0263E with RC=X'00000040' and terminates abnormally with U0100-00000004
- CQS0263E with RC=X'00000040' and CQS0263E with RC=X'00000020'

And then the master CQS ends the overflow threshold process.

If a participant CQS cannot obtain the structure quiesce latch and it terminates abnormally with U0100-00000004, the master CQS continues with the overflow threshold process. If this CQS does not abend, the master CQS terminates the overflow threshold process.

See reason codes RC=X'00000040' and RC=X'00000020' for more information.

\textbf{X'00000044'}
The CQS overflow threshold process in another CQS could not obtain the structure quiesce latch. This is a propagated error. The CQS overflow threshold process for this CQS ends. The master CQS does not issue message CQS0263E with RC=X'00000044'; the master CQS ends the overflow threshold process and issues message CQS0263E with RC=X'00000020'.

See reason codes RC=X'00000040' and RC=X'00000020' for more information.

\textbf{X'000000A0'}
The CQS overflow threshold process was unable to allocate a buffer (through BPEBPGET) during Phase 2. Overflow threshold processing ends.

\textbf{X'00000104'}
The CQS overflow threshold process was unable to write the Overflow Threshold End log record. Overflow threshold processing has already completed.

\textbf{X'00000108'}
The CQS overflow threshold process encountered an error when it attempted to access the structure during Phase 2. This situation might have been a failure that required a rebuild, but the rebuild was either not initiated or it failed. Overflow threshold processing ends.

\textbf{X'0000010C'}
The CQS overflow threshold process encountered an error while attempting to obtain a resource latch during Phase 2. Overflow threshold processing ends.

\textbf{X'00000110'}
The CQS overflow threshold process received a nonzero return code from BPE AWE services during Phase 2. Overflow threshold processing ends.

\textbf{X'00000114'}
The CQS overflow threshold process attempted to translate a queue type into a list header number during Phase 2. The CQS service CQSLHLS indicated the queue type was invalid. Overflow threshold processing ends.

\textbf{X'00000118'}
No queues were moved to the
overflow structure during phase 2 of threshold processing. Threshold processing does not occur again until one of the following occurs:

- CQS is no longer in overflow mode, if CQS was already in overflow mode before the current threshold process started.
- The overflow structure is rebuilt.

X'0000011C'

This CQS lost connectivity to the structure between overflow threshold IXLUSYNC 2 and 3. The cqsid in the message is the identifier of the overflow master CQS. Structure overflow threshold processing unsuccessfully ends for this CQS. If this CQS was the overflow master, another CQS that has connectivity to the structure, if any, will take over the overflow process. If this CQS was not the overflow master, overflow threshold continues for all CQSs that still have connectivity to the structure.

System action: CQS processing continues. If the system is still over the overflow threshold the next time CQS writes data to the structure, overflow threshold processing is initiated again (except when the reason code is X'00000024')

System programmer response: If you are unable to resolve the problem, copy the SYSLOG and dump of the master CQS address space, and call IBM Software Support for help.

Module: CQSSTE10, CQSOFL00, CQSOFL50

CQS0264I  CQS cqsname TERMINATED OVERFLOW THRESHOLD PROCESSING, ALTER SUCCESSFUL FOR STRUCTURE structurename

Explanation: The CQS Overflow threshold process issued an IXLALTER request to increase the size of the structure. The alter increased the size enough so that the structure is below the overflow threshold. Threshold processing is terminated.

In the message text:
cqsname
  The name of the CQS that was master of overflow threshold processing.

structurename
  The name of the structure for which CQS started overflow threshold processing.

System action: CQS processing continues.

Module: CQSSTE10, CQSOFL00

CQS0265I  STRUCTURE ALTER REQUEST STARTED structurename

Explanation: A structure alter request started because one of the following occurred:

- The operator entered a SETXCF START,ALTER command
- CQS reached the overflow threshold level
- CQS detected that a resource structure was full

In the message text:
  structurename
  The name of the structure for which the alter request was started.

System action: CQS processing continues.

Module: CQSSTE00

CQS0266I  STRUCTURE ALTER REQUEST COMPLETED FOR STRUCTURE structurename

Explanation: A structure alter request successfully completed. This request was initiated because an operator entered a SETXCF START,ALTER command or because CQS reached the overflow threshold level.

In the message text:
  structurename
  The name of the structure for which the alter request successfully completed.

System action: CQS processing continues.

Module: CQSSTE00

CQS0267W  STRUCTURE ALTER REQUEST FAILED FOR STRUCTURE structurename RC=xxxxxxx

Explanation: A structure alter request failed. The structure ALTER might have been initiated by:

- The operator when a SETXCF START,ALTER command is entered to alter the size of the structure.
- The CQS Overflow Threshold process to increase the size of the structure when the overflow threshold is reached.
- The CQS Inform process to increase the size of the structure when there is no more room for EMCs (Event Monitoring Controls). The inform process occurs for a CQSINFRM request, a structure rebuild, or after reconnecting to a structure. In the message text:

In the message text:
  structurename
  The name of the structure for which the alter request failed.

xxxxxxx
  The return code, which can be one of the following codes:

Chapter 4. CQS messages (Common Queue Server)  61
Return code
Explanation
X’00000004’
The CQS was unable to alter the coupling facility structure to the target size. The structure size might not have changed. This return code is possible when the structure alter attempts to increase the structure size or EMC percentage, but there is not enough room in the coupling facility for the altered structure. This return code is also possible when an operator-initiated structure alter attempts to decrease the structure size, but the structure data objects will not fit in the smaller structure.

X’00000008’
The CQS was unable to alter the coupling facility structure to the target size. A rebuild was initiated during the alter process. CQS was unable to alter the coupling facility structure size was not changed.

X’0000001C’
The CQS was unable to alter the coupling facility structure to the target size. The structure failed during the alter process. The coupling facility structure size was not changed.

X’00000010’
The CQS was unable to alter the coupling facility structure to the target size. Structure connectivity was lost during the alter process. The coupling facility structure size was not changed.

X’00000018’
The CQS was unable to alter the coupling facility structure to the target size. Changes specified on the alter request are not consistent with the structure. The coupling facility structure size was not changed.

X’0000001C’
The CQS was unable to alter the coupling facility structure to the target size. An unknown error occurred. The coupling facility structure size was not changed.

X’00000020’
The CQS was unable to alter the coupling facility structure to the target size. The structure alteration was stopped by the operator. The coupling facility structure size was not changed.

X’00000024’
The CQS was able to alter the coupling facility structure to the target size but there was no space allocated for the EMC. The target EMC count was zero. CQS initiated another IXLALTER to restore the coupling facility structure to its previous size.

System action: CQS processing continues.

System programmer response: If you are unable to resolve the problem, copy the SYSLOG, create a memory dump of the master CQS address space, and call IBM Software Support for help.

Module: CQSST00
structure while in overflow mode. If a primary structure goes into overflow mode without an overflow structure, CQS must exit overflow mode before another attempt is made to connect to the overflow structure. CQS connects to the overflow structure during overflow threshold processing.

**Module:** CQSSTS10

---

### CQS0269E

**CQS queues to be placed in the overflow structure:**

**Explanation:** The overflow scan processing failed for the structure.

**In the message text:**

- **csqname**
  - Name of the CQS that was the master of the overflow scan processing.
- **phase**
  - The phase of the overflow scan processing that failed, either START or END.
- **structurename**
  - The name of the structure for which CQS attempted overflow scan processing.

**xxxxx**

- The reason code.

**Reason code**

<table>
<thead>
<tr>
<th>Description</th>
<th>Reason code</th>
</tr>
</thead>
<tbody>
<tr>
<td>X'00000040'</td>
<td>The CQS overflow scan process in this CQS could not obtain the structure quiesce latch. The overflow scan process for this CQS ends.</td>
</tr>
<tr>
<td>X'00000044'</td>
<td>The CQS overflow scan process in another CQS could not obtain the structure quiesce latch. This error is propagated. The CQS overflow scan process for this CQS ends.</td>
</tr>
</tbody>
</table>

**System action:** CQS processing continues. If CQS is still in overflow mode, then the overflow scan process will start again after 15 minutes.

**System programmer response:** If you are unable to resolve the problem, copy the syslog and dump of the master CQS address space, and call IBM Software Support for help.

**Module:** CQSSTE10

---

### CQS0270I

**THE FOLLOWING QUEUE NAMES ARE ADDED TO OVERFLOW FOR STRUCTURE structurename**

**Explanation:** CQS has selected one or more queue names to be placed in the overflow structure.

The first line of this message is issued once each time CQS selects queue names for overflow mode. That line is followed by a list of the queue names that were selected. Queue names are displayed either in characters or hexadecimal, if the name contains unprintable characters.

In the message text:

- **structurename**
  - The name of the coupling facility primary message queue structure.
- **tt**
  - The queue type code of the queue name, in hex. CQS queue names use the first byte of the queue name to identify the type of queue.

The meaning of the queue type is defined by the client of CQS. For an IMS shared queue structure, **tt** can be one of the following:

- **01** - Transaction ready queue
- **02** - Transaction staging queue
- **03** - Transaction suspend queue
- **04** - Transaction serial queue
- **05** - LTERM ready queue
- **06** - LTERM staging queue
- **07** - APPC ready queue
- **08** - Remote ready queue
- **09** - OTMA ready queue

For an IMS shared expedited message handler (EMH) structure, **tt** can be one of the following:

- **01** - Program ready queue
- **05** - LTERM ready queue

**xxxxxxxxxxxx**

- The 15-character queue name that was moved to overflow, in printable EBCDIC.

**xxxxxxxxxxxxxxxxxxxxxxxxxxx**

- The 15-byte queue name that was moved to overflow, in hexadecimal. The queue name contained at least one byte that was not a printable EBCDIC character.

**System action:** The queue names identified in the message are marked as being in overflow mode.

If an overflow structure is defined, any objects on the affected queue names that are in the primary structure are moved to the overflow structure. Any new objects queued to the affected queue names are also placed in the overflow structure.

If an overflow structure is not defined, CQS rejects subsequent CQSPUT requests for the indicated queue names.

**System programmer response:** No action is required.

This message identifies what queue names have been selected for offloading to the overflow structure. CQS selects the queue names that are consuming the most number of coupling facility structure elements to be moved.

However, you can use the information from this message to help determine whether a particular queue destination is not processing the messages queued to it.
Module: CQSOF50

CQS0271I THE FOLLOWING QUEUE NAMES ARE REMOVED FROM OVERFLOW FOR STRUCTURE structurename

tt-xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
or
	tt-xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

Explanation: CQS removed one or more queue names from overflow. This message is issued when CQS performs overflow scan processing and finds a queue name that had been in overflow no longer has any messages queued to it.

The first line of this message is issued once each time CQS performs the process of removing queue names from overflow mode. That line is followed by a list of the queue names that were removed from overflow mode. Queue names consisting of all printable characters are displayed in EBCDIC. Queue names containing one or more unprintable characters are displayed in hex.

In the message text:

structurename
The name of the coupling facility primary message queue structure.

tt
The queue type code of the queue name, in hex. CQS queue names use the first byte of the queue name to indicate the queue type of the name. The meaning of the queue type is defined by the client of CQS. For an IMS shared queue structure, tt can be one of the following:

01 - Transaction ready queue
02 - Transaction staging queue
03 - Transaction suspend queue
04 - Transaction serial queue
05 - LTERM ready queue
06 - LTERM staging queue
07 - APPC ready queue
08 - Remote ready queue
09 - OTMA ready queue

For an IMS shared expedited message handler (EMH) structure, tt can be one of the following:

01 - Program ready queue
05 - LTERM ready queue

cccccccccccccccc
The 15-character queue name that was removed from overflow, in printable EBCDIC. This form of the message is used when all characters of the queue name are printable EBCDIC characters.

xxxxxxxxxxxxxxxxxxxxxxxxxxxxxx
The 15-byte queue name that was removed from overflow, in hex. This form of the message is used when at least one byte of the queue name is not a printable EBCDIC character.

System action: The indicated queue names are removed from overflow mode. Any new objects queued to the affected queue names are placed in the primary structure.

System programmer response: No action is required.

Module: CQSOF50

CQS0280I CONNECT REJECTED FOR
CLIENT=client USERID=userid
INSUFFICIENT AUTHORITY TO STRUCTURE structure
RACROUTE AUTH R15=r15 RC=rc
RSN=rsn

Explanation: A client attempted to connect to a CQS structure using a CQSCONN request, but the client was not authorized to access the structure. CQS issues a RACROUTE REQUEST=AUTH call to determine if the connecting client has the appropriate authority to access the requested structure. CQS uses the client job user ID to perform the authorization. The userid must have at least UPDATE authority to the structure name.

In the message text:

client
The client ID that is attempting to connect.

userid
The user ID associated with the client address space. If this field contains *NONE*, the client is running with no user ID specified.

structure
The CQS structure name to which the client is trying to connect.

r15
The value in register 15 from the RACROUTE call.

rc
The RACF® return code from the RACROUTE call.

rsn
The RACF reason code from the RACROUTE call.

System action: The connection request is rejected and the client is not allowed to access the requested CQS structure.

System programmer response: If the indicated user should be allowed to access the requested CQS structure, authorize the user to the structure resource with at least RACF UPDATE authority. If the indicated user should not be allowed to access the requested CQS structure, you might want to determine why the user is trying to connect to it, and take appropriate action to protect against unauthorized or malicious access.

Module: CQSCONN00

Related reference:

z/OS: RACROUTE return codes and reason codes

CQS0281I REGISTRATION REJECTED FOR
CLIENT=client USERID=userid
INSUFFICIENT AUTHORITY TO CQS cqsid

Module: CQSOF50
RACROUTE AUTH R15=r15 RC=rc
RSN=rsn

Explanation: A client attempted to register with a CQS using a CQSREG request, but the client was not authorized to register with the CQSID. CQS issues a RACROUTE REQUEST=AUTH call to determine if the registering client has the appropriate authority to register with the requested CQSID. The client job user ID is used by CQS to perform the authorization. The user ID must have at least UPDATE authority to the CQSID.

In the message text:
client The client ID that attempted to register.
userid The user ID associated with the client address space. If this field contains *NONE*, the client is running with no user ID specified.
cqsid The CQSID of the CQS to which the client is trying to register.
r15 The value in register 15 from the RACROUTE call.
rc The RACF return code from the RACROUTE call.
rsn The RACF reason code from the RACROUTE call.

System action: The registration request is rejected and the client is not allowed to access the requested CQS.

System programmer response: If the indicated user should be allowed to access the requested CQS, authorize the user to the structure resource with at least RACF UPDATE authority. If the indicated user should not be allowed to access the requested CQS structure, determine why the user is trying to connect to it, and take appropriate action to protect against unauthorized or malicious access.

Module: CQSREG20

Related information:

- z/OS: Return codes and reason codes for z/OS RACROUTE REQUEST=AUTH

CQS0282W CQS OVERFLOW STRUCTURE
structurename IS APPROACHING FULL;
SOME QUEUES COULD NOT BE MOVED

Explanation: During the overflow threshold process, CQS could not move some queues to the overflow structure because the overflow structure did not have enough space to hold these queues.

In the message text:
structurename The name of the overflow structure.

System action: CQS processing continues.

System programmer response: No action is required.

Module: CQSOFL00

CQS0300I command COMMAND REJECTED,
RC=rc

Explanation: CQS could not process the command. The command is rejected.

In the message text:
calendar The command that was rejected.
rc A return code that indicates why the command was rejected. The following return codes are defined:
0100004 A z/OS STOP command for a CQS address space was rejected because there were clients still connected to the CQS. A z/OS STOP command for a CQS address space is processed only when there are no clients connected.

System action: The command is not processed.

Module: CQSCMD00

CQS0301I CLIENT client IS REGISTERED TO
CQS, JOBNAME jobname ASID asid

Explanation: A z/OS STOP command was issued to stop a CQS address space. The command was rejected because there were clients still connected to the CQS. In response to the STOP command, CQS issues one CQS0301I message for each client that is currently connected to it.

In the message text:
client The CQS client name of a client that is connected to the CQS address space.
jobname The z/OS job name of the client.
asid The z/OS address space ID (ASID) of the client.

System action: No action is required.

System programmer response: No response is required. However, if you want to stop CQS by using the z/OS STOP command, stop each client address space listed on the CQS0301I message or cause each client to disconnect from the CQS, and then issue the z/OS STOP command again to terminate the CQS.

Module: CQSCMD00

CQS0350W reason
LOG STREAM:
logstreamname STRUCTURE: structurename cqsid

Explanation: CQS requested a function from the
In the message text:

**CQS0350W**

System logger. The system logger returned a nonzero return and reason to CQS.

In the message text:

*reason* is one of the following values:

- **CQS LOG CONNECT DS DIRECTORY**
  - **FULL** CQS received return code X'00000004' and reason code X'00000408' from a System Logger connect request (IXGCONN).

- **CQS LOG CONNECT POSSIBLE LOSS OF DATA**
  - Delete and redefine the log stream (not the log structure), restart CQS, then take two structure checkpoints.

- **CQS LOG WRITE LOSS OF DATA**
  - CQS received return code X'00000004' and reason code X'00000407' from a System Logger write request (IXGWRITE).

- **CQS LOG WRITE POSSIBLE LOSS OF DATA**
  - CQS received return code X'00000004' and reason code X'00000407' from a System Logger write request (IXGWRITE).

- **CQS LOG WRITE PREVIOUS OFFLOAD ERROR**
  - CQS received return code X'00000004' and reason code X'00000409' from a System Logger write request (IXGWRITE).

- **CQS LOG WRITE UNABLE TO DUPLEX LOG DATA TO STAGING DATA SETS**
  - CQS received return code X'00000004' and reason code X'0000040A' from a System Logger write request (IXGWRITE). The logger write request was successful; however, the logger was not able to duplex the log data to staging data sets.

- **SYSTEM LOGGER UNAVAILABLE**
  - CQS received return code X'00000008' and reason code X'00000890' from a System Logger connect, write, browse, or delete request (IXGCONN, IXGWRITE, IXGBRWSE, IXGDELETE).

**LOG STREAM IS NOT AVAILABLE**

Dia**g=diag1 diag2 diag3**

In the message text:

- **diag1** A 4-byte value in field IXgenEvents of IXGENF DSECT, or a 4-byte value in fieldAnsaa_Diag1.
- **diag2** A 4-byte value in field IXgenEventReasons of IXGENF DSECT, or a 4-byte value in fieldAnsaa_Diag2.
- **diag3** A 4-byte value in field IXgenEventSpecificInfo of IXGENF DSECT, or a 4-byte value in fieldAnsaa_Diag3.

logstreamname

The name of the log stream to which CQS is connected for the structure. The name is defined in the CQSSGxxx PROCLIB member.

structurename

The name of the coupling facility message queue structure.

cqid

The CQS identifier.

**CQS LOG FULL, OFFLOAD ERRORS**

Dia**g=diag1 diag2 diag3**

CQS received return code X'00000008' and reason code X'0000085D' from a system logger write request (IXGWRITE). The system logger CF structure or staging data set space is full, and the logger has encountered severe errors attempting to offload data. In the message text:

- **diag1** The diagnostic data from the fieldAnsaa_Diag1 in the answer area returned on the IXGWRITE request.
- **diag2** The diagnostic data from the fieldAnsaa_Diag2 in the answer area returned on the IXGWRITE request.
- **diag3** The diagnostic data from the fieldAnsaa_Diag3 in the answer area returned on the IXGWRITE request.

**LOG STREAM CF STRUCTURE FULL**

Dia**g=diag1 diag2 diag3**

CQS received return code X'00000008' and reason code X'00000860' from a system logger write request (IXGWRITE). The logger write request was not successful. The coupling facility structure space allocated for this log stream is full. No further requests can be processed until the log data in the coupling facility structure is offloaded to DASD log data sets. In the message text:

- **diag1** Diagnostic data from fieldAnsaa_Diag1 in the answer area returned on the IXGWRITE request.
- **diag2** Diagnostic data from fieldAnsaa_Diag2 in the answer area returned on the IXGWRITE request.
- **diag3** Diagnostic data from field
CQS0350W

System action: The system action is determined by the function and result:

**CQS LOG CONNECT DS DIRECTORY FULL**

or

**CQS LOG CONNECT PREVIOUS OFFLOAD ERROR**

When this error occurs, CQS initiates a structure checkpoint, and processing continues. If CQS is initializing, the structure checkpoint is delayed until CQS restarts.

**CQS LOG CONNECT POSSIBLE LOSS OF DATA**

When this warning is received during CQS initialization, CQS issues abend 0014, subcode X'000000A0' from module CQSIST10. Any other time this error occurs, CQS initiates a structure checkpoint, and processing continues.

**CQS LOG WRITE LOSS OF DATA**

or

**CQS LOG WRITE POSSIBLE LOSS OF DATA**

CQS initiates a structure checkpoint and processing continues.

**SYSTEM LOGGER UNAVAILABLE**

When this warning occurs, CQS waits for the system logger address space to become available. CQS is not able to process any work for this structure, which requires access to the CQS log stream.

**CQS LOG WRITE PREVIOUS OFFLOAD ERROR**

When this error occurs, CQS initiates a structure checkpoint, and processing continues.

**LOG STREAM IS NOT AVAILABLE**

The logger has determined that the log stream is not available for use and issued this message. Normally, this condition only lasts for a short time during the rebuild of the log structure, the offload of the log stream, or a change of log resources. CQS waits for the log stream to become available. Message CQS0351I is issued after CQS receives notification from logger that the log stream is available.

**CQS LOG WRITE UNABLE TO DUPLEX LOG DATA TO STAGING DATA SETS**

When this problem occurs, CQS writes a CQS0350W message to the operator console, and processing continues. CQS processing continues; however, the CQS log stream is not duplexed to staging data sets.

**CQS LOG FULL, OFFLOAD ERRORS**

When this error occurs, z/OS logger allows CQS to attempt the write requests as soon as any structure space is freed and before the offloading completes. CQS periodically retries the write requests to the log stream and the write attempt may succeed, so that CQS can continue processing its client's requests during the offloading process.

System programmer response: The programmer response is determined by the function and result.

**CQS LOG WRITE UNABLE TO DUPLEX LOG DATA**

Delete and redefine the log stream, restart CQS, and then take a structure checkpoint.

**SYSTEM LOGGER UNAVAILABLE**

The System Logger address space is not currently available for use by CQS. Before any CQS processing can continue, you must start the System Logger address space so CQS can connect to the CQS log stream.

**CQS LOG WRITE PREVIOUS OFFLOAD ERROR**

Check the system log for message IXG301I to determine the cause of the error.

**LOG STREAM IS NOT AVAILABLE**

If message CQS0351I is not displayed after this message, and there is no CQS activity for several minutes, it is likely that CQS has encountered an unrecoverable error. If you are unable to resolve the problem, copy the SYSLOG, create memory dumps of CQS address space, the logger address space, and all data spaces associated with the logger. Then call IBM Software Support for help.

**CQS LOG WRITE UNABLE TO DUPLEX LOG DATA TO STAGING DATA SETS**

CQS continues processing without the staging data sets. If staging data set duplexing is required, determine the cause and correct the problem with the logger staging data sets.

**CQS LOG FULL, OFFLOAD ERRORS**

Check the console log for message IXG301I to determine the cause of the system logger offload error. Correct the logger offload error to prevent the problem from happening again.

**LOG STREAM CF STRUCTURE FULL**

Correct the logger offload error to prevent the problem from happening again.

For all other reasons, ensure that the structure checkpoint completes successfully.

Related information:

*CQS0351I" on page 68*
CQS0351I • CQS0351I

CQS0351I CQS LOG STREAM IS AVAILABLE;
LOG STREAM: logstreamname
STRUCTURE: structurename cqsid

Explanation: CQS received an available notification ENF48 event from the logger. CQS usually displays this message when the log stream is again available, after it has issued a CQS0350W with variable reason text LOG STREAM IS NOT AVAILABLE.

In the message text:

logstreamname
The name of the log stream to which CQS is connected for the structure. This name is defined in the CQSSGxxx PROCLIB member.

structurename
The name of the coupling facility message queue structure.

cqsid
The CQS identifier.

System action: CQS processing continues.

Operator response: No action is required.

Module: CQSLEN00

Related information:
"CQS0350W" on page 65

CQS0352E LOG WRITE ERROR reason
LOG logstreamname STRUC structurename cqsid

Explanation: An error was encountered while attempting to write a log record to the CQS log.

In the message text:

reason
• DUE TO BUFFER SIZE, LEN=blocklen
  MAX=maxbufsize
  The length of the log record that CQS attempted to write is longer than the maximum buffer size that can be written to the log. CQS is unable to write the required log record. The process that attempted to write the log records ends unsuccessfully.

All CQS address spaces that are connected to the log stream must be shut down in order to disconnect from the log stream.

blocklen
The length of the buffer that CQS attempted to write to the CQS log stream. This value is specified by CQS on the MVS IXGWRITE macro for the BLOCKLEN= parameter, and is the length of the CQS log record.

maxbufsize
The maximum length of a buffer that can be written to the CQS log stream. This value is specified by the user in the LOGR policy for the MAXBUFSIZE parameter.

CQS0353I CQS LOG STREAM IS A
AVAILABLE;
LOG STREAM: logstreamname
STRUCTURE: structurename cqsid

Explanation: An error was encountered while attempting to write a log record to the CQS log. CQS is unable to write the record. CQS is unable to write the record. CQS is unable to write the record. CQS is unable to write the record.

In the message text:

logstreamname
The name of the log stream to which CQS is connected for the structure. The name is defined in the CQSSGxxx PROCLIB member.

structurename
The name of the coupling facility message queue structure.

cqsid
The CQS identifier.

System action: CQS processing continues.

Programmer response: Change the MAXBUFSIZE parameter in the LOGR policy to be large enough to contain the largest log record written by CQS.

Delete the log structure and the old LOGR policy, then activate the new LOGR policy. If CQS did not shut down normally from the previous execution, CQS can be warm started. If CQS did not shut down normally, there is no log to read for restart processing; CQS must be cold started.

Important: You cannot recover the message queues if the structure is lost or the CF that contains the queues fails while the MAXBUFSIZE is being changed. After changing MAXBUFSIZE and restarting all the CQS address spaces, initiate a structure checkpoint for each structure to ensure that the structures can be recovered in a structure or CF failure is encountered.

Module: CQSLOG20

CQS0353I variable text
LOG logstreamname STRUC structurename cqsid

Explanation: When the message indicates LOG READ, CQS is reading the log stream. The message indicates whether the log read is starting, in progress, or complete. When the log stream is being read, the in-progress message is issued at intervals of not less than one minute.

In the message text:

variable text
• CQS LOG READ STARTED FROM
  BEGINNING OF LOG
• CQS LOG READ STARTED FROM
  LOGTOKEN logtoken
• CQS LOG READ STARTED FROM
  TIMESTAMP timestamp
• CQS LOG READ IN PROGRESS, LOG
  RECORD COUNT logrecordcount
• CQS LOG READ COMPLETED, LOG
  RECORD COUNT logrecordcount

where:

logtoken
The log token from which CQS started reading the log stream.

timestamp
The log record time stamp from which CQS started reading the log stream.
logrecordcount
    The current number of log records that have been read from the log stream.

logstreamname
    The name of the log stream to which CQS is connected for the structure. The name is defined in the CQSSGxxx PROCLIB member.

structurename
    The name of the coupling facility message queue structure.

cqsid
    The CQS identifier.

System action: CQS processing continues.
Module: CQSLOG30, CQSLOG50

CQS0354E variable text LOG logstreamname STRUC
                              structurename cqsid RC=return_code
                              RSN=reason_code
Explanation: When the message indicates LOG READ, CQS log stream read processing failed.
In the message text:
variable text
    CQS LOG READ FAILED, LOG RECORD COUNT logrecordcount
    logrecordcount
        The current number of log records that have been read from the log stream.

logstreamname
    The name of the log stream to which CQS is connected for the structure. The name is defined in the CQSSGxxx PROCLIB member.
structurename
    The name of the coupling facility message queue structure.
cqsid
    The CQS identifier.
return_code
    Indicates the hexadecimal return code from the IXGBRWSE service. For details, see the IXGBRWSE macro documentation.
reason_code
    Indicates the hexadecimal reason code from the IXGBRWSE service. For details, see the IXGBRWSE macro documentation.

System action: If this error occurs during initialization, CQS terminates abnormally. If this error occurs during the structure rebuild process, CQS terminates the rebuild. Otherwise, CQS processing continues.
If the IXGBRWSE service returns return code 08 and reason code 0807 (Invalid browse token), reply CONTINUE to the CQS0034A message, and initiate a new rebuild with the command: SETXCF START,REBUILD,STRNAME=structurename
System programmer response: If you cannot resolve the problem, copy the SYSLOG and the memory dump of the CQS address space and call IBM Software Support for help.
Module: CQSLOG50

CQS0360W QUEUE REGISTRATION FAILED FOR STRUCTURE structurename CHANGE CFRM POLICY AND REBUILD

Explanation: Queue registration failed for one or more queues because all the Event Monitoring Controls (EMC) are in use. CQS attempted to alter the structure to increase the EMC percentage, but the increase could not be made. All future queue registrations will fail until the structure is altered or rebuilt and more EMCs are made available. After any successful queue registrations have been performed, this message is issued each time a queue registration fails. Queue registration occurs when:
• There is a CQSINFRM request.
• At the end of structure rebuild.
• After CQS reconnects to a structure.
• After CQS moves queues to the overflow structure.

System action: CQS processing continues.
System programmer response: Change the CFRM policy to increase the structure size. Activate the new CFRM policy and initiate a structure rebuild using the z/OS operator command SETXCF START,REBUILD.
Module: CQSINF00

CQS0370I STRUCTURE structurename IS DEFINED AS NON-RECOVERABLE

Explanation: You defined the structure identified in the message as unrecoverable, that is RECOVERABLE=NO in the CQS global parameter PROCLIB member, CQSSGxxx. The data in this structure is lost if the structure fails. There is no z/OS log stream associated with this structure. In the message text:
structurename
    The name of the structure that is defined as unrecoverable

System action: CQS processing continues.
System programmer response: No action is required.
Module: CQSICQS0

CQS0371I CQS COLD START FORCED FOR NON-RECOVERABLE STRUCTURE structurename

Explanation: A CQS cold start was forced for the structure identified by structurename, because it is a nonrecoverable structure. Nonrecoverable structures do not have a z/OS log stream associated for them for recovery, and must always go through CQS cold start processing when CQS restarts. Additionally, when a nonrecoverable structure fails, CQS will cold start the
structure (initialize it to empty) as a part of the structure rebuild process. This message is issued for both of these cases.

In the message text:
structurename

The name of the structure for which CQS cold started

**System action:** When this message is issued during CQS restart processing, CQS processing continues. When this message is issued due to a nonrecoverable structure failure and rebuild, CQS terminates abnormally with a CQS abend 0373 as the structure cold start has completed.

**System programmer response:** No action is required.

If a nonrecoverable structure failure occurred, restart CQS to perform resynchronization processing with its clients and to resume operations using the empty new structure.

**Module:** CQSIST40, CQSSTR00

**Related information:**

CQS abend 0373

---

**CQS0372E** CQS COLD START FAILED FOR NON-RECOVERABLE STRUCTURE

**structurename**

**Explanation:** An error was encountered while attempting to cold start CQS with a nonrecoverable primary queue structure after a prior structure failure. The rebuild structure could not be cold started.

In the message text:
structurename

The name of the structure that CQS was attempting to start

**System action:** CQS terminates abnormally with a CQS abend 0372.

**System programmer response:** No action is required.

If any surviving old structure is still allocated, either a primary or overflow structure, manually delete the structures. Then, restart CQS to allow CQS initialization to freshly allocate and cold start the structure. To delete the structure, first ensure that all CQSs using that structure are stopped. Then delete the structure by using the following z/OS command:

```
SETXCF FORCE,STR,STRNAME=structurename
```

**Module:** CQSSTE20

**Related information:**

CQS abend 0373

---

**CQS0373E** CQS CLEAN UP COMPLETED FOR NON-RECOVERABLE STRUCTURE

**structurename**

**Explanation:** CQS has completed cleanup processing for a failed nonrecoverable structure.

When a recoverable structure fails, CQS attempts to recover the structure from the system recovery data set (SRDS) and the z/OS log stream. CQS allocated a new structure is allocated and puts the data objects from the SRDS and log in to the new structure. For a nonrecoverable structure (one defined with RECOVERABLE=NO in the CQSSGxxx PROCLIB member), there is no log stream from which to recover. Instead, CQS allocates the new structure and cold starts it, that is, initializes it as an empty CQS structure. This message indicates that the cleanup process is complete.

In the message text:
structurename

The name of the failed structure for which CQS performed cleanup processing

**System action:** After cleaning up the failed structure and cold starting it, CQS terminated abnormally with a CQS abend 0373. This termination is required because CQS cannot allow active clients to use the new empty structure until they have gone through CQS resynchronization processing that occurs during client reconnect processing after CQS is restarted.

**System programmer response:** No action is required.

Restart CQS. CQS connects to the empty new structure and performs the resynchronization processing when its clients reconnect. All the messages that were on the original failed structure are lost, because the structure was defined as nonrecoverable.

**Module:** CQSSTE20

**Related information:**

CQS abend 0373

---

**CQS0374I** STRUCTURE CHECKPOINT SKIPPED FOR NON-RECOVERABLE STRUCTURE

**structurename**

**Explanation:** CQS processing triggered a structure checkpoint as part of its processing. However, the structure involved was a non-recoverable structure. For this reason, the structure checkpoint was skipped. CQS internal structure checkpoints are generated after significant structure events, such as an overflow and rebuild. CQS skips taking internal structure checkpoints for non-recoverable structures, because these structures cannot be rebuilt from structure checkpoints.

In the message text:
structurename

The name of the primary queue structure whose internal structure checkpoint was skipped
**System action:** CQS continues processing.

**System programmer response:** No action is required.

This is an expected message for non-recoverable structures when a significant structure event occurs. This message is issued for diagnostic purposes.

**Module:** CQSCHK30

---

**CQS0375E**

**CONNECT TO NON-RECOVERABLE STRUCTURE**

**structurename**

**Explanation:** This message is issued when the Common Queue Server (CQS) connects to a non-recoverable queue structure and detects an error. The error requires CQS to abend and be restarted. A CQS abend 0373 follows this message.

When a non-recoverable queue structure fails, CQS must perform rebuild processing that cold starts the structure and then CQS abends. This is to restart CQS and resynchronize it with its clients so that they are aware of the cold start of the structure. It issues this message followed by a CQS abend 0373. If CQS does not connect to a queue structure when this rebuild or cold start processing occurs, a cold start occurs the next time CQS connects to the structure.

In the message text, the variables have the following meanings:

- **details** The detected error, which can have one of the following values:
  
  **REBUILD IN PROGRESS AND STRUCTURE IS IN state STATE**
  
  CQS connects to a non-recoverable structure and detects that a rebuild is in progress for a structure that failed, or for a structure that CQS lost connectivity to.

  **VERSION MISMATCH prev_version cur_version**
  
  CQS connects to a non-recoverable structure and finds that the logical instance version number of the structure is different from the last time CQS connected to it. This indicates that the structure was cold started while CQS was not connected to it.

- **structurename** The name of the structure that CQS connects to.

- **state** The state of the structure, which has one of the following values:
  
  **FAILED** The structure failed before CQS disconnected from it.

---

**CONLOSS** The structure lost connectivity to CQS.

- **prev_version** The logical instance version number of the structure the last time CQS connected to it. The version number is the 8-byte hardware time-of-day (TOD) clock value in the store clock (STCK) format when the structure was first initialized.

- **cur_version** The current logical instance version number of the structure. The version number is the 8-byte hardware time-of-day (TOD) clock value in the STCK format when the structure was cold started the last time.

**System action:** CQS abends with a CQS abend 0373.

**System programmer response:** Restart CQS. CQS connects to the new structure and performs resynchronization when its clients reconnect. All the messages on the structure that failed and the structure that CQS lost connectivity to are lost because the structure was defined as non-recoverable.
Chapter 5. CSL messages (Common Service Layer)

The Common Service Layer (CSL) issues messages that begin with CSL.

Messages issued by the Common Service Layer (CSL), which includes:
- Operations Manager (OM)
- Resource Manager (RM)
- TSO Single Point of Control (SPOC)
- Structured Call Interface (SCI)
- Open Database Manager (ODBM)

CSL messages

This topic contains the following messages:

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Message Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CSL0001E</td>

</table>

Explanation: An error occurred during the initialization of a CSL address space. The initialization error could occur while processing a service, validating a parameter in a PROCLIB member, or initializing a TCB.

In the message text:
- detail: Provides additional information about the error.
- modulename: The name of the module that issued the error.
- parmname: The name of the PROCLIB member parameter that is in error. The variable can be one of the following values:
  - ARMRST: The ARMRST parameter is invalid. Valid values are Y or N. This parameter is specified as a CSL address space run time parameter, or specified in the CSL address space initialization PROCLIB member (CSLOIxxx, CSLRIxxx, or CSLSIxxx).
  - CMDSEC: The OM run time parameter CMDSEC is invalid. Valid values are A, E, N, or R.
  - CQSSSN: The CQSSSN parameter is invalid. If this parameter is specified, it must contain something other than all blanks. Embedded blanks are ignored. The CSLRIxxx PROCLIB member defines the CQSSSN parameter.
  - CQSSSN=MISSING: The IMSplex is defined with a resource structure (STRNAME), but the CQS subsystem name definition (CQSSSN) is missing. A CQS subsystem name is required with a resource structure.
  - IMSPLEX COUNT=MAX: The OM CSLOIxxx, SCI CSLSIxxx, or RM CSLRIxxx PROCLIB member defines an invalid number of IMSplexes. The IMSplex count is more than the maximum number supported.
  - NAME: The NAME parameter, which defines the IMSplex name, is invalid. If this parameter is specified, it must contain something other than all blanks. Embedded blanks are ignored. The NAME parameter is specified in the CSLOIxxx, CSLRIxxx, or CSLSIxxx PROCLIB member.
  - NO SECURITY EXIT: The security exit is requested with the CMDSEC=A or CMDSEC=E option,
but the security exit was not defined to BPE in the user exit PROCLIB member.

**ODBMNAME**
The ODBMNAME parameter is not specified for ODBM. This parameter must be specified as an ODBM run time parameter or specified in the CSLDI xxx PROCLIB member.

**OMNAME**
The OMNAME parameter is not specified for OM. This parameter must be specified as an OM run time parameter or specified in the CSLOIxxx PROCLIB member.

**RMNAME**
The RMNAME parameter is not specified for RM. This parameter must be specified as an RM run time parameter or specified in the CSLRIxxx PROCLIB member.

**RRS**
The optional RRS parameter was not correctly specified for ODBM. If specified, set the value of this parameter to Y or N.

**RSRCSTRUC**
The CSLRIxxx PROCLIB member defines a CQS subsystem (CQSSSN), but there is no IMSplex defined in the CSLRIxxx PROCLIB member with a resource structure (RSRCSTRUC). A resource structure is required with a CQS subsystem name.

**SCINAME**
The SCINAME parameter is not specified for SCI. The SCINAME parameter must be specified as an SCI run time parameter or specified in the CSLSIxxx PROCLIB member.

**STRNAME**
The STRNAME parameter is invalid. If this parameter is specified, it must contain something other than all blanks. Embedded blanks are ignored. The CSLRIxxx PROCLIB member defines the STRNAME parameter.

**rc**
The return code for the failing service.

See the information about the BPE service return codes and CQS return and reason codes.

**rsn servicename**
The reason code from the failing service.

The name of the service that detected the error. The service can be provided by:

**BPEservicename**
See the information about the BPE service return codes.

If BPELOAD displays as the failing service name, the CSL address space was attempting to load a module. The text that appears in the message is the name of the module that could not be loaded. Ensure that the module is linked into the IMS.SDFSRESL.

**CSLZARM0**
For information about ARM service names, see [z/OS: IXCARM description](#).

**CSLZLIC0**
Possible return codes from CSLZLIC0 are:

- **X’04’**
  An invalid function code was passed to CSLZLIC0.

**CQSservicename**
See the information about CQS return and reason codes.

**MVSServicename**
Service can also be provided by z/OS. For information about z/OS services, see:

- [z/OS MVS Programming: Authorized Assembler Services Reference, Vol. 1](#)
- [z/OS MVS Programming: Authorized Assembler Services Reference, Vol. 2](#)
- [z/OS MVS Programming: Authorized Assembler Services Reference, Vol. 3](#)
- [z/OS MVS Programming: Authorized Assembler Services Reference, Vol. 4](#)

**tcbtype**
The TCB type that encountered an error.

**errortext**
The error text can be one of the following values:

**REPOSITORYINPLEX**
A higher-level RM was enabled to use the repository. A RM from an earlier version of IMS cannot coexist in the IMSplex with the higher level RM. You must disable the usage of the repository in the IMSplex before restarting the earlier version of IMS.

**System action:** The CSL address space terminates abnormally with the CSL abend 0010.

**System programmer response:** If you are unable to resolve the problem, save the SYSLOG and the memory dump, and call IBM Software Support for assistance.

**Module:** CSLDCF00, CSLDIN00, CSLDIN10, CSLDIT00, CSLOI00, CSLOIN00, CSLOIT00, CSLRIN10, CSLRIT00, CSLSI00, CSLSING0, CSLSIN00, CSLSIS00, CSLSIT00, CSLSIT10, CSLSIX00, CSLSPL10, CSLSFRG0

**Related reference:**

IMSPLEX INITIALIZATION ERROR IN  
modulename servicenm RC=rc detail  
or
IMSPLEX INITIALIZATION ERROR IN  
parm validation error detail  
or
IMSPLEX INITIALIZATION ERROR IN  
servicenm RC=rc RSN=rsn CC=compcode

Explanation:  IMSplex initialization encountered an error.
In the message text:

- compcode: The service completion code.
- detail: Extra detail about the error that is unique to the specific error. This variable can be one of the following values:
  - MULTIPLE RMS
    This RM cannot join the IMSplex because it would result in an IMSplex with multiple RMs where at least one of the RMs is not defined with the resource structure. Only one RM is allowed in an IMSplex with no resource structure identified.
  - RMGLOBAL IMSPLEX
    The IMSplex name defined by this RM does not match the IMSplex name defined by other RMs in the IMSplex. The IMSplex name is defined in the global resource for RM.
  - STRUCTURE TYPE
    RM connected to a structure whose type is not supported by RM. RM can only connect to resource structures. The structure defined with the CSLRIxxx STRNAME parameter is not a resource structure.

- modulename: The name of the module that issued the error. The first four characters of the module name indicate which CSL address space encountered an error:
  - CSLO indicates OM.
  - CSLR indicates RM.

System action:  The CSL address space terminates abnormally with the CSL abend 0010.
If ODBM is attempting to register commands with OM, failures do not result in the ODBM address space terminating. Instead, registration is attempted again when OM becomes available.

System programmer response:  If you are unable to resolve the problem, save the SYSLOG and the dump, then call IBM Software Support for assistance.

Module:
CSLDPL10, CSLOPL10, CSLRPL10, CSLRPL20, CSLRPL30, CSLSINP0, CSLSINX0, CSLSRGSO, CSLSXCG0,CSLDPL20

Related reference:

Related information:
- IMS abend 0010

CSL0002E  csltype IS WAITING FOR target

Explanation:
The CSL address space is waiting for the target address space to become active. The CSL address space tries accessing the target address space several times. If the target address space remains inactive, the CSL address space abends with CSL abend 0010. You might need to start the target address space if it is not already started.

In the message text:

- csltype: The CSL type, which can be OM, RM, or ODBM.
- target: The target address space, which can be SCI or CQS.

System action:  The CSL address space continues attempting to communicate with the target address space. If the target address space remains inactive, the CSL address space abends with CSL abend 0010.

Operator response:
Start the target address space.
- If the target is CQS, start the CQS identified in the CSLRIxxx PROCLIB member by the CQSSSN= parameter.
If the target is SCI, the IMSplex name in the initialization PROCLIB member for the csltype must match the IMSplex name in the SCI initialization PROCLIB member (CSLISxxx).

The initialization PROCLIB members for the CSL types are: OM (CSLOIxxx), RM (CSLRIxxx), and ODBM (CSLIDxxx).

**Module:** CSLDPL10, CSLDPL20, CSLDREG0, CSLOPL10, CSLRIN10, CSLRPL10

---

**CSL0004E**  
**CSLOMREG REQUEST FAILED IN MODULE**

**name**  
**VERB**=verb  
**KEYWORD**=keyword  
**CC**=cc  
**OM**=om.

**Explanation:** A CSL component, such as ODBM, attempted to register a command with Operations Manager (OM), but the registration failed. One CSL0004E message is issued for each command and keyword combination that failed.

In the message text:

- **cc**  
The completion code for the command that failed to register with OM. The cc values are defined in the CSLORR macro.
- **keyword**  
The keyword that failed to register with OM.
- **module**  
The name of the module that issued the error.
- **om**  
The name of the OM that failed to register the command.
- **verb**  
The command verb that failed to register with OM.

**System action:** The CSL component attempts to register the rest of the commands in the list. A CSL0004E message is printed for each command that fails. After all attempts are completed, a CSL0002E message is printed.

**Operator response:** Terminate the CSL component if you cannot continue operating without the type-2 commands that failed registration with OM. Type-2 command registration failures with OM are errors that are internal to the CSL components or instances of OM. Gather the necessary diagnostic data and call IBM Software Support for assistance.

**System programmer response:** Type-2 command registration failures with OM are errors that are internal to the CSL components or instances of OM. Gather the necessary diagnostic data and call IBM Software Support for assistance. The required diagnostic data is this message and a console dump of the CSL component address space.

**Module:** CSLDPL20

---

**CSL0012I**  
**THIS CSL REGION IS REGISTERED AS AN IMS VUE PRODUCT**

**Explanation:** The CSL region is registered with the System Management Facility (SMF) as an IMS Value Unit Edition (VUE) product. This message is issued during ODBM address space initialization if the region is registered with SMF as an IMS Database VUE product. The ODBM address space is registered as an IMS Database VUE product if the terms and conditions of the IMS Database VUE product were accepted.

**System action:** The ODBM address space is registered with SMF as an IMS Database Value Unit Edition (VUE) product.

**Programmer response:** No action is required.

**Module:** CSLZLIC0

---

**CSL0020I**  
**csl READY**

**Explanation:** The CSL address space is available and ready. In the message text, csl is the type of CSL and can be OM, RM, or SCI.

**System action:** Processing continues.

**Operator response:** No action is required.

**Module:** CSLDIN10, CSLOIN10, CSLRIN10, CSLSIS00

---

**CSL0021I**  
**csl SHUTDOWN COMPLETE**

**Explanation:** The CSL address space indicated by csl has completed shutdown.

In the message text, csl can be OM, RM, or SCI.

**System action:** Processing continues.

**Operator response:** No action is required.

**Module:** CSLDTM20, CSLOTM20, CSLRTM20, CSLSTM20

---

**CSL0300I**  
**csl SHUTDOWN REQUESTED, CLIENT COUNT=cnt IMSPLEX=plex**

**Explanation:** Shutdown was requested for the CSL address space indicated by csl in the IMSplex indicated by plex. There are clients connected to the csl address space.

In the message text:

- **csl**  
The address space for which shutdown was requested. This variable can be OM, RM, ODBM, or SCI.
- **cnt**  
The number of clients connected to the csl address space.
- **plex**  
The name of the IMSplex in which csl resides.

**System action:** For OM, the clients are internally deregistered and shutdown proceeds when all outstanding commands have completed or timed out.

For RM, the clients are internally deregistered and shutdown proceeds.

For ODBM, the clients are internally deregistered and shutdown proceeds when all outstanding requests have completed or timed out.

For SCI, shutdown proceeds when all outstanding...
requests have either completed or timed out.

**Programmer response:** No action is required.

**Module:** CSLDTM10, CSLOTM10, CSLRTM10, CSLSTM10

---

**CSL1000I** Error reconnecting to OM Audit Trail logstream. Processing continues.

**Explanation:** The LOGENF awe queue server attempted to reconnect to the MVS logger. The reconnection was successful, but the IXGCONN REQUEST=CONNECT service returned a warning return code.

In the message text:

- `return_code` Indicates the hexadecimal return code from the IXGCONN service.
- `reason_code` Indicates the hexadecimal reason code from the IXGCONN service.

**System action:** Processing continues normally.

**Operator response:** No action is required.

**System programmer response:** No action is required.

**User response:** No action is required.

**Module:** CSLOLEN0

**Related reference:**

- [z/OS: Return and reason codes for the IXGCONN macro](#)

---

**CSL2020I** STRUCTURE strname REPOPULATION SUCCEEDED

**Explanation:** Resource Manager (RM) was notified by CQS that the structure needs to be repopulated after a resource structure failure. RM successfully repopulated its resources on the resource structure.

In the message text, `strname` is the resource structure name.

**System action:** Processing continues

**Programmer response:** No action is required.

**Module:** CSLRPOP0

---

**CSL2021E** STRUCTURE strname REPOPULATED ERROR, details

**Explanation:** CQS notified the resource manager (RM) that the resource structure needed to be repopulated after a resource structure failure. RM attempted to repopulate its resources, but failed.

In the message text:

- `strname` The resource structure name.

**details** Indicates the details of the error. Details on the information can be found in one of the following locations:

- `servicename RC=return_code RSN=rsn_code`
- `CC=compcode`

Where:

- `servicename` The name of the service that encountered an error.
- `return_code` The service return code.
- `rsn_code` The service reason code.
- `compcode` The service completion code.

- `resource name resource value errortext`

Where:

- `resource name` The name of the resource that encountered an error. A resource name of CSLRRTYP indicates the resource type table. A resource name of CSLRGLBL indicates the RM global information resource.
- `resource value` The attribute value of a resource that is in error. A resource value of IMSPLEXNAME indicates that the IMSplex name did not match the IMSplex name in the CSLRRTYP resource on the resource structure.
- `errortext` Additional text about the error. Error text that is MISMATCH, indicates that the resource value did not match the resource value on the resource structure.

- `resource name errortext`

Where:

- `resource name` The name of the resource that encountered an error. A resource name of CSLRRTYP indicates the resource type table. A resource name of CSLRGLBL indicates the RM global information resource.
- `errortext` Additional information about the error. Error text that is CQS UNAVAILABLE means that the repopulation failed because CQS is unavailable. Error text that is STRUCTURE UNAVAILABLE means that the repopulation failed because the structure is unavailable.
System action: RM quiuesces activity for the IMSplex so that it no longer processes RM requests.

System programmer response: Shutdown RM, since it can no longer process RM requests. You might try restarting RM after shutting it down.

Module: CSLRPPOP0

CSL2030I  RM rmid IS QUIESCED; CQS cqsid IS UNAVAILABLE

Explanation: RM rmid is quiuesced and unavailable to process RM requests, because CQS cqsid is no longer available. RM cannot process RM requests without CQS. RM rmid is associated with CQS cqsid. If CQS becomes unavailable and RM is already quiuesced for another reason, this message is not issued.

System action: RM notifies SCI it is quiuesced so that SCI stops routing RM requests to this RM.

System programmer response: Bring up CQS cqsid, to make RM rmid available. Ensure that there is at least one RM in the IMSplex that is available to process RM requests.

If you are unable to resolve the problem, copy the SYSLOG, dump the CQS and RM address spaces, and call IBM Software Support for help.

Module: CSLRCQE0

CSL2031I  RM rmid IS AVAILABLE; CQS cqsid IS AVAILABLE

Explanation: The resource manager (RM) indicated by rmid is again available to process RM requests because CQS cqsid became available. RM rmid is associated with CQS cqsid.

System action: RM registers to CQS and connects to the resource structure. RM notifies SCI it is ready to process requests. SCI resumes routing requests to this RM.

System programmer response: No action is required.

Module: CSLRCQE0

CSL2040I  RM rmid IS QUIESCED; STRUCTURE strname IS UNAVAILABLE

Explanation: The resource manager (RM) indicated by rmid is quiuesced and unavailable to process RM requests because resource structure strname is no longer available. RM cannot process RM requests without the resource structure. RM rmid is associated with CQS cqsid. If the structure becomes unavailable and RM is already quiuesced for another reason, this message is not issued.

System action: RM notifies SCI it is quiuesced so that SCI stops routing RM requests to this RM.

System programmer response: Analyze why the structure is unavailable and correct the problem.

If the structure failed, a new structure could not be allocated. Analyze coupling facility usage and the CFRM policy to determine why the new structure could not be allocated.

If the link failed, restore the link or initiate a structure copy to copy the resource structure to a coupling facility to which all CQSs have access. Ensure that there is at least one RM in the IMSplex that is available to process RM requests.

If you are unable to resolve the problem, copy the SYSLOG, dump the CQS and RM address spaces, and call IBM Software Support for help.

Module: CSLRSTE0

CSL2041I  RM rmid IS AVAILABLE; STRUCTURE strname IS AVAILABLE

Explanation: Resource manager (RM) rmid is again available to process RM requests because resource structure strname has become available. RM rmid is associated with CQS cqsid.

System action: RM notifies SCI it is ready to process requests. SCI resumes routing requests to this RM.

Programmer response: No action is required.

Module: CSLRSTE0

CSL2050E  SERVICE servicename ERROR MODULE modulename RC=rc RSN=rsn CC=compcode

or

SERVICE servicename ERROR MODULE RC=rc RSN=rsn

Explanation: Resource manager (RM) normal processing invoked a service that failed.

In the message text:

servicename

The name of the service that failed. The service can be a CQS request, such as CQSREG, or CQSCONN.

modulename

The module that invoked the service.

rc

The service return code.

rsn

The service reason code.

compcode

The service completion code.

For information about the reason, return, and completion codes, see the CQS service return codes information.

System action: If CQS became available and the RM CQSREG or CQSCONN request failed, RM remains quiuesced.
System programmer response: Look up the service name, return code, reason code, and completion code to determine if you can correct the problem.

If you cannot resolve the problem, copy the SYSLOG, dump the CQS and RM address spaces, and call IBM Software Support for help.

Module: CSLRCQE0
Related reference: 

CQS service return codes (Messages and Codes)

CSL2200I CLIENT client INITIATED PROCESS

Explanation:
An IMSplex-wide process was initiated by a client, or initiated again after an RM or resource structure failure. If an RM or resource structure failure occurs during the process and the client forces a process step to recover from the failure, this message might appear more than once.

In the message text:
client The name of the client that initiated the process.
imsplexprocess The name of the process that was initiated.
imsplexname The name of the IMSplex for which the process was initiated.

System action: Processing continues.
Programmer response: No action is required.
Module: CSLRPR00, CSLRPR10

CSL2201I CLIENT client TERMINATED PROCESS

Explanation: A client successfully terminated an IMSplex-wide process.

In the message text:
client The name of the client that terminated the process.
imsplexprocess The name of the process that terminated.
imsplexname The name of the IMSplex on which the process was terminated.

System action: Processing continues.
Programmer response: No action is required.
Module: CSLRPR40

CSL2210I RM SHUTDOWN TERMINATED PROCESS imsplexprocess FOR IMSPLEX imsplexname

Explanation: You requested a resource manager (RM) shutdown for an IMSplex defined with no resource structure, but the shutdown could not proceed because an IMSplex-wide process is in progress. RM terminates the process so that RM shutdown might proceed. It is up to the RM clients to clean up any knowledge of the IMSplex-wide process that they have.

In the message text:
imsplexprocess The name of the IMSplex-wide process. DFS0LC indicates an IMS global online change process.
imsplexname The name of the IMSplex.

System action: The IMSplex-wide process is terminated. RM no longer has knowledge of the IMSplex-wide process.
System programmer response: Ensure that the RM clients clean up their knowledge of the IMSplex-wide process.
Module: CSLRTOT0

CSL2500I RM rmid request REQUEST SUCCESSFUL FOR REPOSITORY NAME=reponame, REPOSITORY TYPE=repotype

Explanation: Resource Manager (RM) successfully connected to the IMSRSC repository whose name was obtained from either the CSLRIxxx PROCLIB member or the resource structure.

In the message text:
rmid Indicates the RM ID of the RM that is issuing the message.
request Indicates the type of request. The value can be either CONNECT or DISCONNECT.
reponame Indicates the 44-byte repository name that RM is connected to.
repotype Indicates the 8-byte repository type that RM is connected to. The only supported value is IMSRSC.

System action: RM continues processing. RM is connected to, or disconnected from, the repository.
User response: No action is required.
index fields, the RM control information, or both. This message indicates that the key and index fields or the RM control information was not initialized in the repository when RM connected to the repository.

Note: In an IMSplex, when multiple RMs are starting at the same time or when multiple RM's connect to the repository after the repository data sets were scratched and reallocated, CSL2501I might be issued by multiple RMs. This is because each RM might have initialized a different entity such as the key and index fields or RM control information.

In the message text:

repotype
Indicates the 8-byte repository type that RM is connected to. The only supported value is IMSRSC.

repname
Indicates the 44-byte repository name that RM is connected to.

**System action:** RM is connected to the repository.

**Operator response:** No action is required.

**System programmer response:** No action is required.

**User response:** No action is required.

---

**CSL2502A**

**RM WAITING FOR MASTER REPOSITORY SERVER ADDRESS SPACE**

**Explanation:** RM is enabled with the IMSRSC repository in the CSLRIxxx member. However, RM initialization cannot connect to the repository name specified in the CSL2503A message. The CSL2511E message, which is issued before the CSL2503A message, identifies the error that RM received on the repository CONNECT request.

The CSL2503A message is highlighted and remains highlighted until RM can connect successfully to the repository whose name is specified in the message. RM attempts to connect to the repository every 5 seconds. The error with the RS CONNECT request must be fixed so that RM can connect to the repository and continue RM initialization.

In the message text,

repotype
Indicates the repository type

repname
Indicates the repository name.

**System action:** RM issues the CSL2502A and CSL2511E messages once. RM attempts to register to the RS every 5 seconds until it is successful or RM is terminated using the CANCEL command.

**Operator response:** Fix the error as indicated in the CSL2502A and CSL2511E message so that RM can successfully connect to the repository. Alternatively, terminate RM by using the CANCEL command.

**System programmer response:** Fix the error as indicated in the CSL2502A and CSL2511E message so that RM can successfully connect to the repository. Alternatively, terminate RM by using the CANCEL command.

**User response:** Fix the error as indicated in the CSL2502A and CSL2511E message so that RM can successfully connect to the repository. Alternatively, terminate RM by using the CANCEL command, and restart RM when the RS REGISTER error is fixed.

**User response:** Fix the error as indicated in the CSL2510E message so that RM can successfully register to the RS address space. Alternatively, terminate RM by using the CANCEL command, and restart RM when the RS REGISTER error is fixed.

**Programmer response:** No action is required.

**Problem determination:** Check the error return and reason codes in the CSL2510E message, and fix the error so that RM can register to the RS address space.

**Module:** CSLRRP10
the CANCEL command and restart RM when the RS CONNECT error is fixed.

**Programmer response:** No action is required.

**Problem determination:** Check the error return and reason codes in the CSL2511E message and fix the error so that RM can connect to the repository.

**Module:** CSLRRP20

| CSL2504I | RM rmid ENABLED FOR REPOSITORY REQUESTS FOR REPOSITORY NAME=reponame, REPOSITORY TYPE=repotype |

**Explanation:** Resource Manager (RM) completed initialization and is now available to process client repository requests.

In the message text:
- **rmid** Indicates the RM ID of the RM that is issuing the message.
- **reponame** Indicates the 44-byte repository name that RM is connected to.
- **repotype** Indicates the 8-byte repository type that RM is connected to. The only supported value is IMSRSC.

**System action:** RM is available to process the client repository requests.

**Operator response:** Any IMS commands that require access to the IMSRSC repository can be issued.

**System programmer response:** Any utilities or IMS commands that require access to the IMSRSC repository can be issued.

**User response:** No action is required.

| CSL2504I | rgsname REQUEST TO REPOSITORY SERVER DID NOT SUCCEED, RC=rc,RSN=rsn,ERRORTEXT=errtext |

**Explanation:** The REGISTER or DEREGISTER request to the Repository Server (RS) failed.

In the message text:
- **rgsname** Indicates the type of request that did not succeed. The value can be either REGISTER or DEREGISTER.
- **rc** Indicates the return code from the RS.
- **rsn** Indicates the reason code from the RS.
- **errtext** Indicates the error text from the RS request. The error text can be either null or 6 words of text.

See the FRPSRVR macro in the IMS.SDFSMAC data set for a description of the return and reason codes from the RS.

**System action:** If the CSL2510E message is issued during RM initialization, the CSL2510E message is followed by the CSL2502A message. The CSL2510E and CSL2502A messages are issued once. RM initialization is not complete and RM attempts to register to the RS every 5 seconds until the request is successful or RM is terminated.

If the message is issued during UPDATE RM command processing at either the command master or the non-command master RM, the message indicates that RM is not enabled to use the repository.

**Operator response:** Fix the error that is preventing RM from registering to the RS.

If the CSL2510E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to register to the RS again.

**System programmer response:** Fix the error that is preventing RM from registering to the RS.

If the CSL2510E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to register to the RS again.

**User response:** Fix the error that is preventing RM from registering to the RS.

If the CSL2510E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to register to the RS again.

**Module:** CSLRRP10

| CSL2511E | rgsname REQUEST TO REPOSITORY DID NOT SUCCEED, RC=rc,RSN=rsn,ERRORTEXT=errtext REPOSITORY NAME= reponame |

**Explanation:** The request to the Repository Server (RS) failed.

In the message text:
- **rgsname** Indicates the name of the request that did not succeed. The value can be one of the following:
  - CONNECT
  - DISCONNECT
  - CONTROLQUERYFIELDS
  - CONTROLSETFIELDS
  - CONTROLSETAUDIT
CSL2512W • CSL2513E

- STARTUOW

reponame Indicates the 44-byte name of the repository that RM is trying to connect to or disconnect from.

rc Indicates the return code from the RS.

rsnt Indicates the reason code from the RS.

erertext Indicates the error text from the RS request. The error text can be either null or 6 words of text.

See the FRPSRVR macro in the IMS.SDFSMAC data set for a description about the return and reason code from the RS.

System action: If the CSL2511E message is issued during RM initialization, the CSL2511E message is followed by the CSL2503A message. The CSL2511E and CSL2503A messages are issued once during RM initialization for each error that RM encounters on RS CONNECT. RM initialization is not complete and RM attempts to connect to the RS every 5 seconds until the request is successful or RM is terminated.

If the message was issued during UPDATE RM command processing at either the command master or the non-command master, the message indicates that RM is not enabled to use the repository.

Operator response: Fix the error that is preventing RM from connecting to the repository.

If the CSL2511E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to connect to the repository.

System programmer response: Fix the error that is preventing RM from connecting to the repository.

If the CSL2511E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to connect to the repository.

User response: Fix the error that is preventing RM from connecting to the repository.

If the CSL2511E message was issued during RM initialization, RM initialization will continue when the error is fixed.

If the error message was issued during UPDATE RM command processing, restart RM or issue the UPDATE RM command to enable RM to connect to the repository.

Module: CSLRPP20, CSLRPX30, CSLRRPM0

CSL2512W THE REPOSITORY NAME FOR REPOSITORY TYPE=repotype IS OVERRIDDEN WITH THE RESOURCE STRUCTURE REPOSITORY NAME; RMINIT MBR VALUE: reponame RSC STR VALUE: rscstrreponame

Explanation: The IMSRSC repository name specified in the CSLRIxxx member is different from the repository name in the resource structure. The first resource manager (RM) that connects to the repository saves its repository name in the resource structure. Subsequent RMs use the repository name from the resource structure because there is one active repository in the IMSplex.

This message is issued as an informational message to notify the user of the mismatch so that the user can modify the CSLRIxxx members to ensure that all RMs use the same repository name. If the CSLRIxxx members are not modified to be the same for all RM address spaces, RM issues the CSL2512W message at next RM restart.

In the message text:

repotype Indicates the 8-byte repository type that RM is connected to. The only supported value is IMSRSC.

reponame Indicates the repository name from the RMINIT member.

rscstrreponame Indicates the repository name read from the RM resource structure.

System action: RM connects to the repository with the information obtained from the resource structure.

Operator response: No action is required.

System programmer response: Modify your CSLRIxxx member to ensure that all RMs are using the same repository name for the specified repository type.

User response: No action is required.

CSL2513E DUPLICATE REPOSITORY STATEMENTS FOR REPOSITORY TYPE=repotype IN THE RMINIT MEMBER=rminitmbr

Explanation: Resource Manager (RM) was not able to process the CSLRIxxx PROCLIB member as the REPOSITORY section because there were duplicate statements for the same IMSRSC repository type.

In the message text:

repotype Indicates the 8-byte repository type. The only valid value is IMSRSC.
connect to the IMSRSC repository because of a Common Queue Server (CQS) error reading or writing to the resource structure. RM is not connected to the repository.

CQS request return codes, reason codes, and completion codes are mapped by macros that use the naming convention CQSRRxxx, where xxx represents the function that is being traced. For example, the macro CQSRRPUT maps return codes, reason codes, and completion codes that are associated with the CQSPUT request. To identify the error, use the macro based on the request name returned in the message.

In the message text:

remname
  Indicates the 44-byte repository name that RM is trying to connect to.

rqstname
  Indicates the CQS request name in error.

rc
  Indicates the CQS request return code.

rsn
  Indicates the CQS request reason code.

System action:  RM is not connected to the repository.

Operator response:  Issue the UPDATE RM command after the CQS error is fixed so that RM can use the repository.

System programmer response:  Fix the CQS error and restart RM, or issue the UPDATE RM command after the CQS error is fixed so that RM can use the repository.

User response:  No action is required.

Related reference:

- Return codes and reason codes for CQS requests

CSL2516E  REPOSITORY Parmname PARAMETER SPECIFIED IN RMINIT MEMBER mbrname IS INVALID

Explanation: Resource Manager (RM) was not able to connect to the IMSRSC repository because the repository name specified in the CSLRIxxx member of the IMS PROCLIB data set was invalid.

In the message text:

Parmname
  Indicates the parameter that is invalid.

Parmname is 8 bytes and can have a value of either GROUP or NAME.

mbrname
  Indicates the CSLRIxxx RMINIT member being processed.

System action:  RM continues processing without the repository being enabled.

Operator response:  Correct the RMINIT member with a valid repository name or a z/OS cross-system coupling facility (XCF) group name, and then issue the UPDATE RM command.
CSL2517E • CSL2518E

System programmer response: Correct the RMINIT member with a valid repository name or an XCF group name as specified in the error message. Then, restart RM or issue the UPDATE RM command so that RM can use the repository.

User response: No action is required.

Module: CSLRIN20

Related reference:

[CSLRIxxx member of IMS PROCLIB data set](System Definition)

CSL2517E THE XCFGROUP NAME FOR REPOSITORY TYPE=repotype DID NOT MATCH THE XCFGROUP NAME FROM THE RESOURCE STRUCTURE; RMINIT MBR VALUE: xcfgrpname RSC STR VALUE: rscstrxcfgrpname

Explanation: Resource Manager (RM) was not able to register to the Repository Server address space because the XCFGRP name value specified in the CSLRIxxx member did not match the XCFGRP name in the RM resource structure.

In the message text:

repotype Indicates the 8-byte repository type that RM is connected to. The only supported value is IMSRSC.

xcfgrpname Indicates the XCFGRP name read from the RMINIT member.

rscstrxcfgrpname Indicates the XCFGRP name read from the RM resource structure.

System action: RM continues processing without the repository being enabled.

Operator response: Issue the UPDATE RM command after the RMINIT member is modified to have a valid repository name.

System programmer response: Fix the RMINIT member with a valid XCFGRP name. Restart RM or issue the UPDATE RM command so that RM can use the repository.

User response: No action is required.

Programmer response: No action is required.

Module: CSLRIN20

CSL2518E modulename COULD NOT INITIALIZE REPOSITORY TYPE repotype servicename RC=returncode

or

CSLRIN20 COULD NOT INITIALIZE REPOSITORY TYPE repotype ERRORTEXT=errortext

Explanation: Initialization of the IMSRSC repository failed. In the message text:

modulename The name of the module that issued the message. modulename can be CSLRDIR0, CSLRIN20, or CSLRRP20.

repotype The 8-byte repository type to which resource manager (RM) is connected. The only supported value is IMSRSC. If RM initialization has not yet read the repository name specified in the CSLRIxxx PROCLIB member, repotype is UNKNOWN.

servicename The 8-byte RM service name that encountered an error. servicename can be a BPE or SCI service, such as BPEPARSE or CSLSCMSG, or it can be one of the following internal RM services:

• GETIOBUF - I/O buffer request
• INITAFMT - Initialize Attribute Field Mapping Table
• INITMBT - Initialize member table
• STRGREQ - Storage request
• UPDAFMT - Update Attribute Field Mapping Table

returncode The 4-byte return code from servicename that failed.

errortext 16-byte error text that explains why the repository could not be initialized. The error text can be one of the following values:

• EMPTYSECTION – The CSLRIxxx member was defined with the REPOSITORY section header but no REPOSITORY= statements were defined. RM initialization completes without the repository being enabled.

System action: If the message is issued during RM initialization, RM continues initialization if the error can be corrected by the user and repository initialization is tried again. Examples of the errors that can be corrected include:

• RM cannot read the PDS that contains the CSLRIxxx member
• There is a syntax error in the CSLRIxxx member of the REPOSITORY section

If RM initialization could not obtain storage or perform the initialization function necessary for RM processing, RM ends abnormally. If the message is issued after RM initialization is complete, RM remains registered to the RS and connected to the IMSRSC repository. When the error causing the CSL2518E message is resolved, RM will reregister to the RS and reconnect to the repository.

Operator response: Correct the RMINIT member with a valid repository name or a z/OS cross-system
coupling facility (XCF) group name, and then issue the UPDATE RM command.

Issue the QRY RM TYPE(REPO) to see if the IMSRSC repository is enabled. For each RM where the repository is not enabled, issue the UPDATE RM SET(REPO(Y)) command to enable the repository. The command must be routed to any RM that does not have the repository enabled.

**System programmer response:** If RM ends abnormally, contact IBM Software Support.

**User response:** No action is required.

**Module:** CSLRRP20, CSLRPX30, CSLRRPM0

---

**CSL2601I modid WRITE TO REPOSITORY WAS SUCCESSFUL FOR REPOTYPE=repotype, REPONAME=repository_name**

**Explanation:** The information was written to the repository. In the message text:

- `modid` Indicates the module ID. The value can be CSLURP10.
- `repotype` Indicates the type of the IMSRSC repository. The value can be IMSRSC.
- `repository_name` Indicates the name of the repository.

**System action:** Processing continues.

**System programmer response:** No action is required.

**User response:** No action is required.

**Module:** CSLURP10

---

**CSL2601E modid FAILED TO START BPE LIMITED FUNCTION SERVICES, RC=rc**

**Explanation:** The utility identified by `modid` failed to start the BPE Limited Function Services (LFS). The return code from the BPESTART FUNC=STARTLFS function is returned. See the BPESTART services and the BPE0042E for details of the error.

In the message text:

- `modid` Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- `rc` Indicates the return code from the BPESTART FUNC=STARTLFS function.

**System action:** CSLURP10 or CSLURP20 terminates with return code 8.

**Operator response:** No action is required.

**System programmer response:** See the BPE0042E message for details on why BPE LFS could not be started.

**User response:** No action is required.

**Programmer response:** No action is required.

**CSL2608E**

modid ENCOUNTERED AN ERROR TRYING TO rqstname THE RDDSDSN DD STATEMENT RSNTEXT=rsntext

**Explanation:** The utility identified by modid encountered an error while trying to read or write to the RDDSDSN DD statement that was specified on the RDDSDSN DD statement.

In the message text:
modid Indicates the module ID. This value can be either CSLURP10 or CSLURP20.
rqstname Indicates the type of request. The value can be either READ or WRITE.
rc Indicates the return code that is returned from the QSAM GET macro. The error return code information is provided in the QSAM GET macro description in the z/OS DFSMS Macro Instructions for Data Sets.
rsntext Indicates the reason for the error. rsntext can be one of the following values:
- DATA SET IS NOT AN RDDSDSN DD STATEMENT
- DATA IS NOT FROM A SUCCESSFUL EXPORT

**System action:** The utility terminates with a return code of 8.

**Operator response:** No action is required.

**System programmer response:** Update the RDDSDSN DD statement to point to one of the following data sets:
- RDDSDSN DD statement
- RDDSDSN DD statement created from one of the RDDSDSN DD statement creation utilities

**User response:** No action is required.

**Programmer response:** No action is required.

**Module:** CSLURP10

modid AN ERROR OCCURRED TRYING TO PROCESS THE RDDSDSN DD STATEMENT RSNTEXT=rsntext

**Explanation:** The utility identified by modid encountered an error while trying to process the RDDSDSN DD statement.

In the message text:
modid Indicates the module ID. This value can be either CSLURP10 or CSLURP20.
rqstname Indicates the type of request. The value can be either READ or WRITE.
rc Indicates the return code that is returned from the QSAM GET macro. The error return code information is provided in the QSAM GET macro description in the z/OS DFSMS Macro Instructions for Data Sets.
rsntext Indicates the reason for the error. rsntext can be one of the following values:
- DATA SET IS NOT AN RDDSDSN DD STATEMENT
- DATA IS NOT FROM A SUCCESSFUL EXPORT

**System action:** CSLURP10 or CSLURP20 terminates with return code 8.

**System programmer response:** Check the device on which the RDDSDSN DD statement is located. If no permanent device error is detected, run the utility again.

**User response:** No action is required.

**Programmer response:** No action is required.

**Module:** CSLURP10, CSLURP20

**Related reference:**
- [z/OS: QSAM GET macro](#)
modid
- Indicates the module ID. The value can be either CSLURP10 or CSLURP20.

rsntext
- Indicates the reason for the error. rsntext can be one of the following values:
  - RDJFCB REQUEST FAILED TO RETURN DSNAME
  - MULTIPLE RDDS DATA SETS DEFINED

System action: CSLURP10 or CSLURP20 terminates with return code 8.

Operator response: No action is required.

System programmer response: Make sure the RDDSDSN DD statement is coded correctly and that it does not contain concatenated data sets.

User response: No action is required.

Programmer response: No action is required.

Module: CSLURP10, CSLURP20

CSL2611E  modid INVALID IMSID SPECIFIED

**Explanation:** The IMSID parameter contains invalid characters.

In the message text:
- modid Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- imsid Indicates the IMSID parameter that is invalid.

System action: CSLURP10 or CSLURP20 terminates with return code 8.

Operator response: No action is required.

System programmer response: Correct the IMSID parameter so that it contains only valid alphanumeric characters.

User response: No action is required.

Programmer response: No action is required.

Module: CSLURP10, CSLURP20

---

CSL2612E  modid INVALID IMSPLEX NAME SPECIFIED. plexname

**Explanation:** The utility identified by modid specified an invalid value for the IMSPLEX NAME parameter.

In the message text:
- modid Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- plexname Indicates the invalid IMSPLEX(NAME=plexname) parameter value.

System action: CSLURP10 or CSLURP20 terminates with return code 8.

Operator response: No action is required.

System programmer response: Correct the IMSplex name specified in IMSPLEX(NAME=plexname) so that it contains only valid alphanumeric characters.

User response: No action is required.

Programmer response: No action is required.

Module: CSLURP10, CSLURP20

---

CSL2613E  modid FAILED TO REGISTER WITH SCI, CSLSCREG REQUEST RC=rc, RSN=rsn

**Explanation:** The utility identified by modid failed the CSLSCREG request to register with Structured Call Interface (SCI).

In the message text:
- modid Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- rc Indicates the return code from the CSLSCREG request.
- rsn Indicates the reason code from the CSLSCREG request.

System action: The utility terminates with return code 8.

Operator response: No action is required.

System programmer response: Make sure that the SCI for the IMSplex specified is available. Restart the utility after the SCI becomes available.

User response: No action is required.

Programmer response: No action is required.

CSL2614E  modid FAILED TO REGISTER WITH RM, RMNAME=rmname, RC=rc, RSN=rsn

**Explanation:** The utility identified by modid failed to register with the Resource Manager (RM) system identified by rmname.

In the message text:
- modid Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- rmname Indicates the name of the RM system with which the CSLRMREG registration request failed.
- rc Indicates the return code from the CSLRMREG request.
- rsn Indicates the reason code from the CSLRMREG request.

Module: CSLURP10, CSLURP20

or

modid FAILED TO REGISTER WITH RM, RMNAME=rmname, ERRORTEXT=errortext

**Explanation:** The utility identified by modid failed to register with the Resource Manager (RM) system identified by rmname.

In the message text:
- modid Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- rmname Indicates the name of the RM system with which the CSLRMREG registration request failed.
- rc Indicates the return code from the CSLRMREG request.
- rsn Indicates the reason code from the CSLRMREG request.

Module: CSLURP10, CSLURP20
**CSL2615E**  
**modid TOO MANY NAME= PARAMETERS SPECIFIED**

**Explanation:** In the utility identified by *modid*, more than one IMSplex name is specified by use of the IMSPLEX(NAME= parameter on the SYSIN input statement.

In the message text:
- *modid* indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- *rsn* indicates the reason code. See the CSLRRR macro for details.

**System action:** The utility terminates with return code 8.

**Operator response:** No action is required.

**System programmer response:** Correct the SYSIN input statement by specifying only one IMSPLEX(NAME= parameter.

**User response:** No action is required.

**Programmer response:** No action is required.

**Module:** CSLURP10, CSLURP20

---

**CSL2616E**  
**modid request REQUEST FAILED RC=rc, RSN=rsn**

**or**

**CSL2617E**  
**modid request REQUEST FAILED RC=rc, RSN=rsn**

**Explanation:** The utility identified by *modid* failed to update resource definitions in the IMSRSC repository. Any error results in the entire request being canceled. The error text identifies repository-specific errors. The resource name and the resource type identify the resource name that caused the error.

In the message text:
- *modid* indicates the module ID. The value can be either CSLURP10 or CSLURP20.
- *request* indicates the request. The value can be CSLRPUPD or CSLRPQR.
- *rc* indicates the return code returned from the CSLRPUPD or CSLRPQRY request. See the CSLRRR or CSLSRR macro for the description of the return code.
- *rsn* indicates the reason code returned from the CSLRPUPD or CSLRPQRY request. See the CSLRRR or CSLSRR macro for the description of the reason code.
- *errtext* indicates null or six words of error text with repository error information.
- *rsname* indicates the name of the resource in error.
- *rsctype* indicates the type of the resource in error.
- *comcode* indicates the completion code for the error. See the CSLRRR macro for details.

**System action:** The utility terminates with return code 8.

**System programmer response:** Fix the error identified in the return and reason codes from the CSLRPUPD or CSLRPQRY request, and rerun the utility.

**Module:** CSLURP10, CSLURP20

---

Chapter 5. CSL messages (Common Service Layer)  89
Operator response:  No action is required.

<tr>
<td>CSL2619E</td>
<td><strong>modid</strong> RM NOT DEFINED WITH REPOSITORY FOR RMNAME= <strong>rmname</strong>, REPOTYPE= <strong>repotype</strong></td>
</tr>
</tbody>
</table>

Explanation:  The utility identified by **modid** registered with a Resource Manager (RM) that is not enabled or not defined with the IMSRSC repository type specified in the message.

In the message text:
- **modid**: Indicates the module ID. The value can be either CSLURP10 or CSLURP20.
**CSL2622E**  
**modid** COULD NOT REGISTER TO ANY RM IN THE IMSPLEX

**Explanation:** The utility identified by **modid** failed to register with any Resource Manager (RM) system.

In the message text:

**modid** The module ID. This value can be either CSLURP10 or CSLURP20.

**System action:** The utility terminates with return code 8.

**System programmer response:** Fix the error and retry the utility. Make sure that at least one RM system for the IMSplex is specified and that the RM system is enabled with the IMSRSC repository. The RM system in the IMSplex must be at level 1.5 (for IMS Version 12) or higher.

**Module:** CSLURP10, CSLURP20

---

**CSL2625I**  
**modid** WRITE TO RDDS WAS SUCCESSFUL FOR RDDSdsn=rddsdsn_name FROM REPOSITORY=repotype REPO_NAME=reponame

**Explanation:** The Repository-to-RDDS utility (CSLURP20) successfully wrote resource definitions from the specified IMSRSC repository to the specified resource definition data set (RDDS).

In the message text:

**modid** Indicates the module ID. The value is CSLURP20.

rddsdsn_name Indicates the RDDS data set name.

repotype Indicates the repository type. The value can be IMSRSC.

reponame Indicates the repository name.

**System action:** Processing continues.

**User response:** No action is required.

**Programmer response:** No action is required.

**Module:** CSLURP20

---

**CSL3000E**  
**SCI IMSPLEX INITIALIZATION ERROR**  
**sciname** ALREADY ACTIVE ON OS IMAGE

**Explanation:** An SCI, specified by **sciname**, was already active on the z/OS image.

**System action:** The initializing SCI is abnormally terminated.

**Operator response:** In the CSLSxxx - SCI initialization PROCLIB member, check to ensure that there is no SCI with the same name as **sciname** on the z/OS Image; if there is, change the SCI name.

**Module:** CSLSXCG0

---

**CSL2622E**  
**sciname** The name of the SCI that is managing the IMSplex on the z/OS system.

**System action:** The initializing SCI is abnormally terminated.

**Operator response:** Take one of the following actions:

- If SCI terminates with an abend 0010 subcode X’0000072C’, the IMSplex is being managed by an active SCI. If the IMSPLEX parameter is coded correctly in the CSLSIxxx (SCI Initialization PROCLIB member), no response is required since the IMSplex is managed by the active SCI.
- If SCI terminates with an abend 0010 subcode X’00000730’, the IMSplex was managed by an SCI that is no longer active. In order to manage the IMSplex with the new SCI, you must start SCI using the old name with the FORCE=(ALL,SHUTDOWN) startup parameter. This action cleans up the global blocks left by the previous SCI and allow you to manage the IMSplex using an SCI with a different name.

**Module:** CSLSINP0

**Explanation:** An SCI with the same name is already active in the IMSplex.

In the message text:

**sciname** The name of the SCI that already exists in the IMSplex.

plex The name of the IMSplex.

**System action:** The initializing SCI is abnormally terminated.

**Operator response:** In the CSLSIxxx - SCI initialization PROCLIB Member, check to make sure that there is no SCI with the same name as **sciname** in the IMSplex; if there is, change the SCI name.

**Module:** CSLSXCG0

---

**CSL3002E**  
**SCI INITIALIZATION ERROR**  
**sciname** ALREADY ACTIVE ON OS IMAGE

**Explanation:** An SCI, specified by **sciname**, was already active on the z/OS image.

**System action:** The initializing SCI is abnormally terminated.

**Operator response:** In the CSLSIxxx - SCI Initialization PROCLIB member, check to ensure that there is no SCI with the same name on the z/OS Image; if there is, change the SCI name.

**Module:** CSLSXCG0, CSLSFRCO
**Explanation:** The Structured Call Interface (SCI) attempted to clean up global storage and was unable to delete a control block or module. This cleanup was done during normal SCI initialization or because the FORCE startup parameter was used.

In the message text:
- **storage_type**
  Type of storage that could not be released. If the storage is the registration cell pool, the ID is R6 CPOOL. The possible values are:
  - **CONTROL BLOCK**
    The storage is an SCI global control block.
  - **CPOOL**
    The storage is the registration cell pool.
  - **MODULE**
    The storage is an SCI global module whose address was obtained from the SGBL.
  - **MODULE (CURR)**
    The storage is an SCI global module whose address was obtained from the current SGRT.
  - **MODULE (PREV)**
    The storage is an SCI global module whose address was obtained from the previous SGRT.
- **storage_id**
  The ID of the piece of storage that could not be released. If the storage is a control block, the storage ID is the control block name. If the storage is a module, the storage ID is the module name.
- **reason**
  The reason the storage could not be released. The possible values are:
  - **BAD DATA**
    If the storage is a control block, either the eyecatcher is bad, the length is negative, or the length is too large. If the storage is a module, the storage does not have the typical initial two bytes at the entry point address or an eyecatcher, which indicates a vector table.
  - **ABEND**
    An abend occurred while trying to access or release the storage.

**System action:** SCI continues processing.

**System programmer response:** The problem might have been caused by a previous problem with SCI (for example, a storage overlay). If you are unable to resolve or understand the problem, save the SYSLOG and the LOGREC data and call IBM Software Support for assistance.

**Module:** CSLSFRC0, CSLSIS00

---

**Explanation:** SCI was unable to delete the specified z/OS Name/Token.

In the message text:
- **control_blk_id**
  The ID of the control block that is represented by the Name/Token that was being deleted. The possible values are:
  - **CSLSSGBL**
    The Name/Token represented the SCI global block.
  - **CSLSPGBL**
    The Name/Token represented an IMSplex global block.
- **nt_name**
  The name that was used to specify the Name/Token that was being deleted.
- **return_cd**
  The return code from the IEANTDL service.

**System action:** SCI continues processing. Depending on the return code received from the IEANTDL service, SCI might not be able to initialize because it might be unable to add the Name/Token later in the SCI initialization.

**System programmer response:** The problem might have been caused by a previous problem with SCI (for example, a storage overlay). If you are unable to resolve or understand the problem, save the SYSLOG and the LOGREC data and call IBM Software Support for assistance.

**Module:** CSLSFRC0

---

**Explanation:** The message is issued when SCI is requested to clean up global storage with the FORCE startup parameter and SCI is not able to locate the z/OS Name/Token for the indicated type and name. The global storage that might have been associated with the Name/Token is not deleted.

In the message text:
- **nt_type**
  The type of z/OS Name/Token that SCI is not able to locate. The possible values are:
  - **SCI**
    The Name/Token that represents the SCI instance.
  - **IMSPLEX**
    The Name/Token that represents the IMSplex.
- **nt_name**
  The name that was used to specify the Name/Token that was being deleted.

**System action:** SCI continues processing. No attempt
is made to delete any global storage that is associated with the Name/Token type.

**System programmer response:** The storage and Name/Token might have already been cleaned up by a previous instance of SCI or the Name/Token was never created on the system because SCI was never started. If you are unable to resolve or understand why this message was issued, save the SYSLOG and the LOGREC data and call IBM Software Support for assistance.

**Module:** CSLSFRC0

---

**CSL3014I** SHUTDOWN REQUESTED AFTER GLOBAL STORAGE CLEANUP

**Explanation:** This message is issued when Structured Call Interface (SCI) is started with the SHUTDOWN parameter of the FORCE startup parameter. It is issued after SCI has completed its global storage cleanup and is ready to shut down.

**System action:** SCI shuts down with a return code of 4.

**System programmer response:** No action is required.

**Module:** CSLSIN00

---

**CSL3051I** resource_type IN SHORT SUPPLY, XCF

**RC=return_code RSN=reason_code, failure_count FAILURES SINCE LAST MESSAGE**

**Explanation:** This message is issued when SCI is unable to send data using XCF because of an XCF resource shortage. SCI waits for one second and attempts to send the data again. If the resource shortage has not been alleviated after a set number of attempts for a single piece of data, SCI will not send that data. The message is not issued more than once per minute for any resource type.

In the message text:

- **resource_type**
  - The type of resource for which XCF has a shortage. The possible values are:
    - **BUFFER**
      - XCF has a temporary shortage of message buffers. This situation can occur because there is suddenly a large amount of buffer usage. Possible causes are a large amount of SCI XCF message traffic or a large amount of message traffic from another XCF user.
    - **RESOURCE**
      - XCF has a temporary shortage of non-buffer resource. Examples of other XCF resources are signaling paths, message spaces, and storage. Use the XCF return and reason codes listed in the message to determine what resource is in short supply.

- **RETURN_CODE**
  - The codes that were received when SCI attempted to send the data.

- **FAILURE_COUNT**
  - The number of failures for the indicated resource type since the last message was issued.

**System action:** SCI waits for one second and attempts to send the data again. If the resource shortage has not been alleviated after a number of attempts for a single piece of data, SCI will not send that data.

**System programmer response:** If the shortage is a result of a temporary large increase of data being sent through XCF, nothing must be done because the situation will be resolved as the volume of data traffic is reduced. If the problem persists, adjust the XCF configuration.

**Module:** CSLSXCO0

**CSL3070I** SCI INSTANCE ssssssss FOUND

**INACTIVE MEMBER mmmmmmmmm WHICH REGISTERED WITH SCI INSTANCE tttttttt**

**Explanation:** An SCI instance that is running on one z/OS LPAR detected that an inactive IMSplex member registered with an SCI instance that is running on another z/OS LPAR. The inactive member is deregistered from the SCI.

This message is issued from both the SCI instance that found the inactive member and the SCI instance that the inactive member registered with.

In the message text:

- **ssssssss** The member name of the SCI that found the inactive member in its member list.
- **mmmmmmmm** The member name of the inactive member.
- **tttttttt** The member name of the SCI instance that the inactive member registered with.

**System action:** The inactive member is removed from the member list of the SCI instance that found the inactive member.

**System programmer response:** Take a console dump of the two SCI address spaces and contact IBM Software Support.

**Module:** CSLSRML0
### CSL3101I  
**SCI CLEANUP COMPLETE** `sciname`

**Explanation:** The z/OS resource manager has completed its cleanup for the SCI specified by `sciname`.

**System action:** Processing continues.

**Operator response:** No action is required.

**Module:** CSLSRM00

---

### CSL3102I  
**SCI CLEANUP HAS COMPLETED FOR MEMBER** `membername`

**Explanation:** SCI completed cleanup for the IMSplex member specified by `membername`. If `membername` is **UNKN** or **_**SCI was not able to determine the name of the IMSplex member.

**System action:** Processing continues.

**Operator response:** No action is required.

**Module:** CSLSRM20

---

### CSL3110E  
**MEMBER** `member_name` **EXIT SRB**

**ABEND** `abend_code`  
**PSW**=`psw`  
**RSN**=`rsn`  
**modname**=`module_name`  
**module_addr**

**Explanation:** Structured Call Interface (SCI) scheduled a service request block (SRB) to the address space of the member identified by `member_name` to either drive an SCI member exit or to perform a task in the member address space. Either the SCI SRB routine or the member exit terminated abnormally.

In the message text:
- `member_name` - The name of the IMSplex member in which the abend occurred.
- `abend_code` - The abend that occurred (Sxxx for system abends, and UXxxx for user abends.)
- `psw` - The PSW (program status word) contents at the time of the abend.
- `rsn` - The abend reason code, if any, or N/A if there is none.
- `modname` - The name of the SRB module that was scheduled by SCI.
- `module_addr` - The address of the module indicated by `modname`.
- `exit_addr` - The address of the member exit that was called. This field is not displayed if the abend occurred in CSLSSR50.
- `status` - Text that indicates where the abend occurred during SCI interface processing. `status` can be one of the following values:
  - **BEFORE EXIT** - The abend occurred before the member exit was called.
  - **IN EXIT** - The abend occurred while the member exit was in control.
  - **AFTER EXIT** - The abend occurred after the member exit returned.

**System action:** When the SCI member address space SRB routines abend, SCI does not abnormally terminate either the member or the SCI address space. The SRB recovery routine takes the following actions before returning to z/OS:
- Issues this message.
- Produces an SDUMP of the member and SCI address spaces.
- Attempts to clean up any SCI and member storage associated with the SRB instance.

The recovery routine records diagnostic information about the abend in the LOGREC data set.

**System programmer response:** Save a copy of the memory dump produced and save or print a copy of the LOGREC records pertaining to this abend. If the status field in this message is something other than IN EXIT and the member is an IBM product (for example, IMS), contact IBM Software Support. If the status field is IN EXIT and the member is not an IBM product, contact the supplier of the member.

**Module:** CSLSR00, CSLSR10, CSLSR20

---

### CSL3111E  
**SCI INTERFACE ABEND** `abend_code`

**PSW**=`psw`  
**RSN**=`rsn`  
**modname**=`module_name`  
**module_addr**

**Explanation:** An abnormal termination occurred in the Structured Call Interface (SCI) during the processing of an SCI service request.

In the message text:
- `abend_code` - The abend that occurred (Sxxx for system abends and UXxxx for user abends.)
- `psw` - The PSW (program status word) contents at the time of the abend.
- `rsn` - The abend reason code, if any, or N/A if there is none.
- `modname` - The name of the main module that processed the SCI call that terminated. The module identified by `modname` might not be the module in which the abend occurred.
- `module_addr` - The address of the module indicated by `modname`.
- `status` - Text that indicates where the abend occurred during SCI interface processing. `status` can be one of the following values:
  - **AFT CPY BACK** - The abend occurred after the member data was copied back to the requesting address space.
SCI interface processing can abend if the destination member terminates during interface processing. For this type of abend, the interface recovery routine recovers and returns a return and reason code that indicates that the destination member is unavailable. No message or SDUMP are produced for this type of abend.

SCI interface processing can abend if SCI itself terminates during interface processing. For this type of abend, the interface recovery routine recovers and returns a return and reason code that indicates that SCI is unavailable. No message or SDUMP are produced for this type of abend.

For abends in all other situations, the interface recovery routine issues this message and produces an SDUMP of the member address space and the SCI address space, if possible. The recovery routine also logs diagnostic information to the LOGREC data sets and attempts to clean up resources associated with the service request.

If the abend occurred at a point where the recovery routine can safely retry, it retries and returns a nonzero return code to the member. If the abend occurred at a point where recovery is not possible because the status is unknown, then abend is not retried. In these cases, the member might be abended or the service request might never complete.

**System action:** When a termination occurs in the SCI interface, the interface recovery routine receives control from z/OS. The recovery routine analyzes the abend, takes appropriate recovery action, and gathers diagnostic data.

**System programmer response:** Save a copy of the dump and save or print a copy of the LOGREC records pertaining to this abend. If the member is an IBM product (for example, IMS, OM, or RM), contact IBM Software Support. If the member is not an IBM product, contact the supplier of the member.

**Module:** CSLSDR00, CSLSPC10, CSLSPC30, CSLSRG00, CSLSRQ00, CSLSRQ10

**Explanation:** Structured Call Interface (SCI) issued an SDUMP call to z/OS to produce memory dump of the address space after an abnormal termination, but the SDUMP was not successful.

In the message text:
- **abend** The abend code for which the storage dump was created. For system abends, the format of the code is Sxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of the code is Udddd, where dddd is the 4-digit abend code in decimal.
- **rc** The return code from the z/OS SDUMP macro.
CSL3113I  •  CSL3116E

The reason code from the z/OS SDUMP macro.

System action: The SDUMP is skipped.

System programmer response: Use the return and reason code from the z/OS SDUMP macro to determine the cause of the SDUMP failure. If appropriate, correct the cause of the failure so that future memory dumps are not lost.

Module: CSLSSR00 (ABENDDMP subroutine)

Related reference:

*z/OS: SDUMP return and reason codes

CSL3113I  DAE SUPPRESSED DUMP FOR abend ABEND

Explanation: Structured Call Interface (SCI) issued an SDUMP call to z/OS to produce a memory dump of the address space after an abnormal termination, but the SDUMP was suppressed by z/OS dump analysis and elimination (DAE).

The SCI recovery routines gather symptom string data related to an abend and provide this data to z/OS when an SDUMP is requested. If DAE is enabled, z/OS suppresses duplicate memory dumps (for example, dumps that have symptom strings identical to previously captured memory dumps). DAE is controlled through the MVS ADYSETxx PARMLIB member and the MVS SET DAE command. For details on specifying DAE options, see the z/OS MVS Initialization and Tuning Guide (SA22-7591).

In the message text, abend is the abend code for which the storage dump was created. For system abends, the format of the code is Sxxxx, where xxx is the 3-digit abend code in hexadecimal. For user abends, the format of the code is Uddddd, where dddd is the 4-digit abend code in decimal.

System action: The SDUMP is skipped. A SCI-generated memory dump is suppressed if the symptom string matches a previous dump and if the current DAE setting in ADYSETxx is either SUPPRESS or SUPPRESSALL.

Programmer response: No action is required.

Module: CSLSSR00 (ABENDDMP subroutine)

Related reference:

*z/OS: ADYSETxx (dump suppression)
*z/OS: Statements/parameters for ADYSETxx

CSL3114I  ABEND RECURSION DETECTED IN modname - RETRY WILL BE SKIPPED

Explanation: While processing an abend in the recovery routine, Structured Call Interface (SCI) detected a condition where retry is not allowed. This situation can occur if a recursive abend is detected, the recovery routine has been entered too many times, or z/OS tells SCI that retry is not allowed. SCI attempts to cleanup and then percolates.

In the message text, modname is the name of the routine in which the retry is being skipped.

System action: Error recovery processing continues.

Programmer response: No action is required.

Module: CSLSPC10, CSLSPC30, CSLSRQ00, CSLSRQ10, CSLSXMG0

CSL3115E  ABEND OCCURRED IN module PROCESSING - UNABLE TO LOCATE SCI BLOCKS FOR DIAGNOSTICS

Explanation: An abend occurred in an SCI interface module. Normally, either message CSL3110I or CSL3111E would be issued, and a storage dump would be created to document the abnormal termination. However, the SCI recovery routines could not locate the SCI control blocks required to perform this diagnostic processing. Data is still written to SYS1.LOGREC regarding the abend.

In the message text, module is the name of the SCI module whose recovery routine was driven.

System action: Diagnostic data is written to SYS1.LOGREC. Abend processing continues, but no other error message is written, and no SDUMP is created by the module that issued this message. You probably cannot recover from the abend, and it might result in the abnormal termination of the related SCI client.

System programmer response: Save or print a copy of SYS1.LOGREC and the console log. If a related memory dump is created from another component (for example, due to a client abnormally terminating from the abend), save that memory dump as well. Contact IBM Software Support.

Module: CSLSDR00, CSLSDR20, CSLSPC10, CSLSPC30, CSLSRG00, CSLSRG20, CSLSRQ00, CSLSRQ10, CSLSSR00, CSLSSR10, CSLSSR20, CSLSSR30, CSLSSR40, CSLSSR60, CSLSRM00, CSLSRM20, CSLSXMG0

CSL3116E  SRB ABEND abend_code MEMBER member_name PSW=psw RSN=rsn module_name=module_address

Explanation: An abend occurred in an SCI service request block (SRB) routine that does not schedule an IMSplex member exit.

In the message text:

abend_code

The abend that occurred (Sxxxx for system abends and Uxxxx for user abends).
**member_name**
The name of the member that the SRB was scheduled into, if available, or N/A if not available.

**psw**
The PSW (program status word) contents at the time of the abend.

**rsn**
The abend reason code, if any, or not applicable.

**module_name**
The name of the module in which the abend occurred.

**module_address**
The address of the module in which the abend occurred.

**System action:** When the SCI member address space SRB routines abend, SCI does not abnormally terminate either the member address space or the SCI address space. The SRB recovery routine takes the following actions before returning to z/OS:

- Issues the CSL3111E message.
- Produces an SDUMP of the member and the SCI address spaces.
- Attempts to clean up any SCI and member storage associated with the SRB instance.

The recovery routine records diagnostic information about the abend in the LOGREC data set.

**System programmer response:** Save a copy of the dump produced and save or print a copy of the LOGREC records pertaining this abend. Contact IBM Software Support.

**Module:** CSLSSR70

**Related information:** ["CSL3111E" on page 94]

---

**CSL3117E**  
**SVC ABEND abend_code MEMBER**

*member_name*  
The name of the member from which the SVC was issued.

*psw*  
The PSW (program status word) contents at the time of the abend.

*rsn*  
The abend reason code, if any, or N/A.

*module_name*  
The name of the module in which the abend occurred.

*module_address*  
The address of the module in which the abend occurred.

**Explanation:** An abnormal termination occurred in a Structured Call Interface (SCI) SVC routine.

In the message text:

*abend_code*  
The abend code (Sxxx for system abends and Uxxxx for user abends).

*member_name*  
The name of the member from which the SVC was issued.

*status*  
Text that indicates where the abend occurred in the SCI SVC processing. Status can be one of the following:

**CLEANUP**
The abend occurred while the registration SVC routine was cleaning up after an error was encountered.

**COPY BACK**
The abend occurred while the registration SVC routine was copying back the registration output data.

**DECL ACT CNT**
The abend occurred while decrementing the active member count in the MGBL block.

**DELET RESMGR**
The abend occurred while deleting the z/OS resource manager monitoring this member for SCI.

**DEQ**
The abend occurred while releasing the ENQ with a DEQ.

**IXCLEAVE**
The abend occurred while leaving the XCF group.

**PURGEDQ**
The abend occurred while issuing the MVS PURGEDQ.

**REG PROC**
The abend occurred while the registration SVC routine was processing the registration.

**RLSE MRT**
The abend occurred while releasing the storage that contains the MRT.

**SCHED SR40**
The abend occurred while scheduling CSLSSR40 in the SCI address space.

**Sylvnt OKSWP**
The abend occurred while issuing the SYSEVENT OKSWP.

**TERM SBM**
The abend occurred while terminating the SCI buffer manager for the member address space.

SCI registration and deregistration terminations can have several causes:

- Invalid data passed by the member program.
- Errors in the interface modules.
- Environmental errors (for example, overlaid control blocks or storage problems).
- Problems in SCI resource cleanup for an SCI that is currently terminating.

Problems can occur in SCI resource cleanup or timing conditions for an SCI that is currently terminating when an SCI address space is forced to terminate and certain SCI resources were not cleaned up.

For abends in the SVC routines, the SVC recovery routine issues this message and produces an SDUMP of
the member address space and the SCI address space, if possible. The recovery routine also logs diagnostic information to the LOGREC data sets and attempts to clean up resources associated with the service request.

If the abend occurred at a point where the recovery routine can safely retry, it retries and returns a nonzero return code to the member. If the abend occurred at a point where recovery is not possible because the status is unknown, then the abend is not retried. In these cases, the member might have terminated or the service request might never complete.

**System action:** When an abend occurs in the SCI registration or deregistration SVC, the SVC recovery routine receives control from z/OS. The recovery routine analyzes the abend, takes appropriate recovery action, and gathers diagnostic data.

**System programmer response:** Save a copy of the dump and save or print a copy of the LOGREC records pertaining to this abend. If the member is an IBM product (for example, IMS, OM, or RM), contact IBM Software Support. If the member is not an IBM product, contact the supplier of the member.

**Module:** CSLSRG20, CSLSDR20

---

**CSL3118E RES MGR ABEND abend_code MEMBER**

*member_name* PSW=psw RSN=rsn

*module_name=module_address status*

**Explanation:** An abnormal termination occurred in a Structured Call Interface (SCI) MVS Resource Manager.

In the message text:

*abend_code*

The abend code (Sxxx for system abends and Uxxx for user abends).

*member_name*

The name of the member for which the resource manager was running. *member_name* is always SCI for CSLSRM00.

*psw*

The PSW (program status word) contains at the time of the termination.

*rsn*

The abend reason code, if any, or N/A.

*module*

The name of the module in which the abend occurred.

*module_address*

The address of the module in which the abend occurred.

*status*

Text that indicates where the abend occurred in the SCI MVS Resource Manager processing. The possible values are:

**CMBR VALIDTE**

The abend occurred while CSLSRM20 was attempting to validate the CMBR that was passed to the module.

**DECR ACT CNT**

The abend occurred while CSLSRM20 was decrementing the active connection count in the MGBL block.

---

**DEQ**

The abend occurred while CSLSRM20 was releasing an ENQ with a DEQ.

**IXCLEASE**

The abend occurred while CSLSRM20 was leaving the XCF group.

**MBR NOTIFY**

The abend occurred while CSLSRM00 was notifying the local IMSplex members that SCI has terminated. Outstanding requests are also POSTed as part of this process.

**PGBL RESET**

The abend occurred while CSLSRM00 was resetting the active flag in the PGBL blocks.

**PURGEDQ**

The abend occurred while CSLSRM20 was issuing the MVS PURGEDQ.

**SCHED SR40**

The abend occurred while CSLSRM20 was scheduling CSLSSR40 in the SCI address space.

**STORAGE RLSE**

The abend occurred while CSLSRM00 was releasing storage after completing the notification of the local IMSplex members.

SCI MVS Resource Manager terminations can have several causes:

- Errors in the interface modules.
- Environmental errors (for example, overlaid control blocks or storage problems).

Problems in the resource managers should be rare. However, when one of the modules abends, it will recover and if possible, continue with the cleanup.

For abends in the resource manager routines, the recovery routine issues this message and produces an SDUMP of the member address space and the SCI address space, if possible. The recovery routine also logs diagnostic information to the LOGREC data sets and attempts to clean up resources associated with the service request.

If the abend occurred at a point where the recovery routine can safely retry, it will retry. If the abend cannot be retried because of the particular abend or z/OS indicates that retry is not possible, the resource manager will not finish the cleanup and the cleanup complete message will not be issued.

**System action:** When an abend occurs in an SCI MVS Resource Manager routine, the recovery routine receives control from z/OS. The recovery routine analyzes the abend, takes appropriate recovery action, and gathers diagnostic data.

**System programmer response:** Save a copy of the dump and save or print a copy of the LOGREC records...
pertaining to this abend. Contact IBM Software Support.

**Module:** CSLSRM00, CSLSRM20

---

**CSL319E** SRB ABEND abend_code MEMBER

   member_name PSW=psw RSN=rsn
   module_name=module_address status

**Explanation:** An abnormal termination occurred in a Structured Call Interface (SCI) service request block (SRB) routine that runs in the SCI address space.

In the message text:

- **abend_code**
  The abend code (Sxxx for system abends and Uxxxx for user abends).

- **member_name**
  The name of the member from which the SRB was scheduled, if available, or N/A if unavailable.

- **psw**
  The program status word (PSW) contents at the time of the termination.

- **rsn**
  The abend reason code, if any, or N/A if unavailable.

- **module_name**
  The name of the module in which the abend occurred.

- **module_address**
  The address of the module in which the abend occurred.

- **status**
  The text that indicates where the abend occurred in the SCI SRB processing. The status can be one of the following:

  **AFTER ENQUEUE**
  The abend occurred after the AWE was enqueued.

  **AFTER ENQUEUE ER**
  The abend occurred after an error was encountered enqueuing the AWE.

  **AFTER RQST RET**
  It was determined that a remote request was being processed and the abend occurred after an error was encountered enqueuing the AWE and after the request was returned.

  **BEFORE ENQUEUE**
  The abend occurred before the AWE was enqueued.

  **BEFORE RQST RET**
  It was determined that a remote request was being processed and the abend occurred after an error was encountered enqueuing the AWE but before the request could be returned.

- **IN ENQUEUE**
  The abend occurred while the AWE was being enqueued.

- **REG RETURN**
  The abend occurred after the registration was returned.

---

**STATUS UNKWN**

The recovery routine could not determine the status of the member service request when the abend occurred.

Abnormal termination should not occur in the SCI SRB routines that run in the SCI address space. If an abend does occur, it is probably due to an overlay or some other error condition that is not related to the data that is being sent to the SCI address space.

For abends in the SRB routines, the SRB recovery routine issues this message and produces an SDUMP of the SCI address space. The recovery routine also logs diagnostic information to the LOGREC data sets.

If the abend occurred at a point where the recovery routine can safely retry, it retries. The member might not be notified that an error occurred. If the abend occurred at a point where recovery is not possible because the status is unknown, the abend is not retried.

**System action:** When an abend occurs in an SCI SRB routine running in the SCI address space, the SRB recovery routine receives control from z/OS. The recovery routine analyzes the abend, gathers diagnostic data, and takes appropriate recovery action.

**System programmer response:** Save a copy of the memory dump and save or print a copy of the LOGREC records pertaining to this abend. Contact IBM Software Support.

**Module:** CSLSRR30, CSLSRR40, CSLSRR60

---

**CSL3120E** MSG-IN EXIT ABEND abend_code MEMBER member_name PSW=psw RSN=rsn

**Explanation:** An abnormal termination occurred in Structured Call Interface XCF Message-In exit.

In the message text:

- **abend_code**
  The abend code (Sxxx for system abends and Uxxxx for user abends).

- **member_name**
  The name of the destination member for the data sent through XCF. If there is no destination member, this field contains N/A.

- **psw**
  The program status word (PSW) contents at the time of the termination.

- **rsn**
  The abend reason code, if any, or N/A if unavailable.

- **modname**
  The name of the module in which the abend occurred.

- **module_address**
  The address of the module in which the abend occurred.
The most common reason an abend occurs in the SCI Message-In exit is because the destination member deregistered from SCI while the routine was sending data to the member. For these abends, no message is issued and no memory dump is taken because this is a timing problem and not an error.

If this message is issued, it means that an unexpected condition occurred. If a message was in the process of being sent when the abend occurred, the message is lost.

System action: When an abend occurs in the SCI Message-In exit, the Message-In exit recovery routine receives control from z/OS. The recovery routine analyzes the abend, gathers diagnostic data, and takes an appropriate recovery action.

System programmer response: Save a copy of the memory dump, and save or print a copy of the LOGREC records that pertain to this abend. Contact IBM Software Support.

Module: CSLSXMG0

---

**CSL4001A**  
RRS not active but RRS=Y specified -  
Reply: RETRY, CONTINUE, or CANCEL

**Explanation:** You started the CSL Open Database Manager (ODBM) with RRS=Y specified, or accepted as the default, but the RRS/MVS subsystem is not active.

**System action:** ODBM suspends initialization until the operator submits a response.

**Operator response:** The operator must submit one of the following responses to either continue, try again, or cancel ODBM initialization:

CANCEL  
ODBM terminates initialization with CSL abend 041I-07.

CONTINUE  
ODBM continues initializing. If the operator starts RRS/MVS later, ODBM automatically connects to RRS.

RETRY  
ODBM attempts to reconnect to RRS/MVS.

**CSL4002I**  
ODBM Registration with RRS/MVS complete

**Explanation:** The CSL Open Database Manager (ODBM) has completed registration with RRS/MVS. ODBM can now participate in RRS controlled sync point processes as an RRS resource manager.

**System action:** ODBM continues to run.

**Administrator response:** No action is required.

**Module:** CSLDRRS1

---

**CSL4003W**  
ODBM Disconnected from RRMS/MVS due to RRS/MVS not available

**Explanation:** The CSL Open Database Manager (ODBM) disconnected from RRMS/MVS because RRS/MVS terminated.

**System action:** When RRS/MVS is restarted, ODBM is notified by RRMS and automatically registered with RRMS again.

**Operator response:** Restart the RRS/MVS subsystem.

**Module:** CSLDRRS1

---

**CSL4004I**  
ODBM Connected to IMS datastore cccc

**Explanation:** The CSL Open Database Manager (ODBM) successfully connected to the identified IMS data store.

In the message text:

ccc  
Identifies the IMS ID of the IMS data store as registered with SCI and the IMSplex

**System action:** ODBM continues to run.

**Operator response:** No action is required.

**Module:** CSLDIN10, CSLDREG0

---

**CSL4005W**  
ODBM Failed to connect to IMS datastore cccc due to reason text

**Explanation:** The CSL Open Database Manager (ODBM) was unable to connect to the identified IMS data store because of the reason shown in the message text.

In the message text:

ccc  
IMS ID of the IMS data store in the IMSplex.

reason text  
Reason that ODBM was unable to connect to the IMS data store:

- IMS is not RRS/MVS capable
- IMS is unavailable
- AIB rc=x xxx, AIB rsn=yyyy, AIB errxt=zzzzzzzz

These codes are the AIB return and reason codes that are set in the application interface block (AIB) during DL/I processing.

**System action:** If the message was issued from module CSLDIN10 during ODBM initialization, ODBM terminates with CSL abend 0010-4D8, unless the connection failure is due to the IMS data store not being enabled for RRS/MVS or not being active.

If the message was issued from module CSLDREG0 during ODBM online processing, ODBM continues with online processing.

**Operator response:** If the failure was because an IMS data store was unavailable, start IMS. ODBM automatically attempts to connect to the IMS data store.
If the failure was because IMS was not enabled for RRS/MVS, start IMS with the RRS=Y option specified. Determine the problem by referring to the information about the AIB return and reason codes.

**Module:** CSLDIN10 or CSLDREG0

**Related reference:**

- [AIB return and reason codes (Messages and Codes)]

**Related information:**

- [CSL ODBM abend 0010]

---

**CSL4006W** ODBM Failed to connect to IMS datastore cccc due to AIB rc=xxxx, AIB rsn=yyyy, errxt=zzzzzzz

**Explanation:** The CSL Open Database Manager (ODBM) was unable to connect to the identified IMS data store because of the reason shown in the message text.

In the message text:

- **cccc** IMS ID of the IMS data store in the IMSplex
- **reason text** Reason that ODBM was unable to connect to the IMS data store. The reason can be any one of the following codes:
  - **errxt** - more information
  - **rc** - return code
  - **rsn** - reason code

This message is returned to an OM API in a message along with command response for the command: UPD ODBM STOP(CONNECTION) DATASTORE().

**System action:** The UPD ODBM STOP(CONNECTION) DATASTORE() command fails for the data store specified in the CSL4006W message.

**Operator response:** Determine the meaning of the AIB return/reason codes by looking at the appropriate IMS documentation.

**Module:** CSLDU010

**Related reference:**

- [AIB return and reason codes (Messages and Codes)]

---

**CSL4008E** ODBM thread nnnnnnn has been terminated during DL/I ffff call. Abend sss/uuuu has been detected.

**Explanation:** The Open Database Manager (ODBM) thread recovery routine has detected an abnormal termination of the thread identified in the message. Recovery was attempted to clean up the thread.

In the message text:

- **nnnnnn** The thread ID. This identifier can be up to 32 characters.
- **ffff** The DL/I call function.
- **sss** The system abend.
- **uuuu** The user abend.

**System action:** ODBM processing continues.

**Operator response:** Use the abend codes to determine whether you can correct the problem. If you cannot resolve the problem, copy the SYSLOG, gather any memory dumps taken for the error, and call IBM Software Support.

**Module:** CSLDBR00

**Related information:**

- [CSL4006W]`]

---

**CSL4007W** ODBM Failed to disconnect to IMS datastore cccc due to AIB rc=xxxx, AIB rsn=yyyy, errxt=zzzzzzz

**Explanation:** The CSL Open Database Manager (ODBM) was unable to disconnect to the identified IMS data store because of the reason shown in the message text.

In the message text:

- **cccc** Identifies the IMS ID of the IMS data store in the IMSplex.
- **reason text** Identifies the reason that ODBM was unable to connect to the IMS data store. The reason can be any one of the following codes:
  - **errxt** - more information
  - **rc** - return code
  - **rsn** - reason code

---

**CSL4009I** ODBM Disconnected from IMS datastore cccc

**Explanation:** The CSL Open Database Manager (ODBM) successfully disconnected from the identified IMS data store.
CSL4100E • CSL4103E

In the message text:
ccc  Identifies the IMS ID of the IMS data store as registered with SCI and the IMSplex

System action: ODBM processing continues.

Operator response: No action is required.

Module: CSLDREG0

CSL4100E  A requested field is beyond the length of the data returned:
FIELD OFFSET=fldos FIELD LENGTH=fldln DATA LENGTH=dtaln

Explanation: A client application program that is accessing an IMS database through ODBM specified an offset and length for a requested data field that together exceed the length of the data returned to ODBM by IMS on a DL/I call. A possible cause is that variable length segments are being used.

In the message text:
fldos  Offset of the requested data field, as specified by the client application program
fldln  Length of the requested data field, as specified by the client application program
dtaln  Actual length of the data that is returned to ODBM by IMS

System action: ODBM rejects the client request.

Programmer response:
Verify that the client application has a correct view of the database by reviewing the database metadata that was generated by the IMS Enterprise Suite Explorer for Development or validated by IMS catalog and that it is not requesting data beyond the length of the database record.

(DRDA® programmer) Verify that the client application has a correct view of the database and that it is not requesting data beyond the length of the database record.

Module: CSLDBR00

CSL4101E  An ODBM DL/I call=ccc failed.
AIBRETRN=xxxxxxx
AIBREASN=yyyyyyyy
AIBERRXT=zzzzzzzz DLI PCB status=cc.

Explanation: A DL/I call identified by ccc in the message text was issued by Open Database Manager (ODBM) on behalf of a client application request, but it failed. The return and reason codes are included in the message.

In the message text:
ccc  DL/I call that failed
xxxxxxx  AIB return code
yyyyyyyy  AIB reason code

CSL4102E  A continue query (CNTQRY) request was received but the corresponding open query (OPNQRY) request was not found.

Explanation: Open Database Manager (ODBM) received a request to continue an open RETRIEVE command, however it was unable to locate the corresponding retrieve. A possible cause is that an OPNQRY RETRIEVE command has not been issued.

System action: The client request is rejected by ODBM.

Programmer response: Verify that the client application issues the OPNQRY RETRIEVE request.

Module: CSLDBR00

CSL4103E  Update failed: update data exceeds length of the record. Data length=dlen, Data offset=offset, Record length=rlen

Explanation: The CSL Open Database Manager (ODBM) received a request to update a database record, but from the offset specified by the client application program, the length of the data in the update request exceeds the total length of the database record as shown in the database metadata definition that the client application is using.

The length of the data in an update request might exceed the total length of the database record if:
• An offset for a segment in the update request was incorrectly specified
• The length of a segment in the update request was incorrectly specified

In the message text:
dlen  The length in bytes of the segment or field in the update request that contains the data that extends beyond the length of the database record.

doffset  The offset of the segment or field in the update request that contains the data that extends beyond the length of the database record.
rlen  The total length of the database record segments as defined in the database metadata definition.

System action: The client request is rejected by ODBM.

Programmer response: Verify that the client application has a correct view of the database by reviewing the database metadata that was generated by the IMS Enterprise Suite Explorer for Development or validated by IMS catalog. Also verify that the application is not updating data beyond the length of the database record.

Module: CSLBR00

CSL4104E No datastore or alias is available to process the request. Verify that at least one datastore and alias that can process the request is active.

Explanation: Open Database Manager (ODBM) could not locate an active data store or alias to process the DL/I APSB call.

System action: The client request is rejected by ODBM.

Programmer response: Verify that the data store and alias is active.

Module: CSLBR00

CSL4105E The ODBM buffer pool is depleted. Recycle ODBM.

Explanation: Open Database Manager (ODBM) was not able to obtain storage from its internal output buffer pool.

System action: The client request is rejected by ODBM.

Programmer response: Recycle ODBM.

Module: CSLDMO0

CSL4106E ODBM is not registered with RRS. The global transaction request is rejected.

Explanation: The Open Database Manager (ODBM) is not registered with z/OS Resource Recovery Services (RRS). Local transaction requests are permitted. Global transaction requests are rejected.

System action: The global transaction request is rejected by ODBM.

Programmer response: Restart ODBM with RRS=Y to register with RRS services.

Module: CSLBR00

CSL4107E ODBM was unable to perform a system function. Return code=xxxxxxxx Reason code=yyyyyyyy.

Explanation: The Open Database Manager (ODBM) has encountered an internal system failure.

System action: The client request is rejected by ODBM.

Programmer response: To determine the cause of the error, check the return and reason codes.

See the CSLDMI return and reason code information for an explanation of the codes.

Module: CSLBR00

Related reference:

[CSLDMI: ODBM application program interface (System Programming APIs)]

CSL4108E An ODBM request to RRS failed. ODBM service name=odbmserv. ODBM RRS service name=odbm_rrs_service RC=rc.

Explanation: A z/OS Resource Recovery Services (RRS) service request sent by Open Database Manager (ODBM) has failed.

In the message text:

odbmserv distributed data management (DDM) request sent by the client
odbm_rrs_service RRS service request that failed
rc    RRS return code

System action: A negative response is returned to the client.

Operator response: Investigate the RRS failure and correct the problem.

Module: CSLBR00

CSL4109E ODBM has detected a RRS system failure. A rollback has been performed. The PSB is deallocated and the thread is terminated. RRS return code=xxxxxxx.

Explanation: Open Database Manager (ODBM) detected a z/OS Resource Recovery Services (RRS) system failure.

In the message text:

xxxxxxx RRS return code

System action: The transaction is rolled back, the PSB is deallocated, and the thread is terminated.
CSL4110E • CSL4114E

Administrator response: Investigate the RRS failure. Restart RRS.
Module: CSLDBR00

CSL4110E  An ODBM has detected an abnormal thread termination due to abend ssss | uuuu. A rollback has been performed. The PSB is deallocated and the thread is terminated.

Explanation: Open Database Manager (ODBM) detected an abnormal thread termination.

In the message text:
sss  A system abend code
uuuu A user abend code

System action: The transaction is rolled back, the PSB is deallocated, and the thread is terminated.

Administrator response: Investigate the thread termination failure.
Module: CSLDBR00, CSLD1ENU

CSL4111E  The syncpoint request resulted in a rollback because datastore dddd was terminated. The thread has been terminated.

Explanation: The client issued a sync point request that resulted in a rollback because the data store was terminated.

In the message text:
ddd  The name of the data store

System action: ODBM terminates the thread after it has been completed a rollback.

Programmer response: Ensure that all other work is rolled back accordingly.
Module: CSLDBR00, CSLDBR10

CSL4112E  A database request contains text

Explanation: A client application that is accessing an IMS database through ODBM has issued a request that contains an invalid combination of segment descriptors.

In the message text:

- A segment request (vvvvv) for a segment not described in the segment information (SEGMLIST)
- These variables can be:
  - ffffffff = RTRVFLD or FLDENTRY
  - vvvvvv = RTRVFLDREL or FLDENTRYREL

System action: ODBM rejects the client request.

Programmer response: Verify that the client application has a correct view of the database. Review the database metadata that was generated by the IMS Enterprise Suite Explorer for Development or validated by IMS catalog.

(DRDA programmer) Verify that the client application has a correct view of the database.
Module: CSLDRDA0

CSL4113E  ODBM encountered an error while processing an IMS SQL call.

aibretrn=rrrrrrr aibreas=ssssssss
aiberrxt=xxxxxxxx

Explanation: A client application that is accessing an IMS database through ODBM has issued an IMS SQL call that resulted in an error. The AIBRETRN, AIBREASN, and AIBERRXT fields contain codes that describe the problem encountered. See the AIB return and reason codes for details.

System action: ODBM rejects the current request.

Programmer response: Determine and correct the cause of the error and rerun the application.
Module: CSLDBR40
Related reference:

AIB return and reason codes (Messages and Codes)

CSL4114E  ODBM IMS SQL varying text

Explanation: In the message text, varying text can be:

- PREPARE call processing encountered a previously opened cursor with the same section number.
- OPEN call processing did not locate a cursor with the same section number specified on OPNQLRY command.
- CLOSE call processing did not locate the cursor with the section number specified on CLSQRY command.

A client application that is accessing IMS through ODBM has issued one of the following calls specifying an invalid section number. The section number uniquely identifies the cursor.

- A PREPARE call specifying a cursor section number that has already been used.

Expand Command panel. The Expand command was not issued.

**System action:** Processing continues.

**User response:** For information on the editor return codes, see the OS/390 Interactive System Productivity Facility (ISPF): Services Guide. Investigate and resolve the problem.

**Module:** DFSSPOC

---

CSLM012I  The user preferences have not been set. Please set them now using the Preferences panel from the Options list.

**Explanation:** The user preferences in the Preferences panel must be set before commands can be issued, including specifying the IMSplex name. An IMSplex name consists of eight characters. The first three characters are automatically assigned the prefix of CSL. The last five characters are available for you to assign. For example: CSLxxxx. When you assign the last five characters, do not use CSL again.

**System action:** Commands are be accepted until the preferences are set.

**User response:**

1. From the menu, select Options, then Preferences. The Preferences panel displays.
2. Enter the appropriate values for the preferences, and then press Enter.

To leave the Preferences panel without making changes, press the Cancel (F12) key.

**Module:** DFSSPOC

---

CSLM013I  The information was written to the ISPF list file.

**Explanation:** The command response information was written to the ISPF list file.

If you want, you can route the file to a printer when you exit ISPF. You can also use other utilities to print the contents of the file.

**System action:** Processing continues.

**User response:** No action is required.

**Module:** DFSSPOC

---

CSLM014W  There is a problem with the LIST file. The information was not written.

**Explanation:** An error occurred when information was being written to the ISPF list file.

**System action:** The command response information was not written to the ISPF list file.

**User response:** The ISPF list files are named your_prefix.SPFn.LIST. The your_prefix variable identified

the prefix you specified for the list files, and n is a number between zero and nine. Make sure the files are available and have space sufficient for the amount of data that will be saved to them.

**Module:** DFSSPOC

---

CSLM015W  A group name must be provided for a group definition.

**Explanation:** An entry was added in the Group Definition panel; however, no group name was provided.

**System action:** A question mark is inserted as the group name.

**User response:** Specify a group name in the Group Definition panel. The group name uses normal PDS member name syntax.

**Module:** DFSSPOC

---

CSLM016I  Group group has been added.

**Explanation:** The TSO SPOC successfully added the new group to the group definitions table.

**System action:** The new group was successfully added to the group definitions table.

**User response:** No action is required.

**Module:** DFSSPOC

---

CSLM017I  A group named group already exists.

**Explanation:** The group name identified by group was added to the Group Definition panel in the New Group field; however, the name already exists in the group definitions table.

**System action:** The duplicate group name was added to the group definition table but a question mark was added as a prefix.

**User response:** Modify the duplicate group name so that it is a unique name and remove the question mark.

**Module:** DFSSPOC

---

CSLM018I  Group group has been deleted.

**Explanation:** The group identified by group was successfully deleted from the group definitions table.

**System action:** The group was successfully deleted.

**User response:** No action is required.

**Module:** DFSSPOC
CSLM019I Group group has been changed.
Explanation: The TSO SPOC successfully processed the changes to the group definition identified by group.
System action: The changes were made to the group definitions table. The information is saved to the ISPTABL file when you press the Cancel key to escape the panel and return the TSO SPOC main panel.
User response: No action is required.
Module: DFSSPOC

CSLM020I Group group will now be used for default routing.
Explanation: The S option was specified in the action column of the TSO SPOC group definition panel. As a result, the group identified by group will be used for default routing.
System action: TSO SPOC will now use group as the default for routing TSO SPOC commands.
User response: No action is required.
Module: DFSSPOC

CSLM021W The command did not complete successfully. Use SHOWLOG to view results.
Explanation: The system issued a command on your behalf, but the command did not complete successfully.
System action: Processing continues.
User response: Use the PF key marked as SHOWLOG to view the command response.
Module: DFSSPOC

CSLM022I A resource name is required.
Explanation: You must supply a resource name before processing can continue.
System action: The system waits for you to enter a resource name.
User response: Enter a resource name and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM023I The resource name is too long.
Explanation: The name you entered for the resource is too long. Resource names can only be eight characters long.
System action: The system waits for you to correct the resource name.
User response: Correct the resource name and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSLM024I Valid input is Y (yes) or N (no).
Explanation: You entered an invalid value. The valid values are Y or N.
System action: The system waits for you to enter a valid value.
User response: Enter a correct value and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM025I Valid input is Excl, Brws, Read, or Upd
Explanation: You entered an invalid value. The correct values can be excl, brws, read, or update.
System action: The system waits for you to enter a valid input.
User response: Enter a correct value and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM026I There is no information to save or print.
Explanation: You attempted to print information or use the Save As option, but there is currently no information on a command response to print or save.
System action: No information is printed or saved to the output file.
User response: Issue the command on which you would like information, and then use the Save As or Print option again.
Module: DFSSPOC

CSLM027E Program DFSSPOC cannot run outside of ISPF.
Explanation: The TSO SPOC program needs ISPF dialog services to process correctly. TSO SPOC must be invoked from within ISPF.
System action: The TSO SPOC was not started.
User response: Start ISPF and then issue the DFSSPOC command from an ISPF command line.
Module: DFSSPOC
CSLM028I  Valid input is Y (yes).
Explanation: You entered an incorrect value. The only correct values are Y or blanks.
System action: The panel waits until you performs another action.
User response: Enter a correct value in the field and press Enter, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM029I  Valid values are blank or *.
Explanation: You entered an incorrect value. The only correct values are * or blanks.
System action: The panel waits until you performs another action.
User response: Enter a correct value in the field and press Enter, or press Cancel to return to the previous panel.
Module: DFSSPOC

Module: DFSSPOC

CSLM030I  Valid input is E (exclusive) or N (not)
Explanation: You entered an invalid value. You must enter an E or an N.
System action: The system waits for you to provide a valid input.
User response: Enter an E or an N and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM031I  Valid input is 1, 2, 3, 4, or 5
Explanation: You entered an invalid value. The valid entries are 1, 2, 3, 4, or 5.
System action: The system waits for you to provide a valid input.
User response: Enter a valid input and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM032I  Valid input is 1 or 2
Explanation: You entered an invalid value. The entry can be 1 or 2.
System action: The system waits for you to provide a valid input.
User response: Enter a valid input and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM033I  The resource was not found.
Explanation: You entered the name of a resource, but the resource could not be found.
System action: The system waits for you to provide the name of an existing resource.
User response: Ensure the resource name is spelled correctly and that the resource exists. Then press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM034I  The query type is not valid for descriptors.
Explanation: You entered a query type that is not compatible with the resource type specified.
System action: The system waits for you to enter a valid query.
User response: Change the resource type or the query type field so they are compatible and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM035I  You must change the resource name.
Explanation: A CREATE action for that resource finished successfully. You cannot create another resource with the same name.
System action: The system waits for you to change the resource name.
User response: Change the name of the resource and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM036I  Valid input is ON or OFF.
Explanation: You specified an invalid value. The valid value is 0n or 0FF.
System action: The system waits for you to enter a valid value.
User response: Enter 0n or 0FF and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC
CSLM040E  There are no SYSIN records.
Explanation:  No records were found in the SYSIN file.
System action:  The batch SPOC utility does not issue any commands and ends with return code 8.
User response:  Add IMS operator commands to the SYSIN file, and submit the job again.
Module:  CSLUSPOC

CSLM047E  The parameter specified was not recognized.
Explanation:  The parameter specified in the PARM=(...) text not recognized. The valid parameter is:
F=option, where option can be WRAP, BYCOL, or BYRSC
System action:  Processing continues. The message is written to the SYSPRINT file.
Programmer response:  Correct the parameter and run the job again.
Module:  CSLULALE

CSLM048I  Search for string was successful.
Explanation:  The Find menu option or RFIND key found the text identified by string.
System action:  The cursor is positioned on the search string that was found. The display might have scrolled to display the search string.
User response:  No action is required.
Module:  DFSSPOC

CSLM049I  Text string not found. Press RFIND key to continue from the top.
Explanation:  The text indicated by string was not found in the command response log.
System action:  The search string was not found.
User response:  Press the RFIND key (F5) to search from the top of the command response log.
Module:  DFSSPOC

CSLM050I  The command was issued, see Command Status for results.
Explanation:  The command you just entered was issued. Your preferences indicated that TSO SPOC should not wait for a response. The response information is available only from the Command Status panel.
System action:  Processing continues.
User response:  Use the action bar to switch to the Command Status panel. When the command completes, type the selection character (/) and press Enter to display the command response log.
Module:  DFSSPOC

CSLM051I  The command has been deleted.
Explanation:  The entry in the command status table was deleted at your request.
System action:  The command was deleted and is no longer in the command status table.
User response:  No action is required.
Module:  DFSSPOC

CSLM052W  Unrecognized line command.
Explanation:  The line command that was just entered in the Action column of the command status display is not a supported line command.
System action:  The invalid line command was removed from the display. If no other line commands were issued, the cursor remains on the same line.
User response:  For a list of valid line commands, place the cursor in the Action column and press F1.
Module:  DFSSPOC

CSLM053E  DFSSPOC severe error - getmain failed.
Explanation:  TSO SPOC needed virtual storage and could not get it.
System action:  Processing continues.
User response:  Ensure that the region size specified at logon is adequate for the commands issued and for the other applications that are active in your TSO user address space. If possible, specify a larger region size.
Module:  DFSSPOC

CSLM054E  The last line contained a continuation character, but no continuation line was found.
Explanation:  The last line of the SYSIN file contains a continuation character. However, the expected continuation line was not found.
System action:  The batch SPOC utility does not issue any commands and ends with return code 8.
User response:  Add a line to complete the command or remove the continuation character from the last line of the SYSIN file.
Module:  CSLUSPOCs
CSLM055I  Data sorted by column_name in ascending order

Explanation: The user asked to sort the data by the column name indicated by column_name. The default for the sort is to present the data in ascending order. If you requested descending order, the message text indicates “descending” instead. The sort can be initiated by using the action bar or by positioning the cursor on the column heading and pressing Enter.

System action: The list displays in the desired sort order.

User response: No action is required.

Module: DFSSPOC

CSLM056I  The command selected has not yet completed.

Explanation: You typed a selection character (’) in the command status panel, but the command response is not available yet because the command has not completed.

System action: No action is performed.

User response: Wait until the command completes. The status list will be refreshed when you press the Enter key. After the Status column indicates Complete, the command response can be selected again.

Module: DFSSPOC

CSLM057I  Find canceled by the cancel command.

Explanation: The Find panel displayed but instead of pressing the Enter key to process, you pressed the Cancel key.

System action: Any data typed in the Find panel was discarded. The command response log is not searched.

User response: If you wanted to run a text search, bring up the Find panel again. Enter the search string and press the Enter key.

Module: DFSSPOC

CSLM058W  The WAIT parameter has invalid syntax.

Explanation: The WAIT field does not contain the correct syntax format.

System action: The command was rejected.

User response: Change the WAIT field to the correct format. The format is either SSSS (seconds) or MMM:SS (minutes: seconds).

Module: DFSSPOC

CSLM059I  You must type ’/’ to confirm the removal of the group.

Explanation: When a group is deleted from the TSO SPOC Group Definition panel and the group name is listed in the default route list, you must confirm the removal of the group from the route list by entering a forward slash (/).

System action: No action is performed until the removal is confirmed or until you Cancel the removal by pressing the F12 key.

User response: To confirm removal of the group from the default route list, enter the forward slash (/) and press Enter.

Module: DFSSPOC

CSLM060I  Removal of the group was canceled by CANCEL command.

Explanation: The removal of the group from the default route list was not confirmed. The Cancel key was pressed instead.

System action: The group name remains in the default route list.

User response: If the Cancel key was pressed by mistake, you must reissue the B command in the Act field.

Module: DFSSPOC

CSLM061E  The record format for SYSIN is not supported.

Explanation: The SPOC utility could not process the SYSIN file because of a problem in the record format. Only RECFM types of F, FB, V, or VB are supported.

System action: The batch SPOC utility does not issue any commands and ends with return code 8.

User response: Change the data set attributes of the SYSIN file to have a supported RECFM type and submit the job again.

Module: CSLUSPOC

CSLM062I  The changes to the group were canceled by CANCEL command.

Explanation: You were prompted to correct a problem that was found when a group definition was changed, and you canceled the change.

System action: The prior definition of the group is restored.

User response: No action is required.

Module: DFSSPOC
CSLM063I  The information was saved to savedsn.

Explanation: The response from the type-1 or type-2 command was saved to the data set you specified, indicated by savedsn.

System action: The command response data is saved to savedsn.

User response: No action is required.

Module: DFSSPOC

CSLM064W  There is a problem with the SAVE file. The information was not saved.

Explanation: A problem occurred when the command response information was being saved.

System action: The information is not saved to the Save file.

User response: Ensure that the data set you specified exists and that it has appropriate attributes. The data set should be a partitioned data set or a sequential data set with the record format of FB or VB. The record length should be 120 characters. Ensure that the data set is large enough to hold the number of records that will be written.

Module: DFSSPOC

CSLM065I  A shortcut command name must be provided for a shortcut command definition.

Explanation: You created a shortcut in the TSO SPOC Command Shortcuts panel, but you did not specify a command name.

System action: The shortcut is added to the list with a name of ? .

User response: Modify the command name to create a unique name in the shortcuts table. Remove the entry with the question mark by using the D line command in the Action column, and press Enter.

Module: DFSSPOC

CSLM066I  Shortcut command text has been added.

Explanation: The command indicated by text was added to the TSO SPOC command shortcuts table.

System action: The new entry is added to the table in alphabetical sequence. The New Entry line continues to display. The new entry might not be visible if there are already several command shortcuts defined.

User response: No action is required.

Module: DFSSPOC

CSLM067I  A shortcut command named text already exists.

Explanation: You created a shortcut command in the TSO SPOC Command Shortcuts panel, but the command name already exists in the shortcut table.

System action: The shortcut name is added to the shortcut table list with a question mark prefix, (?)

User response: Modify the command name to create a unique name in the shortcuts table. Remove the entry with the question mark by using the D line command in the Action column, and press Enter.

Module: DFSSPOC

CSLM068I  Shortcut command shrtcmd has been deleted.

Explanation: The command shortcut identified by shrtcmd was successfully deleted from the shortcut definitions table.

System action: The shortcut command is deleted.

User response: No action is required.

Module: DFSSPOC

CSLM069I  Shortcut command shrtcmd has been changed.

Explanation: TSO SPOC successfully processed the changes to the command shortcut identified by shrtcmd.

System action: The changes are made to the table used by the Command Shortcut panel. The information is saved to the ISPTABL file when you press the Cancel key to return the TSO SPOC main panel.

User response: No action is required.

Module: DFSSPOC

CSLM070I  The member name was not specified.

Explanation: You specified the name of a partitioned data set, but you did not specify a member name.

System action: No action is taken.

User response: Either specify a member name, or change the name of the data set to a sequential data set.

Module: DFSSPOC

CSLM071W  savedsn has an unsupported record format.

Explanation: The data set you specified in the Save As options panel does not have a supported record format. Only FB and VB data sets are supported.

System action: The data is not saved.
User response: Use a different data set for the Save As data set, or redefine this data set with FB or VB.

Module: DFSSPOC

CSLM072W savedsn has an unsupported dataset type: sysdsorg.

Explanation: The data set you specified for savedsn in the Save As options panel does not have a supported data set organization. Only sequential or partitioned data sets are supported.

System action: The data set is not saved.

User response: Use a different data set in the Save As options panel, or redefine this with either a partitioned or sequential data set organization.

Module: DFSSPOC

CSLM073W sysmsglvl2

Explanation: The LISTDSI built-in function of the TSO REXX processor returned a nonzero return code. This message contains the problem description returned by LISTDSI in REXX variable, sysmsglvl2.

System action: The command response is not saved.

User response: Refer to the TSO/E REXX/MVS Reference (SC28-1883) for information regarding this message.

Module: DFSSPOC

CSLM074I Template name not found.

Explanation: A template with the name that you specified could not be found.

System action: The system waits for you to enter a valid template name.

User response: Change the template name and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSLM077I The command entered is too long: n characters.

Explanation: The command you entered is too long. Commands issued by the TSO SPOC Expand command dialog can only be 32 760 bytes.

System action: The command is not issued.

User response: Make sure the command is coded correctly. If a longer command is needed, issue the command from the batch SPOC utility.

Module: DFSSPOC
CSSL084I  Valid input is 1, 2, or 3

Explanation: You entered an invalid input. Valid values are 1, 2, or 3.

System action: The system waits for you to change the input value.

User response: Enter a valid value and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL085I  Valid input is Access, Schd, or Updates

Explanation: You entered an invalid input. Valid values are Access, Schd, or Updates.

System action: The system waits for you to change the input value.

User response: Enter a valid value and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL086I  Valid input is ALL or ACTIVE

Explanation: You entered an invalid input. Valid values are ALL and ACTIVE.

System action: The system waits for you to change the input value.

User response: Enter a valid value and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL087I  You must only select either START or STOP, but not both.

Explanation: You selected both START and STOP; you can only select one.

System action: The system waits for you to change the value.

User response: Select either START or STOP and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL088I  This option is mutually exclusive with another option.

Explanation: You have entered two mutually exclusive options.

System action: The system waits for you to change one of the values.

User response: Deselect the option that is indicated by the cursor, or remove the selection character from the mutually exclusive option. For example, You cannot specify OPEN and NOOPEN at the same time. Press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL089I  This option is invalid.

Explanation: You entered an invalid option.

System action: The system waits for the value to be changed.

User response: Ensure that you have entered valid options in the OPTION field. Consult the IMS commands documentation to determine which parameters can be specified in the OPTION field. Change the field to have a valid value and press Enter to continue, or press Cancel to return to the previous panel.

Module: DFSSPOC

CSSL090E  Required IMSPLEX name was not supplied.

Explanation: You did not supply the name of the IMSplex. The IMSplex name is required.

System action: The batch SPOC job ends with return code 8.

User response: Provide the IMSplex name in the JCL and submit the job again.

Module: CSLUSPOC

CSSL091E  Failed registration to IMSPLEX

Explanation: The batch SPOC could not register with the IMSplex.

System action: The batch SPOC job ends with return code 8.

User response: Ensure that you have specified the IMSplex name correctly. Also, make sure the SCI address space for that IMSplex has been started.

Module: CSLUSPOC

CSSL092E  Length of IMSPLEX name is invalid

Explanation: The name of the IMSplex that you specified was too long. The names of IMSplexes can be 1 to 5 characters long. Do not specify the CSL prefix as part of the name.

System action: The batch SPOC job ends with return code 8.

User response: Ensure that you have specified the IMSplex name correctly. Fix the IMSplex name and submit the job again.
CSLM093W  •  CSLM101I

Module: CSLUSPOC

CSLM093W  Wait time is invalid.
Explanation: The format of the wait time that you specified is not valid.
System action: The job continues with the default wait interval.
User response: Change the wait time as needed
Module: CSLUSPOC

CSLM094I  No output information to print.
Explanation: The command that you entered returned no information.
System action: Processing continues.
User response: Verify that the command was specified correctly.
Module: CSLUSPOC

CSLM095I  Resource name must start with an alphabetic character.
Explanation: The resource name that you specified was not correct. The first character must be a letter.
System action: The system waits for you to change the value.
User response: Enter a valid resource name and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM096I  Resource name contains invalid character.
Explanation: The resource name that you specified contained invalid characters.
System action: The system waits for you to change the value.
User response: Enter a valid resource name and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM097I  Resource name can not match with reserved name.
Explanation: The resource name you entered is the same as a reserved name.
System action: The system waits for you to change the resource name.
User response: Enter a valid name for the resource
and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM098I  The resource name is duplicated.
Explanation: The list of resources that you supplied contains at least two resources with the same name.
System action: The system waits for you to change the list of resources.
User response: Correct the list of resources and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM099I  Valid input is Access
Explanation: The input you entered is invalid.
System action: The system waits for you to enter valid input.
User response: Enter a valid input and press Enter to continue, or press Cancel to return to the previous panel.
Module: DFSSPOC

CSLM100I  Invalid character in name field.
Explanation: You have entered an invalid character in the name field for the resource type. Various resources have different naming requirements.
System action: The TSO SPOC does not issue the command and waits for you to correct the problem and press Enter again.
User response: Remove the invalid character and press Enter. Position the cursor on the name field and press the help key to see help information.
Module: DFSSPOC

CSLM101I  Enter a numeric value between min and max.
Explanation: The number you entered is outside the required range.
System action: The TSO SPOC does not issue the command and waits for you to correct the problem and press Enter again.
User response: Change the value to a number in the indicated range and press the Enter key to continue.
Module: DFSSPOC
CSLM130I Unable to connect to the log stream

Explanation: The OM audit trail viewer is not able to connect to the log data stream.

System action: Program continues processing.

User response: Verify that the log stream data set name is correct and specified in uppercase. If the data set name is correct, search the system log for IXG messages. For example, message IXG513I indicates a log stream data loss:

```
IXG513I LOGGER SUBSYSTEM (LOGR) EXIT ENCOUNTERED POSSIBLE LOSS OF DATA DD=SYSUT1 LOGSTREAM=IMS.OM.PLEX1.LOG EXIT=IXGSEXIT SERVICE=IXGCONN RSNCODE=00000407
```

For more information about IXG reason codes and corrective actions, see the z/OS MVS System Message manuals.

Module: CSLUSPOC

Related reference:

- z/OS: IXG messages

CSLM136W The response was not displayed because the record was truncated.

Explanation: The output was truncated in the z/OS System Logger. The command response output was greater than either 32,760 bytes or the z/OS System Logger maximum buffer size.

System action: The response cannot be processed. The information is not written to the SYSPRINT file nor displayed.

User response: Issue the command with more specific keywords or parameters so that the length of the response is less than 32,760 bytes. Set the z/OS System Logger maximum buffer size to a minimum of 32,760. Use the CSLOERA3 format and print exit to dump partial record.

Module: CSLULALE

CSLN messages

Messages beginning with CSLN are issued from an IBM single point of control application.

These messages are issued from a single point of control application, such as the IBM Management Console for IMS and DB2® for z/OS, in response to situations in the Operations or the Common Service Layer (CSL). These messages include the following:

CSLN002W The IMS SCI is not available.

Explanation: The Structured Call Interface (SCI) is not active for the IMSplex specified as the default or the IMSplex you specified to override the default.

System action: The command is rejected.

User response: Make sure that the SCI address space for the specified IMSplex has been started. Ensure that other IMSplex members have been started.

Module: DFSSPOC, IMS Control Center

CSLN004W You are not authorized to use the IMS SPOC with this IMSplex.

Explanation: The RACF profiles indicate that the TSO user ID is not authorized to register with this SCI.

System action: The command is rejected.

Module: DFSSPOC
CSLN005W  The command issued was rejected.

User response: Make sure the name of the IMSplex is typed correctly.

Programmer response: You are attempting to access an IMSplex (CSL imsplex_name in the Facility class) with a TSO user ID that is not authorized. The user ID must have at least update authority. Contact your security administrator to have the RACF profile for this user ID created or modified.

Module: DFSSPOC, IMS Control Center

CSLN005W  The command issued was rejected.

Explanation: The command that was issued through SPOC was rejected by the processor for an unknown reason, indicated by an rc of X'02000008'.

System action: The command was rejected.

Programmer response: See the CSLOCMCMD return and reason codes information for an appropriate response. For a list of these return and reason codes, see the information about the CSLOCMCMD command request.

Module: DFSSPOC, IMS Control Center

Related reference:

CSLOCMCMD: command request (System Programming APIs)

CSLN011W  The command entered has more than one filter specified.

Explanation: This message is issued if you enter mutually exclusive filters (keywords) in the command. For example, this message would be issued if TYPE and STATUS are both specified on a QUERY IMSPLEX command.

System action: The command that was just entered was rejected.

User response: Make sure that the command syntax is correct.

Module: DFSSPOC, IMS Control Center

CSLN021I  There are no active clients in the route list.

Explanation: The command was not routed to any clients because none of the clients in the route list are active in the IMSplex.

System action: The command was not routed to any client because none of the clients in the route list are active in the IMSplex.

User response: See the CSLOCMCMD return and reason codes information for an appropriate response. For a list of these return and reason codes, see the information about the CSLOCMCMD command request.

Module: DFSSPOC, IMS Control Center

Related reference:

CSLOCMCMD: command request (System Programming APIs)

CSLN023I  At least one request was successful.

Explanation: A command was routed to multiple clients. At least one client was able to process the request successfully and return either command response data or a response message.

System action: If the type-2 command response is available, it is returned to you. If the response is not available, the command response is displayed in the SPOC log display.

User response: See the CSLOCMCMD return and reason codes information for an appropriate response. For a list of these return and reason codes, see the information about the CSLOCMCMD command request. You might need to switch to the LOG display to see the completion codes.

Module: DFSSPOC

Related reference:

CSLOCMCMD: command request (System Programming APIs)

CSLN024I  No requests were successful.

Explanation: The entries were processed but no information was returned. The command you just issued was routed to multiple clients but none of the clients were able to process the request successfully.

System action: The command returned no response data or response messages from any client.

User response: For additional information, refer to the completion codes for the request in the log panel.

Module: DFSSPOC, IMS Control Center

CSLN028E  An internal error was detected. return code=omrcx reason=omreax

Explanation: An error occurred. The return code omrcx and the reason code omreax identify the problem.

System action: Processing continues.

User response: See the CSLOCMCMD return and reason codes information for an appropriate response. For a list of these return and reason codes, see the information about the CSLOCMCMD command request.

Module: DFSSPOC, IMS Control Center

Related reference:

CSLOCMCMD: command request (System Programming APIs)
The command contains an invalid primary keyword or no client registered for the keyword.

Explanation: The primary keyword on the command you just entered is invalid. The keyword itself might be invalid or the client for the keyword might not be registered.

System action: The command is rejected.

User response: Make sure the command syntax is correct.

Module: DFSSPOC, IMS Control Center

The command timed out.

Explanation: The command timed out before all of the command response information could be collected. One or more clients might not be responding or a client might have needed more time to process the command.

If your preferences are set to wait for command response information, the command that timed out is the last command you entered. If your preferences are set to continue processing, check the command status table to determine which command timed out.

System action: All command response information that was collected prior to the time-out is returned.

User response: If a wait interval was specified in the Preferences panel, ensure it is long enough to allow for the command to process.

If an interval was not specified, the interval defaults to five minutes. Specify an interval longer than five minutes to give the command time to process.

Module: DFSSPOC, IMS Control Center

The input exit rejected your command.

Explanation: The INPUT exit rejected the command that you just entered.

System action: The command was rejected.

User response: The INPUT exit was written by one of your programmers. Consult with your IMS programmer to determine why the INPUT exit rejected the command.

Module: DFSSPOC, IMS Control Center

The command entered contains an invalid keyword sublist.

Explanation: A keyword was specified with an equal sign, keyword=, but the keyword is defined with a sublist of values, keyword(). You must use parentheses to specify a sublist of values.

System action: The command was rejected.

User response: Make sure that the command syntax is correct.

Module: DFSSPOC, IMS Control Center

The command entered contains an incomplete keyword parameter.

Explanation: An incomplete keyword or keyword parameter was specified in the command that was just entered.

System action: The command was rejected.

User response: Make sure that the command syntax is correct.

Module: DFSSPOC, IMS Control Center

The command entered is missing a required parameter.

Explanation: A required parameter is missing from the command that was just entered.

System action: The command was rejected.

User response: Make sure that the command syntax is correct.

Module: DFSSPOC, IMS Control Center
### CSLN039W  The command entered contains an invalid keyword parameter value.

**Explanation:** You specified an invalid parameter for a keyword in the command that you just entered.

**System action:** The command was rejected.

**User response:** Make sure that the command syntax is correct.

**Module:** DFSSPOC, IMS Control Center

### CSLN040W  The command entered contains duplicate keywords.

**Explanation:** You specified a duplicate keyword in the command that you just entered.

**System action:** The command was rejected.

**User response:** Make sure that the command syntax is correct.

**Module:** DFSSPOC, IMS Control Center

### CSLN041W  The command entered has an invalid syntax.

**Explanation:** The command that you just entered contains invalid syntax. Text containing the syntax error is returned in the message section of the command response log.

**System action:** The command was rejected.

**User response:** Make sure that the command syntax is correct.

**Module:** DFSSPOC, IMS Control Center

### CSLN042W  The command processing client required to process this command is not ready.

**Explanation:** The command that you just entered could not be processed by the command processor indicated in messages section of the command response log. The command processor was not ready to process commands.

**System action:** The command was rejected.

**User response:** Reissue the command after the command processor is ready.

**Module:** DFSSPOC, IMS Control Center

### CSLN043W  The command processing client required to process this command is not registered.

**Explanation:** The command that you just entered could not be processed by the command processor indicated in messages section of the command response log. The command processor is not registered to process this command.

**System action:** The command is rejected.

**User response:** Make sure that the entry in the Route field is correct and that the correct command was issued.

**Module:** DFSSPOC, IMS Control Center

### CSLN044W  The system required to process this command is not active in this IMSplex.

**Explanation:** The command that you just entered could not be processed by the command processor indicated in the Member section of the command response log. The command processor is not active in the IMSplex.

**System action:** The command was rejected.

**User response:** Make sure that the entry in the Route field is correct and that the command processor is active.

**Module:** DFSSPOC, IMS Control Center

### CSLN045E  Your userid is not authorized to issue this command.

**Explanation:** The command that you just entered could not be processed. The TSO user ID that you used to issue the command is not authorized. Examine the log information to determine why the client is not authorized.

**System action:** The command was rejected.

**User response:** You might need to consult with your security administrator to create or modify the RACF profiles. The profiles that control IMS commands are in the OPERCMDS class.

**Module:** DFSSPOC, IMS Control Center

### CSLN046W  The command entered contains an invalid verb or no client registered for the verb.

**Explanation:** The command that you just entered is invalid. The command itself might be invalid, or the client for the command might not be registered currently.

**System action:** The command was rejected.

**User response:** Make sure that the command syntax is correct. Issue a QUERY IMSPLEX command to determine if the client is available. If the client is not available, contact your system administrator.

**Module:** DFSSPOC, IMS Control Center
CSLN050E Command not supported with currently running OM version.

Explanation: The command that you issued is not supported with the version of Operations Manager (OM) that is currently running.

System action: The command is rejected.

User response: Upgrade to the appropriate version of OM that can process this command.

Module: DFSSPOC

CSLN054I No clients returned return code 0. Check return code(s)

Explanation: The command was routed to multiple clients. None of the clients that processed the command returned a return code 0 and reason code 0 to the Operations Manager. CSLOMCMD command request return and reason codes help to identify the problem.

System action: At least one command client returned either command response data or a response message.

User response: Examine the TSO SPOC log display or the IMS Control Center results window to determine the return and reason codes from each command processor. The log might also contain additional messages that identify the problem.

See the CSLOMCMD return and reason codes information for an appropriate response. For a list of these return and reason codes, see the information about the CSLOMCMD command request.

Module: DFSSPOC, IMS Control Center

Related reference: CSLOMCMD: command request (System Programming APIs)

CSLN055I THE COMMAND COMPLETED WITH WARNING(S) CHECK RETURN CODE(S)

Explanation: The command was routed to multiple clients. Not all the clients that processed the command returned a return code 0 and reason code 0 to the Operations Manager. In addition, at least one client member returned return code 4.

For a list of these return and reason codes, see the information about the CSLOMCMD command request.

System action: At least one command client returned either command response data or a response message.

User response: Examine the TSO SPOC log display to determine the return and reason codes from each command processor. The log might also contain additional messages that identify the problem.

Module: DFSSPOC

Related reference: CSLOMCMD: command request (System Programming APIs)

CSLN061W The Operations Manager is not available.

Explanation: Operations manager (OM) is not available and CSLSCRQS issued an X'010000010' return code and X'0000400C' reason code.

System action: The command was rejected.

User response: Determine the reason that OM was not active, then contact your system administrator to have OM restarted.

Also, check the information about CSLSCRQS and CSLSCMSG service and return codes.

Module: DFSSPOC

Related reference: CSLSCRQS: send request (System Programming APIs)

CSLN070W User Id cannot be greater than 8 characters

Explanation: The user ID entered contains more than eight characters.

System action: User login rejected.

User response: Make sure a valid user ID is entered.

CSLN071W Password cannot be greater than 8 characters

Explanation: The password that you entered contained more than eight characters.

System action: User login rejected.

User response: Make sure a valid password is entered.

CSLN072W You must enter a User Id

Explanation: User ID was not provided on the Login dialog.

System action: User login rejected.

User response: Make sure a valid user ID is entered.

CSLN073W You must enter a Password

Explanation: You did not provide a password on the Login dialog.

System action: User login rejected.

User response: Make sure a valid password is entered.
CSLN074E  Invalid client data returned
Explanation: During login processing, the IMSplex attempted to return data about IMSplex members. This data was corrupted when received.
System action: None.
User response: Try to login again. If the error continues, contact the IBM Support Center for help.

CSLN075E  Invalid syntax data returned
Explanation: During login processing, the IMSplex attempted to return data about available commands. This data was corrupted when received.
System action: None.
User response: Try to login again. If the error continues, contact the IBM Support Center for help.

CSLN076E  This group has no assigned members
Explanation: No members were assigned to the group folder from which you launched the wizard.
System action: None.
User response: Change the group folder and select at least one member.

CSLN077E  The IMSplex system name that you are adding already exists
Explanation: You tried to add or define a duplicate IMSplex system using the Add System dialog. System (IMSplex) names must be unique.
System action: None.
User response: Choose a different IMSplex name.

CSLN078E  A group with this name already exists
Explanation: You tried to add or define a duplicate group using the Add Groups dialog. The names of groups must be unique.
System action: None.
User response: Choose a different group name to be added.

CSLN079E  You entered a folder name that is reserved
Explanation: You tried to define a group name, but the name you specified is reserved.
System action: None.
User response: Choose a different group name.

CSLN080E  Please make a selection from page(s) pagename
Explanation: A selection on a wizard page, identified by pagename, is required but not being selected.
System action: None.
User response: Make the required selection on the wizard pages.

CSLN081E  Internal error, Return Code:rc
Explanation: Internal error encountered.
System action: None.
User response: Contact the IBM Support Center for help. Be sure to supply the return code rc from this message.

CSLN082E  Enter valid port number
Explanation: The port number that you specified was invalid; it contained a nonnumeric value.
System action: None.
User response: Enter a port number with numeric value.

CSLN082W  The IMSplex system name that you are changing to already exists
Explanation: You tried to change the name of an existing IMSplex system using the Change System dialog, but the new name is currently assigned to another IMSplex system. System (IMSplex) names must be unique.
System action: None.
User response: Make sure the new system name is the one that you want.

CSLN083E  The following required keywords are missing from the command: keywords.
Explanation: The command you want to issue requires certain keywords; however, the keywords shown in the message text are missing.
System action: The command was not issued.
User response: Add the required keywords to the command.

CSLN084E  Parenthesis mismatch. Please make sure that each opening parenthesis has a closing parenthesis.
Explanation: The command you entered contains an opening parenthesis without a matching closing parenthesis.
System action: The command was not issued.
User response: Check the syntax of the command and ensure that each opening parenthesis has a closing parenthesis.

CSLN085E Invalid hostname entered.
Explanation: The IP address that you provided on the Add or Change System dialog was invalid.
System action: None.
User response: Enter a valid IP address.

CSLN086E Error opening socket to host.
Explanation: The IP address that you specified in the Add or Change System dialog cannot be accessed. The connection failed.
System action: None.
User response: Check with your System Administrator on the status of the IP address.

CSLN087E Error receiving response from host.
Explanation: The IP address that you provided on the Add or Change System dialog cannot be accessed. The connection failed.
System action: None.
User response: Check with your System Administrator on the status of the IP address.

CSLN088E Error sending command to host.
Explanation: An internal error occurred while receiving data from the host system.
System action: None.
User response: Contact the IBM Support Center for help.

CSLN089E Required resource type is missing
Explanation: The command you entered was missing a required resource type.
System action: None.
User response: Reenter the command with the resource type you want for the command.

CSLN090E Invalid IMSplex name
Explanation: You cannot connect to the IMSplex system name specified on the Add System dialog because that name is not currently defined on the host system.
System action: None.
User response: Enter an IMSplex name that is currently defined on the host.

CSLN092E IMS Connect in shutdown.
Explanation: IMS Connect was in shutdown state and the connection to the IMSplex could not be established.
System action: None.
User response: Restart IMS Connect.

CSLN093E Error detected by SCI. Reason code: rsn
Explanation: IMS Connect encountered an error that was detected by the structured call interface (SCI) in the IMSplex.
In the message text:
rsn CSLOMI reason code
System action: None.
User response: See the information about CSLOMI return and reason codes for an appropriate response.
Related reference:
[CSLOMI: API request (System Programming APIs)]

CSLN094E Connection to host does not exist
Explanation: The socket connection to the host failed.
System action: None.
User response: Check with your system administrator on the status of the IP address.

CSLN095E Invalid response from host
Explanation: The length of data returned from IMS Connect was invalid.
System action: None.
User response: If the IMS Connect Recorder is not open when this message appears, open the Recorder and retry the action that caused the error.
When the IMS Connect Recorder is open and you receive message CSLN095E:
1. Close the Recorder
2. Capture the Recorder’s output with IMS Connect’s IDCAMS job
3. Contact the IBM Support Center for help

CSLN096E Error detected by IMS Connect: Return Code: rc Reason Code: rsn
Explanation: IMS Connect encountered an error. For more information about the return code and reason code (rc and rsn in the message text), see the information about IMS Connect return and reason codes.
System action: None.
User response: See the information about IMS
Connect return and reason codes for the appropriate response.

Related reference:
- IMS Connect return and reason codes (Messages and Codes)

**CSLN097E**  
**Connection to IMSplex is terminating**

**Explanation:** IMS Connect acknowledged that the connection to the IMSplex was being terminated. The SCI that IMS Connect was registered to was being shut down.

**System action:** None.

**User response:** Determine the reason that caused the SCI to be shut down and correct this situation.

**CSLN099E**  
**Connection to IMSplex has been stopped**

**Explanation:** IMS Connect was not able to communicate with Structured Call Interface (SCI) in the IMSplex. The SCI address space in the IMSplex has been stopped.

**System action:** None.

**User response:** Determine why the SCI address space has stopped. Remedy the problem, restart SCI, and try to reconnect.

**CSLN101E**  
**Security failure**

**Explanation:** IMS Connect RACF authentication was turned on and the RACF call made by IMS Connect failed. The user ID or password or both entered from the User Login dialog might be invalid.

**System action:** None.

**User response:** See the IMS Connect error message on the system console to determine the error and provide a valid user ID, password, or both.

**CSLN102E**  
**IMS Connect protocol error**

**Explanation:** IMS Connect detected a communication protocol error. For example, the IBM Management Console for IMS and DB2 for z/OS, is in the wrong state while sending data through IMS Connect.

**System action:** None.

**User response:** Create an SDUMP of the IMS Connect address space and contact the IBM Support Center for help.

**CSLN103E**  
**Error detected by OM. Reason Code: rsn**

**Explanation:** IMS Connect encountered error that was detected by the operations manager (OM) in the IMSplex.

In the message text:
- rsn  
  CSLOMI reason code

**System action:** None.

**User response:** See the information about CSLOMI return and reason codes for the appropriate response.

**Related reference:**
- CSLOMI: API request (System Programming APIs)

**CSLN105E**  
**Invalid command shortcuts file.**

**Explanation:** The internal file cmdshortcuts.xml cannot be read. It might be corrupted.

**System action:** None.

**User response:** Contact the IBM Support Center for help.

**CSLN106E**  
**I/O error when importing command shortcuts.**

**Explanation:** An I/O error occurred when reading the internal cmdshortcuts.xml file.

**System action:** None.

**User response:** Contact the IBM Support Center for help.

**CSLN107I**  
**Invalid verb or resource in the command.**

**Explanation:** You entered either an invalid verb or resource for the command in the Adding or Changing Default Parameter window.

**System action:** None.

**User response:** Make sure the command being entered in the default parameter window contains valid command verb or resource.

**CSLN108I**  
**The command you entered has already been used. Please use a different command.**

**Explanation:** In the Adding or Changing Default Parameter window, the command you entered has been previously defined.

**System action:** None.

**User response:** Make sure the command being added or changed is the one you want. To modify an existing command, select the command and click the Change button to make your updates.
CSLN109I  A short name must begin with an &
Explanation: In the Adding or Changing Short Name window, you entered a short name that did not begin with an ampersand (&).
System action: None.
User response: Add an ampersand (&) at the beginning of the short name.

CSLN110I  The short name you entered contains a space. Spaces are not allowed in short names.
Explanation: In the Adding or Changing Short Name window, you entered a short name that contained one or more spaces. Spaces are not allowed in the short name field.
System action: None.
User response: Remove the space in the short name field.

CSLN111I  The short name you entered has already been used. Please use a different short name.
Explanation: In the Adding or Changing Short Name window, you entered a short name that was already defined. Short names must be unique.
System action: None.
User response: Define a different short name. To modify an existing short name, select the short name and click the Change button to make your updates.

CSLN112E  Invalid character was found within the command; please remove the invalid character.
Explanation: The command that you entered in the Command Editor contained an invalid character.
System action: None.
User response: Remove the invalid character in the command and re-execute the command.

CSLN113E  The command short name is not defined. Please define a short name.
Explanation: The short name you entered in the Command Editor has not been defined.
System action: None.
User response: Define the desired short name in the add short name window or correct the command and re-execute it.

CSLN114I  Please select from the following keywords: keywords
Explanation: The listed keywords in the command dialog are required but have no selections.
System action: None.
User response: Make selections for the keyword controls listed with the message.

CSLN115E  Error encountered during SSL processing. Error: error_code
Explanation: Creation of secure socket failed. The error code explanation can be found in z/OS Cryptographic Services System SSL Programming (SC24-5901).
System action: None.
User response: Correct the error based on the explanation in z/OS Cryptographic Services System SSL Programming.
Chapter 6. DSP messages (Database Recovery Control)

Messages issued by the Database Recovery Control (DBRC) feature begin with DSP.

DSP messages DSP0001-DSP0050

This topic contains the following messages:

DSP0001I INSUFFICIENT MAIN STORAGE
Explanation: Sufficient storage was not available to perform the requested utility function.
System action: The utility function was terminated.
Programmer response: Increase the region size and rerun the utility function.
Problem determination: 2, 3, 8
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0002I UNABLE TO OPEN ddname DATA SET
DSNAME=dsname VSAM RETURN CODE=nn ERROR CODE=nnn
Explanation: The attempt to open a VSAM data set failed.
In the message text:
ddname The type of data set (for example, the ddname of the RECON data set)
dsname The name of the VSAM data set that could not be opened
nn The VSAM return code
nnn The VSAM error code from the ACB error field
System action: The utility function was terminated.
Programmer response: For an explanation of the VSAM return codes and error codes, see z/OS DFSMS Macro Instructions for Data Sets.
Problem determination: 1, 2, 3, 8, 20
Module: DSPURI00, DSPURI10, DSPURU00
Related reference: z/OS: VSAM macro return and reason codes
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0003I UNABLE TO CLOSE generic-name DATA SET
DSNAME=dsname VSAM RETURN CODE=nn ERROR CODE=nnn
Explanation: An attempt to close a VSAM data set failed.
In the message text:
generic-name The type of data set (for example, RECON1 or RECON2)
Problem determination: 2, 3, 8, 20
Related reference:

Chapter 2, “IMS problem determination,” on page 13

DSP0007I RECORD LENGTH APPROACHING
RECON MAXIMUM RECORD
LENGTH = llllllI ppp% OF
RECORDSIZE sssssss

Explanation: DBRC just wrote a record to RECON, and the size of the record exceeds the SIZALERT value specified on the CHANGE.RECON command.

In the message text:
lllllll The record size in decimal.
ppp The percentage of the maximum size of the record.
ssssssss The maximum size allowed for a record.

This message is followed by DSP0020I which lists the formatted record key.

System action: Processing continues.

User response: Determine what action is needed, if any, to prevent the specified record from exceeding the maximum size. For additional information about initializing and maintenance for RECON, see IMS Version 13 System Administration.

Module: DSPURI00
Related information:
### DSP0008I  
**VSAM LOGICAL ERROR ON** `ddname`  
**DATA SET** `DSNAME=dsnname`  
**VSAM FEEDBACK CODE=nnn**  

**Explanation:** The VSAM data set, indicated by `ddname`, encountered a VSAM logical error that prevented further processing. The information in the message is intended for problem analysis by IBM personnel.

In the message text:
- `ddname` The ddbname associated with the data set in error.
- `dsnname` The name of the affected data set.
- `nnn` The VSAM feedback code from the RPL feedback area.

This message is followed by DSP0020I, which lists the formatted record key.

**System action:** The request in progress was terminated with an abend and its associated dump.

**Programmer response:** Determine the cause of the VSAM logical error. Correct the problem and rerun.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related reference:**
- [z/OS: VSAM macro return and reason codes](#)

### DSP0009I  
**VSAM PHYSICAL ERROR ON** `ddname`  
**DATA SET** `DSNAME=dsnname`  
**VSAM FEEDBACK CODE=nnn**  

**Explanation:** A physical I/O error occurred while a read or write request was being attempted for the specified VSAM data set.

In the message text:
- `ddname` The ddbname associated with the data set in error.
- `dsnname` The affected data set.
- `nnn` The VSAM feedback code from the RPL feedback area.

Message DSP0010I follows this message to identify the information returned from VSAM for the physical error.

**System action:** The utility function was terminated.

**Programmer response:** See the DSP0010I message to determine the cause of the physical error.

**Problem determination:** 8

**Related reference:**
- [z/OS: VSAM macro return and reason codes](#)

---

Related information:

**DSP0012I**

| Chapter 2, “IMS problem determination,” on page 13 | DSP0012I  
| SVC `nnn` IS NOT A VALID DBRC TYPE 4 SVC | **Explanation:** DBRC initialization has determined that the Type 4 SVC number `nnn` is not the valid DBRC SVC, for one of the following reasons:
- The DBRC Type 4 SVC was not defined correctly.
- The DBRC Type 4 SVC is downward compatible.
- The IMS Version 13 Type 4 SVC can be used by IMS.

**Related reference:**
- [Chapter 2, “IMS problem determination,” on page 13](#)
Version 12 or IMS Version 11. IMS Version 13 cannot use a lower-release Type 4 SVC.

The following IDs are returned to DBRC initialization by the Type 4 SVC for the specified IMS release:
- 2MVS returned in R15
  - IMS Version 11
- 3MVS returned in R15
  - IMS Version 12
- 4MVS returned in R15
  - IMS Version 13

- The current release (or a compatible release) of the SVC module DSP00MVS of DBRC was not linked into SYS1.LPALIB or an MLPA library under the name 16C00*** (*** is the signed decimal SVC number; for example, SVC 255 = 25E).

**System action:** Processing is terminated.

**Programmer response:** Correct the condition that caused the error and try again.

There are two options for installing a new version DBRC Type 4 SVC after linking the new routine to an LPA library:
- IPL z/OS again.
- Use the IMS Dynamic SVC Utility (DFSUSVC0) to dynamically install a new copy without loading z/OS again.

If you used the IMS Dynamic SVC utility (DFSUSVC0) to install a new DBRC Type 4 SVC dynamically, message DFS1886A might be issued. The message indicates an error during installation and that the command response was to continue the installation. You might need to install a new DBRC Type 4 SVC.

If DFSUSVC0 was not used to dynamically install a new DBRC Type 4 SVC, z/OS was not restarted specifying CLIPA or MLPA=xx, or both.

**Module:** DSPUI00, DSPBIN20

**Related information:**
- DSP1886A (Messages and Codes)

**DSP0014I**

**DYNAMIC ALLOCATION FAILED FOR RECON=nn RETURN CODE=xx REASON CODE=xxxx**

**Explanation:** An attempt to allocate the specified RECON data set failed. The hexadecimal return code, along with the reason code returned from the failing dynamic allocation supervisor call, are identified in the message.

**System action:** If the minimum set of RECON data sets is available, processing continues. Otherwise, the utility function is terminated.

**Note:** In an XRF environment, this message might be issued repeatedly until DBRC is able to reenter dual RECON mode. For information about allocating and initializing RECON data sets, see Initializing the RECON data set for DBRC (System Definition) for information about maintaining RECON data sets, see Maintaining the RECON data sets (System Administration).

**Programmer response:** See z/OS MVS Programming: Authorized Assembler Services Guide (SA22-7608) for an explanation of the return and reason codes returned from the dynamic allocation supervisor call.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related reference:**
- Chapter 2, “IMS problem determination,” on page 13

**DSP0015I**

**VSAM SEVERE ERROR ON dname DATA SET NAME=dname VSAM FEEDBACK CODE=xxx**

**Explanation:** The data set indicated by dname, data set name dname, encountered a VSAM severe error (return code 16). xxx is the VSAM feedback code from the RPL feedback area.

**System action:** If serial access was in use, the request in progress was terminated with an abend and its associated dump. If parallel access was in use, the request in progress is backed out, the RECON data sets are closed and opened again, and the request is reprocessed. If the problem persists, messages DSP1184W might be issued.

**System programmer response:** If the problem persists, determine the cause of the VSAM severe error (RC=16).

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPUI00, DSPUR01, DSPUR02

**Related reference:**
- z/OS: Interpreting error reason codes from DYNALLOC

**Related information:**
- Chapter 2, “IMS problem determination,” on page 13

**DSP0016I**

**DBRC HAS RECOVERED FROM RESERVE ERROR**

**Explanation:** An abnormal termination occurred during the processing of a RESERVE request by DBRC for one of the RECON data sets. DBRC has recovered from the abend. This problem can occur if an I/O error occurs on the volume being reserved.

**System action:** The data set for which RESERVE fails to be discarded and processing continues with the remaining RECON data sets.

**Related information:**
- Chapter 2, “IMS problem determination,” on page 13
DSP0017I  DYNAMIC DEALLOCATION FAILED FOR RECON(IN) RETURN CODE=XXX  
REASON CODE=xxxx

Explanation: An attempt to deallocate the specified RECON data set failed. The hexadecimal return code, along with the reason code returned from the failing dynamic allocation supervisor call, are identified in the message.

System action: Processing continues.

Programmer response: See z/OS MVS Programming: Authorized Assembler Services Guide (SA22-7608) for an explanation of the return and reason codes returned from the dynamic allocation supervisor call.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related reference:

DSP0018I  type ERROR ON name DATA SET, DD NAME ddname

Explanation: During the processing of a GENJCL command, the error identified in the message (OPEN, CLOSE, or I/O) was encountered while accessing the named data set (JCLPDS or JCLOUT). The DD statement for the data set is identified by ddname. This message is also issued if an OPEN or CLOSE error was encountered while accessing the MDA PDS data set, D0 NAME IMSDALIB, during the processing of RECON dynamic allocation.

System action: Processing of the command terminates. Subsequent commands are not processed.

Programmer response: Review the information described in Problem Determination, determine the reason for the error, correct the problem, and reissue the command.

Problem determination: 2, 3, 8

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0019I  INCOMPLETE SEGMENTED RECORD FOUND

Explanation: During an access of a RECON data set, DBRC was not able to locate all physical segments for a segmented RECON record. Message DSP0008I or DSP0009I contains more information about the error.

System action: DBRC discards the data set containing the incomplete record and continues processing if another available data set exists.

Programmer response: No action is required.

Module: DSPUR100, DSPUR30, DSPUR40

Related information:

DSP0020I  FORMATTED RECORD KEY: KEY TYPE= , DBD= ,DDN | GRPN | SSID=  
TIME= record time

Explanation: This message contains the formatted record key for diagnostic purposes.

System action: Processing continues.

Programmer response: No action is required.

Module: DSPURL00

DSP0021I  RECON DATA SETS SUCCESSFULLY UPDATED

Explanation: After the completion of the Recovery Control utility command, with which this message is associated, the RECON data sets were successfully updated to reflect the results of the command.

System action: Processing by the utility continued.

Programmer response: No action is required.

DSP0022I  SIGNOFF NOT PERFORMED FOR SUBSYSTEM (xxxxxxxx OR UNKNOWN)

Explanation: After an abnormal termination occurred, IMS issued a signoff command to DBRC. Because DBRC was active at the time of the abend, DBRC is unable to process the signoff request.

Programmer response: Take appropriate action to recover. If this message is followed by message DFS0036I (BATCH BACKOUT IS REQUIRED), then run batch backout. Otherwise issue a CHANGE.SUBSYS command specifying the abnormal parameter.

Problem determination: 1, 2, 3, 8, and listing of the RECON data set

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0024I  RECON(IN) HEADER RECORD MISSING OR INVALID

Explanation: Either a header record, which identifies a RECON data set, was not found in the identified RECON data sets, or a record with the correct key did not contain identifying information.

If the RECON data sets are a lower release than the
current IMS release, issue a CHANGE.RECON UPGRADE command using the new release of IMS. If the data set was not initialized as a RECON data set (that is, the header record should exist and be correct), the header record has been inadvertently modified and should be corrected. If the other RECON data set does contain a valid header record, use an Access Method Services REPRO command to copy it to the one that contains the invalid header record.

System action: Processing terminates.

Programmer response: If the identified RECON data set has not been initialized as a RECON data set, use the INIT.RECON command of the Recovery Control utility to initialize it. If the RECON Upgrade utility has been started, ignore this message. If the data set has been initialized as a RECON data set (that is, the header record should exist and be correct), the header record has been inadvertently modified and should be corrected. If the other RECON data set does contain a valid header record, use an Access Method Services REPRO command to copy it to the one that contains the invalid header record.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0025I RECON RECORD ALREADY EXISTS
RECORD KEY=record key

Explanation: A command to add a record to the RECON data set failed because a record with an identical key exists.

This message is followed by DSP0020I, which lists the formatted record key.

System action: The command failed, and subsequent commands were not processed.

Programmer response: Make the command unique, and then reissue it and any subsequent commands that were not executed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Module: DSPURI00

Related information:
“DSP0020I” on page 129
Chapter 2, “IMS problem determination,” on page 13

DSP0026I UNABLE TO BUILD VSAM LSR POOL
- REASON CODE = nn

Explanation: DBRC was unable to build the local shared resource (LSR) pool needed to process the RECON in an ESA environment. Reason code nn corresponds to the codes given for the Build VSAM Resource Pool (BLDVRP) macro described in z/OS DFSMS Macro Instructions for Data Sets (SC26-7408).

System action: DBRC reverts to the use of the Non Shared Resource (NSR) option to process the RECON, which degrades DBRC performance. As a result, DBRC attempts to reissue the BLDVRP macro later if it detects a reconfiguration of the RECONs by another copy of DBRC. If the condition causing the problem does not clear up, this message might repeat itself periodically. This condition does not affect the integrity of the RECON data set. For details about LSR and NSR processing of VSAM data sets, see z/OS DFSMS Macro Instructions for Data Sets.

Programmer response: For reason code 8 (not enough storage is available), increase the size of the region in which DBRC is executing or decrease the number of index or data buffers DBRC is using in LSR mode. IMS Version 13 Exit Routines explains how the buffer size specification facility (DSPBUFFS) controls the number of buffers used for RECON data sets.

For reason code 4 or 32, DBRC and some other program within the same address space are in contention for the use of all VSAM LSR buffer pool IDs. If possible, modify the other programs to use fewer VSAM LSR buffer pool IDs to process VSAM data sets.

Problem determination: 2, 3, 8, 35, and a description of the operating environment being used when this message was issued (for example, batch job, running under TSO, DBRC attached by a user/vendor product, or other).

Related reference:

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0027I ddname DATA SET IS FULL

Explanation: All the space allocated for the RECON data set that is identified by ddname in the message has been used.

System action: The system discards the named RECON. The remaining RECON data set are copied to an available spare, if one exists. Processing continues.

Programmer response: Delete and Redefine the identified RECON data set; increase the space allocation. You can leave the redefined RECON SPARE status. It will be used the next time the DBRC copy function is necessary. As an alternative, you can use CHANGE.RECON REPLACE (specify the RECON you want replaced). Then DBRC copies the good RECON to the redefined RECON.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13
DSP0028I  RECON DATA SETS MUST BE INITIALIZED

Explanation: A request to access or update the RECON data sets failed because the RECON data sets have never been initialized.

System action: The request failed.

Programmer response: If there are incorrect data sets on the RECON1 and RECON2 DD statements, correct them. If the correct data sets are identified in the RECON1 and RECON2 DD statements, issue an INIT.RECON command to initialize them as RECON data sets. Rerun the job step that failed, after making the corrections.

Problem determination: 2, 3, 8, and the listings of the RECON data sets that were produced by an Access Method Services PRINT command.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0029I  RECORD WITH LENGTH OF nnnnnnnn BYTES EXCEEDS THE MAXIMUM DBRC RECON RECORD SIZE OF nnnnnnn BYTES

Explanation: An attempt to add or change a record in the RECON data sets failed because the maximum DBRC record size defined for the RECON data sets was exceeded. nnnnnnnn is a decimal value representing the number of bytes.

This message is followed by DSP0020I, which lists the formatted record key. If the record key contains an invalid type, this message is followed by message DSP0186I and the hexadecimal printout of the record key.

System action: The record was not added or changed. Processing by the utility that attempted to add or change the record was terminated.

Programmer response: Increase the RECORDSIZE value on the VSAM DEFINE CLUSTER statement for the RECON data sets, and then rerun the utility job step that failed.

If message DSP0029I is received from the BACKUP.RECON command, you must use the Access Method Services IDCAMS REPRO command or DFSMSdss to back up the RECON.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: "DSP0020I" on page 129
"DSP0186I" on page 158
Chapter 2, “IMS problem determination,” on page 13

DSP0030E  RECON IS READ MODE ONLY - action IS NOT ALLOWED

Explanation: A READONLY user attempted to alter the RECON data set. A READONLY user is not allowed to change the RECON. The message variable action can be:

CONFIG An attempt was made to reconfigure the RECON data sets.
DELETE An attempt was made to delete a record from the RECON.
INSERT An attempt was made to create a new RECON record.
UPDATE An attempt was made to update an existing RECON record.
UPGRADE An attempt was made to upgrade the RECON data sets.

MODE-SW An attempt was made to switch accessing mode.

System action: The I/O operation fails and return code 12 is set. If the Database Recovery Control utility attempted to execute a command which would update the RECON, the command fails and subsequent commands were not processed.

System programmer response: Resubmit the job without the READONLY parameter.

Problem determination: 2, 3, 8, 23

Module: DSPURl00

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0031I  DATA BASE NOT REGISTERED IN RECON DBD=database name

Explanation: A DBRC command was issued referencing a nonexistent database record.

System action: The command fails and subsequent commands are not processed. The RECON data set is not updated.

Programmer response: Determine if the database name is invalid or incorrectly spelled. Correct the error; then issue the command and all subsequent commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Module: DSPURCM8, DSPURDPT, DSPURMPT

Related information: Chapter 2, “IMS problem determination,” on page 13
DSP0032I  RECON DATA SET ALREADY UPGRADED

Explanation: A request was made to upgrade RECON data sets that are already at the current level.

System action: Processing is terminated.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0034I  RECON INCONSISTENCY, PARTITION RECORD CANNOT BE FOUND DBD=...... PART=.......  

Explanation: DBRC was unable to locate the partition record associated with a partition database record (TYPE=PART). There is an inconsistency in the RECON data sets; all partition database records must have a corresponding partition record.

System action: Processing terminates. The RECON data sets are not updated.

Programmer response: Contact IBM Software Support for assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0036I  UPGRADE ATTEMPTED WHILE RECON MULTIPLE UPDATE FLAG IS ON  

Explanation: The RECON data sets multiple-update flag in the RECON header record is on. The RECON data set cannot be upgraded until the flag is turned off.

System action: Processing is terminated.

Programmer response: The RECON multiple-update flag is turned off during the normal update activity that occurs in the RECON data sets. Issue the CHANGE.RECON UPGRADE command again. If the problem still exists, contact IBM Software Support.

DSP0037I  RECON DATA SET NOT UPGRADED  

Explanation: A DBRC request or command was issued for a RECON data set that was not upgraded.

System action: Processing is terminated.

Programmer response: Issue a CHANGE.RECON UPGRADE command using the new release of IMS.

Problem determination: None

DSP0038I  RECON INCONSISTENCY RECON HEADER RECORD NOT FOUND  

Explanation: DBRC was unable to find the RECON header record during a command other than the INIT.RECON command. There is an inconsistency in the RECON data sets.

System action: Processing is terminated. The RECON data sets are not updated. Subsequent commands are not processed.

Programmer response: Attempt to execute the command that failed. If the problem persists, contact IBM Software Support for assistance in problem resolution.

Problem determination: 2, 3, 8, 35, the memory dump provided by ABEND processing, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0040I  UNABLE TO LOAD MODULE (modname)  

Explanation: During the initialization of DBRC in the IMS system, the module (modname) could not be loaded.

System action: Processing is terminated.

Programmer response: Make sure that the DBRC modules reside in the library defined by the JCL. If the DBRC modules do reside in the correct library, then sufficient storage was not available to load the module (modname). Increase the region size to allow DBRC to load the module.

Problem determination: 2, 3, 8, 10, 13

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0039I  RECON INCONSISTENCY DB RECORD CANNOT BE FOUND DBD=database name  

Explanation: DBRC was unable to find the database record associated with a database data set record during a DELETE,DBDS command, or a CHANGE,DBDS command with one of the following parameters specified: ICON, ICOFF, RECOV, or NORECOV. There is an inconsistency in the RECON data sets, because all database data set records must have a corresponding database record.

Alternatively, DBRC was unable to find the database record associated with an allocation, image copy, reorganization, or recovery record while executing a NOTIFY,IC, NOTIFY,UIC, NOTIFY,RECOV, NOTIFY,REORG, NOTIFY,ALLOC, or other database-oriented command. There is an inconsistency in the RECON data set in as much as each of the
record types listed above must have a corresponding database record.

**System action:** Processing is terminated. The RECON data sets are not updated.

**Programmer response:** Attempt to execute the command that failed. If the problem persists, contact IBM Software Support for assistance in problem resolution.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0042I**

**RECON INCONSISTENCY CAGRP RECORD REFERENCED BY DBDS RECORD CANNOT BE FOUND DBD= dbdname DDN= ddname CAGRP= cagrpname**

**Explanation:** DBRC was unable to find the CAGRP record associated with the DBDS record or the AREA record during command processing. The DBDS or AREA record indicated that the DBDS was a member of the specified CA group, but the CA group was not registered in the RECON data set. This problem indicates an inconsistency in the RECON data set.

**System action:** If the error occurred during the processing of a LIST command, processing continues. Otherwise the command failed, and subsequent commands are not processed.

**Programmer response:** Attempt to execute the command that failed. If the problem persists, contact IBM Software Support for assistance in problem resolution.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0043I**

**DATA BASE ALREADY REGISTERED IN RECON DBD=database name**

**Explanation:** The database specified in the DBD parameter of the INIT.DB command already exists.

**System action:** Processing is terminated. The RECON data sets are not updated.

**Programmer response:** Determine if the database name was invalid, inadvertently specified, or incorrectly spelled. Correct the error and run the INIT.DB command again.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0044I**

**DATA BASE STILL AUTHORIZED BY A SUBSYSTEM**

**Explanation:** During a DELETE.DB or a CHANGE.DB command, the database to be deleted or changed was still authorized by a subsystem (the DB record had subsystem entries). Changing or deleting the database is not allowed in this situation.

For a CHANGE.DB command, the NONRECOV or RECOVABL keyword cannot be specified for an authorized database.

For the LIST.DB CHKAUTH command, this message is used to report that the specified DBD is still authorized to a subsystem. A return code RC=04 is also received.

For a NOTIFY.ALOC command that specifies a USID value that is greater than the current USID value for the database, this message reports that the specified DBD is still authorized to a subsystem. A return code RC=12 is also received.

**System action:** Processing is terminated. The RECON data set is not updated. Subsequent commands are not processed.

**Programmer response:** If you still want the DB record to be deleted, all subsystem records referred to by the DB record must first be deleted.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0045I**

**DATA BASE STILL AUTHORIZED BY A SUBSYSTEM DBD=database name**

**Explanation:** During a CHANGE.DB (ALL) command, an attempt to change the share level of a database was made while the database was still authorized by a subsystem (the DB record had subsystem entries).

During a CHANGE.DB command, the database was still authorized. The database must be unauthorized before the command can continue.

During a CHANGE.DB UNAUTH command, a subsystem record matching the specified SSID still exists in the RECON. The database authorization cannot be removed with the CHANGE.DB command under this condition. Use CHANGE.SUBSYS STARTRCV and CHANGE.SUBSYS ENDRCOV commands instead.

During a CHANGE.DBDS command for a full-function database, an attempt was made to change the ddname, add or delete an error queue element (EQE), change the data set name, or change the recovery-needed status (RECOV/NORECOV) while the database was still authorized by a subsystem.

A DELETE.SUBSYS or CHANGE.DBDS command can also issue this message when the specified database is
still authorized to the specified subsystem. The
CHANGE.DB, DELETE.SUBSYS, or CHANGE.DBDS
command is not permitted at this time.

**System action:** Processing is terminated. The RECON
data sets are not updated.

**Programmer response:** Wait until the databases have
been unauthorized.

**Problem determination:** 2, 3, 8, and the listings of the
RECON data sets

**Related reference:**
- CHANGE.DB command (Commands)
- CHANGE.DBDS command (Commands)
- DELETE.SUBSYS command (Commands)

**Related information:**
Chapter 2, “IMS problem determination,” on page 13

**DSP0046I** SUBSYSTEM ID NOT FOUND IN
DATA BASE RECORD DBD=database
name SSID=subsystem id

**Explanation:** During a CHANGE.DB command, the
specified database did not contain the subsystem name
identified by the SSID parameter.

**System action:** Processing is terminated. The RECON
data sets are not updated.

**Programmer response:** To change the database record,
first change all subsystem records referred to by the
database record.

**Problem determination:** 2, 3, 8, and the listings of the
RECON data sets

**Related information:**
Chapter 2, “IMS problem determination,” on page 13

**DSP0047I** SUBSYSTEM ALREADY MARKED
ABNORMAL SSIDNAME=subsystem-name

**Explanation:** A CHANGE.SUBSYS command was
issued with the ABNORMAL parameter specified. However, the SUBSYS record in RECON was already
marked abnormal. The abnormal attribute is not changed; however, other parameters on the command
are honored.

**System action:** Processing continues.

**Programmer response:** No action is required.

**Problem determination:** None

**DSP0048I** SUBSYSTEM ALREADY REGISTERED
IN RECON SSID=subsystem-name

**Explanation:** The subsystem identified in the SSID
parameter of the NOTIFY.SUBSYS command already
exists.

**System action:** Processing is terminated. The RECON
data sets are not updated.

**Programmer response:** Determine if the subsystem
name was invalid, inadvertently specified again, or
incorrectly spelled. Correct the error and issue the
NOTIFY.SUBSYS command again.

**Problem determination:** 2, 3, 8, and the listings of the
RECON data sets

**Related information:**
Chapter 2, “IMS problem determination,” on page 13

**DSP0049I** AREA STILL AUTHORIZED BY A
SUBSYSTEM

**Explanation:** During DBRC command processing (that
is, DELETE.ADS, DELETE.DBDS, DELETE.DB,
CHANGE.ADS, or NOTIFY.ALOC), it was discovered
that the Fast Path data entry database or area to be
deleted was still authorized by a subsystem (the area
record had subsystem entries). Doing this is not
permitted.

For a NOTIFY.ALOC command, a USID value that is
greater than the current USID value for the area is
specified when the area is still authorized to a
subsystem.

**System action:** Processing is terminated. The RECON
data sets are not updated, and subsequent commands
are not processed.

**Programmer response:** If the database or area record
is still to be deleted or changed, the area must first be
unauthorized by all subsystems that have authorized it.

**Problem determination:** 2, 3, 8, and the listings of the
RECON data sets

**Related information:**
Chapter 2, “IMS problem determination,” on page 13

**DSP0050I** AREA IS STILL AUTHORIZED BY A
SUBSYSTEM DBD=database name,
SSID=subsystem ID

**Explanation:** During DBRC command processing (that
is, CHANGE.DB, CHANGE.DBDS, or INIT.ADS
AVAIL), it was discovered that an attempt to change or
initialize a database, area, or area data set record was
made while the area was still authorized by a
subsystem (the area record had subsystem entries).

During a CHANGE.DBDS command, the area was
found still to be authorized. The area must be
unauthorized before the command can complete.
System action: Processing is terminated. The RECON data sets are not updated, and subsequent commands are not processed.

Programmer response: Wait until the areas have been unauthorized.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

Chapter 6. DSP messages (Database Recovery Control) 135
DSP0056I • DSP0059I

_type record exists in the RECON data set. _type is one of the following:
• TYPE IMS
• TYPE FPE
• TYPE HALDB

System action: Processing continues.

Programmer response: No action is required.

DSP0056I RIOP DATA AU=... OP=... AL=... Q=... S=... R=... I=...

Explanation: This message provides RECON I/O performance data. This information can help you determine how DBRC processed the RECON I/O requests.

In the message text:
• AU: The number of authorization requests that occurred during the given interval
• OP: The number of database open requests that occurred during the given interval
• AL: The number of allocation requests that occurred during the given interval
• Q: The average queuing time (QT) for the RECON during the given interval. Queuing time is a measure of time from DBRC reserve request state for the RECON data set to DBRC reserve complete state. The format of the given time is: ssthnm where:
  - ss represents seconds
  - t represents tenths of a second
  - h represents hundredths of a second
  - m represents thousandths of a second
• S: The average service time (ST) for the RECON during the given interval. Service time is a measure of time from DBRC reserve complete state for the RECON data set to DBRC dequeue complete state. DBRC issues one or more RECON I/0 requests during a given service time. The format of the given time is: ssthnm where:
  - ss represents seconds
  - t represents tenths of a second
  - h represents hundredths of a second
  - m represents thousandths of a second
• R: The calculated RECON Request Rate per minute for the given interval
• I: The interval value. The interval value determines how many RECON usage requests must take place before DBRC presents the RECON I/O performance data in message DSP0056I. RECON usage requests for functions other than authorization, database open, and allocation can occur during the interval, so the sum of the AU, OP, and AL counts might be less than the interval value, I.

System action: Processing continues.

Programmer response: No action is required.

DSP0057I MESSAGE BUFFER FULL, OUTPUT TRUNCATED

Explanation: Online DBRC command processing encountered one of the following errors:
• If the /RMLIST command was issued from the OM API (such as from TSO SPOC), the output from a /RMLIST command was greater than the DBRC internal output buffer could hold. The DBRC internal output buffer is limited by the DBRC region size.
• If the command was entered from input sources other than the OM API, the output from an online DBRC command (/RMxxx) was greater than could be stored in the output buffer passed by IMS. Many DBRC commands generate output that can exceed this buffer size (for example, the command /RML DBR=’RECON’). For the /RMLIST command, the size of the buffer is 32 KB. For all other /RMxxx commands, the size of the buffer is 4 KB.

System action: The processing of the command is terminated, and any remaining output is discarded.

Programmer response: Use the DBRC Recovery Control utility to issue the DBRC command to obtain the completed output.

If the /RMLIST command is issued, you can either reissue the command from the OM API if you have not done so or use the DBRC API to query the information from the RECON data set.

If the LIST.DB or LIST.DBDS command is issued and the recovery-related information is not of interest, reissue the command with the keyword NORCVINF to minimize the output size.

If the error is caused by an unavailable DBRC internal buffer, specify a larger DBRC region size. The larger DBRC region size will not take effect until IMS is recycled.

Problem determination: None

Module: DSPUCP40, DSPURX00

DSP0058I RMx COMMAND COMPLETED

Explanation: This message is issued when the command processing finishes before returning to IMS.

System action: The system continues processing.

Programmer response: No action is required.

Problem determination: None

DSP0059I RM COMMAND EXECUTION TERMINATED, verb [modifier] NOT SUPPORTED

Explanation: This message is issued when command processing detects an invalid verb or modifier during online command execution.

136 Messages and Codes, Volume 2: Non-DFS Messages
| Chapter 2, “IMS problem determination,” on page 13 |

---

**System action:** The system continues processing.

**Programmer response:** Correct the verb or modifier.

**Problem determination:** None

### DSP0060I

**Message:** NO PARTITIONS REGISTERED FOR THE DATABASE DBDNAME=\(db\) name

**Explanation:** The command was attempting to process all of the partitions of a HALDB, identified by \(db\) name. However, no partitions exist for the database in the RECON data set. Every HALDB must have at least one partition defined.

**System action:** LIST command processing continues. Other processing is terminated.

**Programmer response:** Contact IBM Software Support for assistance.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

### DSP0061I

**Message:** SUBSYS SSID=\(ssidname\) CURRENTLY ACTIVE, COMMAND REQUEST REJECTED

**Explanation:** An online IMS subsystem is not allowed to delete its subsystem entry in RECON with the /RMD command or to do a CHANGE.SUBSYS SSID(\(ssidname\)) ABNORMAL against it using the /RMC command.

**System action:** The /RMD or /RMC command failed.

**Programmer response:** Do not enter a /RMD or /RMC command using the SSID of this subsystem.

**Problem determination:** None

### DSP0062I

**Message:** NO DATABASE DATA SET REGISTERED FOR THE DATA BASE DBD=\(db\) name

**Explanation:** A LIST.DB, LIST.HISTORY, or LIST.DBDS command was issued specifying a database name without specifying a ddname. There were no database data sets or DEDB areas registered in the RECON data set for the specified database. Alternatively, a LIST.RECON was issued and there were no database data sets or DEDB areas registered for one of the databases in the RECON data sets.

**System action:** Processing continues with this message.

**Programmer response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

### DSP0063I

**Message:** IMAGE-COPY DATA SET WITHIN RECOVERY PERIOD CANNOT BE REUSED DBD=\(dbdname\) DDN=\(ddname\) RUNTIME=oldest ic time

**Explanation:** Verification exit processing, which occurs before executing the Image Copy utility, determined that:

- The GENMAX was reached.
- The oldest image copy is within the recovery period and cannot be reused.
- No available image copies exist.

**System action:** Processing is terminated.

**Programmer response:** Issue the INIT.IC command to define an available image copy of the required type, or issue the CHANGE.DBDS command to change the recovery period.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

### DSP0064I

**Message:** IMAGE-COPY DATA SET WITHIN RECOVERY PERIOD CANNOT BE DELETED DBD=\(dbdname\) DDN=\(ddname\) RUNTIME=oldest IC time

**Explanation:** This message is issued because one of the following problems occurred:

- Verification exit processing (which occurs before executing an image copy utility) determined that the oldest IC in RECON could not be deleted when the specified DBDS was defined in the RECON data set as having a NOREUSE attribute. The GENMAX value has been reached, but the recovery period has not been exceeded.
- During the execution of the CHANGE.DBDS command, the IC within the recovery period cannot be deleted to meet the value of GENMAX that is being changed by the CHANGE.DBDS command. The new GENMAX value is recorded.

**System action:** The processing is terminated.

**Programmer response:** The current RECOVPD value for the DBDS can result in more image copies maintained by DBRC than specified by GENMAX. Review your RECOVPD and GENMAX values and use the CHANGE.DBDS command to adjust them if necessary.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

Chapter 6. DSP messages (Database Recovery Control) 137
**DSP0065I**  
**PREDEFINED IC HAS BEEN USED,**
**GENMAX EXCEEDED DBD=dbname**  
**DDN=ddname**

**Explanation:** Verification exit processing, which occurs before executing the Image Copy utility, determined that:
- GENMAX was reached.
- The oldest image copy is within the recovery period and cannot be reused.

A predefined IC is used, which remains available in the RECON data set until the Image Copy utility successfully completes.

**System action:** Processing continues.

**Programmer response:** The current RECOVPD value for the DBDS can result in more image copies maintained by DBRC than specified by GENMAX. Reevaluate your RECOVPD and GENMAX values and use the CHANGE.DBDS command to adjust them if necessary.

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0066I**  
**IMPLIED DBDS GROUP DBD=dbname IS EMPTY**

**Explanation:** An implied DBDS group was specified on a GENJCL command. For example, DBD was specified without a DDN or area specification. However, there were no database data sets or DEDB areas registered in the RECON data set for the specified database.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Reissue the command, specifying the correct database name.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0067I**  
**DBDS OR DEDB AREA NOT DEFINED IN RECON, NAME=(dbname,ddname)**

**Explanation:** An INIT.DBDSGRP or CHANGE.DBDSGRP command was issued and the MEMBERS or ADDMEM list contained the name of a database data set (DBDS) or data entry database (DEDB) AREA that was not defined in the RECON data set.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Correct the member name, and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0068I**  
**DDN OR AREA PARAMETER INVALID WITH GROUP PARAMETER**

**Explanation:** The command requested processing of a database data set (DBDS) group or change accumulation (CA) group, but a specific DDN or AREA was also specified. This combination of parameters is invalid.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Correct the parameters, and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0069I**  
**NO AVAILABLE SUBSYSTEM ENTRIES LEFT**

**Explanation:** NOTIFY.MN processing encountered an MN record that already has 64 subsystem entries, and a request is received to add another subsystem entry.

**System action:** Processing of this NOTIFY.MN command is terminated. The existing MN record in the RECON data sets remains unchanged.

**Programmer response:** Merge the records.

**Problem determination:** None

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0070I**  
**GRPNAME grpname ALREADY DEFINED TO RECON**

**Explanation:** An attempt to add a database data set (DBDS) group or change accumulation (CA) group record to the RECON data set failed. A DBDS or CA group record with the same group name already exists in the RECON data set.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Reissue the command with a different group name.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0071I**  
**DBDS OR DEDB AREA NOT DEFINED IN RECON, NAME=(dbname,ddname)**

**Explanation:** An INIT.DBDSGRP or CHANGE.DBDSGRP command was issued and the MEMBERS or ADDMEM list contained the name of a database data set (DBDS) or data entry database (DEDB) AREA that was not defined in the RECON data set.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Correct the member name, and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

**DSP0072I**  
**DUPLICATE GROUP MEMBER SPECIFICATION, NAME=(dbname,ddname)**

**Explanation:** You issued an INIT.DBDSGRP or CHANGE.DBDSGRP command, and a duplicate
member name appeared in the corresponding MEMBERS, ADDMEM, or DELMEM list.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Check for a duplication and a possible omission.

Problem determination: 2, 3, 8, and the listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0075I
NAME TO BE DELETED FROM GROUP= name IS NOT A MEMBER.
NAME= (dbname, ddname)

Explanation: An attempt to delete the specified member from a database data set (DBDS) or change accumulation (CA) group failed because the member was not found in the specified group.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Determine the correct member name and reissue the command.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0076I
NAME TO BE ADDED TO GROUP= name IS ALREADY A MEMBER.
NAME= (dbname, ddname)

Explanation: An attempt to add the identified member to a change accumulation (CA) or database data set (DBDS) group failed because the member already exists in the specified group.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Determine the correct member name and reissue the command.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0078I
dbname (areaname) ALREADY IN RECOVERY GROUP gypname

Explanation: An INIT.DBDSGRP RECOVGRP or CHANGE.DBDSGRP ADDRECOV command was being processed. The database or area specified by dbname and areaname could not be added to the recovery group because it already belongs to another recovery group.

System action: The command is not executed.

System programmer response: Delete the database or area from the other recovery group or correct the command.

DSP0079I
RECORD NOT ACCESSIBLE

Explanation: A DBRC function attempted to retrieve a RECON record only accessible to a later DBRC release. The formatted record key is displayed after this message is issued. This message can also be followed by other error messages or unpredictable results.

This message can be issued when a CAGRP or DBDSGRP record containing DBDS names that belong to partitioned databases is used, or when records inaccessible to this release are accessed or changed. Examples of inaccessible records are DB or DBDS records belonging to partitioned databases, and DBDSGRP records designated as recovery groups.

System action: Execution continues.

User response: Do not attempt to access RECON records with inappropriate DBRC releases.

Module: DSPURUCO

DSP0080I
DB NOT ELIGIBLE FOR RECOV GRP - NAME= dbname

Explanation: You attempted to add an ineligible type of database to a recovery group.

In the message:

dbtype is one of the following types:
FAST PATH
PARTITION

dname The name of the database that was to be added.

A recovery group can be defined with only DL/I (non-HALDB) databases, HALDB databases, or Fast Path areas. Fast Path databases and partition databases are not allowed as part of a recovery group.

System action: The command fails and subsequent commands are not processed.

User response: Redefine the recovery with only the following types and resubmit the job:
• DL/I (non-HALDB) database
• HALDB database
• Fast Path area

Module: DSPURM70

DSP0081I
DATA SETS BEING USED ARE PREDEFINED IN RECON

Explanation: Data sets are predefined in the RECON data sets for use by the utility that was running. The database data set or change-accumulation group being used by the utility is identified in the RECON data sets with the REUSE attribute.
**System action:** Processing by the utility continues.

**Programmer response:** No action is required.

**Problem determination:** None

---

**DSP0084I**

**DIGITIZE MORE IMAGE COPY DATA SETS TO RECON**

**DDNAME=dbname DDNAME=ddname**

**Explanation:** The identified database data set or area is defined in the RECON data set with the REUSE attribute, and the maximum number of image copy data sets (IDSs) has not been reached. However, no predefined IDSs for the identified database data set or area remain for use by the Image Copy utility or by HSSP image copy processing.

**System action:** Processing by the Image Copy utility or the Begin HSSP IC exit terminates.

**Programmer response:** Issue the INIT.IC command to create an available IDS for the identified database data set or area, and record it in the RECON data set. As an alternative, issue a CHANGE.DBDS command to change the maximum number of generations to be maintained so that it equals the number of image copy data sets already in use. Then rerun the Image Copy utility job that failed or re-invokes the HSSP application.

**Problem determination:** None

---

**DSP0085I**

**INITIALIZE MORE CHANGE ACCUMULATION DATA SETS TO RECON CAGRP=name**

**Explanation:** The identified change accumulation group is defined in the RECON data sets with the REUSE attribute. Although the maximum number of change accumulation data sets to be maintained for the group has not been reached, and the recovery period has not been reached, no records of available change accumulation data sets remain for the Change Accumulation utility to use.

**System action:** Processing by the Change Accumulation utility was terminated.

**Programmer response:** Create an empty change accumulation data set for the CA group and record its existence in the RECON data sets using the INIT.CA command. If the maximum number of change accumulation data sets to be maintained (GRPMAX) has not been reached, an alternative is to issue the CHANGE.CAGRP command to change the GRPMAX value to equal the number of change accumulation data sets already in use. If the GRPMAX value has been reached, but the recovery period (RECOVPD) has not been exceeded, you can also issue the CHANGE.CAGRP command to reduce the recovery period and allow the oldest change accumulation data set to be reused. Then rerun the Change Accumulation utility job that failed.

**Problem determination:** None

---

**DSP0087I**

**GROUP MEMBER COUNT WILL EXCEED ALLOWABLE MAXIMUM**

**Explanation:** While defining a new database data set (DBDS) or change accumulation (CA) group, or while changing an existing DBDS or CA group, the number of group members exceeded the maximum of 32767.

**System action:** The command failed, and subsequent commands are not processed.

**Programmer response:** Limit the number of group members to 32767 and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data set

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0088I**

**DBRC EXTERNAL TRACE IS NOT ACTIVATED. GTF WAS NOT STARTED.**

**Explanation:** This message warns that GTF (generalized trace facility) had not been started and DBRC external trace (GTF trace) was not activated.

**System action:** DBRC trace records are not placed in a GTF data set.

**Programmer response:** If the user wants to have DBRC trace records in a GTF data set, GTF must be started for the USR events as the external mode.

**Related reference:**

- z/OS: Generalized Trace Facility (GTF)

---

**DSP0089I**

**AN IMAGE COPY IS RECOMMENDED FOR DBD=dbld DDN=ddn AREA=area name**

**Explanation:** A request was made to DBRC to update a database identified by dbld and area name. However, the DBDS or area has not been image copied yet. Without an image copy, you might not be able to recover the DBDS or area.

**Programmer response:** Schedule an image copy of the identified area or DBDS. If you determine that an image copy is not necessary, use the CHANGE.DBDS ICOFF command to reset the IC RECOMMENDED status.

---

**DSP0090I**

**CONCURRENT IMAGE COPY OF A NON-RECOVERABLE DATA BASE IS NOT ALLOWED.**

**Explanation:** A concurrent image copy was attempted for a database which is marked as unrecoverable or user-recoverable. Allocation records are not recorded in the RECON for user-recoverable databases, therefore,
concurrent image copy is not supported. Changes are not logged for a unrecoverable database; therefore, the image created of it by a concurrent image copy is fuzzy and not usable.

This message is issued during execution of the GENJCL.IC command, the Database Image Copy utility (DFSUDMP0), or the Database Image Copy 2 utility (DFSUDMT0).

System action: If the error occurs during execution of the GENJCL.IC command, the command fails and subsequent commands are not processed. If the error occurs during execution of the Database Image Copy utility, processing of the utility terminates.

User response: Run the Image Copy utility without the CIC execution parameter.

DSP0092I  HSSP IMAGE COPY PROCESSING HAS ALREADY BEEN ENDED

DBDNAME=dbdname
AREANAME=areaname

Explanation: A request was made to end a high-speed sequential processing (HSSP) image copy (IC) in which processing had already been terminated.

System action: Processing by the End HSSP IC exit was terminated or the CHANGE.IC command failed and subsequent commands were not processed.

Programmer response: If the CHANGE.IC command was issued, determine if the command correctly identified the HSSP Image Copy for which processing is being terminated and reissue the command. Otherwise, this problem is an internal HSSP error, contact IBM Software Support for assistance.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0093I  NO DBDSGRP RECORD FOUND IN RECON

Explanation: A LIST.DBDSGRP ALL or LIST.RECON command was issued, but no DBDSGRP record was found in the RECON data set.

System action: Processing continues.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0094I  GRPNAME grpname DOES NOT EXIST IN RECON

Explanation: A command expected to find the identified group in the RECON data set, but the group is not defined in the RECON data set.

System action: This command failed with either RC=4 or 12. Subsequent commands continue processing if RC=4. However, if RC=12, subsequent commands fail.

Programmer response: Reissue the command that failed specifying the correct group name. Also, reissue any following commands that were not processed.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0095I  DBDS GROUP RECORD DELETED,

GRPNAME= name

Explanation: All members of the identified database data set (DBDS) group and the empty group record were deleted.

System action: None

Programmer response: No action is required.

DSP0096E  THE STATUS OF THE SPECIFIED CA RECORD CANNOT BE CHANGED

Explanation: A CHANGE.CA VALID (or INVALID) command was issued for a change accumulation (CA) record with the PITCA flag ON. The command failed because the ERR flag must remain ON in this record so other DBRC functions do not attempt to use it.

System action: The command fails and subsequent commands are not processed.

User response: Resubmit the CHANGE.CA command after removing the VALID or INVALID parameter or specify a different CA record.

Module: DSPURM00

DSP0099I  THE AREA DOES NOT HAVE THE IC DATA SET REUSE ATTRIBUTE

DBDNAME=dbdname
AREANAME=areaname

Explanation: High-speed sequential processing (HSSP) Image Copy requires an area to have reusable image copy data sets.

System action: Processing by the Begin HSSP IC exit was terminated or the command failed and subsequent commands were not processed.

Programmer response: Issue the CHANGE.DBDS REUSE command for the specified area. If an HSSP application was terminated then issue the INIT.IC
command for the specified area to identify new image copy data sets to RECON, and restart the HSSP application. If a DBRC command failed then reissue it and any others that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

DSP messages DSP0101-DSP0150

This topic contains the following messages:

DSP0101I  IMAGE COPY DATA SET CANNOT BE PREDEFINED DBDNAME=dbname DDNAME=ddname

Explanation: The database data set or area data set listed in the message text was identified in the RECON data set with the NOREUSE attribute. Empty image copy data sets for this database data set or area data set can be recorded in the RECON data set only if the database data set or area data set is redefined with the REUSE attribute.

System action: The INITIC command failed, and subsequent commands were not processed. No change was made in the RECON data sets.

Programmer response: Determine if the command was incorrect. If so, correct and reissue it. Otherwise, use a CHANGE,DBDS command of the Recovery Control utility with the REUSE parameter to redefine image copy data sets for the identified DBDS or area data set. Then reissue the command that failed.

Problem determination: None

DSP0102I  CHANGE ACCUMULATION DATA SET CANNOT BE PREDEFINED CAGRP=name

Explanation: The change accumulation (CA) group name was identified in the RECON data sets with the NOREUSE attribute. Empty change-accumulation data sets for this change-accumulation group might be recorded in the RECON data sets only if the change-accumulation group is redefined with the REUSE attribute.

System action: The INIT.CA command failed, and subsequent commands were not processed. No change was made to the RECON data sets.

Programmer response: Determine if the command was incorrect. If so, correct and reissue it. Otherwise, use a CHANGE.CAGRP command of the Recovery Control utility with the REUSE parameter to redefine change-accumulation data sets for the identified CA group. Then reissue the command that failed.

Problem determination: None

DSP0103I  DATA SET NAME DOES NOT FOLLOW NAMING CONVENTION DSNAME=dsname

Explanation: The data set name identified by dsname in the message text does not adhere to the optional data set naming convention of the Recovery Control utility for data sets being identified in the RECON data sets.

System action: The data set name was accepted, but its uniqueness cannot be ensured.

Programmer response: No action is required.

If the data set name is to adhere to the naming convention, use the appropriate command to change the data set name.

Problem determination: None

DSP0104I  DSNAME IS NOT UNIQUE WITHIN RECON DSNAME=dsname

Explanation: An attempt was made to add the name of an image copy data set or a change accumulation (CA) data set to the RECON data sets. The name is identical to a data set name that already exists there.

System action: This command of the Recovery Utility failed, and subsequent commands were not processed. No changes were made in the RECON data sets.

Programmer response: Reissue the command, specifying a unique data set name; reissue any other commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0105I  parm1 PARAMETER SPECIFIED WITHOUT CORRESPONDING parm2 PARAMETER

Explanation: parm1 requires that you also specify parm2; parm2 was not specified in the command.

System action: Processing is terminated. The RECON data set is not updated. Subsequent commands were not processed.
Programmer response: Add the missing parameter to the command. Then reissue the command that failed, and any other commands that were not processed.

Problem determination: 2, 3, 8
Related information:
Chapter 2, “IMS problem determination,” on page 13

---

DSP0106I  parm1 TIME-STAMP time-stamp NOT WITHIN VALID RANGES

Explanation: The time-stamp value of the parameter identified by parm1 in the message text is not within valid ranges. The time-stamp field is a formatted image of the invalid time stamp.

System action: This command failed, and subsequent commands were not processed.

Programmer response: Correct the invalid time stamp. Reissue the command that failed, and any other commands that were not processed.

Problem determination: 2, 3, 8
Related information:
Chapter 2, “IMS problem determination,” on page 13

---

DSP0107I  DATA BASE DATA SET ALREADY DEFINED TO CA-GROUP name DBDNAME=ddname DDNAME=ddname

Explanation: The request to add the identified database data set or area data set to the identified change accumulation (CA) group failed because the database data set or area data set is already a member of the change accumulation group.

System action: This command failed, and subsequent commands were not processed.

Programmer response: Correct the name of the database data set or area data set if it was specified incorrectly, or redefine the change accumulation group before reissuing the unchanged command. Reissue any other commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information:
Chapter 2, “IMS problem determination,” on page 13

---

DSP0108I  DATA BASE DATA SET CANNOT BE INCLUDED IN CA-GROUP grpname DBDNAME=ddname DDNAME=ddname

Explanation: The request to add the identified database data set or area data set to the change accumulation (CA) group identified by grpname failed because the database data set or area data set is:
- Not identified in the RECON data sets.
- A user-recoverable area. User-recoverable areas cannot be added to a change-accumulation group.

System action: This command failed, and subsequent commands were not processed.

Programmer response: Correct the name of the database data set or area data set if it was specified incorrectly. If the database data set or area data set is not identified in the RECON data set, use an INIT.DBDS or INIT.ADS command to do so. Then reissue the command that failed and any other commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data set
Related information:
Chapter 2, “IMS problem determination,” on page 13

---

DSP0109I  DATA BASE DATA SET NOT DEFINED IN RECON DBDNAME=ddname DDNAME=ddname

Explanation: This message is issued because one of the following problems occurred:
- During execution of the Recovery Control utility, a request for information from the RECON data set related to the identified database data set failed because the RECON data set has no record of the database data set.
- During execution of the IMS Recovery utility, the Image Copy utility, or /DBRC processing, the identified database data set is not in the RECON data set.
- A LIST command was issued, but a database data set or DEDB AREA specified on the command, or belonging to the group specified on the command, is not defined in the RECON data set.

System action: In the first case, this command failed, and subsequent commands were not processed. In the second and third cases, normal processing continues.

Programmer response: For the first case, correct the command so it identifies a database data set that is identified to the RECON data sets or initialize the database data set in the RECON data set. Then reissue the command that failed and any other commands that were not processed. For the second and third cases, no response is required.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information:
Chapter 2, “IMS problem determination,” on page 13

---

DSP0110I  UNABLE TO OPEN dname DATA SET

Explanation: An attempt to open a non-VSAM data set failed. The dname field identifies the DD statement that described the data set that could not be opened.

System action: Processing of this utility was terminated.

Programmer response: Determine the reason for the
OPEN failure, correct the problem, and rerun the failing utility.

**Problem determination:** 1, 2, 3, 8
**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0111I** DATA BASE DATA SET NOT DEFINED IN RECON DBDNAME=dbdbname DDNAME=ddname DSNAME=dsname

**Explanation:** During execution of the IMS Recovery utility and the Image Copy utility, the identified database data set is not in the RECON data set.

**System action:** Processing continues.
**Programmer response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets
**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0112I** VOLSER volser SPECIFIED FOR newvvol ALREADY EXISTS IN LOG RECORD

**Explanation:** The CHANGE.PRILOG or the CHANGE.SECLOG command was issued with the NEWVOL parameter, and the specified volume serial number was found in the PRILOG or SECLOG record.

**System action:** The command failed, and subsequent commands are not processed.
**Programmer response:** Correct the volume serial number and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets
**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0113I** record type RECORD NOT FOUND IN RECON DBDNAME=dbdbname DDNAME=ddname TIME=time-stamp

**Explanation:** The request to access or change a record in the RECON data set failed because a record with the specified attributes was not found.

**System action:** The request to access or change a record in the RECON data set failed.
**Programmer response:** Correct the attributes that identify the record, and reissue the command that failed.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0114I** CHANGE ACCUMULATION RECORD NOT FOUND IN RECON CAGRP=name RECORD TIME=time-stamp

**Explanation:** The request to access or update a change accumulation (CA) execution record in the RECON data sets failed because a record with the specified attributes could not be found. The name identifies the change accumulation group, and time-stamp identifies the record time stamp.

**System action:** The requested access or update of the RECON data sets could not be accomplished.
**Programmer response:** Correct the attributes that identify the record, and reissue the command.

**Problem determination:** 2, 3, and the listings of the RECON data sets
**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0115I** record-type RECORD NOT FOUND IN RECON RECORD TIME=time-stamp

**Explanation:** The request to access or change a record in the RECON data sets failed because a record with the specified attributes could not be found.

**System action:** The request to access or change a record in the RECON data set failed.
If the request required the identified record in order to continue, the command fails with return code 12 and subsequent commands are not processed. However, return code 4 is set if processing expected this record to exist but can continue without it.

**Programmer response:** Correct the attributes that identify the record and reissue the command that failed. This message can also occur as an informational message during DELETE.ALLOC command processing, if the corresponding LOGALL record is not found and the allocation record was deleted.

For return code 4, this message is informational and no further action is necessary. For return code 12, correct the command that failed. Resubmit the command and any other commands that were not processed.

**Problem determination:** 2, 3, and the listings of the RECON data sets.
**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0116I** RECON DATA SETS TO BE INITIALIZED ARE NOT EMPTY

**Explanation:** An INIT.RECON command was issued for a RECON data set that is already initialized.

**System action:** The INIT.RECON command failed, and subsequent commands were not processed.
Related information:
Chapter 2, “IMS problem determination,” on page 13

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Explanation:**
A command to change the RECON data set specified a time stamp that already exists for a record of the same type. The record field identifies the record with the duplicate time stamp.

**System action:**
The command failed, and subsequent commands were not processed. No changes were made in the RECON data sets.

**Programmer response:**
Determine if the failed command is being used to add to the RECON data set a record that is truly a duplicate, or if it is being used to add a record of a separate event. In the second case, the time stamp must be unique. Correct the time stamp before reissuing the command that failed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Explanation:**
A command to change in the RECON data sets the DDNAME of a database data set failed because a database data set with the same DBDNAME and DDNAME already exists in the RECON data sets. The *dbname* and *ddname* fields identify the database data set.

**System action:**
This command failed, and subsequent commands were not processed.

**Programmer response:**
Determine if the new DDNAME in command was incorrect. If it was, correct it, and reissue the command that failed, and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Explanation:**
A command was issued either to identify a database data set in the RECON data sets, or to change the organization or ddname of a database data set that is already identified in the RECON data sets. The IMS DBD library contains no record of this database data set.

**System action:**
A record of the database data set was not added to or changed in the RECON data sets.

**Programmer response:**
Correct the identification of the
DSP0122I • DSP0125I

database data set and reissue the command that failed.

Problem determination: 2, 3. Also, see the listing of the IMS DBD library

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0122I NO PREDEFINED CHANGE ACCUMULATION DATA SETS REMAINING CAGRPMNAME=name

Explanation: No empty change accumulation data sets remain for the identified change accumulation (CA) group name. The maximum number of change accumulation data sets to be maintained for this group has not yet been reached. (This would permit the reuse of existing change accumulation data sets in the group.) The current execution of the Change Accumulation utility was successful, and it used the last remaining predefined change accumulation data set for the identified change accumulation group. A subsequent Change Accumulation utility request fails unless one of the following actions is completed:
• Additional change accumulation data sets for the identified change accumulation group are predefined.
• The GRPMAX value for the identified change accumulation group is changed to permit the reuse of change accumulation data sets during the next execution of the Change Accumulation utility.
• The RECOVPD value for the identified change accumulation group is changed to permit the reuse of change accumulation data sets during the next execution of the Change Accumulation utility.

System action: Processing by the Change Accumulation utility continued.

Programmer response: Issue an INIT.CA command to define a new change accumulation data set for the identified change accumulation group, or issue a CHANGE.CAGRP command to change the GRPMAX or RECOVPD values.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0124I DSNAMES IS NOT UNIQUE WITHIN ADS DBD=dbname AREA= area name ADSN=ADS DSN name

Explanation: During DBRC command processing (that is, CHANGE.ADS or INIT.ADS), the specified data set name was already registered in the RECON data set.

System action: The command failed, and subsequent commands were not processed.

Programmer response: Determine why the command specified a previously initialized data set name. Correct and reissue the command, if appropriate.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0125I CHANGE ACCUMULATION GROUP NOT DEFINED IN RECON CAGRPMNAME=grpname

Explanation: A request for information about the change accumulation (CA) group identified by grpname failed because there is no record of the specified group in the RECON data set.

System action: This command failed and subsequent commands were not processed.

Programmer response: Correct the command that failed so that it identifies a change accumulation group that is identified in the RECON data set. Reissue the command and any others that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0126I NUMBER OF INACTIVE PRILOG RECORDS DELETED WAS nnnnnnnnn

Explanation: This message identifies the number of inactive PRILOG records that were deleted by a DELETE.LOG command. For each PRILOG record that was deleted, any corresponding SECLOG, PRISLDS, and SECSLDS records were also deleted.

System action: Processing by the DELETE.LOG command continued.

Programmer response: No action is required.

Problem determination: 2, 3, 8

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0130I IMAGE COPY DATA SET NAMES NOT UNIQUE

Explanation: A command to add or change the record of an image copy data set in the RECON data sets specified an existing data set name.

System action: The command failed, and subsequent commands were not processed.

Programmer response: Make the data set name of the image copy data set unique. Reissue the failed command, and any other commands that were not processed.

Problem determination: 2, 3, 8

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0132I IMAGE COPY NEEDED FOR DBD=DBD DDN=ddn

Explanation: An HD reload operation completed or an application just loaded a database (PROCOPT=L or PROCOPT=LS). An image copy should be taken before applications are scheduled to use the database data set or area data set.

System action: None

Programmer response: Schedule an image copy

DSP0129I INSUFFICIENT MAXIMUM RECORD SIZE FOR RECON DATA SET

Explanation: At least one of the data sets to be initialized as a RECON data set was created with a maximum record or CI size that is insufficient for the data set to be used as a RECON data set.

System action: The INIT.RECON command failed, and subsequent commands were not processed. The RECON data sets were not initialized.

Problem determination: Recreate the data sets to be initialized as RECON data sets with maximum record size, CI size, or both sufficient for RECON processing.

Problem determination: 2, 3, 8

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0131I DUPLICATE MEMBERS IDENTIFIED FOR CHANGE ACCUMULATION GROUP DBDNAME=dbdname DDNAME=ddname

Explanation: Duplicate database data set names were specified as members for the change-accumulation group being initialized by an INIT.CAGRP command. The duplicate database name (dbdname) and data set ddname (ddname) are identified in the message.

Programmer response: Make sure that all database data sets have unique names in the INIT.CAGRP command. Reissue the command and any other commands that were not processed.

Problem determination: 2, 3, 8

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0131I IMAGE COPY DATA SET NAMES NOT UNIQUE

Explanation: A command to add or change the record of an image copy data set in the RECON data sets specified an existing data set name.

System action: The command failed, and subsequent commands were not processed.

Programmer response: Make the data set name of the image copy data set unique. Reissue the failed command, and any other commands that were not processed.

Problem determination: 2, 3, 8

Related information: Chapter 2, “IMS problem determination,” on page 13
operation before scheduling application use of the identified database data set or area data set.

**Problem determination:** None

**DSP0133I PRILOG IS ASSOCIATED WITH AN ACTIVE SUBSYSTEM RECORD**
**TIME=timestamp SSIDNAME=ssidname**

**Explanation:** This message indicates that the DBRC command identified a PRILOG or SECLOG record with any of the following possibilities:
- PRILOG or SECLOG record was within the log retention period for DELETE.LOG
- PRILOG or SECLOG record was within the time specified by the CLEANUP.RECON command.
- There were no active allocation records
- PRILOG or SECLOG is associated with a subsystem record

**System action:** Processing by DELETE.LOG command continues with return code=X'04'.

Processing CLEANUP.RECON command continues with return code=X'04' and the RECON log record is not deleted. Processing by the NOTIFY command fails with a return code of X'0C'.

**Programmer response:** No action is required.

For the CLEANUP.RECON case, evaluate whether the log is truly active. If it is not, delete the subsystem record and the associated RECON log records.

**DSP0134I DATA BASE DATA SET HAS BEEN UPDATED SINCE HISAM UNLOAD**
**DBDNAME=dbdname DDNAME=ddname STARTTIME=timestamp**

**Explanation:** An allocation record indicated that the identified database data set was updated after the HISAM unload operation completed but before the reload operation was executed.

**System action:** The HISAM reload operation failed.

**Programmer response:** If the changes to the database data set are to be kept, rerun the HISAM unload and reload operation. If the database data set changes are to be backed out, use the DELETE.ALLOC command and rerun the HISAM reload utility.

**DSP0135I LOG RECORD(S) COMPRESSED, RECORD TIME=timestamp**

**Explanation:** While executing the DELETE.LOG INACTIVE command, the NOTIFY.PRILOG RLDS command, the IMS Log Archive utility, or the batch logging utility, DBRC determined that there were inactive data set entries in the identified PRILOG and deleted them, compressing the PRILOG. The corresponding entries in the SECLOG, PRISLDS, and SECSLDS, if applicable, were also compressed. Inactive data set entries are those older than the oldest log required for recovery.

**System action:** Processing continues.

**DSP0136I MAXIMUM NUMBER OF CHANGE ACCUMULATION DATA SETS ALREADY DEFINED**
**CAGRP=cagrpname**

**Explanation:** An INIT.CA command was issued to redefine a change-accumulation data set in the RECON data sets for a change-accumulation group for which the maximum number of change-accumulation data sets has already been defined. cagrpname in the message identifies the change-accumulation group.

**System action:** The INIT.CA command failed, and subsequent commands were not processed.

**Programmer response:** If additional change-accumulation data sets for the identified change-accumulation group are to be defined, use a CHANGE.CAGRP command to increase the maximum number of change-accumulation data sets maintained in the RECON data sets. Reissue the INIT.CA command and any others that were not processed.

**DSP0137I parameter 1 IS INCONSISTENT WITH PREDEFINED VOLUME INFORMATION**

**Explanation:** The volume information specified in the identified parameter of a NOTIFY.IC or NOTIFY.CA command does not agree with volume information in the record in the RECON data sets of the image copy or change-accumulation data set that is related to the command. The volume information in the RECON data sets must be the same as or be a subset of that specified in a NOTIFY.IC command. The volume information in the RECON data sets must be the same as that specified in a NOTIFY.CA command.

**System action:** The NOTIFY.IC or NOTIFY.CA command failed, and subsequent commands were not processed.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0138I  parameter1 TIME-STAMP IS NOT GREATER THAN parameter2 TIME-STAMP

Explanation: In the command or function being run, parameter1 must specify a time stamp that is later than the time stamp in parameter2.

For the NOTIFY PRI/SEC LOG switch call (closing the existing entry and opening a new OLDS entry at the same time), parameter1 (insert run time) refers to the time stamp of the OLDS to be closed, and parameter2 (insert start time) refers to the existing OLDS entry start-time time stamp.

If the command is NOTIFY.CA and the specified time stamps are correct, then parameter1 refers to the specified run time, and parameter2 refers to an existing change accumulation (CA) stop time.

For the End HSSP image copy processing, parameter1 refers to the stop time of the HSSP image copy, and parameter2 refers to the start time.

For the DASD logging switch exit, parameter1 refers to the close time and parameter2 refers to the start time of the current OLDS.

For the DASD logging close exit, parameter1 refers to the close time, and parameter2 refers to the start time of the OLDS to be closed.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Correct the time stamps; then reissue the failing command and any others that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

Chapter 6. DSP messages (Database Recovery Control) 149

Chapter 2, “IMS problem determination,” on page 13

DSP0140I  REQUIRED parameter PARAMETER NOT SPECIFIED

Explanation: A command was not processed because the parameter identified by parameter in the message text was not specified.

System action: The command failed, and subsequent commands were not processed.

Programmer response: Add the missing parameter. Then issue the command and any others that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0141I  parameter PARAMETER SHOULD NOT BE SPECIFIED

Explanation: A command could not be processed because there was a problem with the parameter identified by parameter in the message text. The parameter is either not valid with the command, or not consistent with the existing information in RECON.

The following situations can cause this error:

- The FULLSEG, NOFULLSG, or SHADOW keyword was specified for a non-Fast Path database.
- The OSAM8G or NOOSAM8G keyword was specified for a non-OSAM HALDB database.
- The OSAM8G keyword was specified for a database that is capable of being reorganized online.

System action: The command failed and subsequent commands were not processed.

Programmer response: Delete the indicated parameter. Then reissue the command and any others that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13
DSP0142I  REQUIRED parameter PARAMETER NOT SPECIFIED

Explanation:  A command could not be processed because you did not specify a required parameter in the command. The parameter is identified by parameter in the message text.

System action:  Processing is terminated. The RECON data sets are not updated, and subsequent commands are not processed.

Programmer response:  Determine the correct parameters to specify.

Problem determination:  2, 3, 8, and the listings of the RECON data sets

Related information:  Chapter 2, “IMS problem determination,” on page 13

DSP0143I  parameter PARAMETER SHOULD NOT BE SPECIFIED

Explanation:  A command could not be processed because the identified parameter was specified. The parameter identified by parameter in the message text is either not valid with the command, or not consistent with the existing information in the RECON data sets.

System action:  The NOTIFY.PRILOG or NOTIFY:SECLOG command failed, and subsequent commands were not processed.

Programmer response:  Delete the indicated parameter or determine the correct parameters to specify. Then reissue the command, and any others that were not processed.

Problem determination:  2, 3, 8, and the listings of the RECON data sets

Related information:  Chapter 2, “IMS problem determination,” on page 13

DSP0144I  parameter PARAMETER INCONSISTENT WITH RECON INFORMATION

Explanation:

• The CFSTR2 parameter was entered for a CHANGE.DBDS command. If the area has been defined with the MAS parameter, CFSTR2 cannot be defined. The MAS parameter specifies that the area resides in a multi-area structure (MAS). For these structures, IMS duplexing is not supported.

• The ICDSN2 parameter cannot be specified in a DELETE:IC command if no duplicate image copy data set information exists in the image copy record.

• The VOLLIST2, INVALID2, VALID2, FILESEQ2, or UNIT2 parameters cannot be specified in a CHANGE:IC command if no duplicate image copy data set information exists in the image record, and the ICDSN2 parameter was not specified in the CHANGE:IC command to add information about a duplicate image copy data set.

• The SSID parameter was specified with the STARTTIME parameter in the LIST:LOG command. The SSID specified did not match the SSID in the log record with the specified STARTTIME.

• The INVALID or VALID parameters cannot be specified for any command to change an available, unused record in the RECON data sets.

• The REUSE attribute cannot be specified for a CHANGE.DBDS command when a nonstandard image copy data set is associated with that database data set.

• The STARTTIME specified for a NOTIFY:PRILOG OLDS command is within the time bounds of an existing online log data set identified in the RECON data set for the specified subsystem ID. This is not allowed.

• The STOPTIME specified for a NOTIFY:PRILOG OLDS command is within the time bounds of an existing online log data set identified in the RECON data set for the specified subsystem ID. This is not allowed.

• The number of PURGLIST items specified in the NOTIFY command is greater than the number of database data sets defined (as group members) in the change accumulation (CAGROUP) record. This is not allowed.

• The ADDDB | DELDB parameters cannot be specified in the CHANGE:DBDSGRP command when changing members in a DBDS group.

• The ADDMEM | DELMEM parameters cannot be specified in the CHANGE:DBDSGRP command when changing members in a DB group.

• The CHANGE:SG command was issued with the NORTA parameter, but either no remote takeover processing had been requested or actions have been taken (by the operator) so that you cannot reverse the takeover. Once you start the new active or new tracker or start a batch backout job after the /RTAKEOVER command has completed, you cannot reverse the remote takeover without first reinstalling the tracking subsystem databases.

• The NOICREQ parameter was specified in a CHANGE:DB command for a recoverable database.

• The total number of PURGLIST, LSN, USID, LRID, or DSSN keyword values specified in the NOTIFY command is greater than the total number of database data sets defined (as group members) in the change accumulation (CAGROUP) record. This is not allowed. For example, if a group has five members and you want to specify values for LSN for this group, you can specify only up to five LSN values, such as LSN(101,102,103,104,105).

System action:  The command is rejected.

System programmer response:  If the area is defined with the MAS parameter indicating that it resides in a multi-area structure, remove the CFSTR2 parameter from the CHANGE:DBDS command. If the area is to reside in a single-area structure with IMS duplexing
(CFSTR1 and CFSTR2 defined), remove the MAS keyword.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0145I** RECON ALREADY INFORMED OF LOG DATA SET CLOSE

**Explanation:** A NOTIFY.PRILOG or NOTIFY.SECLOG command was issued to add to the RECON data sets information about the closing of a log data set. The record of the log data set in the RECON data sets already has a nonzero time stamp for its closing, indicating that this information was already entered.

**System action:** The NOTIFY.PRILOG or NOTIFY.SECLOG command failed, and subsequent commands were not processed.

**Programmer response:** Determine if the command correctly identified the log data set and the time stamp of its closing. Make any necessary changes to the command. If the command was correct, and the information in the RECON data set is incorrect, use a CHANGE.PRILOG or CHANGE.SECLOG command to correct the record. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0146I** MORE THAN 255 VOLUMES SPECIFIED FOR LOG DATA SET

**Explanation:** A NOTIFY.PRILOG or NOTIFY.SECLOG command was used to define additional volumes for a log data set. The total number of volumes exceeds the allowable maximum of 255.

**System action:** The NOTIFY.PRILOG or NOTIFY.SECLOG command failed, and subsequent commands were not processed.

**Programmer response:** Change the volume information in either the RECON data sets or the command that failed. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0147I** RECOVERY TO timestamp IS NOT VALID

**Explanation:** A NOTIFY.RECOV command was issued to add information about a recovery of a database data set to the RECON data sets. The RCVTIME value specified in the command and listed in the message is not valid according to information in the RECON data sets. This value must be a time when the DBDS or area was not being updated; that is, a time that is not covered by an active ALLOC record in the RECON and might not fall within the range of an existing time stamp recovery.

**System action:** The NOTIFY.RECOV command failed, and subsequent commands were not processed.

**Programmer response:** Correct the RCVTIME value specified in the NOTIFY.RECOV command and reissue the command along with any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0148I** parameter TIME-STAMP IS NOT GREATER THAN LAST VOLUME STOPTIME

**Explanation:** A NOTIFY.PRILOG, NOTIFY.SECLOG, CHANGE.PRILOG or CHANGE.SECLOG command was issued to add or change the stop time of a log data set in the RECON data sets. The time stamp in the command is not greater than the time stamp already recorded in the RECON data sets for the log data set.

**System action:** The command failed, and subsequent commands were not processed.

**Programmer response:** Correct the time stamp in the command. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0149I** USER IMAGE COPY OR REORG NOTIFICATIONS NOT VALID WITH REUSE ATTRIBUTE DBDNAME=name DDNAME=name

**Explanation:** A NOTIFY.UIC or NOTIFY.REORG command was issued for the identified database data set or area data set. The command did not complete because the identified database data set or area data set is defined in the RECON data sets with the REUSE attribute.

If a NOTIFY.REORG command was issued, a REORG
record was written, but the Image Copy record was not created.

**System action:** The NOTIFY:UIC or NOTIFY:REORG command did not complete. For the NOTIFY:REORG command, only the REORG record was created; the IC record was not.

**Programmer response:** Only database image copy data sets created by the DataBase Image Copy utility or the Online ImageCopy utility can be recorded in the RECON data set for database data sets or area data sets with the REUSE attribute. If the database data set or area data set is no longer to have this attribute, change it with a CHANGE:DBDS command. That would allow addition of information to the RECON data sets about nonstandard image copy data sets for the identified database data set or area data set. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

DSP0150I DATA SET IDENTIFIER IN DBDLIB AND RECON DO NOT MATCH
DBDNAME=name DDNAME=name

**Explanation:** A NOTIFY:REORG, CHANGE:DBDS, or INIT:DBDS command determined that the data set identifier in the IMS DBD library no longer matches the data set identifier in the RECON data set. The database data set or area data set for which the command was issued is identified in the message.

**System action:** The NOTIFY:REORG, CHANGE:DBDS, or INIT:DBDS command failed, and subsequent commands were not processed.

The INIT:DBDS command reports all DBD or AREA records that no longer match the RECON.

**Programmer response:** The latest DBDGEN has resequenced the database in the DBDLIB. Because the data set identifier has been changed, all image copy data sets, change-accumulation data sets, and database changes recorded on logs are no longer valid for use in recovering the identified database data set or area data set.

Rerun the DBDGEN after changing the cause of the resequencing. Otherwise, you must delete and reinitialize all of the identified database data sets or area data sets in the RECON using the INIT:DBDS command, and take new image copies.

**Problem determination:** 2, 3, 8, and a listing of the RECON data set

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

DSP messages DSP0151-DSP0200

This topic contains the following messages:

**DSP0151I DATA BASE OR DATA SET ORGANIZATION HAS CHANGED**

**Explanation:** A NOTIFY:REORG or CHANGE:DBDS command was processed. The database organization of a database data set, or its data set organization, has been changed over that previously recorded in the RECON data sets.

**System action:** If the command was NOTIFY:REORG, processing continued; if the command was CHANGE:DBDS, processing was terminated. If the organization of the database or of the database data set has changed, use a NOTIFY:REORG command to add this information to the RECON data sets before reissuing the CHANGE:DBDS command that failed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0152I IMAGE COPY NOTIFICATIONS NOT VALID FOR DATA BASE ORGANIZATION DBDNAME=name DDNAME=name**

**Explanation:** A NOTIFY:REORG command specifying an image copy data set was not processed because the corresponding database is not a HISAM database. Therefore the image copy data set is not usable by the DataBase Recovery utility.

**System action:** The NOTIFY:REORG command failed, and subsequent commands were not processed.

**Programmer response:** Remove from the NOTIFY:REORG command the information about the image copy data set. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0153A DEALLOCATION EXIT FAILED FOR**

**Explanation:** The request to record the deallocation for timestamp2 failed. If timestamp1 or timestamp2 does not print, the time stamp was invalid.
**System action:** Further authorization to the database is prohibited. Message DSP0300I is issued and identifies the error that was found:

- No ALLOC record
- ALLOC already deallocated

For information about these errors, see message DSP0300I.

**Operator response:** Review the information in RECON to determine why the deallocation exit failure occurred. Take appropriate actions to ensure recoverability of the database by taking one of the following actions:

- Take an image copy of the database or area.
- Record the allocation record in RECON by issuing NOTIFY.ALLOC command.

Issue the CHANGE.DB AUTH command to allow access to the database or area when appropriate.

If this problem appears to be a logical error within DBRC, contact IBM Software Support.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

- DSP0300I
- Chapter 2, “IMS problem determination,” on page 13

---

**DSP0154I \* DSP0157I**

**DSP0154I** \* SPECIFIED IMAGE RECORD IS USER IMAGE COPY

**Explaination:** A DELETE.IC or CHANGE.IC command failed because the image copy record specified in the command identifies a nonstandard image copy data set.

**System action:** The DELETE.IC or CHANGE.IC command failed, and subsequent commands were not processed.

**Programmer response:** If the record of the standard image copy data set is correct in the RECON data sets, use a DELETE.IC or a CHANGE.IC command to delete or change the record, respectively. Then reissue any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

- Chapter 2, “IMS problem determination,” on page 13

---

**DSP0156I** \* NO ACTIVE ALLOCATIONS TO BE DELETED

**Explaination:** A DELETE.ALLOC command failed for one of these reasons:

- No active allocations of the database data set specified in the command were found in the corresponding LOGALL record.
- The corresponding PRILOG record is not closed in the RECON data sets.

**System action:** The DELETE.ALLOC command failed, and subsequent commands were not processed.

**Programmer response:** Determine if the DELETE.ALLOC command correctly identified the allocation to be deleted. If not, correct the command. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

- Chapter 2, “IMS problem determination,” on page 13

---

**DSP0157I** \* IMAGE COPY DATA SET NAME INCONSISTENT WITH RECON INFORMATION

**Explaination:** You issued a DELETE.IC command to delete information about a duplicate image copy data set from a specified image copy record in the RECON data sets. The command failed because the name specified in the ICDSN2 parameter of the command did not match the name of the duplicate image copy data set in the identified record of the RECON data sets.

**System action:** The DELETE.IC command failed, and subsequent commands were not processed.

**Programmer response:** Correct the name specified in the ICDSN2 parameter of the DELETE.IC command. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

Chapter 6. DSP messages (Database Recovery Control) 153
**DSP0158I • DSP0162I**

**Chapter 2, “IMS problem determination,” on page 13**

---

**DSP0158I**

**MEMBER OF CHANGE ACCUMULATION GROUP NOT FOUND IN RECON DBDNAME=name DDNAME=name**

**Explanation:** A DELETE.CAGRP command failed. The database data set or area data set identified in the message was a member of the CAGRP being deleted, but no header record for the database data set or area data set was found in the RECON data set. This situation indicates an inconsistency in the RECON data sets.

**System action:** The DELETE.CAGRP command failed, and subsequent commands were not processed.

**Programmer response:** Obtain a listing of the RECON data set to determine the location and extent of the inconsistency. If the identified database data set or area data set had been deleted from the RECON data set, the corresponding entry in the CAGRP record should also have been reset to binary zeros. Correct the inconsistencies in the RECON data set. Then reissue the command that failed, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

---

**DSP0159I**

**DATA BASE DATA SET NOT DEFINED IN CHANGE ACCUMULATION GROUP DBDNAME=name DDNAME=name**

**Explanation:** A DELETE.CAGRP command failed. The header record of the database data set or area data set identified in the message indicates that it is not a member of the change-accumulation group for which the DELETE.CAGRP command was issued. However, the record of the change-accumulation group lists the identified database data set or area data set among its members. This situation indicates an inconsistency in the RECON data set.

**System action:** The DELETE.CAGRP command failed and subsequent commands were not processed.

**Programmer response:** Using a listing of the RECON data set, identify the inconsistency. Correct the inconsistency in the RECON data set. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

---

**DSP0160I**

**parameter TIME-STAMP IS INCONSISTENT WITH RECON INFORMATION**

**Explanation:** The parameter of a CHANGE.PRILOG or CHANGE.SECLOG command specified a time stamp for the last volume of a log data set that was not equal to its equivalent in the RECON data sets. The parameter is identified by parameter in the message text.

**System action:** The CHANGE.PRILOG or CHANGE.SECLOG command failed, and subsequent commands were not processed.

**Programmer response:** Correct the time stamp of the identified parameter. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

---

**DSP0161I**

**VOLLIST AND RUNTIMES LISTS DO NOT CONTAIN THE SAME NUMBER OF ENTRIES**

**Explanation:** A CHANGE.PRILOG or CHANGE.SECLOG command failed because VOLLIST and RUNTIMES parameters do not contain the same number of entries.

**System action:** The CHANGE.PRILOG or CHANGE.SECLOG command failed, and subsequent commands were not processed.

**Programmer response:** Correct the parameters of the command. Then reissue the command, and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

---

**DSP0162I**

**LOG DATA SET VOLUME INFORMATION CANNOT BE CHANGED**

**Explanation:** A CHANGE.PRILOG or CHANGE.SECLOG command to change information in the RECON data sets about a log data set failed because the log data set is not closed. The VOLLIST and RUNTIMES parameters can be specified only for a log data set that has a stop time of nonzero, indicating that it is closed.

**System action:** The CHANGE.PRILOG or CHANGE.SECLOG command failed, and subsequent commands were not processed.

**Programmer response:** Wait until the closing of the log data set has been recorded in the RECON data sets.
Then reissue the failed command and any others that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP0164I** ONLY ONE CHECKPOINT COUNT VALUE CAN BE SPECIFIED FOR A TRACKING LOG RECORD.

**Explanation:** A CHANGE command was issued to change the checkpoint count value, but more than one value was specified.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Reissue the command with only one checkpoint count value specified.

**Module:** DSPURM35, DSPURM40

---

**DSP0165I** DATA BASE RECORD NOT FOUND IN RECON DBD=database name

**Explanation:** A LIST.db or LIST.HISTORY command was issued for a nonexistent database record. If the database identified by database name in the message text is a partition of a HALDB, a RECON inconsistency has been encountered.

**System action:** If this error occurs while listing a HALDB, DBRC processing terminates. Otherwise, processing continues.

**Programmer response:** If this error occurs while listing a HALDB, contact IBM Software Support for assistance. Otherwise, determine if the database name was misspelled in the command. Reissue the command that failed and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP0166I** BACKOUT RECORD NOT FOUND IN RECON SSID=subsystem name

**Explanation:** During a CHANGE, DELETE, or LIST backout (BKOUT) or subsystem (SUBSYS) command was issued for a nonexistent subsystem name. A NOTIFY.BKOUT command might have been issued for an existing subsystem name.

**System action:** Processing is terminated. The RECON data sets are not updated. Subsequent commands are not processed.

**Programmer response:** Determine if a misspelling has occurred. Then issue again the command that failed, and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP0167I** IRLM irlmid NOT FOUND IN ANY SUBSYSTEM RECORDS

**Explanation:** During a CHANGE.SUBSYS command, it was discovered that the specified IRLMID was not found in any subsystem record.

In the message text, irlmid identifies the IRLMID.

**System action:** Processing is terminated. The RECON data sets are not updated.

**Programmer response:** Determine if the IRLMID has been misspelled or if the specified IRLMID has no outstanding subsystem records. If the IRLMID has been misspelled, correct the spelling and submit the command again.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP0168I** BATCH BACKOUT IS NEEDED FOR SUBSYSTEM SSID=ssid

**Explanation:** The subsystem record in RECON was marked abnormally terminated as a result of the CHANGE.SUBSYS ABNORMAL command. The message is issued for either of two reasons:

1. The subsystem had updated databases; the failed subsystem could have caused some databases to need backout.
2. The subsystem was a batch subsystem using the IRLM, and it had not updated a database.

The Backout utility should be run to clean up the IRLM locks.

**System action:** The command was successful.

**Programmer response:** Run the IMS Backout utility.
**DSP0169I**  
**BATCH BACKOUT IS NOT NEEDED FOR SUBSYSTEM SSID=** subsystem name

**Explanation:** The subsystem record in RECON was deleted during the execution of CHANGE.SUBSYS ABNORMAL; batch backout does not need to be run. The subsystem record was deleted because the subsystem had not updated a database. All databases authorized by the subsystem were unauthorized.

**System action:** The command was successful.

**User response:** No action is required.

**Problem determination:** None

**DSP0170I**  
**NO DATABASE RECORDS FOUND IN RECON**

**Explanation:** A LIST.DB command was issued, but no database records exist in the RECON data set.

**System action:** Processing continues.

**User response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0171I**  
**ABNORMAL AND (STARTRCV | ENDRECOV) SHOULD NOT BE SPECIFIED TOGETHER**

**Explanation:** During a CHANGE.SUBSYS command, it was discovered that the ABNORMAL parameter was specified with the STARTRCV or ENDRECOV parameters. This situation is an inconsistency.

**System action:** Processing is terminated. The RECON data set is not updated.

**User response:** Determine the correct parameter and submit the command again.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0172I**  
**NO SUBSYSTEM RECORDS FOUND IN RECON**

**Explanation:** You issued a LIST.SUBSYS command, but no subsystem records exist in the RECON data set.

**System action:** Processing continues.

**User response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0174I**  
**CORRESPONDING PRILOG RECORD NOT FOUND**

**Explanation:** During the processing of a LIST.HISTORY command, an ALLOC record was found in the RECON data set without a corresponding PRILOG record. This indicates an inconsistency in the RECON data set. The ALLOC record without a corresponding PRILOG record is listed before this message.

**System action:** Processing of the LIST request continues.

**Programmer response:** Correct the inconsistency in the RECON data set.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**DSP0175I**  
**UNAUTHORIZATION PROCESSING WAS UNSUCCESSFUL DBD=dbdname SSIDNAME=subsystem name RC=return code**

**Explanation:** The subsystem called DBRC to unauthorized the database, but DBRC encountered a problem preventing successful unauthorized. RC identifies the error return code. See DBRC request return codes for the meaning of the return code.

For RC=24, DBRC tried to calculate a new held-authorization state and a valid state was not obtained. The subsystem was unauthorized, but the database record is marked in the RECON data set, so no other subsystem can be authorized to use the database. This problem is a program error in DBRC or IMS.

**System action:** The unsuccessful return code is passed to the caller.

**User response:** Gather information about the unauthorized process and contact IBM Software Support. For RC=24, the database can be authorized again after all of the subsystems identified in the SSID list have unauthorized the database.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPSDBUA

**Related reference:** DBRC request return codes

**Related information:** Chapter 2, “IMS problem determination,” on page 13
DSP0177I  NO type RECORDS DEFINED IN RECON

Explanation: As a result of a LIST command, no records of the type indicated by type in this message can be found in the RECON.

System action: Processing continues.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0178I  CORRESPONDING LOGALL NOT FOUND

Explanation: During the processing of a LIST.LOG or a LIST.RECON command, a PRILOG record was encountered in the RECON data set for which a corresponding LOGALL record was not found. This problem indicates an inconsistency in the RECON data set. The PRILOG record for which a corresponding LOGALL record was not found is listed preceding this message.

System action: Processing of the LIST request continues.

User response: Correct the inconsistency in the RECON data set.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0179I  EXTRANEOUS record-type RECORD FOUND IN RECON

Explanation: The record, either LOGALL or SECLOG, identified by record-type in the message was found in the RECON data set, but a corresponding PRILOG record was not found. This situation indicates an inconsistency in the RECON data set. The extraneous record is listed following this message.

System action: Processing of the LIST request continues.

User response: Correct the inconsistency in the RECON data set.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0180I  NUMBER OF RECORDS LISTED IS nnnnn

Explanation: This message specifies the total number of records displayed by the DBRC LIST command.

System action: Processing continues.

User response: No action is required.

DSP0181I  NO record-type RECORD FOUND

Explanation: While processing the LIST.HISTORY command, no records of the specified type were found for the database data set or DEDB area being listed. The possible record types are:

- available: IC
- available CA
- IC
- CA
- ALLOC
- MRGND
- REORG
- RECOV

System action: None.

Programmer response: No action is required.

DSP0182I  EXTRANEOUS SECSLDS RECORD FOUND SSID=ssid TIME=timestamp

Explanation: During the processing of a LIST.LOG command, a secondary system log data set (SLDS) record with the specified SSID and start time was found without a corresponding primary SLDS record. This problem is the result of an inconsistency in the RECON data sets.

System action: Processing continues.

Programmer response: Correct the inconsistency in the RECON data sets.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0183I  NO record-type RECORD FOUND DBDNAME=dbdname DDNAME=ddname

Explanation: DBRC processing failed because it could not locate the record type identified by record-type in the message text for this database data set.

System action: DBRC processing terminates.

Programmer response: Contact IBM Software Support for assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13
DSP0184I  USE OF THE INPUT LOG BY THIS RELEASE IS UNSUPPORTED

Explanation: This IMS release was unable to use the input log.

System action: Processing is terminated.

Programmer response: Process the input log with the IMS release that created it.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Module: DSPARC00, DSPARC10, DSPLRC00, DSPLRC10, DSPUBK00

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0185I  RECON RECORD LENGTH IS ZERO record-key

Explanation: An attempt to add or change a record in the RECON data sets failed because the passed length of the record image is zero.

This message is followed by DSP0020I, which lists the formatted record key.

System action: The record was not added or changed. Processing by the Database Recovery Control utility ended.

Programmer response: Contact IBM Software Support.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Module: DSPARC00, DSPARC10, DSPLRC00, DSPLRC10, DSPUBK00

Related information: DSP0020I on page 129

"Chapter 2, “IMS problem determination,” on page 13"

DSP0186I  UNRECONGIZABLE RECON RECORD TYPE record-key

Explanation: A record was found in the RECON data set that contains an unrecognizable record type. The key of this record is identified in the message.

System action: Processing of the command continues.

User response: Examine the unrecognizable record. An Access Method Services PRINT command can be used to obtain a hexadecimal listing of the record in question to determine if it is a true RECON record with an erroneous key that should be corrected, or if it is a totally unrecognizable record type. If unrecognizable, the record should be deleted from the RECON data set. The REPRO command of Access Method Services can be used to copy all records of the RECON data set except the unrecognizable record.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0187I  CAGRP=grpname AND ALL ASSOCIATED CA RECORDS ARE DELETED

Explanation: All members of the change accumulation (CA) group identified by grpname, the empty CAGRP record, and all associated CA execution records were deleted.

System action: None.

Programmer response: No action is required.

DSP0188I  BACKOUT RECORD COMMAND FAILED- REASON nbr

Explanation: A NOTIFY, CHANGE, or DELETE backout (BKOUT) record command failed for one of the following reasons, where nbr is the reason code:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>An invalid character was found in the unit of recovery (UOR) parameter. The characters must be hexadecimal in the range 0-9 or A-F.</td>
</tr>
<tr>
<td>2</td>
<td>Neither the DBD nor the BKO parameter was specified when a new UOR was added to the backout record. At least one is required.</td>
</tr>
<tr>
<td>3</td>
<td>The same database name was specified in both the DBD and BKO parameters. A database cannot require backout and have already been backed out.</td>
</tr>
<tr>
<td>4</td>
<td>None of the optional parameters for the CHANGE.BKOUT command were specified. The command must be directed to take some action.</td>
</tr>
<tr>
<td>5</td>
<td>The DELETE parameter was specified, but the UOR identified by the UOR and UORTIME parameters does not exist in the backout record identified by SSID.</td>
</tr>
<tr>
<td>6</td>
<td>At least one of the databases listed in the DELETE parameter does not exist in the identified UOR entry of the backout record involved.</td>
</tr>
<tr>
<td>7</td>
<td>An attempt was made to add or change the status of databases to that of databases requiring backout for a UOR that has backout processing completed. Only the databases marked as backed out (BKO parameter) and deleted (DELETE parameter) can be in this UOR. This error condition is included for integrity purposes. However, for a successful change, a valid change to the UOR is made using a CHANGE.BKOUT command, such as resetting the PSB to the current value. Then,</td>
</tr>
</tbody>
</table>
The NOTIFY.BKOUT command cannot be used to create a backout record for a subsystem (SSID) that is authorized to any of the databases listed in the DBD or BKO parameter. This error might be the result of a misspelled SSID or database name.

System action: Processing terminates. The RECON data sets are not updated, and subsequent commands are not processed.

User response: Correct, remove, or include the parameters required. Then, reissue the backout command and any other commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information: Chapter 2, “IMS problem determination,” on page 13

---

DSP0189I  GENJCL COMMAND REJECTED FOR USER-RECOVERABLE DATABASES
DBD= database name  AREA=area name

Explanation: DBRC GENJCL command processing discovered that the GENJCL.RECOV command was specified with a user-recoverable database.

System action: This command failed and subsequent commands were not processed.

Module: DSPJCMAI, DSPJCRCV

---

DSP0190I  GENERATED UTILITY JCL:

Explanation: A listing of the job control language that was generated by a GENJCL command follows this informational message.

System action: Processing continues.

User response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information: Chapter 2, “IMS problem determination,” on page 13

---

DSP0191E  INVALID GENJCLIC STATEMENT
SYNTAX, REASON=nn

Explanation: A control statement for the GENJCLIC command is invalid for one of the following reasons:

Reason code nn  Meaning
01  VOLLIST2, VOLLIST3, or VOLLIST4 is specified with the parameter SMSONLC or SMOFFLC.
02  Invalid number of output copies is specified for SMSONLC or SMOFFLC.
03  One or more of the following parameters is specified, but the HLQ parameter is not:
    DSNSUF
    NODSNSUF
    STORCLAS
    MGMTCLAS

You cannot specify these parameters without also specifying the HLQ parameter.

04  One or more of the following parameters is specified, but neither the SMSONLC parameter nor the SMOFFLC parameter is specified:
    HLQ
    DSNSUF
    NODSNSUF
    STORCLAS
    MGMTCLAS

You cannot specify these parameters without also specifying either the SMSONLC parameter or the SMOFFLC parameter.

05  The generated output data set name exceeds 44 characters or contains invalid qualifiers.
06  Either the parameter STORCLAS or the parameter MGMTCLAS is specified with VOLLIST. You cannot specify these parameters with VOLLIST.
07  The SETPATCH parameter contains syntax errors.
08  The SETPATCH parameter can be specified only with the parameters SMSONLC, SMOFFLC, SMSCIC, or SMNOCIC.

System action: Control statement processing is terminated. The return code for the utility is 8.

System programmer response: Correct the problem indicated and issue another GENJCL IC command to create the input for the Database Image Copy 2 utility.

Module: DSPJCIMG

---

DSP0192I  SAMEDS KEYWORD NOT VALID

Explanation: The SAMEDS keyword was specified as a subparameter of the GENJCLIC command, but one of the following problems exists:

• The ONEJOB keyword was omitted.
• The group specified by the GROUP keyword has more than 255 members.

System action: Command processing terminates and subsequent commands are ignored.

User response: Reenter the command without the SAMEDS keyword.

Problem determination: 2, 3

Module: DSPJCMAI, DSPJCIMG

Related information:
DSP0193I  parameter PARAMETER IS INCONSISTENT WITH REUSE ATTRIBUTE

Explanation: The database data set that was specified in a GENJCL.IC command or a GENJCL.OIC command, or the change-accumulation group specified in a GENJCL.CA command, is identified in the RECON data set with the REUSE attribute. The parameter identified in the message can be specified only for database data sets or change-accumulation groups that are identified in the RECON data set with the NOREUSE attribute.

System action: The command (GENJCL.IC, GENJCL.OIC, or GENJCL.CA) failed, and subsequent commands were not processed.

User response: Remove the identified parameter and reissue the failing command. Any other commands that were not processed can also be reissued.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0194I  OPERATION NOT ALLOWED FOR ILDS OR INDEX DATABASE DATA SETS DBD=db name DDN=dd name

Explanation: The requested operation, command, or utility is attempting to run for an ILDS or Index data set of a HALDB. These data sets are not recoverable and therefore the operation is not allowed. For operations involving more than one DBDS, DBD and DDN identify the problem DBDS.

In the message text:

db name Identifies the name of the HALDB that contains the problem database data set.

dd name Identifies the DD name of the data set experiencing the problem.

System action: The utility failed or the command failed and subsequent commands were not processed.

Programmer response: Determine if the operation correctly identified the DBDS. Make any necessary change and run the operation again.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0195I  keyword KEYWORD IS NOT ALLOWED FOR THIS DL/I PARTITIONED-DB RECORD DBDNAME=db name

Explanation: The keyword identified by keyword was either not applicable or not allowed for records that are associated with HALDBs. For operations involving more than one database, db name identifies the problem database.

System action: If the command was for a specific database, the command failed and subsequent commands were not processed. A command involving more than one database results in a warning (RC=4). Subsequent commands are processed.

Programmer response: Determine if the command correctly identified the record.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0197I  ONLINE REORG NOTIFICATION NOT VALID FOR DATABASE ORGANIZATION

Explanation: A command to update the RECON regarding a HALDB OLR was issued for a database that is not the correct type. HALDB OLR is valid for HALDB PHDAM or PHIDAM databases only.

System action: Processing is terminated. The command fails. Review the RECON contents and reissue the command appropriately.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0198I  RECOVERY NOT ALLOWED DURING ONLINE REORGANIZATION

Explanation: Recovery when HALDB OLR is active is not allowed.

System action: Processing is terminated. The command fails. Review the RECON contents and reissue the command appropriately.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13
**DSP messages DSP0201-DSP0250**

This topic contains the following messages:

<table>
<thead>
<tr>
<th>Message Code</th>
<th>Message Text</th>
</tr>
</thead>
</table>
| DSP0201I | THE FOLLOWING REQUIRED PARAMETERS ARE MISSING:  
parameter1 parameter2 parameter3 parameter4 parameter5 |
| Explanation: | One or more of the identified parameters required for a command were not found. A common cause of this message is incorrect continuation of a command. |
| System action: | This command was not processed. |
| User response: | Reissue the command, specifying all required parameters, using the correct continuation for the command. |
| Problem determination: | 2, 3 |
| Related information: | Chapter 2, “IMS problem determination,” on page 13 |
| DSP0202I | INVALID PARAMETER: string |
| Explanation: | The character string identified by string was found in a command where a parameter was expected. The character string does not match any valid parameter for the command being processed. The message identifies the first 20 characters of the input that was encountered and interprets the characters as a parameter. The specified invalid parameter might be implied by other parameters and might not have been entered as part of the command. For example, entering a command for a group implies either a DDN(...). or AREA(...). parameter, which might be invalid for the command. |
| System action: | The command failed, and subsequent commands were not processed. |
| User response: | Reissue the command after correcting the error in its parameters. |
| Problem determination: | 2, 3 |
| Related information: | Chapter 2, “IMS problem determination,” on page 13 |
| DSP0204I | INVALID VALUE FOR PARAMETER parameter |
| Explanation: | A value for a command or EXEC card parameter was found that did not meet the requirements of the parameter. parameter in the message text identifies the parameter. Possible errors are:  
• A numeric value was not within the allowed limits.  
• The value contained a nonnumeric character.  
• The opening parenthesis before the value was missing.  
• A character string had an invalid length or contained an invalid character. |
| System action: | This command failed, and subsequent commands were not processed. |
| Operator response: | Correct the parameter value and reissue the command. |
| Problem determination: | 2, 3 |
| Related information: | Chapter 2, “IMS problem determination,” on page 13 |
| DSP0205I | PARENTHESIS ERROR AFTER KEYWORD keyword |
| Explanation: | There is a problem with the parentheses in a command:  
• Too many parentheses delimit keyword values.  
• Parentheses occur where not expected.  
• Parentheses occur before an optional or required parameter, which might be missing. |
| System action: | This command failed, and subsequent commands were not processed. |
| User response: | Correct the error and reissue the command. You can reissue any other commands that were not processed. |
| Related information: | Chapter 2, “IMS problem determination,” on page 13 |
Problem determination: 2, 3
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0206I    INVALID COMMAND NAME  string
Explanation:  The character string identified by string in the message text was found where a verb.modifier was expected in the command. The character string does not match any valid command name. The message identifies the first 20 characters of the input that was encountered and interprets the characters as a parameter.
System action:  This command failed, and subsequent commands were not processed.
User response:  Correct the command name and reissue the command. Any other commands that were not processed can also be reissued.
Problem determination: 2, 3
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0207I    INVALID APOSTROPHE AFTER KEYWORD  keyword
Explanation:  The special character apostrophe was encountered in a command in a place where it was not expected. The error occurred after the specified keyword.
System action:  This command failed, and subsequent commands were not processed.
User response:  Correct the invalid character and reissue the command. You can reissue any other commands that were not processed.
Problem determination: 2, 3
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0208I    END OF COMMENT DELIMITER MISSING - ONE IS ASSUMED
Explanation:  The */ delimiter, which specifies the end of a comment in a command line, was not found before the end of the command line, and the continuation delimiter (to continue the line) was not specified.
System action:  A */ delimiter was assumed at the end of the input line. Processing of the command continued.
User response:  Correct the command if the assumed */ delimiter caused other problems.
Problem determination: 2, 3
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0209I    PROCESSING TERMINATED WITH CONDITION CODE = nn
Explanation:  Because of errors described in preceding error messages, processing of commands was terminated. The nn field identifies the highest condition code encountered.
System action:  Processing was terminated. Subsequent commands were ignored.
User response:  Correct the errors. Reissue the command that failed and any subsequent commands that were not processed.
Problem determination: 2, 3, 8
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0210I    CLOSING QUOTE DELIMITER MISSING - ONE IS ASSUMED
Explanation:  A quote delimiter, which specifies the end of a character string that began with a quote, was not encountered before the end of the command input line, and the minus continuation delimiter (to continue the line) was not specified.
System action:  A closing quote delimiter was assumed at the end of the input line. Processing of the command continued.
User response:  Correct the command if the assumed quote delimiter caused other problems.
Problem determination: 2, 3
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0211I    COMMAND PROCESSING COMPLETE. HIGHEST CONDITION CODE=nn
Explanation:  All Recovery Control utility commands in the SYSIN input data set have been processed. The nn field identifies the highest condition code encountered.
System action:  None.
User response:  If the condition code is not 0, determine from other messages if processing was successful.
Problem determination: 2, 3, 8
Related information:
Chapter 2, “IMS problem determination,” on page 13
DSP0212I  STRING BEGINNING string IS TOO LONG
Explanation: The identified character string exceeded 255 characters for the command being processed. The message identifies up to the first 20 characters of the string in error. The error might be caused by a missing closing quote delimiter.
System action: This command failed, and subsequent commands were not processed.
User response: Correct the character string with the error and reissue the command.
Problem determination: 2, 3
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0213I  COMMAND CONTINUATION ERROR
Explanation: The last record in a command contained a continuation delimiter, which indicates the command was continued, but no continuation record was found.
System action: This command failed, and subsequent commands were not processed.
User response: Remove the continuation delimiter or supply the continuation record. Reissue the command that failed, and any other commands that were not processed.
Problem determination: 2, 3
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0214I  NO COMMANDS IN INPUT FILE
Explanation: No commands were found in the SYSIN input file.
System action: No processing was performed.
User response: Correct the SYSIN input and rerun the job.
Problem determination: 2, 3
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0215I  NEITHER parameter1 NOR parameter2 PARAMETERS SPECIFIED
Explanation: Either the parameter1 parameter or the parameter2 parameter is required for the command, but neither parameter was specified in the command.
System action: The command failed, and subsequent commands were not processed.
User response: Correct the command and reissue it; any other commands that were not processed can also be reissued.
Problem determination: 2, 3, 8, and the listings of the RECON data set.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0216I  BOTH parameter1 AND parameter2 PARAMETERS SPECIFIED
Explanation: The parameter1 and parameter2 parameters are mutually exclusive parameters for the command being processed, but both have been specified in the command.
System action: The command was processed.
User response: Check the results of the command. When mutually-exclusive parameters are specified, the last one in the command is used.
Problem determination: 2, 3, 8, and the listings of the RECON data set.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0217I  THE FOLLOWING SYSIN RECORDS HAVE BEEN SKIPPED:
Explanation: Due to errors described in prior error messages, the remainder of the SYSIN input was not processed. This message precedes a list of records that were not processed.
System action: Processing continues.
User response: No action is required.
Problem determination: 2, 3, 8, and the listings of the RECON data set.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0218I  END OF SKIPPED SYSIN RECORDS
Explanation: This message marks the end of the list of SYSIN records that were not processed because of prior errors.
System action: Processing was completed.
User response: No action is required.
Problem determination: 2, 3, 8, and the listings of the RECON data set.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0219I  CLOSING PARENTHESES ASSUMED
Explanation: One or more parentheses delimiting the end of a parameter value were not encountered before the end of a command input line. A minus continuation delimiter was not specified to continue the line.
DSP0220I  COMMAND COMPLETION TIME

**Explanation:** The DBRC command that was just processed completed at the specified time.

**System action:** None.

**User response:** No action is required.

**Problem determination:** None.

DSP0222I  DSN PARAMETER MUST BE SPECIFIED WITH DDN FOR A DL1 DBDS DBD=ddname

**Explanation:** You issued an INIT.DBDS DBD(ddname) command without a DSN parameter. The DSN parameter is required with the DDN parameter.

**System action:** The command failed.

**User response:** Check the command syntax.

**Problem determination:** 2, 3, 8, and listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

DSP0222I  SPECIFIED PARAMETERS CONFLICT

**Explanation:** DBRC command processing discovered one of the following errors:

- The CHANGE.DB command was issued with the GSGNAME and NOTCOVER keywords. These keywords are mutually exclusive.
- The CHANGE.DB command was issued with the OLRCAP and OSA8G keywords. These keywords are mutually exclusive.
- The CHANGE.DB command was issued with the OSA8G keyword, but the database is capable of being reorganized online, which is not allowed.
- The CHANGE.DB command was issued with the UNAUTH keyword and some keyword other than DB0, AREA, or ACTIVE|TRACKING.
- The INIT.DB command was issued with the NOICREQ keyword but without the NONRECOV or USERRCOV keyword.
- The INIT.DB command was issued with the USERRCOV keyword but without TYPEFP.
- The INIT.DB command was issued with the OLRCAP or OLRNOCAP keyword but without TYPHALDB.
- The INIT.DB command was issued with the OSA8G or NOOSAM8G keyword but without TYPHALDB.
- The INIT.DBDS or CHANGE.DBDS command was issued with both the NOPREO and the PRELOAD keywords. You can only preload a VSO area if it has been opened first.
- A LIST.DB command was issued with the CHKAUTH keyword but without the required DB0 keyword.
- For a LIST.DBDS DBD (ddname) command:
  - The DDN keyword was specified, but the DBDS is a DEDB.
  - The AREA keyword was specified, but the DBDS is a DL/I DBDS.
- The NOTIFY.ALLOC command was issued with both the QUIESCE and STARTIME keywords. QUIESCE is valid only with DEALTIME.
- For the CHANGE.DB command, OLRBYTES, OLRSEGS, and OLRRROOTS are not allowed with ALL, UNAUTH, OLRCAP, or OLRNOCAP.

**System action:** For the LIST.DB command, processing continues with this message. For other commands, processing fails, and any subsequent commands are not processed.

**User response:** For the LIST.DB command, no action is required. For the other commands, correct the parameters and reissue the command.

**Problem determination:** 2, 3, 8, and listings of the RECON data sets.

**Module:** DSPURM10, DSPURM20, DSPURM35, DSPURM40, DSPURM45, DSPURPSS, DSPURS00, DSPUR10, DSPURT10, DSPURX00

**Related information:** Chapter 2, “IMS problem determination,” on page 13
DSP0223I  NO PARAMETERS SPECIFIED

Explanation:  You issued a CHANGE.RECON command without specifying any parameters.

System action:  Processing continues with this message.

User response:  Correct the command and reissue it.

Problem determination:  2, 3, 8, and the listings of the RECON data sets.

Module:  DSPURS10, DSPURR00

Related information:  Chapter 2, “IMS problem determination,” on page 13

DSP0224I  SPECIFIED PARAMETERS ARE NOT ALLOWED

Explanation:  The parameters specified within a command are not allowed. The following situations can cause this error:

• The CHANGE.DB command was specified with the PINIT or NOPINIT keyword for a non-HALDB.
• A parameter was specified for a Fast Path DEDB in a DL/I database or a parameter for a DL/I database in a Fast Path DEDB.
• The CHANGE.DBDS command was issued with the GSGNAME and NOTCOVER parameter. These parameters are mutually exclusive.
• The CHANGE.DBDS command was issued with the DDN parameter and also one or more of the following parameters: GSGNAME, NOTCOVER, RCVTRACK, DBTRACK. These parameters are not allowed with the DDN parameter.
• The CHANGE.DBDS PRELOAD|NOPREL command was issued for a non-VSO area.
• The CHANGE.DBDS or INIT.DBDS command specifying VSO|NOVSO, PREOPEN|NOPREO or PRELOAD|NOPREL was issued for a full function DBDS. These parameters are only applicable to Fast Path DEDB areas.
• The CHANGE.DBDS command was issued with one or more of the following parameters: CFSTR1, CFSTR2, LKASID. These parameters are not allowed for share level 0 or 1 DEDB.
• The GENJCL.IC command was issued with the NOIC or CIIC parameter and either COPIES(3) or COPIES(4) was specified. COPIES(3) or COPIES(4) can only be specified with SMSNOIC or SMUSIC.
• PINIT or NOPINIT parameters cannot be specified with non-partitioned databases.
• NOPINIT cannot be specified with HIKEY because changing the Partition Selection routine requires the partition to be initialized.
• One of the following parameters was specified, but the target database was not a HALDB master database:
  - HIKEY or PARTSEL
  - OLRCAP or OLRNOCAP
  - OSAM8G or NOOSAM8G

DSP0225I  SUBSYSTEM RECORD NOT MARKED AS RECOVERY PROCESSING STARTED SSID=ssid

Explanation:  The command failed because the recovery-processing-started flag was not on in the specified subsystem record in the RECON data set.

System action:  Processing is terminated. The RECON data set is not updated.

User response:  Issue the DBRC CHANGE.SUBSYS STARTRCV command to mark the subsystem record as recovery-processing-started.

Problem determination:  2, 3, 8, and the listings of the RECON data sets.

Related information:  Chapter 2, “IMS problem determination,” on page 13

DSP0226I  SPECIFIED DBDS IS NOT FOR FAST PATH DDB=ddb name AREA=area name

Explanation:  During DBRC command processing, you issued a CHANGE.ADS, DELETE.ADS, or INIT.ADS command but the DBDS is not a Fast Path DEDB.

System action:  The command failed and subsequent commands were not processed.

Programmer response:  Determine if a valid Fast Path DEDB was identified in the command and reissue the command and any others that were not processed.

Problem determination:  2, 3, 8, and the listings of your RECON data sets.

Related information:
DSP0227I USE THE CHANGE OR DELETE BKOUT COMMAND INSTEAD REFERENCING DBDNAME=`.....`

Explanation: Because at least one backout record contains backouts for the database, you must use the CHANGE.BKOUT or DELETE.BKOUT command.

System action: The command failed.

User response: Use the CHANGE.BKOUT or DELETE.BKOUT command.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0228I NEW AREANAME ALREADY EXISTS IN RECON DBD=`database name` AREA=`area name`

Explanation: During DBRC command processing (that is, CHANGE.DBDS), a command to change the AREANAME of a Fast Path area in the RECON data set failed because an area with the same DBDNAME and AREANAME already existed in the RECON data set. The dbd name (database name) and area name (area name) fields identify the Fast Path area.

System action: This command failed and subsequent commands were not processed.

User response: Determine if the new AREANAME in the command was incorrect. If it was, correct it and reissue the command that failed, and any other commands that were not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0229I VOLUME NOT FOUND IN LOG RECORD, VOLSER=`volser`

Explanation: The CHANGE.PRILOG or CHANGE.SECLOG command was issued with the OLDVOL parameter. The specified volume serial number was not found in the PRILOG or SECLOG record.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Correct the volume serial number and reissue the command.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0230I SPECIFIED AREA IS NOT IN RECOVERY NEEDED STATUS DBD=`dbname` AREA=`areaname`

Explanation: The identified area was specified on a GENJCL.RECOV statement for the DB recovery utility to perform the track recovery for the DEDB. However, the specified area is not in recovery-needed status.

System action: Processing was terminated.

Programmer response: Check if the specified area is in recovery-needed status (that is, the area is the recovery-needed flag off).

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0231I UNAUTHORIZATION PROCESSING WAS UNSUCCESSFUL DBD=`dbname` AREA=`areaname` SSID=`subsystem name` RC=`return code`

Explanation: The subsystem called DBRC to unauthorize the AREA, but DBRC encountered a problem preventing successful unauthorization. RC identifies the error return code. See the DBRC request return codes information for the meaning of the return code.

For RC=24, DBRC tried to calculate a new held-authorization state and a valid state was not obtained. The subsystem was unauthorized, but the AREA record is marked in the RECON data set so no other subsystem can be authorized to use the AREA. This is a program error in DBRC or IMS.

System action: The unsuccessful return code is passed to the caller.

User response: Gather information about the unauthorization process and contact the IBM Support Center. For RC=24, the AREA can be authorized again after all of the authorized subsystems have un unauthorized the AREA.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Module: DSPSDBUA

Related reference: DBRC request return codes (Messages and Codes)

Related information: Chapter 2, “IMS problem determination,” on page 13

166 Messages and Codes, Volume 2: Non-DFS Messages
DSP0232I   AREA IS NOT IN RECOVERY
NEEDED STATUS DBD=dbh name
AREA=area name

Explanation: The identified area data set was specified on SYSIN control statement for execution of the DEDB Initialization utility. However, the specified area is not in recovery-needed status and the specified area data set is not in unavailable status. The DEDB initialization utility can be allowed when the specified area has the recovery-needed flag on (recovery-needed status).

System action: Processing by the DEDB Initialization utility was terminated.

User response: Determine if the specified AREA record in RECON should be changed so that the recovery flags are turned on.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0233I   AREA IS IN RECOVERY NEEDED
STATUS DBD=dbh name AREA=area name

Explanation: An INIT.ADS AVAIL or CHANGE.ADS AVAIL command was issued for the specified Fast Path area. However, the AREA is in recovery-needed status. An INIT.ADS AVAIL or CHANGE.ADS AVAIL command can be specified only when the AREA is in not recovery-needed status. If the INIT.ADS AVAIL or CHANGE.ADS AVAIL command is to be specified for the recovery-needed AREA, the AREA has to be changed to the nonrecovery-needed status.

System action: This command failed.

User response: Either run the forward recovery utility for the area, or issue a CHANGE DBDS command to turn off the recovery flags.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0234I   MAX NUMBER OF AREA DATA SETS
BEEN REACHED DBD=dbh name
AREA=area name

Explanation: An INIT.ADS command was specified for the AREA for which the maximum number of the AREA data set has been reached. Up to seven area data sets can be defined under one area. The total number of AREA data sets exceeds the allowable maximum of seven.

System action: This command failed.

DSP0235I   THE DS NAME OF THE FIRST AREA
DATA SET WAS USED FOR THE
DBDS DBD=dbh name DDN=ddname

Explanation: You specified a CHANGE.DB TYPEIMS command for the DEDB record. If the current DEDB has multiple AREA Data Sets, this message is issued. This message indicates that the first data set in the ADS-LIST has been assigned as a DDN and a DSN for the DL/I DBDS record. This message is issued for information only.

System action: Processing continues.

User response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0236I   AREA IS STILL AUTHORIZED AND
ADS IS AVAILABLE DBD=dbhname
AREA=area name AREA=area name
ADDN=ADS dd name

Explanation: You issued a DELETE.ADS command for an area data set that was still available and whose area was still authorized. A DELETE.ADS command is not allowed when the AREA is authorized and the specified ADS is available.

System action: This command failed.

User response: Wait until the area is unassigned or the ADS is unavailable.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0237I   AREA IS STILL AUTHORIZED AND
ADS IS BEING USED BY THE CREATE
UTILITY DBD=dbh name AREA=area
name ADDN=ADS dd name

Explanation: You issued a DELETE.ADS command for an area data set whose AREA is still authorized, and the Create utility is running for the area data set. A DELETE.ADS command is not allowed when the AREA is authorized, and the Create utility is running for the area data set.

System action: This command failed.
User response: Wait until the area is unauthorized and the Create utility completes.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0238I  CANNOT DELETE OLDS SSID=ssid DDNAME=ddname

Explanation: You made a request to delete the last closed online log data set (OLDS) for the subsystem. This data set should not be deleted because it might be needed to close the first online log data set in a later restart.

System action: The command failed, and subsequent commands are not processed.

User response: If the data set must be deleted, execute the DELETE.LOG command with the LASTCLOS keyword.

Problem determination: None.

DSP0239I  INCORRECT NUMBER OF TIME STAMPS FOR NEWTIME PARAMETER

Explanation: The CHANGE.PRILOG or CHANGE.SECLOG command specified the NEWTIME parameter. An incorrect number of time stamps was given for the NEWTIME parameter. The number of time stamps on the NEWTIME parameter must be one less than the number of volumes specified for the NEWVOL parameter.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Specify the correct number of time stamps and reissue the command.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0240I  NO AREA DATA SETS TO PROCESS

Explanation: No area data sets meet the selection criteria of the command entered. For the GENJCL.RECOV command, there is no unavailable ADS. For GENJCL.IC, there is no available ADS to process.

System action: This command failed, and subsequent commands were not processed.

Programmer response: Issue the CHANGE.ADS command to set the ADS AVAIL or UNAVAIL as appropriate.

DSP0241I  ddname1 DSN=dsname REPLACED BY ddname2 DSN=dsname

Explanation: The RECON data set identified by ddname1 has been replaced as an active RECON data set by the data set identified by ddname1. This situation can occur because of an I/O error on a RECON, or because of the CHANGE.RECON REPLACE(RECONn) command.

System action: Processing continues.

User response: No action is required.

Problem determination: None.

DSP0242I  JOB TERMINATED DUE TO UNAVAILABLE SPARE RECON DATA SET. THE ONLY AVAILABLE RECON IS DSN=dsname.

Explanation: DBRC was unable to locate two matching RECON data sets and no spare RECON data set was available. The operating mode does not allow a single RECON data set to be in effect. If more than one RECON data set was presented to the job, the most current data set is identified by dsname.

System action: The job is terminated.

User response: Define two spare RECON data sets and rerun the job.

Problem determination: None.

DSP0243I  JOB CONTINUING IN SPITE OF UNAVAILABLE SPARE RECON DATA SET

Explanation: DBRC was unable to locate two matching RECON data sets, and no spare RECON data set was available. The operating mode allowing a single RECON data set is in effect.

System action: Processing continues.

User response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0245I  JOB TERMINATED DUE TO UNAVAILABLE RECON DATA SETS

Explanation: DBRC was unable to locate any RECON data set.
System action: The job is terminated.
User response: Define RECON data sets, and rerun the job.
Problem determination: None.

DSP0246I DSSN PROCESSING UNABLE TO CONTINUE DBDNAME=dbname DDNAME=ddname DSSN=nnnnnnnn
Explanation: During the DBRC processing of the change accumulation exits or of the GENJCL.CA command, DSSN processing, which determines the place of the log volume in the log volume chain, found an error. There were conflicting DSSN values for database data sets that were changed by two log volumes.
System action: Processing is terminated. If a command was processing, subsequent commands are not processed.
User response: If NOTIFY commands were used to enter information about log records and allocation records, the values of the DSSNs in the allocation records need to be checked. If the NOTIFY commands were not used, gather information for APAR analysis.
Problem determination: 2, 3, 8, and the listings of the RECON data sets.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0247I INVALID LOG VOLUME SUBSET WAS FOUND
Explanation: During input validation for Change Accumulation utility, or while generating JCL for the utility, DBRC determined that one or more of the required log volumes were not available.
If the message was issued during input validation, either the utility JCL did not specify all required log volumes, or one or more of the specified log volumes were not available.
If the message occurred during JCL generation, one or more of the log volumes that must be included in the generated job were not available.
Log volumes might be unavailable for one or more of the following reasons:
• A required volume was in use by an active subsystem.
• An unarchived online log data set was required.
• A required log volume was marked in error.
This message might also occur if an invalid CATIME parameter was specified on the GENJCL.CA command.
System action: Processing is terminated. If the message was issued during GENJCL processing, subsequent commands will not be processed.
User response: Resubmit the job with a valid log subset specified either in the JCL or with a valid value for the CATIME parameter. It might be necessary to close log volumes that are in use by an active subsystem, to archive required OLDS data sets, or to use the IMS Log Recovery utility to recover a log volume that is marked in error.
Problem determination: 2, 3, 8, and the listings of the RECON data sets.
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0248I RECON DATA SET PARTIALLY UPGRADED
Explanation: A non-concurrent upgrade of a single RECON data set was attempted and failed, leaving the RECON data set partially upgraded and inaccessible by further operations.
System action: Processing is terminated.
Programmer response: Delete and reallocate the new RECON data set. Reissue the CHANGE.RECON UPGRADE command.
Tip: Use two RECON data sets and a spare. In case of a failure, DBRC can automatically restore your RECON data sets to their original state and discard the unusable RECON data set.

DSP0249I RECON IN USE, CANNOT UPGRADE
Explanation: This message is issued by the RECON batch command processor executing the CHANGE.RECON UPGRADE command. The RECON is currently in use by one or more IMS subsystems, and the command cannot be executed for one of the following reasons:
• The IMS coexistence SPE for the version you are using has not been applied to one or more of the IMS subsystems. The RECON cannot be upgraded while in use by a subsystem that is not prepared to read an upgraded RECON. Message DSP1113A is issued for each subsystem record found that did not have the DBRC migration/coexistence maintenance applied.
• The CHANGE.RECON UPGRADE command cannot be executed because less than three RECON data sets are allocated. This condition could compromise RECON integrity if an I/O error occurs during the upgrade process.
System action: The CHANGE.RECON UPGRADE command fails with RC=8.
Programmer response: Before you issue the CHANGE.RECON UPGRADE command, ensure that:
The IMS coexistence SPE of the appropriate version of IMS has been applied to all subsystems accessing the RECON.

Two RECON data sets are allocated in addition to a spare data set.

To generate a listing of all subsystem records in the RECON and their coexistence level, issue a LIST:SUBSYS ALL command. Each subsystem record lists the highest release of IMS that the subsystem can coexist with in field COEXISTENCE LEVEL.

Module: DSPUGR00

DSP messages DSP0251-DSP0300

This topic contains the following messages:

DSP0251I  RECON COPY n UPGRADE IS BEGINNING

Explanation: The CHANGE.RECON UPGRADE command is beginning to upgrade the records in the RECON copy data set identified in the message. If a failure occurs during an upgrade for copy 1, DBRC reconfigures the RECON and discards Copy 1; in this case, rerun the CHANGE.RECON UPGRADE command. If a failure occurs during an upgrade for copy 2, DBRC attempts to reconfigure the RECON and discards copy 2; in this case, the upgrade is successful and you do not need to rerun the CHANGE.RECON UPGRADE command.

User response: No action is required.

Module: DSPURI00

DSP0252I  RECON COPY n UPGRADED SUCCESSFULLY

Explanation: The CHANGE.RECON UPGRADE command successfully upgraded all records in the RECON copy data set identified in the message.

User response: No action is required.

Module: DSPURI00

DSP0255I  RECONn IS NOT IN USE

Explanation: You used the CHANGE.RECON REPLACE(RECONn) command to replace the specified RECON data set with a spare RECON data set. However, DBRC was not using the specified RECON data set DBRC when the command was issued.

System action: The command fails and further commands are not processed.

User response: Reissue the command, specifying an active RECON data set.

Problem determination: None.

Module: DSPURI00

DSP0256I  NO SPARE RECON DATA SET AVAILABLE

Explanation: The CHANGE.RECON command was used to reenter dual RECON mode or to replace an active RECON data set with a spare RECON data set. However, no spare RECON data set was available.

System action: The command fails, and further commands are not processed.

User response: Define a spare RECON data set and reissue the command.

Problem determination: None.

Module: DSPURI00

DSP0260I  NO insrt-1 RECORDS FOUND IN RECON insrt-2

Explanation: There is no record of the specified type in the RECON data sets for an online log data set with the specified characteristics. Insrt-1 can be ONLINE LOG, UNARCHIVED LOG, INT-ONLINE LOG, INTERIM RLDS/SLDS, TRACKING SLDS, or UNARCHIVED SLDS.Insrt-2 can be SSID=8-character name or blank. This can occur during the execution of the IMS Log Archive utility, GENJCL.ARCHIVE command, GENJCL.CLOSE command, LIST.RECON command, or LIST.LOG command. For the LIST.LOG command, if a subset of records is requested but no online records exist, the message will address the larger set. For example, if LIST.LOG UNARCH is issued and no online records exist, the message will say NO ONLINE LOG RECORDS FOUND..., rather than NO UNARCHIVED LOG RECORDS FOUND....

System action: If the error occurs during the execution of the LIST command, processing continues. If the error occurs during the execution of the GENJCL.ARCHIVE command, the command fails, and subsequent commands are not processed. If the error occurs during the execution of the IMS Log Archive utility, the utility processing is terminated.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0261I  NO ONLINE LOG FOUND IN RECON SSID=ssid DDNAME=ddname

Explanation: There is no record in the RECON data sets of an online log data set for the specified IMS subsystem with the specified DD statement. This can
occur during the execution of the IMS Log Archive utility, GENJCL.ARCHIVE command, LIST.LOG command, or DELETE.LOG command.

**System action:** If the error occurs during the execution of the LIST.LOG command, processing continues. If the error occurs during the execution of the DELETE.LOG or GENJCL.ARCHIVE command, the command fails, and subsequent commands are not processed. If the error occurs during the execution of the IMS Log Archive utility, the utility processing is terminated.

**User response:** Determine if the SSID and DDNAME parameters were specified correctly. If not, correct the error and resubmit the request.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

### DSP0261I NO insrt-1 insrt-2 RECORDS FOUND IN RECON insrt-3

**Explanation:** A LIST.LOG OPEN or LIST.LOG ERROR command was issued, and no insrt-1 records exist in the RECON data sets. insrt-1 will be either ERROR or OPEN. insrt-2 will be either UNARCHIVED, ONLINE, or INT-ONLINE. insrt-3 will be either SSID=8-character name or blank. For the LIST.LOG command, if a subset of records is requested, but no online or interim online log data set records exist, message DSP0261I will be displayed.

**System action:** Processing continues.

**User response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

### DSP0263I EXTRANEOUS SECOLDS RECORD FOUND IN RECON SSID=ssid

**Explanation:** When the LIST.LOG SSID(ssid) command was issued, and no PRIOLDS record existed, but a SECOLDS record did exist. This indicates an inconsistency in the RECON data sets. The extra record is displayed after this message is issued.

**System action:** Processing continues.

**User response:** Correct the inconsistency in the RECON data sets.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**System action:** The command failed, and subsequent commands were not processed.

**User response:** Correct the error and reissue the command in error.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0268I**  
**record-type RECORD NOT FOUND IN**  
**RECON SSID=ssid DDNAME=ddname**

or

**record-type RECORD NOT FOUND IN**  
**RECON SSID=ssid TIME=timestamp**

**Explanation:** The request to access or change the record of a log data set in the RECON data sets failed because a record with the specified attributes could not be found. The SSID, DDNAME, and STARTIME parameters identify the requested record.

**System action:** The requested access of, or change to, the RECON data set failed.

**User response:** Correct the attributes that identify the record, and reissue the command that failed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0269I**  
**record-type RECORD ALREADY EXISTS IN**  
**RECON SSID=ssid DDNAME=ddname**

or

**record-type RECORD ALREADY EXISTS IN**  
**RECON SSID=ssid TIME=timestamp**

**Explanation:** The request to access or change the record of a log data set in the RECON data sets failed because a record with the specified attributes already exists. The SSID, DDNAME, and STARTIME parameters identify the requested record.

**System action:** The requested access of, or change to, the RECON data set failed.

**User response:** Correct the attributes that identify the record, and reissue the command that failed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0267I**  
**record type CAN NOT BE CHANGED, DATA SET NOT CLOSED**

**Explanation:** You issued a CHANGE.PRILOG or CHANGE.SECLOG command to change the RECON record of a log data set. However, the log data set is still open. RECON records of the log data sets cannot be changed until RECON is notified of the data set close.

**System action:** The command failed, and subsequent commands were not processed.

**User response:** Use the NOTIFY.PRILOG or NOTIFY.SECLOG command to inform RECON of the closing of the log data set and reissue the command.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0268I**  
**record-type RECORD NOT FOUND IN**

or

**record-type RECORD NOT FOUND IN**

**RECON SSID=ssid DDNAME=ddname**

---

**DSP0269I**  
**record-type RECORD ALREADY EXISTS IN**

**RECON SSID=ssid DDNAME=ddname**
DSP0270I  ONLINE LOG ALREADY status
SSID=ssid DDNAME=ddname

Explanation: You made a request to change the status of an online log data set in the RECON data sets. However, the RECON record of the online log data set already had the indicated status. The status can be either ARCHIVED, STARTED, or CLOSED. This can occur during the execution of the IMS Log Archive utility, GENJCL.ARCHIVE command, GENJCL.CLOSE command, CHANGE.PRILOG command, or CHANGE.SECLOG command.

System action: When the error occurs during the execution of the IMS Log Archive Utility, the IMS Log Recovery Utility, and a command, the following conditions result:

IMS Log Archive Utility
The utility processing is terminated if all input online log data sets are already archived or are being archived (archive STARTED). If at least one input online log data set has not been archived, the utility continues archiving the unarchived online log data sets.

IMS Log Recovery Utility
Processing is terminated.

Command
The command fails and subsequent commands are not processed. The command does not fail for STARTED status. See the User response.

User response: This message is for informational purposes only and in most cases, no user response is required. The STARTED status is normal if the indicated online log data set is currently being archived by another job.

If the message is received during GENJCL, then that OLDS is not included in the generated JCL. If the message is received during the IMS Log Archive utility, then that OLDS is treated as if it had been previously archived. A LIST.LOG OLDS(ddname) command shows the archive job name that is running. If that job failed and DBRC was not notified, then the OLDS status remains ARC started and that OLDS is not archived until a CHANGE.PRILOG OLDS(ddname) ARNEEDED command is issued.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0271I  ONLINE LOGS TO BE ARCHIVED ARE NON-CONTINUOUS

Explanation: You made an attempt to archive a set of online log data sets, but the online log data sets to be archived are not contiguous. That is, at least one online log data set exists that was used after the first specified online log data set and before the last specified online log data set.

System action: Processing is terminated by the IMS Log Archive utility.

User response: Use the LIST.LOG command with the ALLOLDS parameter to determine the missing online log data sets. Issue the GENJCL.ARCHIVE command, specifying all unarchived online log data sets, or issue the GENJCL.ARCHIVE command, specifying ALL.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13
Chapter 2, “IMS problem determination,” on page 13

**DSP0273I** ONLINE LOG NOT ARCHIVED
SSID=ssid DDNAME=ddname

**Explanation:** You issued a DELETE.LOG command for the identified log data set, but it has not been archived.

**System action:** The command fails, and subsequent commands are not processed.

**User response:** Use the IMS Log Archive utility to archive the online log data set and reissue the DELETE.LOG command.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0274I** UTILITY REQUESTING AN UNARCHIVED ONLINE LOG OR AN UNAVAILABLE LOG
DBDNAME=dbname DDNAME=ddname
ALLOC TIME=time

**Explanation:** A utility request requires an online log data set that has not been archived. A utility cannot use log data until the online log data set has been archived to a system log data set. This error can occur during the execution of the IMS Database Recovery utility, the IMS Change Accumulation utility, GENJCL.RECOV command, or GENJCL.CA command.

**System action:** Processing continues and DBRC determines whether the open log is required for the requested function.

**Programmer response:** If the open log is needed for the requested function, use the IMS Log Archive utility to archive the online log data set. After the archive has completed, reissue the request.

If no open logs are found, the database allocation time is greater than the PRILOG stop time. The allocation time can be entered manually using the DBRC command. The IMS Log Recovery utility (DFSULTR0) might have been run with ERRC=0000, which closes the new log on the first error encountered. Resolve the problem, and reissue the request.

If this message is issued during GENJCL.CA or by the IMS Change Accumulation utility, the allocation time identifies the first unavailable log DBRC found. If there are other earlier logs available for processing, the job continues.

If the message was issued when a utility was running, use DBRC to generate new JCL. Then compare the new JCL with the original JCL for possible errors.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0275I** DDNAME ddname APPEARS MORE THAN ONCE

**Explanation:** You issued the GENJCL.ARCHIVE command, specifying a list of online log data set DD statements. However, the specified DD statement appears more than once in the DD statement list.

**System action:** Processing continues. The extra DD statements are ignored.

**User response:** No action is required.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0276I** NO ONLINE LOG DATA SETS TO BE PROCESSED

**Explanation:** During the execution of a GENJCL.ARCHIVE command, no online log data sets met the requirements of the command and none of the online log data sets were unarchived.

**System action:** The command failed, and subsequent commands were not processed.

**User response:** No action is required.

**Note:** If an emergency restart (/ERE) was issued after a normal IMS shutdown, the automatic archive job submitted by the emergency restart processing will fail, and this message can be ignored.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

**DSP0277I** ONLINE LOG HAS INCORRECT DATA SET NAME SSID=ssid DDNAME=ddname

**Explanation:** You made a request to archive the online log data set with the specified subsystem ID (ssid) and DD name (ddname). However, the data set name specified on the DD statement for the archive utility is different from the data set name reflected in the RECON data set.

**System action:** Processing by the archive utility is terminated.

**User response:** Probable user error. Correct the JCL for the archive utility and resubmit the archive job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:**
DSP0280I TRACK OPTION INVALID - USE ICKDSF UTILITY

Explanation: You specified the TRACK option in the GENJCL.RECOV command. This option is no longer supported in DFP V3.1.

System action: The command fails and subsequent commands are not processed.

Programmer response: Either reissue the command without the TRACK option specified, or run the ICKDSF utility.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0281I LOG MERGE REQUIRED FOR RECOVERY REQUEST
DBDNAME=dbdsname DDNAME=ddname

Explanation: During the execution of the GENJCL.RECOV command or the IMS Database Recovery utility, it was determined that two or more log data sets must be merged in order to recover the database data set. The log data sets must be merged prior to recovering the database data set.

System action: The GENJCL.RECOV or Database Recovery utility execution fails.

User response: The log data sets must be merged. If the database data set is a member of a change accumulation group, use the IMS Change Accumulation utility to merge the log data sets.

Problem determination: 2, 3, 8, and a listing of the RECON data set.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0282I BACKOUT NEEDED FOR DBD dbname—RECOVERY PROCESS ABORTED

Explanation: During execution of the GENJCL.RECOV command or the IMS Database Recovery utility, the status of the specified database was backout needed. Because dynamic backout executes automatically when this database is started, recovery must not be allowed. If backout is run following a recovery, database damage might result.

System action: Processing terminates for the database. If this error occurs during GENJCL for a group, the processing continues for the other members of the group.

Programmer response: Either run BACKOUT for the database or issue the CHANGE.DB NOBACK command to turn off the BACKOUT NEEDED flag prior to running recovery.

Problem determination: Informational message only.

DSP0283I UNABLE TO DELETE ERROR QUEUE ELEMENT(S) AS DBDS dbdsname CONTAINS NO EQES

Explanation: A request to delete the error queue elements from the specified DBDS or DEDB AREA record failed because there was no error queue elements in the record.

System action: The command failed, and subsequent commands are not processed.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0284I UNABLE TO DELETE ERROR QUEUE ELEMENT eqe FOR DBDS dbdsname AS THE SPECIFIED EQE DOES NOT EXIST

Explanation: A request to delete the specified error queue element from a DBDS or DEDB AREA record failed because the error queue element does not exist in the record.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Correct the error queue element, then reissue the command.

Problem determination: 2, 3, 8, and a listing of the RECON data set.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0285I IRLMID SPECIFIED FOR SUBSYSTEM SSID=ssid INCORRECT

Explanation: You made an attempt to notify DBRC of the existence or deletion of an alternate subsystem. The IRLMID parameter specified in the command does not match the IRLMID in the subsystem record.

System action: The command failed, and subsequent commands are not processed.

Programmer response: Issue a LIST.SUBSYS command to verify that the IRLMID is correct for the specified subsystem.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
DSP0286I  NO BACKUP SUBSYSTEM EXISTS FOR SUBSYSTEM SSID= ssid

Explanation: A request to delete an alternate (backup) subsystem failed because there is no alternate subsystem for the indicated subsystem.

System action: None.

Programmer response: Issue the LIST.SUUSYS command for the specified subsystem to verify that an alternate subsystem name exists.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:

DSP0287I  OLDS SWITCH PROCESSING TERMINATED PRILOG | PRISLDS RECORD LENGTH CRITICAL

Explanation: The amount of space needed to record the archive data sets after all the OLDS are archived (including the OLDS being switched from and the OLDS being switched to) exceeds the maximum PRILOG or PRISLDS record length.

System action: The OLDS switch fails with return code 44 (X'2C'), IMS issues message DFS2482I, and the IMS control region terminates with abend 0071.

Operator response: (master terminal) Before trying to emergency restart the control region, run any archive jobs that were generated before the IMS control region terminated.

Related information:

DSP0289I  "ABNORMAL" PARAMETER IS INVALID WHEN A BACKUP SUBSYSTEM IS AVAILABLE

Explanation: A request to change the status of the subsystem record to abnormal failed because a backup subsystem was available (BACKUP=YES).

System action: The command fails and subsequent commands are not processed.

Programmer response: Determine if the backup subsystem is in fact unavailable. If so, issue the CHANGE.SUUSYS NOBACKUP command to reset the backup flag.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information:

DSP0291I  THE TIME ZONE LABEL TABLE IS FULL.

Explanation: A CHANGE.RECON TIMEZONE command attempted to add a new entry to the time zone label table, but the table already contains the maximum number of 32 entries.

System action: The command fails.

Operator response: Remove any unnecessary entries in the table and reissue the command.

Module: DSPURM90

DSP0292I  ONLINE REORG ACTIVE FOR DBD=XXXXXXXX

Explanation: You issued a command to add or change information in the RECON data set. The command cannot be processed when HALDB OLR is active. If HALDB OLR is active and has an owning IMS which is currently active, parameters OLRRGON | OLRRGOFF, OLRLMSID() | NOOWNER, and OLRLDBDS(A | M) are not allowed. Parameter OLRLDBDS(A | M) is not allowed if HALDB OLR is active.

The REL | NOREL parameters are not allowed to be changed if an online reorganization is active or the owning IMS has not abnormally terminated when the CHANGE.DB command is run.

System action: Processing is terminated. The command fails. Review the RECON contents.

Programmer response: Contact the IBM Support Center if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:

DSP0287W  *WARNING* PRILOG | PRISLDS RECORD LENGTH CRITICAL

Explanation: If logging continues so that an additional OLDS switch will cause the PRILOG or PRISLDS record length to be exceeded (after all OLDS are archived), DBRC terminates the OLDS switch, force the shutdown of the IMS and issues message DSP0287I. The exact point in IMS processing where this message is issued is determined by the value of the LOCALERT parameter of the DBRC CHANGE.RECON command.

System action: IMS continues processing.

Operator response: (master terminal) Stop the IMS control region as soon as possible.

Related information:
DSP0293I  ACTIVE DBDS=M-V FOR DBD=XXXXXXXX

Explanation: You issued a command to add or change information in the RECON data set. The command cannot be processed when the M-V DBDS data sets are active.

System action: Processing is terminated. The command fails. Review the RECON contents.

Programmer response: Contact the IBM Support Center if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0294I  MINVERS PARAMETER INCONSISTENT WITH SUBSYSTEM RECORD FOUND IN RECON FOR SSID=XXXXXXXX

Explanation: You attempted a command to change the MINVERS parameter to a version lower than the current subsystem record found in the RECON data set. The subsystem ID of a subsystem record found in the RECON data set at a lower release is included in the command.

System action: The command fails.

System programmer response: If the subsystem record is for a subsystem that is no longer active and will not need for restart or backout, delete it from the RECON data set. If the subsystem record is for a current active system, wait until it completes. When the subsystems have all been upgraded to the release indicated by the MINVERS parameter, issue the command again.

Module: DSPURM90

DSP0295I  SUBSYSTEM RECORD NOT FOUND IN RECON

Explanation: You issued a command to change the owning IMS for a HALDB OLR but the subsystem record for OLRIMSID name was not found.

System action: Processing is terminated and the command fails. Review your RECON contents. The subsystem record must exist.

Programmer response: Contact the IBM Support Center if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0299I  ONLINE SUBSYSTEM RECORD SSID=name BEING DELETED BY COMMAND

Explanation: An online subsystem record, whose name is identified in the SSID parameter, was deleted by command processing (for example, with the DELETE.SUBSYS SSID(name) command).

This message is informational and is issued when a subsystem record of $stype=online$ is deleted by command processing.

Both subsystem records that are created by online IMS systems and online image copy jobs have the $stype=online$ set.

If you issue a CHANGE.SUBSYS STARTRCV and CHANGE.SUBSYS ENDRECOV command to remove database authorizations to the online subsystem record before issuing the command DELETE.SUBSYS SSID(name), this message is also issued.

Programmer response: The message is issued as a WTO, and the job issuing the message is identified. You can ignore this message unless you issued the DELETE.SUBSYS SSID(name) command in error. In this case, the online system abends when it notices the missing data from the RECON.

Problem determination: 1, 2, 3

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0300I  INTERNAL DBRC ERROR

mmmmmmmm(aaaaaaaa) +X oooo #nn term/dump

DIAG=dddddddd

Explanation: An internal error in the IMS Database Recovery Control Facility was detected. Except for the $term$ and $dump$ values, the information in the message is intended for problem analysis by IBM personnel. An abend 2480 might follow this message.

In the message text:

$mmmmmmmm$ Name of the module that detected the error.

$aaaaaaa$ Maintenance level of the module.

$oooo$ Offset in the module where the message was issued.

$nn$ The $nn$ DSPSTOP invocation in the module. For example, if $nn$=5, the message was produced by the 5th DSPSTOP invocation.

$term$ Can be either:

TERM DBRC terminated with abend 2480.

CONT DBRC execution continues, even if abend 2480 was requested with a dump.

$dump$ Can be either:

DUMP An abend 2480 was requested with a dump.
NODUMP

No dump was requested.

A character string further identifying the error.

User response: Contact your IBM Support Center for assistance.

Problem determination: 2, 3, 8, and the dump

DSP messages DSP0301-DSP0400

This topic contains the following messages:

DSP0301I  LOG INPUT NOT USABLE BEYOND timestamp

Explanation: A utility attempted to use a primary log data set. The record in the RECON data set that identifies the primary log data set indicates that it is unusable, and a corresponding secondary log data set does not exist or is also marked as unusable. Unusable log data sets are not permitted for subsequent processing of utilities other than the log-termination utility or the log-recovery utility. The *timestamp* field identifies the primary log data set by its volume start time. If the Change Accumulation Utility was executing and message DSP0247I accompanies this message, the utility execution will fail. Otherwise, the Change Accumulation Utility will continue processing the log volumes found before the unusable log volume.

System action: Processing of the utility attempting to use the primary log data set was terminated.

User response: Determine the status of the identified primary log data set, and do one of the following before rerunning the job that failed:

- If the primary log data set needs to be terminated or recovered, execute the System Log Terminator utility or System Log Recovery utility, respectively. If the System Log Recovery utility is used, issue a CHANGE.PRILOG or CHANGE.SECLOG command to record information about the new log volumes in the RECON data set.
- If the log data set should be ignored, issue a DELETE.LOG command to delete the records of the log data sets.
- If the stop time of the primary log data set was never recorded in the RECON data set, but otherwise the primary log data set is correct, issue the NOTIFY.PRILOG command to add the stop time information to the RECON set.
- If the log data set is now usable, issue a CHANGE.PRILOG or CHANGE.SECLOG command to indicate in the record of the log data set that it is usable.

Problem determination: 2, 3, 8, and the listings of the RECON data set

DSP0302I  PRIMARY LOG NOT FOUND WITH START TIME *timestamp*

DBDNAME=*dbname* DDNAME=*name*

Explanation: Allocation records in the RECON data set for the identified database data set or area data set that is identified by the DBDNAME and DDNAME fields indicate that a primary log record exists, but the record was not found in the RECON data set. This indicates an inconsistency in the RECON data set. The time stamp field identifies the start time of the primary log data set.

System action: The utility failed.

User response: From a list of the RECON data set, identify the inconsistency of information about the identified primary log data set. If the record of the primary log data set was inadvertently deleted from the RECON data set, issue a NOTIFY.PRILOG command to add the record to the RECON data set. If the allocation records are incorrect, delete them with a DELETE.ALLOC command and add correct information with a NOTIFY.ALLOC command.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:

Chapter 2, “IMS problem determination,” on page 13

IMS abend 2480

DSP0303I  AN OPEN LOG VOLUME WAS FOUND DBDNAME=*dbname*

DDNAME=*addname*

Explanation: There exists a log volume that was not successfully closed, and that might contain change records for the database data set or area data set identified by the DBDNAME and DDNAME or ADDN fields. This indicates that either information in the RECON data set about the volume is not complete or log errors exist that can prevent recovery of the identified database data set.

System action: The utility will fail unless it is the Change Accumulation utility. If the Change Accumulation utility is executing and message DSP0247I accompanies this message, then the utility execution will fail. Otherwise, the Change Accumulation utility will continue processing the log volumes found before the unusable log volume.
User response: Do the following:
1. Stop all IMS activity.
2. Issue a LIST.LOG command with the ALL parameter to list all the information in the RECON data set about all log data sets.
3. For each log volume that does not have a volume stop time (other than the current log volume), execute the System Log Terminator utility for the volumes in the same order in which they were created. If the log volume was successfully terminated, issue a NOTIFY:PRILOG or a NOTIFY:SECLOG command to add the volume stop time to the RECON data set.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
[Chapter 2, “IMS problem determination,” on page 13]

#### DSP0304I

**TIMER SERVICES**

**FAILUREFUNCTION = function**

**DIAGNOSTIC CODE = diagcd**

**CALLER = modname**

**TIMESTAMP=timestamp**

Explanation: The DBRC time service module DSPTIME0, which was called by DBRC module modname, received an error return code from the identified IMS time service function.

The values of function are:

- EXTERNAL TO INTERNAL
- GET CURRENT TIME
- UTC TO LOCAL
- LOCAL TO UTC
- INTERNAL TO EXTERNAL COMPRESSED
- INTERNAL TO EXTERNAL PUNCTUATED
- ADD/SUBTRACT INCREMENT

Only the EXTERNAL TO INTERNAL function is susceptible to direct user errors -- invalid time stamp values coded in a DBRC command or on a utility SYSIN control statement.

Errors in the other functions can result from hardware problems, system logic errors, or invalid data in the RECON data set. In the latter case, if the error occurs during the LIST command, the time field in error is marked by the characters:

```
************ERROR************
```

in the part of the listing that follows this message.

The diagnostic code diagcd identifies the error. A numeric value indicates a system internal error code returned from the IMS time service function. A non-numeric value indicates a user error.

Possible diagcd values for user errors in time stamps are:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>YYL</td>
<td>Length of YY is not 2 or 4.</td>
</tr>
<tr>
<td>DDL</td>
<td>Length of DDD is not 3.</td>
</tr>
<tr>
<td>DDD</td>
<td>The value of DDD is less than 001 or greater than 366.</td>
</tr>
</tbody>
</table>

The three previous error codes can indicate errors that are seemingly unrelated to the year and day values including, for example:

- A time stamp containing blanks was not enclosed in apostrophes.
- Four year digits were entered in the compressed-time format, which only allows two.
- Utility control-card formats have changed, but existing JCL has not been updated.

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>HHL</td>
<td>Length of HH is not 2.</td>
</tr>
<tr>
<td>HH</td>
<td>The value of HH is greater than 24.</td>
</tr>
<tr>
<td>MML</td>
<td>Length of MM is not 2.</td>
</tr>
<tr>
<td>MM</td>
<td>The value of MM is greater than 59.</td>
</tr>
<tr>
<td>SSL</td>
<td>Length of SS is not 2.</td>
</tr>
<tr>
<td>SS</td>
<td>The value of SS is greater than 59.</td>
</tr>
</tbody>
</table>

**OFFSET**

Offset value is invalid.

**MSEPS**

Consecutive non-numeric separators are present.

**EXCESS**

Time value is too long, or there is non-numeric data at the end.

**MVSOFF**

z/OS offset is invalid. The setting of the z/OS local-time clock resulted in an invalid offset from UTC (greater than +14 or less than -11).

**ZERO**

A zero time value was entered where zero is not permitted.

**LABEL**

The input time stamp contains a label that is not defined.

timestamp is the hexadecimal representation of the internal time stamp passed by calling module modname. It is not supplied for a user error, because the value entered by the user always appears in the utility output preceding this message.

Operator response: If the diagnostic code indicates a user error, correct the error and rerun. (For information about how to enter time stamp data in DBRC commands, see the topic on command syntax in [DBRC time stamps (Commands)](https://www.ibm.com).) Otherwise, contact IBM Software Support.

Module: DSPTIME0

#### DSP0305I

**RECON CLEANUP WAS SUCCESSFUL**

Explanation: A previous system failure left inconsistencies between the RECON data sets because the failure occurred during an update operation to the RECON data sets. The RECON data sets have been restored to a mutually-consistent state. The request that required a change in the RECON data sets and that
was issued prior to the system failure might not have been performed.

System action: Processing continued.

User response: Determine which changes in the RECON data set were not made, from a listing of the RECON data set. Rerun whatever is necessary to make the changes.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0306I  RECON CLEANUP UNSUCCESSFUL.

REASON CODE code

Explanation: A previous system failure left inconsistencies in the RECON data set because the failure occurred in the middle of an operation that was updating the RECON data set. The RECON data sets have not been restored to a mutually-consistent state. The reason code identifies the reason for the inconsistency.

The reason codes have the following meanings:

<table>
<thead>
<tr>
<th>Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>01</td>
<td>RECON data set could not be opened</td>
</tr>
<tr>
<td>02</td>
<td>RECON data set encountered an I/O error</td>
</tr>
<tr>
<td>03</td>
<td>RECON header record not found</td>
</tr>
<tr>
<td>04</td>
<td>RECON Cleanup logical error</td>
</tr>
<tr>
<td>05</td>
<td>Header record not found for CAGRP or DBDS</td>
</tr>
<tr>
<td>06</td>
<td>Wrong CAGRP name in DBDS header record</td>
</tr>
<tr>
<td>07</td>
<td>Neither new nor old DBID in CAGRP record for request to change the ddname of a DBDS LOGALL record not found</td>
</tr>
</tbody>
</table>

System action: IMS processing was terminated.

User response: Use an Access Method Services PRINT command to determine how the RECON data sets do not match. If they do not match, determine which one is the most correct and use an Access Method Services REPRO command to copy it to the least correct one. Once the RECON data sets match, make additional changes in both by using appropriate NOTIFY, CHANGE and DELETE commands.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0308I  COMMAND xxx HAS ABENDED

Explanation: A severe error occurred while processing command xxx. This message is issued only in an IMS or CICS® online environment.

System action: The command failed and is disabled for the remainder of the online invocation. A storage dump of the DBRC address space is created following the ABEND, but before normal processing resumes. The command will be enabled when this online region is restarted. The ability to issue this command in other online regions is not affected.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and the dump provided by ABEND processing.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0309I  COMMAND xxx UNAVAILABLE

Explanation: Command xxx encountered a severe error and was disabled for further use.

System action: Command xxx failed and will not be available until the online region is restarted or the command is reset.

Programmer response: After determining and correcting the cause of the original failure, you can reset the command by resubmitting the online command with the RESET parameter specified.

Problem determination: 2, 3, 8

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0310I  CLOSE REQUESTED FOR AN ACTIVE SUBSYSTEM

Explanation: The Log Recovery utility tried to close an online log data set, but the RECON data set shows that this log data set is associated with an active subsystem.

System action: The Log Recovery utility terminates processing.

User response: Correct the JCL, specifying the correct online log data set; then resubmit the job. If the correct online log data set was specified and the associated subsystem is not active, do one of the following:

• Issue the DELETE.SUBSYS command to delete the subsystem record from the RECON data set; then resubmit the job.

• Issue the CHANGE.SUBSYS command specifying the ABNORMAL parameter to indicate that the subsystem has terminated; then resubmit the job.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information:

Chapter 2, “IMS problem determination,” on page 13

DSP0311I  INPUT ONLINE LOG RECORD NOT FOUND IN RECON

Explanation: While the IMS Log Recovery utility or the IMS Log Archive utility was being validated, no record was found in the RECON data set with a data

**DSP0313I** DUPLICATE INPUT LOG DATA SET

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**System action:** Processing is terminated.

**User response:** Correct the JCL, specifying a valid log data set, and resubmit the job.

**Explaination:** During input validation for the IMS Log Archive utility, the RECON record of the input log data set indicated that the log data was not closed.

**System action:** Processing by the Log Archive Utility is terminated.

**User response:** Use the IMS Log Recovery utility to close the log data set and resubmit the archive job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set

**DSP0316I** INPUT rectype DATA SET RECORD

**Marked in error record**

**Problem determination:** The usage of the Log Archive utility was being validated, a record was found in the RECON data set that matched the data set specified in the JCL. This input data set record is marked as being in error. The rectype indicates the type of record in error and is one of the following: PRILOG, SECLOG, PRISLDS, or SECSLDS.

**System action:** The utility execution continues for a dual logging environment if one of the dual logs given in the JCL is not marked as being in error in the RECON data set. In a single logging environment, the utility execution is terminated.

**User response:** If the log data set being archived is in error, use the Log Recovery utility to correct it; then resubmit the archive job.

**DSP0317I** CLOSE REQUIRES ONLINE LOG

**SSID=ssid DDNAME=ddname**

**Explanation:** The IMS Log Recovery utility was invoked to close an online log data set. According to the information in the RECON data sets, the online log data set identified in the message is needed to close the online log data set in error. However, the log recovery request specified that the IMS Write Ahead Data Sets or an invalid online log data set should be used to close the online log data set in error.

**System action:** Processing Log Recovery utility is terminated.

**User response:** Resubmit the close request, specifying the identified online log data set.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

set name and volume serial number combination to match the one specified in the JCL.

**System action:** The utility execution is terminated.

**User response:** Correct the JCL, specifying a valid log data set, and resubmit the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**DSP0315I** NO STOPTIME IN record,

**TIME=timestamp**

**Explanation:** During input validation for the IMS Log Archive utility, the RECON record of the input log data set indicated that the log data was not closed.

**System action:** Processing by the Log Archive Utility is terminated.

**User response:** Use the IMS Log Recovery utility to close the log data set and resubmit the archive job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set

While validating input, the IMS Log Archive utility detected concatenated input DD statements that did not represent a contiguous set of log data sets.

**System action:** The Log Archive utility terminates processing.

**User response:** Noncontiguous logs cannot be archived in the same job step. Correct the JCL and resubmit the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**DSP0314I** CONCATENATED SLDS INPUT IS NOT CONTIGUOUS

**Explanation:** While validating input, the IMS Log Archive utility detected concatenated input DD statements that did not represent a contiguous set of log data sets.

**System action:** The Log Archive utility terminates processing.

**User response:** Noncontiguous logs cannot be archived in the same job step. Correct the JCL and resubmit the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

DSP0318I  INPUT ONLINE LOG RECORD NOT FOUND IN RECON

Explanation: During an open call from the IMS Log Recovery utility for an input log data set, no record was found in the RECON data sets for the online log data set. If DUP or CLS processing, no PRIOLDS record was found; if REP processing, no interim record was found.

System action: Processing Log Recovery utility is terminated.

User response: Use the LIST command to determine the correct online log data set. Correct the JCL and resubmit the job.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0320I  CLOSE REQUEST REQUIRES WRITE AHEAD DATA SET

Explanation: During the execution of the close or the duplicate and close mode of the IMS Log Recovery utility, DFSULTR0, it was determined that the input online log data set was to be closed by using the next online log data set. Information in the RECON data set indicated that online log data set must be closed by using the write-ahead data set.

System action: Processing by the utility is terminated.

User response: Resubmit the utility job, specifying that the online log data set is to be closed using the write ahead data set.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0321I  INPUT ONLINE LOG DATA SET ALREADY CLOSED

Explanation: An attempt was made to use the IMS Log Recovery utility, DFSULTR0, to close an online log data set by using the write ahead data set. Information in the RECON data set indicates that online log data set has already been closed. A write ahead data set can only be used to close an open online log data set, or the GENJCL.CLOSE command was issued to close an online log data set that closed normally during the termination of IMS.

System action: Processing by the utility is terminated.

User response: If the failure occurred during the execution of the Log Recovery utility, resubmit the job recovery job, specifying that the online log data set is to be closed by using the next online log data sets.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0322I  INPUT LOGS TO ARCHIVE ARE FROM DIFFERENT SUBSYSTEMS

Explanation: The input logs to the IMS Log Archive utility were created by different subsystems. The logs must be associated with a common subsystem before the archive utility can process them.

System action: Processing by the archive utility is terminated.

User response: Change the archive job’s JCL, specify the correct set of logs that you want to archive, and resubmit the job.

Problem determination: 2, 3, 8, and the listings of the RECON data sets.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0325I  SKELETAL JCL MEMBER name NOT FOUND, DD NAME ddname

Explanation: The identified skeletal JCL member was not found in the data set associated with the identified ddname.

System action: Processing of the GENJCL command is terminated and subsequent commands are not processed.

Programmer response: There are two probable causes for this error:
1. The skeletal JCL data set specified was incorrect.
2. The member name specified was incorrect. The member name might have been specified by the MEMBER or DEFAULTS parameter on the GENJCL command, or the member name might have been implicitly specified using the INIT.DBDS or INIT.CAGRP command.

To correct the first problem, specify the correct skeletal JCL data set and resubmit the command. To correct the second problem, specify the correct skeletal JCL member on the command, or change the implicitly specified member name by using a CHANGE.DBDS or CHANGE.CAGRP command.

Problem determination: 2, 3, 8, and a listing of the RECON DATA sets.

Related information: Chapter 2, “IMS problem determination,” on page 13
DSP0326I UNDEFINED SIMPLE KEYWORD  
keyword name IN SKELETAL JCL  
MEMBER member name DD NAME  
dname RECORD NUMBER nnn  

**Explanation:** During the processing of the identified skeletal JCL member, a simple keyword without an assigned value was found for record number nnn. An undefined simple keyword within a comment statement can also cause this message. The skeletal JCL member was obtained from the skeletal JCL data set associated with the identified dname.

**System action:** Processing of the GENJCL command continues. No substitution is done for the undefined keyword. The keyword is included in the output file without change. The command completion code is set to 4.

**Programmer response:** Determine if substitution should have occurred for the keyword. If so, reissue the GENJCL command specifying a value for the keyword with the USERKEYS parameter or through a skeletal JCL default member.

**Problem determination:** 2, 3, 8, and the listings of the skeletal JCL data set.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

DSP0327I INVALID statement type CONTROL  
KEYWORD IN SKELETAL JCL  
MEMBER member name DD NAME  
dname RECORD NUMBER nnn  

**Explanation:** During the processing of the specified skeletal JCL member, an invalid control keyword statement was detected for record number nnn. The statement type can be %delete or %select. The skeletal JCL member was obtained from the skeletal JCL data set associated with the identified dname.

**System action:** Processing of the GENJCL command is terminated, and subsequent commands are not processed.

**Programmer response:** Correct the syntax of the control keyword statement in the skeletal JCL member, and reissue the GENJCL command.

**Problem determination:** 2, 3, 8, and a listing of the skeletal JCL member.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

DSP0328I statement type CONTROL KEYWORD  
MISSING IN SKELETAL JCL MEMBER  
member name DD NAME dname  

**Explanation:** One of the following problems occurred during the processing of the identified skeletal JCL member:

- A %select or a %delete control keyword statement was detected without a corresponding %endsel or %enddel control keyword statement.
- A %endsel or a %enddel control keyword statement was detected without a corresponding %select or a %delete control keyword statement.

The skeletal JCL member was obtained from the skeletal JCL data set identified by the specified dname.

**System action:** Processing of the GENJCL command is terminated, and subsequent commands are not processed.

**Programmer response:** Add the missing control statement to the skeletal JCL member, and reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the skeletal JCL member.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

DSP0329I INVALID NESTING OF statement type  
CONTROL KEYWORDS IN SKELETAL JCL MEMBER  
member name DD NAME dname  

**Explanation:** During the processing of the identified skeletal JCL member, nested control keyword statements were found. This means that two %delete or %select statements were specified without an intervening %enddel or %endsel statement. While %delete groups can be contained within a %select group, and vice versa, neither %delete nor %select groups can be nested. The skeletal JCL member was obtained from the skeletal JCL data set identified by the specified dname.

**System action:** Processing of the GENJCL command is terminated, and subsequent commands are not processed.

**Programmer response:** Correct the skeletal JCL member, and reissue the GENJCL command.

**Problem determination:** 2, 3, 8, and a listing of the skeletal JCL member.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

DSP0330I INVALID SKELETAL JCL  
ASSIGNMENT RECORD IN  
SKELETAL JCL MEMBER  
member name DD NAME dname RECORD NUMBER nnn  

**Explanation:** During the processing of the identified skeletal JCL default member, an invalid assignment statement was found on record nnn. The skeletal JCL default member was obtained from the skeletal JCL.
data set identified by the specified ddname.

System action: Processing of the GENJCL command is terminated, and subsequent commands are not processed.

Programmer response: Correct the assignment statement, and resubmit the GENJCL command.

Problem determination: 2, 3, 8, and a listing of the skeletal JCL member.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0331I  CA EXECUTION IS NOT THE LATEST

Explanation: A NOTIFY.CA command was entered that specified a STOPTIME that is equal to or earlier than two or more CA records.

System action: The command fails and any subsequent commands are not processed.

Programmer response: If the command was entered correctly, use the DELETE.CA command to delete the CA records that are more recent than the CA record associated with the NOTIFY.CA command.

Problem determination: This message is informational only.

Module: DSPURU30

DSP0332I  NO rtype RECORDS SATISFY THE SELECT GROUP SELECTION CRITERIA

Explanation: During GENJCL.USER command processing, a select group is processed that returns no records because the selection criteria is not satisfied. rtype is the RECON record type that was to be selected.

The rtype value is one of the following:

<table>
<thead>
<tr>
<th>rtype</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOC</td>
<td>Allocation</td>
</tr>
<tr>
<td>CA</td>
<td>Change accumulation data set</td>
</tr>
<tr>
<td>DBDS</td>
<td>Database data set</td>
</tr>
<tr>
<td>IC</td>
<td>Image copy data set</td>
</tr>
<tr>
<td>OLDS</td>
<td>Online log data set</td>
</tr>
<tr>
<td>RLDs</td>
<td>Primary recovery log data set (PRILOG)</td>
</tr>
<tr>
<td>SRLDS</td>
<td>Secondary recovery log data set (SECLOG)</td>
</tr>
<tr>
<td>SLDS</td>
<td>Primary system log data set (PRISLDS)</td>
</tr>
<tr>
<td>SSLDS</td>
<td>Secondary system log data set (SECSLDS)</td>
</tr>
</tbody>
</table>

System action: Processing of the GENJCL command continues. The command completion code is set to 4. If the GENJCL command is run against a CA group or DBDS group, each member in the group is processed individually and this message is received for each member to which it applies.

User response: This message is issued for informational purposes only. The select group’s selection criteria might need modification to ensure the desired output.

DSP0338E  A RECON LOGALL RECORD INCONSISTENCY WAS DETECTED

RECORD TIME=time
DBNAME=dbname
DDNAME=ddname

Explanation: In the LOGALL record identified in the message text by time, the ALLOC count for the DBDS or area does not agree with the actual number of ALLOC records that exist in RECON for its PRILOG.

System action: If the system was recording an image copy (utility or NOTIFY.IC) for the DBDS or area, the image copy was successfully recorded, but extraneous recovery-related records (ALLOC, RECOV, and REORG) were not deleted.

If an ALLOC record is being deleted using the DELETE.ALLOC command, the command failed, and the ALLOC record is not deleted.

User response: This inconsistency should never occur. Contact IBM Software Support for assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Module: DSPURUL3

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0340I  ALLOCATION DURING THE TIME RANGE OF THE COMPRESSED LOG DATA SET ENTRY NOT ALLOWED, RECORD TIME=timestamp

Explanation: The NOTIFY.ALLOC command was issued to add allocation information for the log with the identified start time. However, the allocation time falls within the time range of compressed data set entry. This is not allowed because the compressed data set entry represents log data sets that were determined to be no longer necessary for recovery.

System action: The command failed and subsequent commands were not processed.

Programmer response: Correct and reissue the command, if appropriate, and reissue any other commands not processed.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0347I  THE RESTORE PARAMETER IS REQUIRED TO GENERATE RECOVERY JCL FOR THE NON-RECOVERABLE DBDS

DBD=dbname
DDN=ddname

or

or
THE RESTORE PARAMETER IS REQUIRED TO
GENERATE RECOVERY JCL FOR THE
NON-RECOVERABLE AREA DBD=dbname
AREA=areaname

Explanation: A GENJCL.RECOV command without the RESTORE parameter was issued for the identified nonrecoverable database data set (DBDS) or area data set either as a single command or as part of an explicit or implicit group invocation.

System action: If a single GENJCL.RECOV command was entered, the command terminates. If the command was part of an explicit or implicit group invocation, the JCL is not generated for this DBDS or area, but the command runs for the other group members.

Programmer response: If the GENJCL.RECOV command must be issued for this DBDS or area, enter the command with the RESTORE parameter.

Problem determination: 1, 2, 3, 8, 40

Module: DSPJCMAI, DSPJCRCV

Related information:
Chapter 2, “IMS problem determination,” on page 13

THE RESTORE PARAMETER MAY NOT BE SPECIFIED FOR GENERATING RECOVERY JCL FOR THE DBDS DBD=dbname DDN=dbname

or

THE RESTORE PARAMETER MAY NOT BE SPECIFIED FOR GENERATING RECOVERY JCL FOR THE AREA DBD=dbname AREA=areaname

Explanation: You issued a GENJCL.RECOV command with the RESTORE parameter for the identified normal or recoverable database data set (DBDS) or area data set either as a single command or as part of an explicit or implicit group invocation.

System action: If a single GENJCL.RECOV command was entered, the command is terminated. If the command was part of an explicit or implicit group invocation, the JCL is not generated for this DBDS or area, but the command is executed for the other group members.

Programmer response: If the GENJCL.RECOV command must be issued for this DBDS or area, enter the command without the RESTORE parameter.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0349I THE FOLLOWING RECORD SHOULD NOT BE ADDED FOR A NON-RECOVERABLE DATABASE.
RECORD TYPE=record type

Explanation: You should not add the identified record to a nonrecoverable database data set (DBDS) or a Fast Path user-recoverable Area. The NOTIFY command detected this record.

System action: The command failed.

Programmer response: Check the DBDS id in the NOTIFY command to verify the recoverability of the DBDS.

Problem determination: 2, 3

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0351I dbname DD INFORMATION IS INCONSISTENT WITH RECON

Explanation: The information supplied on the identified DD statement is inconsistent with related information in the RECON data sets. The information in the RECON data sets appears in the message, and is for the field-name (for example, DSNAME, FILE SEQ NUMBER, VOLUME, or VOLUME SER NUMBER) and the expected field value.

DBRC checks the generated JCL statements to see if the information in the RECON data set is the same at execution time. If changes in RECON occur between JCL generation and execution, this message appears.

This error can also occur if a cataloged multi-volume data set is sequenced apart by DBRC because NOCATDS is specified. In the message text, a data set, unrelated to the different volumes, separates the volumes, and that data set is flagged in error. The data sets associated with the DDNAME in the message will match the DD concatenation list.

This message is also issued by the Database Image Copy 2 utility if the Same Data Set option was specified for a DBDS that is defined in the RECON with the REUSE attribute. The Same Data Set option is not allowed in this case.

System action: This command failed, and subsequent commands were not processed.

User response: Determine the cause of the inconsistency and either correct the DD statement or correct the RECON data set.

If information in the RECON changed before JCL was executed, resubmit the GENJCL job and execute.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
Chapter 2, “IMS problem determination,” on page 13
**DSP0352I**  
**ddname** DD INFORMATION IS INCOMPLETE  

**Explanation:** The information supplied on the identified DD statement is consistent with the RECON data sets, but it is insufficient to perform the utility function requested (for example, for the Database Recovery utility to restore a database data set to its requested state). The last information that was supplied for the specified DD statement is listed. This information is followed by the additional information that is required (as defined in the RECON data set) and is identified in the message as the field-name (for example, DSNAME, FILE SEQ NUMBER, VOLUME, or VOLUME SER NUMBER) and the expected field value.  

**System action:** Utility processing was terminated.  

**User response:** Supply in the JCL for the utility the additional input identified in the message, and rerun the utility.  

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.  

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

---

**DSP0370I**  
AMS REPRO FUNCTION COMPLETE,  
AMS RETURN CODE=code  

**Explanation:** DBRC invoked the Access Method Services REPRO command and regained control with the indicated return code. The return code returned by DBRC is the highest return code returned by Access Method Services.  

**System action:** Normal processing continues.  

**User response:** No action is required.  

**Problem determination:** 2, 3, 8, and the listings of the RECON data set  

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

---

**DSP0379I**  
INSUFFICIENT DD INFORMATION TO COMPLETE THE AMS REQUEST  

**Explanation:** DBRC attempted to perform the Access Method Services REPRO function and determined from the input control statement that DD statements required for the request are not included in the JCL. The ending condition code is 4.  

**System action:** The BACKUP.RECON request terminates.  

**User response:** Ensure that the necessary DD statements are included. For example, if BACKUP.RECON RECON1 is the input control statement, BACKUP1 DD and RECON1 DD statements are required.  

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.  

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

---

**DSP0380I**  
RECONx COPY TO RECONy STARTED.  

**Explanation:** The RECON data set identified as RECONx is being copied to the data set identified as RECONy. This can occur as the result of:  
- Initialization of DBRC with one RECON (COPY1) and at least one spare RECON data set  
- A CHANGE.RECON DUAL command  
- A CHANGE.RECON REPLACE(RECONn) command  
- An I/O error on one of the RECON data sets  

If the copy operation completes successfully, the data set being copied to will be the COPY2 RECON data set, and the data set being copied from will be the COPY1 RECON data set. If the copy operation does not complete successfully, the COPY1 and COPY2 RECON data sets will remain as they were before the operation started. For situations (1) and (2) above, one spare RECON will be used, and the end result will be two active RECONs (COPY1 and COPY2). If there were two spare RECON data sets, the end result will be two active RECONs and one spare RECON data set. For the other situations (3 and 4), the spare will be used, and the RECON data set not involved in the copy operation will be discarded.  

**System action:** Processing continues.  

**Programmer response:** If necessary, delete and redefine the discarded data set to make a spare RECON available again.  

**Problem determination:** 2, 3, 8, and a listing of the RECON data set.  

**Related information:**  
Chapter 2, “IMS problem determination,” on page 13

---

**DSP0381I**  
COPY COMPLETE, RC = mnn  

**Explanation:** This message indicates the completion of a RECON copy operation (refer to message DSP0380I). If the return code is not zero, a previous message will have identified the problem. When the return code is nonzero:  
- If the operation was initiated as the result of an I/O error, there is now only one active RECON data set.  
- If the operation was the result of a CHANGE.RECON REPLACE(RECONn) command, the command fails, and the original RECONs remain unchanged.  
- If the operation occurred during DBRC initialization and there was only one spare RECON, continuation depends on whether STARTNEW or NONEW was the option chosen for starting new jobs. If NONEW was specified, this job will be terminated. If there
were two empty data sets available, a new copy operation will be initiated using the other spare RECON.

See message DSP0380I for expected results if the return code is zero.

System action: Processing continues unless the nonzero return code occurred during DBRC initialization with only one active RECON data set and NONEW is the option chosen for job processing.

Programmer response: If the return code is nonzero, a previous error message indicates the necessary response.

Problem determination: 2, 3, 8, and a listing of the RECON data set.

Related information:
DSP0380I Chapter 2, “IMS problem determination,” on page 13

DSP0383A RETAINED LOCKS EXIST ON COPY1|COPY2 OF RECON

Explanation: DBRC attempted to perform one of the following activities:
• The Access Method Services REPRO function
• An upgrade of the RECON data sets

DBRC determined that retained locks currently exist on copy1 or copy2 of the RECON as indicated in the message. The RECON is using Parallel RECON Access mode. Retained locks are encountered if Transactional VSAM (TVS) or the SMS server (SMSVSAM) has failed.

System action: The BACKUP.RECON or CHANGE.RECON UPGRADE request terminates.

User response: Ensure that the SMS server (SMSVSAM) is active and Transactional VSAM (TVS) is active on all processors that access the RECON data sets. Resubmit the request.

Module: DSPUBU00, DSPUGR00

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0387W WARNING: rrrrrrr SIZE ALERT
RECORD LENGTH = lllllllll ppp% OF RECORDSIZE sssssss
SSID = iiiiiiiii
STARTTIME = timestamp

Explanation: The message is issued when an OLDS is opened or when the system switches from one OLDS to another. The message indicates that when all active OLDS data sets have been archived, the size of the indicated record will exceed the values set by the SIZEALERT parameter of the CHANGE.RECON command.

In the message text:
rrrrrrrr The log record type, which can be: PRILOG, SECLOG, PRISLD, SECSLD, PRTSLD, or SETSLD.
llllllll The log record’s size in decimal.
ppp The log record’s percentage of the maximum size.
ssssssss The maximum size allowed for a log record.
iiiiiiii The IMS subsystem the log record is associated with.
timestamp The start time of the log record.

System action: Processing continues.

User response: Determine if intervention is necessary to avoid terminating IMS. If message DSP0287W is issued, intervention is not possible.

Module: DSPOLD00

DSP0388I SSID=ssidname FOUND

nnnn SSYS RECORD(S) IN THE RECON AT RECONFIGURATION

Explanation: During RECON reconfiguration, DBRC identified subsystems where an action might be required before for the subsystem recognizes the reconfiguration.

The list of subsystems does not include the subsystem that detected the reconfiguration. Also, the list of subsystems does not necessarily contain all subsystem records that exist in the RECON.

In the message text:
ssidname The subsystems requiring action.
nnnn The number of subsystem records found in the RECON requiring action.

For example, the following messages might be issued:
DSP0380I RECON2 COPY TO RECON3 STARTED
DSP0388I SSID=IMS1 FOUND
DSP0380I 0001 SSYS RECORD(S) IN THE RECON AT RECONFIGURATION
DSP0381I COPY COMPLETE, RC = 000

System action: Processing continues.

User response: No action is required.

This is an informational message only. See associated messages DSP0380I and DSP0381I.

Module: DSPURI20

Related information:
DSP0380I” on page 186
DSP0381I” on page 186
**Explanation:** DBRC has detected an inconsistency in the time stamp when processing a call. DBRC waits until the current time is later than the time found in a prior OLDS for an IMS restart and OLDS switch, or the open time of the current OLDS for a close OLDS call. IMS issues this message when DBRC initially finds the error.

In the message text:

- `nnnnnnnnnnnn` The call that is being processed. The value can be:
  - IMS RESTART
  - OLDS SWITCH
  - OLDS CLOSE

- `xxxxxxxx` The subsystem identifier.

- `timestamp1` The time that DBRC obtained from the current MVS clock.

- `timestamp2` Either the latest stop time of a previous OLDS or the start time of the current OLDS to close.

**System action:** DBRC attempts to obtain a more recent time stamp every 1/10 of a second. Any IMS restart, OLDS close, or OLDS switch calls wait for DBRC to finish.

Possible reasons for time stamp errors include:
- The MVS clock was reset incorrectly.
- The OLDS records in RECON were added or changed, or the last OLDS of a prior instance of IMS with future dates was closed.

You need to delete the OLDS in RECON with the invalid dates from RECON before restarting IMS.

**User response:** Determine why the inconsistency in the time stamps occurred. You can determine the length of time DBRC needs to wait by reviewing the two time stamps. If the gap is small, DBRC continues when time catches up. For large gaps, you might have to cancel DBRC or IMS.

**Problem determination:** 2, 3, and the listing of the RECON data sets

Chapter 6. DSP messages (Database Recovery Control) 189
change-accumulation group indicates that the identified database data set or area data set is a member of that change-accumulation group. The RECON data set, however, does not contain a header record for the identified database data set or area data set. This indicates an inconsistency in the RECON data set.

**System action:** Processing by the Change Accumulation utility was terminated.

**User response:** Obtain a list of the RECON data sets to determine where the inconsistency exists. If the database data set was deleted with a DELETE.DBDS command or if the area data set was deleted with a DELETE.ADS command, the corresponding field in the change-accumulation group record should have been reset to binary zeros. Correct the inconsistency in the RECON data set, and rerun the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**Explanation:** A record of the identified change-accumulation group cagrpnme was not found in the RECON data set, which indicates an inconsistency in that data set.

**System action:** Processing by the Change Accumulation utility was terminated.

**User response:** Obtain a list of the RECON data sets to determine where the inconsistency exists. If the change-accumulation group was deleted with a DELETE.CAGRP command, the corresponding field in the header record of each member database data set or area data set should have been reset to binary zeros. Correct the inconsistency in the RECON data set, and rerun the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**Explanation:** The identified database data set was specified on more than one SYSIN control statement for an execution of the Change Accumulation utility.

**System action:** Processing by the Change Accumulation utility was terminated.

**User response:** Eliminate the duplication in the SYSIN control statements, and rerun the job.

**Problem determination:** 2, 3, 8

**Related information:** Chapter 2, “IMS problem determination,” on page 13

**Explanation:** SYSIN input for the Change Accumulation utility is inconsistent with information in the RECON data set in one of the following ways:

- Some members of the identified Change Accumulation group were not specified in the SYSIN control statements, or
- Some database data sets specified in the SYSIN control statements are not defined in the RECON data set.

**System action:** Processing by the Change Accumulation utility was terminated.

**User response:** Correct the SYSIN control statements so that they include the names of all and only those database data sets that are members of the identified change-accumulation group.
**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0706I** IMAGE COPY NOT FOUND IN RECON FOR DBDNAME=ddname DDNAME=ddname

**Explanation:** Changes could not be accumulated for the identified database data set (DBDS) or area data set (ADS) because there is no record of a usable image copy data set in the RECON data set for the DBDS/ADS. The Change Accumulation utility uses the time stamp of an image copy data set to determine which change records to accumulate.

**System action:** If received during the GENJCL.CA process, then processing continues but the identified DBDS/ADS is removed from the generated JCL. If received during execution of the Change Accumulation utility, then processing terminates.

**User response:** If received during the GENJCL.CA process, add the appropriate image copy information to the RECON data set. Reissue the GENJCL.CA command.

If received during execution of the Change Accumulation utility, the state of the RECON data set has changed between the JCL generation and the JCL execution. Reissue the GENJCL.CA command.

**Problem determination:** 2, 3, 8, and the listings of RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0707I** generic-name INPUT IS NOT ALLOWED - ddname DD STATEMENT IS NOT DUMMY CAGRP=name

**Explanation:** A request to run the Change Accumulation utility for the identified change-accumulation group does not allow the input identified by generic-name (for example, CHANGE ACCUMULATION, or LOG TAPE). The corresponding DD statement for the data set ddname must be specified as dummy, or omitted.

**System action:** The utility request was not processed.

**User response:** Omit the identified DD statement or change it to dummy, and reissue the request.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0708I** DDNAME MUST BE SPECIFIED FOR DBDNAME=ddname

**Explanation:** A DB0 SYSIN control statement for the Change Accumulation utility contains the database name identified in the message, but does not contain a corresponding data set ddname. The Database Recovery Control requires that both the database name and the data set ddname be specified for the DB0 control statements of the Change Accumulation utility.

**System action:** Processing by the Change Accumulation utility was terminated.

**User response:** Add the needed ddnames to the DB0 control statement in error, and rerun the Change Accumulation utility.

**Problem determination:** 2, 3, 8

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0709I** NO IMAGE COPY OBTAINED FOLLOWING REORGANIZATION DBDNAME=ddname DDNAME=ddname

**Explanation:** You received this message during the GENJCL.CA processing when an offline reorganization of the database data set (DBDS) or area data set (ADS) identified in the message was recorded in the RECON data set. However, there is no record of a usable image copy data set was created and there was no online reorganization since that offline reorganization. This message might also be issued during CA utility processing if the CA JCL, which was not created by the GENJCL.CA command, did not include the purge times.

**System action:** The GENJCL.CA processing continues as long as there are other DBDSs to process. The DBDS identified in the message by ddname is removed from the generated JCL job. If there are no other DBDSs to process, the GENJCL.CA command fails. The CA utility execution fails.

**User response:** The next GENJCL.CA command will use the new starting point for the next Change Accumulation utility. If the CA utility was executing, issue a new GENJCL.CA command.

**Problem determination:** 2, 3, 8, and the listing of the RECON data set.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP0710I** DB0 *ALL OPTION NOT ALLOWED

**Explanation:** The *ALL parameter was specified on a DB0 SYSIN control statement or was defaulted for an execution of the Change Accumulation utility. This option is not valid when the IMS Database Recovery Control is installed.

**Problem determination:** 2, 3, 8

**Related information:** Chapter 2, “IMS problem determination,” on page 13
DSP0712I • DSP0715E

System action: Processing by the Change Accumulation utility was terminated.

User response: Replace the *ALL specification on the DB0 SYNIN control statement with DB0 control statements containing the names of the database data sets to be processed.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
  Chapter 2, “IMS problem determination,” on page 13

DSP0712I  NO INPUT TO PROCESS FOR CHANGE ACCUMULATION GROUP CAGRPname

Explanation: The most recent change records available have already been processed by the Change Accumulation utility for all database data sets in the change-accumulation group.

System action: The Change Accumulation utility terminated without processing any change-accumulation data sets.

User response: If a database has been added to the CA group, then there may be change records that need to be processed for that added member. However, the resultant CA would be invalid since its STOPTIME would be earlier than the last CA created. You should either delete the most recent CA record from RECON or wait for additional updates to occur to a member in the CAGRP.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
  Chapter 2, “IMS problem determination,” on page 13

DSP0713I  DATABASE DATA SETS BEING PROCESSED ARE NOT DEFINED IN RECON

Explanation: The database data sets for which change records are being accumulated are not defined in the RECON data set. No checking of the data sets used as input to the utility is performed, and no results are recorded in the RECON data set.

System action: The Change Accumulation utility continues without processing any change-accumulation data sets.

User response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
  Chapter 2, “IMS problem determination,” on page 13

DSP0714I  SPECIFIED PURGETIME IS EARLIER THAN THE CURRENT PURGETIME FOR DBDNAME=dbdname DDNAME=ddname CURRENT PURGETIME timestamp IS NOT USED

Explanation: When running the Change Accumulation utility, the PURGETIME specified in the SYSIN control statement for the identified database data set or area data set was not the current purge time. One of the following might have occurred since the GENJCL.CA command completed:
  • A later image copy has been added and has been recorded in RECON.
  • An online reorganization has completed. The changes for the input data sets for the online reorganization are no longer needed. Its purge time would be set as the stop time of that online reorganization.
  • An OLDS was archived and the selected purge time is based on the image copy type, allocations, checkpoint IDs, and number of checkpoints on the log volumes.

System action: Processing by the Change Accumulation utility continues as long as log input verifies. The PURGETIME specified in the SYSIN control statement is used.

User response: No action is required.

If the Change Accumulation fails, the failure is due to a different reason and a different message would be issued indicating the reason for the failure.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
  Chapter 2, “IMS problem determination,” on page 13

DSP0715E  SPECIFIED PURGETIME IS LATER THAN THE CURRENT PURGETIME FOR DBDNAME=dbdname DDNAME=ddname CURRENT PURGETIME = timestamp

Explanation: During Change Accumulation utility execution, the PURGETIME specified in the SYSIN control statement for the identified database data set or area data set is later than the purge time DBRC selected based on a usable image copy data set or online reorganization.

One of the following may have occurred since the GENJCL.CA command completed:
  • The latest image copy was marked in error.
  • An online reorganization was deleted from RECON.
  • An image copy has been deleted from RECON.

System action: Processing by the Change Accumulation utility fails.

User response: Issue a GENJCL.CA command and execute the new CA JCL.
Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0716I  LATER OFFLINE REORGANIZATION FOLLOWING PURGETIME FOR 
DBDNAME=ddname DDNAME=ddname 
RUNTIME = timestamp

Explanation: You receive this message during Change Accumulation utility processing when an offline reorganization of the identified database data set (DBDS) was recorded in the RECON data set, but there is no record of a usable image copy data set created and no online reorganization since that offline reorganization. timestamp in the message test identifies the time stamp of the offline reorganization.

System action: The purge time for the SYSIN statement is used. If changes after the offline reorganization are found on any logs input to the JCL, the Change Accumulation utility fails.

User response: No action is required.

The Change Accumulation utility completes using the purge time in the SYSIN statement as long as no changes are included after the offline reorganization in the JCL.

DSP messages DSP0801-DSP0900

This topic contains the following messages:

DSP0802I  IMAGE COPY INPUT IS REQUIRED FOR RECOVERY

Explanation: A SYSIN control statement (or USEDBDS/USEAREA parameter on the GENJCL.RECOV command) for the Database Recovery utility indicates that an image copy data set is not to be used as input to the recovery action. This is a valid option if this recovery request was preceded by a successful time stamp recovery, and only changes that occurred since the time to which the database data set was recovered are to be applied. The Database Recovery utility determined, however, that either changes were made to the database data set since the previous time stamp recovery, or the previous recovery restored the database data set to a time that is within another time stamp recovery range. Therefore, a full recovery using an image copy data set is required.

System action: The Database Recovery utility terminates processing for the DBDS that is being processed. If recovery for a DBDS group is requested, processing continues for the remaining members of the group.

User response: Change the SYSIN control statement (or the GENJCL command) to request a full recovery, and run the job again.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0804I  DATABASE DATA SET REORGANIZED timestamp

Explanation: The recovery of a database data set to a particular time stamp was requested. This is not possible, because the specified time stamp requires that data sets used in recovery were created both before and after a reorganization of the database data set be used as input to the Database Recovery utility. The time stamp of the reorganization appears in the message.

System action: Processing by the Database Recovery utility was terminated.

User response: Select a time stamp prior to the reorganization or one that requires only information recorded after the reorganization; recover the database data set to that time stamp. If the database data set is to be recovered to its state prior to the reorganization, the DBDLIB might require changes if the reorganization changed information that is maintained in the DBDLIB data set.
Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0805I  generic-name INPUT IS NOT ALLOWED - ddname DD STATEMENT IS NOT DUMMY

Explanation: The input identified by the generic-name field (IMAGE COPY, CHANGE ACCUMULATION, or LOG TAPE) is not allowed as input to this execution of the Database Recovery utility. The DD statement that is identified by the ddname field is not DUMMY and must be, unless it is omitted.

System action: Processing by the Database Recovery utility was terminated.

User response: The file is not required for recovery. Change the identified DD statement to DUMMY (or omit it), and rerun the job.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0806I  PARTIAL RECOVERY OPTION INVALID FOR TRACK RECOVERY

Explanation: Conflicting information was supplied on a SYSIN control statement for the Database Recovery utility. Column 2 of the statement contained a T, indicating a request for a track recovery; columns 31 through 43 of the same statement contained either a time stamp or a comment, indicating a request for a time stamp recovery. Track recovery and time stamp recovery are mutually exclusive.

System action: Processing by the Database Recovery utility was terminated.

User response: Decide which type of recovery the Database Recovery utility is to perform, and change the SYSIN control statement appropriately; then rerun the job.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0807I  NO IMAGE COPY OPTION INVALID FOR TRACK RECOVERY

Explanation: The SYSIN control statement for the Database Recovery utility contains both the following:
- T in column 2, which indicates that track recovery is requested
- C in column 44, which indicates that an image copy data set is not to be used as input

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0808I  RECOVERY OF A KSDDS INDEX NOT SUPPORTED IN RECON

Explanation: The Database Recovery utility processed a request to recover the index of a VSAM key-sequenced data set (KSDS). Because information about the index portion of VSAM key-sequenced data sets is not maintained in the RECON data set, the feature is not involved in any way in the recovery action.

System action: Processing of the recovery request continued. No information was acquired from or written to the RECON data set.

User response: No action is required.

Problem determination: 2, 3, 8

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP0809I  SPECIFIED TIMESTAMP timestamp IS INVALID

Explanation: The identified time stamp, which was specified in a SYSIN control statement, is invalid; either it contains invalid characters, or its value is not within the allowable ranges. Allowable ranges are defined in the description of the GENJCL.RECOV command.

System action: Processing by the Database Recovery utility was terminated.

User response: Correct the time stamp, and reissue the command.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information:
Chapter 2, “IMS problem determination,” on page 13
DSP0810I  REQUIRED CHANGE ACCUMULATION INPUT NOT FOUND FOR TRACK RECOVERY

**Explanation:** A track recovery request always requires a change-accumulation data set as input, but the RECON data sets have no record of a change-accumulation data set for the specified database data set since its last image copy data set.

**System action:** Processing by the Database Recovery utility was terminated.

**User response:** Execute the Change Accumulation utility to obtain the required change-accumulation data set if a track recovery is to be performed, or perform a full recovery of the database data set.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

DSP0812I  USER HAS SPECIFIED A NULL RECOVERY REQUEST

**Explanation:** The recovery of a database data set (DBDS) was requested without using an image copy data set as input. This is a valid option following a time stamp recovery. The Database Recovery utility determined that the specific DBDS being recovered has not been allocated since its last time stamp recovery. With no image copy data set and no allocations, this means that no inputs exist from which to perform the recovery.

**System action:** The Database Recovery utility terminates processing for the DBDS that is being processed. If recovery for a DBDS group is requested, then processing continues for the remaining members of the group.

**User response:** Determine if the SYSIN control statement is correct. If not, correct the input and rerun the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

DSP0813I  DATABASE CHANGES MAY EXIST BEYOND CHANGE ACCUMULATION

**Explanation:** The RECON data set has records of more recent log volumes than those processed in the latest change-accumulation data set that was used for the requested track recovery. The recovered tracks might not include the most recent changes that were made to their equivalents in the database data set prior to the recovery action.

**System action:** Processing by the Database Recovery utility was terminated.

**User response:** Determine from the RECON data sets if any image copy data set exists for the database data set. If one does exist, then either it is not usable due to previous time stamp recoveries of the database data set, or it is not usable because it is marked invalid. Specify

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

DSP0814I  DATABASE DATA SET NOT FOUND IN CHANGE ACCUMULATION GROUP CAGRP=name

**Explanation:** During an execution of the Database Recovery utility, conflicting information was found in the RECON data set about change-accumulation data sets to be used in the recovery of a database data set. The DBDS record in the RECON data set specifies that the database data set to be recovered is a member of the change-accumulation group that is identified in the message. The change-accumulation-group record in the RECON data set, however, does not indicate that the database data set is a member of the change-accumulation group.

**System action:** Processing by the Database Recovery utility continued without using change-accumulation data sets as input.

**User response:** Obtain a listing of the RECON data sets to determine where the conflicting information is. To correct the problem, first delete the change-accumulation group, which deletes all existing change-accumulation data sets for the change-accumulation group. Then redefine the change-accumulation group and the corresponding change-accumulation data sets (now considered empty) in the RECON data sets. Then rerun the job that failed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set.

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

DSP0815I  NO USABLE IMAGE COPY AVAILABLE FOR RECOVERY

**Explanation:** The recovery request cannot be performed because no usable image copy data set exists from which to restore the database data set to the desired state. The use of a user image copy (nonstandard image copy) cannot be used for recovery. See the note under User response.

**System action:** Processing by the Database Recovery utility was terminated.

**User response:** Determine from the RECON data sets if any image copy data set exists for the database data set. If one does exist, then either it is not usable due to previous time stamp recoveries of the database data set, or it is not usable because it is marked invalid. Specify

---

[Chapter 6. DSP messages (Database Recovery Control)](#)
a different time stamp to which to recover the database data set, so that a valid image copy data set will be selected; rerun the job. To recover a database with a nonstandard image copy, first restore the DBDS from the nonstandard image copy. Then, enter a NOTIFY.RECOV command with specified RCVTIME (IC run time) to record this restoration in RECON. Issue the GENJCL.RECOV command with the specified USEDBDS parameter. JCL is generated to add changes to the database in its current state.

Problem determination: 2, 3, 8, and the listings of the RECON data set

Related information:Chapter 2, “IMS problem determination,” on page 13

---

DSP0816I  INVALID RECOVERY OPTION SPECIFIED IN CONTROL STATEMENT

Explanation: Column 57 of the SYSIN control statement for the Database Recovery utility contains neither a $ nor a blank.

System action: Processing by the Database Recovery utility was terminated.

User response: Correct the error on the control statement, and rerun the job.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

---

DSP0817I  CHANGE ACCUMULATION GROUP RECORD NOT FOUND IN RECON CAGRP=nam

Explanation: During the recovery of a database data set, the header record of the database data set indicated that it was a member of the change-accumulation group that is listed in the message, but that change-accumulation group does not exist in the RECON data set. This indicates an inconsistency in the RECON data set.

System action: Processing by the Database Recovery utility was terminated.

User response: Obtain a listing of the RECON data set to determine where the inconsistency exists. Use whatever commands of the Recovery Control utility are needed to restore the RECON data sets to a consistent state before rerunning the failing job.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

---

DSP0818I  LOGS USED FOR PRIOR RECOVERY ARE NOT USABLE

Explanation: DBRC cannot determine if the database data set being recovered will be restored properly due to the following sequence of prior events:

- A time-stamp recovery was performed for the database data set using a certain set of log volumes (usually primary log volumes).
- An image copy was not made of the database data set following the time-stamp recovery.
- One or more of the log volumes used in the time-stamp recovery was marked in the RECON data set as having an I/O error.
- Changes were made to the database data set.
- The recovery request being processed is supposed to restore the database data set to a time stamp beyond that of the prior time-stamp recovery. The problem in this set of circumstances is one of the potential for losing the effects of the prior partial recovery.
- In dual logging mode, a change-accumulation data set required for recovery contains a PRILOG entry that has been marked in error since the execution of the Change Accumulation utility.

The current recovery request will be processed as follows:

- The most recent image copy preceding the time-stamp recovery is used.
- Because of the I/O errors on the log volumes used for the time-stamp recovery, a different set of log volumes is used (usually the secondary log volumes). The primary and secondary log volumes of IMS are not synchronized at end-of-volume; it is thus possible for database changes to exist on the new set of log volumes used in the current recovery request that did not exist on the volumes used in the time-stamp recovery request. The final result is that the recovered database data set might not reflect the results of the prior time-stamp recovery.
- The SECLOG entry for the PRILOG entry that was marked in error is included in the generated JCL.

System action: Processing by the Database Recovery utility continued.

User response: Examine the restored database data set to ensure that it has been recovered to the desired state.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

---

DSP0819I  RECOVERY REQUEST REQUIRES AN OPEN LOG VOLUME

Explanation: The recovery request requires a log volume for which no volume stop-time has been recorded in the RECON data set. A volume is not considered usable in a recovery until a stop time has been recorded for it in the RECON data set.
System action: Processing by the Database Recovery utility was terminated.

User response: If the volume was terminated properly without a record of the termination being added to the RECON data set, use a CHANGE.PRILOG or CHANGE.SECLOG command to add this information to the RECON data set.

Problem determination: 2, 3, 8, and a listing of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0821I TRACK RECOVERY OPTION INVALID FOR NON-VSAM DATA SET

Explanation: A control statement for the Database Recovery utility requested a track recovery. The recovery cannot be performed because the database data set for which the track recovery action was requested is not a VSAM data set.

System action: Processing by the Database Recovery utility was terminated.

User response: If the database data set was incorrectly specified, correct the control statement. If the database data set was correctly specified, and recovery is required due to a permanent I/O error in it, request a full recovery on the control statement for the Database Recovery utility. In either case, rerun the job after correcting the control statement.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0821I RECOVERY REQUESTED TO TIMESTAMP timestamp DBD=dbname

xxxx=name

Explanation: This message indicates that an execution of the Database Recovery utility has requested a recovery to the specified time stamp. If xxxx is AREA, then name is the area name. If xxxx is DDN, then name is the ddn name.

System action: Processing continues.

User response: No action is required.

Problem determination: 2, 3, 8, and the listings of the RECON data set.

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP0828I NO USEABLE IC TO RECEIVE FOR DBD dbname DDN/AREA ddname/areaname

Explanation: DBRC could not find a usable image copy while executing a GENJCL.RECEIVE or NOTIFY.RECOV command. A usable image copy has the following characteristics:

• It is not flagged as “in error.”
• It was created by the IMS batch image copy utility.
• It was created after any updates were received at the tracking site.

System action: The command is terminated.

System programmer response: Create a usable image copy data set at the active site, send it to the tracking site, use NOTIFY to register it in RECON.

Problem determination: 2, 3, 8, and a listing of the RECON data sets.

Module: DSPURVTN

Related information: Chapter 2, “IMS problem determination,” on page 13
DSP0829I NO IMAGE COPY AFTER A POINT-IN-TIME RECOVERY

**Explanation:** During a GENJCL.RECOV command or while the database recovery utility was running, DBRC determined that input to the recovery utility (which was created previously) specifying the PITR parameter is required. As the later PITR recovery only applies committed data and might have removed any Backout records, DBRC cannot guarantee the integrity of the database. The command, the utility, or both have failed.

**System action:** The GENJCL.RECOV command fails and subsequent commands are skipped. If the error is detected while the utility is running, recovery is terminated.

**User response:** After a POINT-IN-TIME recovery, an image copy must be taken so that subsequent recoveries have a valid starting point. If you know the integrity of the database will not be compromised, delete the RECOV record by using the DBRC DELETE.RECOV command, then rerun the job. Otherwise, delete the RECOV record and recover the database using a database recovery service and specify the PITR parameter. For example, recreate the original PITR recovery. Then take an image copy before using the database.

**Module:** DSPURVIN

DSP0830I RECOVERY REQUEST INCONSISTENT WITH ONLINE REORG RUNTIME "timestamp"

**Explanation:** The requested recovery is invalid due to inconsistent information found in the RECON data set. One of the following occurred:
- A HALDB OLR has completed prior to the full recovery and the HALDB OLR record identified cannot be used as input to recovery.
- The recovery-to-time falls within a HALDB OLR and time stamp recoveries are not allowed.

**System action:** Processing is terminated. The RECON data sets are not updated. If the HALDB OLR record cannot be used as input to recovery, select a time stamp that is valid or recover the active DBDS. Choose a valid time stamp if the recovery-to-time is within an HALDB OLR.

**Programmer response:** Contact the IBM Support Center if you require additional assistance.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:** Chapter 2, “IMS problem determination,” on page 13

DSP0832I FULL RECOVERY NOT ALLOWED FOR AN INACTIVE DBDS

**Explanation:** A full recovery of a DBDS was requested. However, the specified DBDS is an inactive DBDS of a HALDB partition.

**System action:** The GENJCL.RECOV command or Database Recovery utility terminates processing for the DBDS.

**Programmer response:** Determine if the GENJCL.RECOV command or the SYSIN control statement is correct. If not, make the correction and rerun the job.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Module:** DSPURVIN

**Related information:** Chapter 2, “IMS problem determination,” on page 13

DSP0833I ONLINE REORG INPUT NOT VALID FOR RECOVERY

**Explanation:** A GENJCL.RECOV command specifying USEOLRRG was issued and DBRC determines that an image copy is needed instead.

**System action:** Processing is terminated. The command fails. Review the RECON contents and reissue the command appropriately.

**Programmer response:** Contact the IBM Support Center if you require additional assistance.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets.

**Related information:**
DSP messages DSP1001-DSP1050

This topic contains the following messages:

**DSP1001I**  
**GSG gsg_name ALREADY DEFINED**

**Explanation:** An attempt was made to define a global service group (GSG) with the name gsg_name, but a GSG with the same name already exists.

**System action:** The command is terminated and subsequent commands are ignored.

**Operator response:** Reissue the command with the correct GSG name.

**Module:** DSPURLSB

**DSP1002I**  
**GSG gsg_name NOT DEFINED**

**Explanation:** An attempt was made to list or delete a global service group (GSG), or otherwise access the GSG named gsg_name, but the GSG does not exist.

**System action:** The command is terminated and subsequent commands are ignored.

**Operator response:** Reissue the command with the correct GSG name.

**Module:** DSPJCCEV, DSPRESET, DSPURCM8, DSPURDLB, DSPURD60, DSPURM60, DSPURM80,
DSP1003I  GSG gsg_name HAS MAXIMUM SGS DEFINED

Explanation: An attempt was made to add a service group to the global service group (GSG) named gsg_name. The named GSG already has the maximum number of service groups (SG) defined.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Either correct the GSG name, or delete a service group before adding a new one.

Module: DSPURSLB

DSP1004I  NO GSG RECORDS FOUND IN RECON

Explanation: A LIST.GSG ALL or LIST.RECON command found no global service groups (GSGs) to be listed.

System action: Processing continues.

Module: DSPURPLB

DSP1005I  GSGNAME MUST BE SPECIFIED

Explanation: An INIT.DB command was entered with either the DBTRACK or RCVTRACK parameter, but no global service group (GSG) name was entered.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Either remove the RSR-related parameters or add a GSGNAME.

Module: DSPURS00, DSPURS10

DSP1006I  CANNOT IC OR REORG A COVERED DB AT THE TRACKING SITE

Explanation: An attempt was made to issue a GENJCL.IC or NOTIFY.REORG command for a database covered by a global service group (GSG) at the tracking site. A covered database cannot be image copied or reorganized at the tracking site.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command with an appropriate database name.

Module: DSPURT00

DSP1007I  USID PARAMETER REQUIRED FOR COVERED DATABASES

Explanation: A NOTIFY.IC, NOTIFY.UIC, or NOTIFY.ALLOC command was issued for a database or area that is covered by a global service group (GSG). In these cases, an update set identifier (USID) parameter is required.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command with the required USID parameter.

Module: DSPURT00, DSPURT10, DSPURT95

DSP1009I  SUBSYSTEM ssidname SIGNED ON TO GSG gsg_name- COMMAND REJECTED

Explanation: A DELETE.GSG, DELETE.SG, or CHANGE.SG command was issued for the global service group (GSG) gsg_name which has been signed on to by subsystem ssidname. All subsystems must be signed off a GSG before it or its SG entries can be modified or deleted. Alternatively, the wrong GSG might have been specified in the command.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command after all subsystems signed on to the GSG have terminated or specify the correct GSG.

Module: DSPURDLB, DSPURM80

DSP1010I  SG sg_name ALREADY DEFINED

Explanation: An attempt was made to define a service group (SG) with the name sg_name, but the SG already exists.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command with the correct SG name.

Module: DSPURSLB

DSP1011I  SG sg_name NOT DEFINED

Explanation: An attempt was made to delete or modify a service group (SG) entry named sg_name, but the SG does not exist within the global service group (GSG) specified.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command with the correct SG or GSG name.

Module: DSPURDLB, DSPURM80
Explanation: An attempt was made to define a service group (SG) as LOCAL or NONLOCAL when an SG of the designated type already exists within the global service group (GSG).

System action: The command is terminated and subsequent commands are ignored.

Operator response: There can only be one LOCAL or NONLOCAL SG per GSG. Make the required corrections and reissue the command.

Module: DSPURSLB

DSP1013I  ACTIVE|TRACKER SG ALREADY DEFINED

Explanation: An attempt was made to assign a service group (SG) to an ACTIVE or TRACKER role when an SG of the designated role already exists within the global service group (GSG).

System action: The command is terminated and subsequent commands are ignored.

Operator response: There can only be one ACTIVE or TRACKER SG per GSG. Make the required corrections and reissue the command.

Module: DSPURSLB

DSP1014I  parameter PARAMETER NOT ALLOWED FOR DL/I

Explanation: A parameter (GSGNAME, RCVTRACK, or DBTRACK) was specified on an INIT.DBDS command for a full function database. These parameters are valid only for a Fast Path area.

System action: The command is terminated.

Programmer response: Either use the INIT.DB command or change DBDS(...) to AREA(...).

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Module: DSPURS00

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1015I  INCONSISTENT RLDS/SLDS RECORDS, SSID subsystem_name START TIME timestamp

Explanation: While processing an IMS request, DBRC found an inconsistency between an OLDS, PRILOG, or PRISLDS record. timestamp is the start time for the record which does exist and for which there should be (but is not) a PRILOG or PRISLDS record.

System action: DBRC returns an error code to IMS.

IMS either terminates abnormally, or issues a message and terminates.

Programmer response: The inconsistency must be corrected before continuing. Initiate your service or maintenance process to diagnose and resolve the problem.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Module: DSPQLOGS, DSPTLG00

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1016I  GSG RECORD NOT FOUND, GSG NAME = gsg name

Explanation: DBRC required a global service group (GSG) name from RECON during execution of a command, but the necessary GSG name could not be found.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Issue INIT.GSG and INIT.SG to create or correct the GSG name. Then reissue the command.

Module: DSPCHKWD, DSPTLG00, DSPTREPL, DSPURCM8, DSPURT00, DSPURT50, DSPURT55

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1017I  COVERED DATABASE AUTHORIZED BY A TRACKING SUBSYSTEM

DBD=database_name, SSID=ssidname

Explanation: A problem was found during the execution of one of the following commands:

CHANGE.ADS
CHANGE.DB
CHANGE.DBDS
DELETE.ADS
DELETE.ALLOC
INIT.DBDS
NOTIFY.ALLOC
NOTIFY.RECOV

It was found that the database or area involved is covered by a global service group (GSG) and authorized by a tracking subsystem. In these circumstances, execution of the command is not permitted.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Wait until the database or area has no tracking subsystems authorized to it, then reissue the command.

Module: DSPCHKWD, DSPURCM8, DSPURT20
DSP1018I • DSP1025I

DSP1018I  GROUP grpname IS NOT A VALID DBDS GROUP

Explanation: The identified group was initialized in RECON as a DB group or RECOV group, that is, the INIT.DBDSGROUP command was used with the DBGRP keyword or the RECOVGRP keyword. The group name specified in the GROUP keyword of a GENJCL command or a LIST.HISTORY command must be either a DBDS Group or a CA Group.

System action: The command fails and subsequent commands are not processed.

Operator response: Correct the command to specify the name of a valid DBDS group. Reissue the command and any others that were not processed.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Module: DSPJCMAI, DSPURPHI

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1021I  AREA IS STILL COVERED DBD= database name AREA= area name

Explanation: You issued the CHANGE.DB command with the TYPEIMS parameter to change a database from Fast Path to DL/I. All areas must be uncovered before issuing CHANGE.DB TYPEIMS.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Uncover the areas and reissue the command.

Module: DSPURCM8

DSP1022I  LOCAL SG ROLES MUST MATCH

Explanation: You issued a CHANGE.DB or CHANGE.DBDS command to change the global service group (GSG) covering the DB or AREA. However, the local service group (SG) roles must be the same before can make this change.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Make sure that the local SG roles are the same before reissuing the command.

Module: DSPURCM8, DSPURM60

DSP1023I  PARAMETER INVALID FOR DBD= database name

or

PARAMETER INVALID FOR DBD= database name AREA= area name

EXPLANATION: One of the following errors occurred:

• The CHANGE.DB command was issued with the following parameters: 6SGNAME, NOTCOVER, RCVTRACK, DBTRACK. These parameters are not allowed for a Fast Path DEDB.

• The CHANGE.DB command was issued with 6SGNAME for a unrecoverable or user-recoverable database which is not allowed.

• The CHANGE.DB command was issued with the TYPEFP, USERRCOV, or NONRECOV parameter on a covered DL/I database without the NOTCOVER parameter.

• The CHANGE.DB command was issued with the USERRCOV parameter on a database that is part of a change accumulation group.

• GENJCL.RECEIVE is not valid for uncovered databases or areas.

• An INIT.DB command was issued with USERRCOV for a DL/I database.

• An INIT.DBDS command was issued for a Fast Path area with one of the following parameters: GSGNAME, RCVTRACK, or DBTRACK. However, the DEDB was defined as unrecoverable or User-Recoverable and these parameters are not allowed for unrecoverable or user-recoverable databases.

• A CHANGE.DB command was specified to change OLRIMSID(), NOOWNER, OLRDBDS(A|M), OLRRGON or OLRRGOFF and the reorg intent flag is on, or the quiesce in progress or quiesce held flags are on for the partition database.

System action: The command is terminated and subsequent commands are ignored.

Operator response: Reissue the command with the correct parameters.

For the CHANGE.DB command with OLRIMSID(), NOOWNER, OLRDBDS(A|M), OLRRGON or OLRRGOFF parameters, wait until the database is done being reorganized or quiesced. If the flags are on in error, issue the CHANGE.DB command to set off the flags. Reissue the command.

Module: DSPURCM8, DSPURS00, DSPURM10

DSP1025I  TRACKING OPTIONS INVALID FOR UNCOVERED DB/AREA DBD= database name

or

TRACKING OPTIONS INVALID FOR UNCOVERED DB/AREA DBD= database name AREA= area name

Explanation: You issued a CHANGE.DB or CHANGE.DBDS command with the following parameters: RCVTRACK or DBTRACK. These parameters are not valid if the database or area is not covered by a global service group (GSG).

System action: The command is terminated and
subsequent commands are ignored.

**Operator response:** Make sure that the database or area is covered before reissuing the command.

**Module:** DSPURCM8, DSPURM60

---

**DSP1027I**

**LOCAL SG OF COVERING GSG NOT A TRACKING SG**

**Explanation:** You issued a GENJCL.RECEIVE command for a database or area that is not a shadow database or area. In other words, the command was issued at the active site. GENJCL.RECEIVE is only valid from the tracking site.

**System action:** The command fails.

**Programmer response:** Issue the command at the tracking site or use another command at the active site.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Module:** DSPJCCEV

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1028I**

**RECORD OF TRACKED SUBSYSTEM MAY NOT BE CHANGED**

**Explanation:** You issued the CHANGE.SUBSYS command specifying a tracking subsystem name. These records cannot be altered by commands.

**System action:** The command fails.

**Programmer response:** Issue the command using the correct subsystem name. If you want to change tracked subsystem record, you need to try other records or procedures to make effect the change.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Module:** DSPURM20

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1029I**

**ABNORMAL OR NORMAL MUST BE SPECIFIED**

**Explanation:** You issued a CHANGE.SUBSYS command specifying a tracking subsystem name. The only parameters that are valid in this case are ABNORMAL or NORMAL.

**System action:** The command fails.

**Programmer response:** Reissue the command.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Module:** DSPURM20

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1030I**

**CURRENT TOD IS EARLIER THAN PREVIOUS ACTSITE TOD, WAITING TILL timestamp**

**Explanation:** An active IMS being brought up for the first time after a remote takeover (planned or unplanned) has determined that the time at the new active site is earlier than the time at the old active site. Any activity now at the active site would cause problems (such as log records' being out of order). Therefore, the new active IMS will wait the amount of time (shown as timestamp) needed to “catch up”. timestamp is specified as a normal time stamp. This situation can occur because the two sites are in different time zones or because the system clocks are not properly set or synchronized.

**System action:** The subsystem waits for the time specified in the message, then continues processing.

**Programmer response:** No action is required.

**Problem determination:** 2, 3, 8, and a listing of the RECON data sets

**Module:** DSPFSIGN

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1031I**

**STARTIME/TOTIME OR SSID WAS NOT GIVEN**

**Explanation:** A command which requires a time stamp or SSID parameter was issued without it.

**System action:** The command is not processed.

**Operator response:** Reissue the command with the appropriate parameters.

**Module:** DSPFTSIGN, DSPURD65

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1032I**

**LOG NOT A TRACKING SITE COPY**

**Explanation:** A DELETE.LOG command was issued with the DSN parameter. This command is only valid on a copy of a tracking site log.

**System action:** The command is not processed.

**Operator response:** Reissue the command against a copy of a tracking site log.

**Module:** DSPFURD60

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1033I**

**LOG CONTAINS MORE THAN ONE DSN, DSN=data set name**

**Explanation:** A DELETE.LOG command was issued with the DSN parameter. One of the log records specified by STARTIME contained more than one data set entry in RECON with the specified data set name.
**DSP1034I**  
**LOG DOES NOT CONTAIN DATA SET**

**Explanation:** A DELETE.LOG command was issued with the DSN parameter. There was no data set entry in RECON with the specified data set name, or the specified time stamp could not be found.

**System action:** The command is not processed.

**Operator response:** Correct the data set name in one of the duplicate entries, then reissue the command.

**Module:** DSPURD60

**Module:** DSP1034I

**DSP1035I**  
**RSR IS NOT ACTIVE**

**Explanation:** You tried to run either an INIT.GSG or an INIT:SG command in an environment where RSR is not installed. No GSG record is created.

**System action:** The command is terminated and subsequent commands are ignored.

**Module:** DSPNORSR

**Module:** DSP1035I

**DSP1036I**  
**RESET GSG COMMAND FAILED - USE BACKUP RECON DATA SET**

**Explanation:** As attempt was made to use a RECON data set which has previously been used for a failed RESET.GSG command. You can only use this RECON to attempt to rerun the RESET.GSG command; any other use is not permitted because the RECON is not stable.

**System action:** An error message is issued and processing continues.

**Operator response:** Replace the current RECON with the backup copy made by the RESET.GSG command.

**Module:** DSPURI00

**Module:** DSP1036I

**DSP1037I**  
**RESET GSG COMMAND INVALID FOR A TRACKING SITE RECON**

**Explanation:** During execution of the RESET.GSG command, DBRC determined that the LOCAL service group in the global service group (GSG) record identified by the GSGNAME value in the command currently operates in a tracking role.

**System action:** DBRC terminates the command and ignores any subsequent commands.

**Operator response:** Issue the command against the

**Module:** DSPURD60

**Module:** DSP1037I

**DSP1038I**  
**CONCURRENT IMAGE COPY NOT ALLOWED FOR SHADOW DATABASES**

**Explanation:** A GENJCL.IC command was issued with the CIC keyword at a tracking site for a covered DBDS or DEDB area. Concurrent image copies are not allowed for covered databases and the command fails with return code 12.

**System action:** Processing by the utility terminates.

**Operator response:** Either change the CIC keyword to NOCIC or remove it. The default for covered databases is NOCIC.

**Module:** DSPJCIMG

**Module:** DSP1038I

**DSP1039I**  
**DEFAULT OF NOCIC USED**

**Explanation:** A GENJCL.IC command was issued with neither the CIC or NOCIC keyword. A default of NOCIC was used because the DBDS or DEDB area was covered by a GSG, was a user-recoverable DEDB, or was nonrecoverable.

**System action:** Processing continues.

**Operator response:** No action is required.

**Module:** DSPJCIMG

**Module:** DSP1039I

**DSP1040I**  
**SPECIFIED DSN FOUND MORE THAN ONCE WITH DIFFERENT LSN RANGES**

**Explanation:** A DELETE.LOG command was issued with the DSN parameter. Entries for the data set were found in more than one of the RLDS and SLDS records specified by STARTIME, but with different log sequence number (LSN) ranges.

**System action:** The command is terminated and subsequent commands are ignored.

**Programmer response:** Delete the RLDS and SLDS records containing the entries for the specified data set, then recreate them with correct log sequence numbers using the NOTIFY command.

**Module:** DSPURD60

**Module:** DSP1040I

**DSP1042I**  
**GENJCL.RECEIVE DID NOT PROCESS UNCOVERED DBDS DBD= dbdname DDN= areaname**

or
GENJCL.RECEIVE DID NOT PROCESS
UNCOVERED AREA DBD= dbdname AREA= arename

Explanation: A GENJCL.RECEIVE command was issued for a database or area not RSR-covered, that is, not assigned to a global service group (GSG).

System action: The command is terminated.

Programmer response: Use either the CHANGE.DB (DL/I) command or the CHANGE.DBDS (Fast Path) command to assign the database or area to the appropriate GSG.

Problem determination: 2, 3, 8, and a listing of the RECON data sets

Module: DSPJCC EV

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1043I LOGTOKEN logtoken SPECIFIED FOR GSG gsgname IS INVALID

Explanation: You issued a NOTIFY.PRILOG Olds command with a LOGTOKEN parameter whose value failed to satisfy one of the following conditions:
- Greater than that contained in the previous PRILOG record for the same GSG, if any
- Less than that contained in the next PRILOG record for the same GSG, if any
- Not more than one greater than that contained in the specified GSG record

System action: The command is terminated and subsequent commands are ignored.

Programmer response: Reissue the command with a correct LOGTOKEN value.

Problem determination: 2, 3, 8, and the listings of the RECON data sets

Module: DSPURTI55

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1044I CHANGE TO COVERED STATE INVALID FOR TRACKING SITE RECON

Explanation: A change of state for a DB or DBDS, from not-covered to covered (member of an RSR global service group), is not permitted.

System action: The command is rejected.

Programmer response: Use the combination of DELETE.DB or DELETE.DBDS with INIT.DB or INIT.DBDS commands to change the covered state of the DB or DBDS. As an alternative, simply remove the GSGNAME() parameter from the CHANGE.DB or CHANGE.DBDS command and reenter the command.

Module: DSPURCM8, DSPURM60
DSP1047I • DSP1050I

DSP1047I

DELETED DSN=data_set_name,
FILESEQ=nnnn,VOLSER=vvvvvv(...)

or

DELETED DSN=data_set_name
FILESEQ=nnnn,VOLSER=vvvvvv(...)
VOLSER=vvvvvv(...)

Explanation: A log data set was deleted from the RECON data set because a DELETE.LOG command was issued or log compression occurred after a log record exceeded the threshold.

In the message text:

- data_set_name: The name of the data set that was deleted
- nnnn: The file sequence number as recorded by DBRC in the RECON data set
- vvvvvv: The volume serial number

This message might be repeated, as necessary, to list all volume serial numbers. The message text might be spread across multiple lines, as shown above, if the data set name cannot fit on one line.

If the CATDS option is used or if the log is a tracking log (one that was created at an RSR tracking site as a shadow of an active system log), the file sequence number and volume serial numbers are not listed. Duplicate data set names (the DSN of the SLDS) are listed if an RLDS was not created when an OLDS was archived.

System action: Either the data set entry was removed from a log record in the RECON, or the entire log record was deleted from the RECON.

Programmer response: No action is required.

This message is issued because LISTDL was specified on the DELETE.LOG command, or it is the default. If you do not want to see these messages, use the CHANGE.RECON command to specify NOLISTDL as the default, or specify NOLISTDL on the DELETE.LOG command.

Module: DSPDSN00

DSP1048I

INVALID LOGRET TIME INTERVAL

or

INVALID LOGRET | RETPRD TIME INTERVAL

Explanation: The time interval specified for the LOGRET or RETPRD keyword is invalid. Message DSP0106I explaining the invalid value might precede this message. The interval specified cannot be zero or greater than 365 days.

System action: This command failed, and subsequent commands were not processed.

Programmer response: Correct the invalid time interval. Reissue the command that failed, and any other commands that were not processed.

Problem determination: 2, 3

Module: DSPURS00, DSPURC00

Related information:

“DSP0106I” on page 143
Chapter 2, “IMS problem determination,” on page 13

DSP1049I

INSUFFICIENT STORAGE AVAILABLE TO LIST DATA SETS

Explanation: This message is issued when log data set names being deleted from the RECON data set are to be listed, and sufficient storage is unavailable to list all the data sets deleted. Log data sets are deleted either by a DELETE.LOG command or by log compression during an archive job.

System action: If this message resulted from a DELETE.LOG command, the command failed and subsequent commands are not executed.

If it occurred during an archive job, the job completes. If the job completes successfully, log compression occurred and one or more log data sets were deleted without being listed.

Programmer response: Make more storage available to the job by increasing the REGION size specified on the JOB or EXEC statement, or execute the job with the NOLISTDL option. NOLISTDL can be specified on the DELETE.LOG command or made the default with the CHANGE.RECON command.

Module: DSPDSN00

DSP1050I

DATABASE NOT DEFINED IN DBD LIBRARY DBD=dbname

Explanation: The member named dbname does not exist in the DBD library identified to DBRC.

System action: The command fails and subsequent commands are not processed.

Programmer response: Either correct the dbname, identify the correct DBD library, or add the member to the DBD library. Then resubmit the command.

Problem determination: 2, 3

Module: DSPUDB00

DSP1057I KEYSRNG PARAMETER (HIGH KEY VALUE) IS REQUIRED

Explanation: The KEYSRNG parameter was not specified on an INIT.PART command for a HALDB that does not have a partition selection exit defined. When there is no partition selection exit, each partition must be defined with a high key value which is specified by the KEYSRNG parameter.

System action: The command fails and subsequent commands are not processed.

Programmer response: Either supply a KEYSRNG value or define the HALDB with a partition selection exit, and resubmit the command.

Problem determination: 2, 3

Module: DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1058I KEYSRNG PARAMETER (HIGH KEY VALUE) IS TOO LONG, MAX=nnn

Explanation: The KEYSRNG parameter exceeded the maximum length allowed for the HALDB. The maximum length allowed is the length of the root segment key and is given as nnn.

System action: The command fails and subsequent commands are not processed.

Programmer response: Correct the KEYSRNG value and resubmit the command.

Problem determination: 2, 3

Module: DSPURMPT, DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1060I parameter NOT ALLOWED FOR NON-PHDM DATABASE

Explanation: On an INIT.PART command for a HALDB which is not a PHDM database, a parameter (parameter) was specified which is allowed only for PHDM databases. The parameter can be RANDOMZR, ANCHOR, HIBLOCK, or BYTES.

System action: The command fails and subsequent commands are not processed.

Programmer response: Remove the parameter and resubmit the command.

Problem determination: 2, 3

Module: DSPURMPT, DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1061I FBFF VALUE CANNOT BE 1

Explanation: FBFF (Free Block Frequency Factor) can be a number between 0 and 100, excluding the number 1.

System action: The command fails and subsequent commands are not processed.

Programmer response: Change the FBFF value and resubmit the command.

Problem determination: 2, 3

Module: DSPURMPT, DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1062I MORE BLOCKSZE VALUES SPECIFIED THAN DATASET GROUP NUMBER

Explanation: The number of BLOCKSZE values that were specified on the command is greater than the number of data set groups.

System action: The command fails and subsequent commands are not processed.

Programmer response: Specify a number of BLOCKSZE values that is equal to or less than the number of data set groups and resubmit the command.

Problem determination: 2, 3

Module: DSPURMPT, DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1063I BLOCKSZE VALUE number MUST BE AN EVEN NUMBER

Explanation: The BLOCKSZE value can be an even number no greater than 32,766. At least one value supplied was not an even number.

System action: The command fails and subsequent commands are not processed.

Programmer response: Correct the BLOCKSZE value (and verify all values) and resubmit the command.

Problem determination: 2, 3

Module: DSPURMPT, DSPURSPT

Related information: Chapter 2, “IMS problem determination,” on page 13
**DSP1064I** KEYSTRING (HIGH KEY VALUE) MUST BE UNIQUE, DBD= dbname PART= partname

**Explanation:** The high key value specified by the KEYSTRING parameter on an INIT.PART command was the same as the high key value for an existing partition. High key values must be unique for each partition.

In the message text:
- `dbname` The database that contains the partition.
- `partname` The existing partition with the same high key value.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Supply a unique high key value and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT, DSPURSPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1065I** INIT COMMAND FAILED, RC= rc RSN= rsn

**Explanation:** An INIT.PART command failed with return code `rc` and reason code `rsn`. Usually this is the result of encountering errors on the RECON data set.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Corrective action depends on if messages indicate a problem with the RECON. If there is a correctable problem with the RECON, resubmit the command after the RECON has been repaired. Otherwise, contact IBM Software Support for assistance.

**Problem determination:** 2, 3

**Module:** DSPURSPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1066I** KEYSTRING CONTAINS AN INVALID HEX VALUE

**Explanation:** The KEYSSTRING value was entered in hexadecimal (in the form X'0FACDE'), but contained an invalid hexadecimal character. Valid hexadecimal characters are: 0, 1, 2, 3, 4, 5, 6, 7, 8, 9, A, B, C, D, E, and F.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Correct the hexadecimal value and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT, DSPURSPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1068I** KEYSTRING PARAMETER LONGER THAN 256 or 512 HEX

**Explanation:** The maximum length of the KEYSSTRING parameter is 256 characters. When specified as a hexadecimal value, the maximum length is 512 since the two hexadecimal characters result in one hexadecimal value. For example, the string X'AB' contains two characters within the quotation marks but results in one byte. Although the absolute maximum is 256, if KEYSTRING is defining a high key value (as opposed to a partition selection string), then the maximum length is limited to the length defined for the root segment key.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Supply a value no greater than 256 bytes (or no longer than the root segment key length with a high key value).

**Problem determination:** 2, 3

**Module:** DSPURSPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1069I** ALREADY AT MAX NUMBER OF PARTITIONS

**Explanation:** An INIT.PART command failed because the maximum number of partitions (1,001) was already defined for the HALDB.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** This situation cannot be corrected by fixing a parameter and resubmitting the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT, DSPURSPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)
command. Have your DBA contact IBM Software Support for assistance.

**Problem determination:** 2, 3

**Module:** DSPURSPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1070I** CANNOT INSERT PARTITION, NEXT ONE IS AUTHORIZED

**Explanation:** An attempt to insert a partition failed because the next partition is in use (authorized). The high key value, defined by the KEYSTRNG parameter of an INIT.PART command, is less than the high key value of an existing partition. As a result, the new partition is being inserted, as opposed to being added to the end. A partition cannot be inserted while the next one is in use.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Stop the next partition using the /DBR command and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURSPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1071I** DATABASE dbname IS NOT A HALDB

**Explanation:** An INIT.PART command failed because the database identified by dbname was not defined to DBRC as TYPHALDB.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Either correct the dbname or delete the database (using the DELETE.DB command) and redefine it as a TYPHALDB (using the INIT.DB command).

**Important:** Deleting a database removes all its associated DBDS records and all recovery-related records. Before deleting a database, be sure that it is the correct thing to do.

**Problem determination:** 2, 3

**Module:** DSPURC8, DSPURDPT, DSPURD10, DSPURMPT, DSPURSPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1072** PARTSEL ENTERED WITHOUT TYPHALDB

**Explanation:** An INIT.DB command was entered with the PARTSEL parameter, but without the TYPHALDB parameter. PARTSEL is valid only for a HALDB.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Either remove the PARTSEL parameter, or ad the TYPHALDB parameter and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURS10

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1073I** BLOCKSIZE IS ALLOWED ONLY FOR OSAM DATABASE

**Explanation:** BLOCKSIZE was specified for a HALDB partition which is not an OSAM database.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Remove the BLOCKSIZE parameter and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT, DSPURSPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1074E** MORE ALTERSZ Values SPECIFIED THAN DATASET GROUP NUMBER

**Explanation:** The number of ALTERSZ values that were specified on the command is greater than the number of data set groups.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Specify a number of ALTERSZ values that is equal to or less than the number of data set groups, and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT, DSPURSPT

**Related tasks:**

- [Modifying block or CI sizes with HALDB alter](Database Administration)

**Related information:** Chapter 2, “IMS problem determination,” on page 13
DSP1075E  ALTERSZE VALUE number MUST BE AN EVEN NUMBER

Explanation: The ALTERSZE value can be an even number no greater than 32,766. At least one value supplied was not an even number.

System action: The command fails and subsequent commands are not processed.

Programmer response: Correct and verify the ALTERSZE values and resubmit the command.

Problem determination: 2, 3
Module: DSPURMPT, DSPURSPT
Related tasks: [Modifying block or CI sizes with HALDB alter](Database Administration)
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1076I  INVALID MINVERS RELEASE LEVEL

Explanation: The MINVERS parameter was specified with an invalid level value. The valid levels are:

Note:
• '1.1' for IMS Version 11
• '12.1' for IMS Version 12
• '13.1' for IMS Version 13

System action: The command fails and subsequent commands are not processed.

Programmer response: Correct the MINVERS parameter and resubmit the command.

Problem determination: 2, 3
Module: DSPURM90, DSPURS00
Related reference: [CHANGE.RECON command (Commands)]
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1077I  THE ACTIVE DBDS IS BEING IMAGE COPIED

Explanation: An image copy of the inactive DBDS was requested. Only active DBDSs can be image copied. The active DBDS is image copied.

System action: Processing continues.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1078I  INACTIVE M-V DBDS RECORDS FOR DBD=xxxxxxxxx DELETED FROM RECON

Explanation: A command was issued to change information in the RECON data set. As a result of the command processing, the inactive M-V DBDSs were deleted. If Y DBDSs existed, they were also deleted.

System action: Processing continues.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1079I  RECON INCONSISTENCY, DBDS RECORD CANNOT BE FOUND FOR DBD=xxxxxxxxx DBN=xxxxxxxx

Explanation: An inconsistency was detected in the RECON data set. A DBDS record for the indicated DBD and DBN was not found.

System action: Processing is terminated. The RECON data sets are not updated.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1080I  ONLINE REORG WITH RUNTIME TIMESTAMP HAS BEEN RESET TO ACTIVE STATUS

Explanation: An unknown command was used to change the status of a HALDB OLR record.

System action: Processing continues.

Programmer response: Contact IBM Software Support if you require additional assistance.

Problem determination: 2, 3, 8, and the listings of the RECON data sets
Related information: Chapter 2, “IMS problem determination,” on page 13

DSP1081I  INACTIVE M-V DBDS RECORDS DO NOT EXIST FOR DBD=xxxxxxxx

Explanation: An attempt to add or change information for a HALDB online reorganization failed for the partition database, identified by xxxxxxx in the message. M-V DBDS records must exist in RECON to process the request. One of the following occurred:
• You attempted to add a HALDB online reorganization record in RECON using the NOTIFY.REORG command with the ONLINE parameter.
• You attempted to change information about the status of a HALDB online reorganization using the CHANGE.DB command with any of these parameters: OLRRGON, OLRRGOFF, OLRMSID(), NOOWNER, and OLRDBDS(A M).

**System action:** The NOTIFY.REORG or CHANGE.DB command fails.

**User response:** If you included the ONLINE parameter in error on the NOTIFY.REORG command, remove it and resubmit the job. Run a HALDB online reorganization to create the M-V DBDS records in RECON. (The M-V DBDSs might be created when the partition database is registered in RECON using the INIT.PART command with the MVDBDS parameter.)

**Module:** DSPURT00, DSPURCMS

---

**DSP1084A**

**COMMAND NOT ALLOWED FOR A DBDS OF A DL/I PARTITIONED DATABASE**

**Explanation:** The command being processed was for a DBDS that is associated with a DL/I partitioned database. The DBDS cannot be processed with this command.

**System action:** The command fails. Subsequent commands are not processed.

**Programmer response:** You cannot delete or initialize individual DBDSs for partitions. You must either delete the partition with a DELETE.PART command, or create a partition with the INIT.PART command.

**Problem determination:** 2, 3

**Module:** DSPURD00, DSPURS00

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1085A**

**THE DATABASE ORGANIZATION DOES NOT MATCH THE DATABASE ORGANIZATION IN THE DBDLIB**

**Explanation:** During CHANGE.PART processing, the database organization in the RECON did not match the database organization in the DBDLIB. Either the DBD definition has been changed since registering the HALDB in the RECON, or you might be using an incorrect DBDLIB.

**System action:** The command fails.

**Programmer response:** If the DBD definition has been changed, delete and redefine the HALDB to DBRC.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1086A**

**INCONSISTENT PARAMETERS SPECIFIED FOR dbname partname**

**Explanation:** The parameters specified for the partition were inconsistent with the current information recorded in the RECON. For the CHANGE.PART command, one of the following might be true:
- ENABLE or DISABLE was specified and another parameter was also specified, which is not allowed.
- The partition is marked as disabled and an attempt to change another parameter besides ENABLE was specified, which is not allowed.

**System action:** The command fails.

**Programmer response:** Correct the conflict and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1087A**

**THE DATA SET GROUP COUNT DOES NOT MATCH THE DATA SET GROUP COUNT IN THE DBDLIB**

**Explanation:** During CHANGE.PART processing, the data set group count in the RECON did not match the data set group count in the DBDLIB. This situation can occur if either the wrong DBDLIB was being used or a new DBDGEM has been performed.

**System action:** The command fails.

**Programmer response:** A DELETE.PART command might need to be entered if a DBDLIB has changed.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1088A**

**THE MASTER DATABASE dbname NOW USES A PARTITION SELECTION ROUTINE**

**Explanation:** Partition strings were removed from all partitions after you added a partition selection routine name.

**System action:** The partition high keys were cleared.

**Programmer response:** Define the partition string values.

**Problem determination:** 2, 3

**Module:** DSPURCM8

**Related information:** [Chapter 2, “IMS problem determination,” on page 13](#)
**Chapter 2, “IMS problem determination,” on page 13**

**DSP1089A**  SET HIGH KEY VALUES FOR EACH PARTITION BEFORE USING

**Explanation:** The name of the selection routine was cleared. Set the high keys value for each partition before it can be used.

**System action:** The partition selection strings were cleared.

**Programmer response:** Set the high key values again.

**Problem determination:** 2, 3

**Module:** DSPURCM8

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1090A**  VALUES SPECIFIED IN CHANGE COMMAND ARE NOT DIFFERENT FROM VALUES ALREADY DEFINED

**Explanation:** No changes were detected from what is already defined.

**System action:** The command fails.

**Programmer response:** No action is required.

**Problem determination:** 2, 3

**Module:** DSPURCM8

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1091A**  DATA BASE DATABASE IS NOT DEFINED IN RECON FOR dbname ddname

**Explanation:** While attempting to change a partition, the database data set could not be found. At least one database data set must exist. This problem is usually an I/O error when accessing the RECON.

**System action:** The command fails.

**Programmer response:** Call IBM Software Support.

**Problem determination:** 2, 3

**Module:** DSPURCM8

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1092A**  CANNOT CHANGE PARTITION, NEXT ONE IS AUTHORIZED

**Explanation:** The change to this partition affects the next partition, because it is authorized.

**System action:** The command fails.

**Programmer response:** Wait until the next partition is not authorized and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURDPT, DSPURD10

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1093A**  CANNOT DELETE PARTITION, NEXT ONE IS AUTHORIZED

**Explanation:** The deletion of this partition affects the next partition which is authorized.

**System action:** The command fails.

**Programmer response:** Wait until the next partition is not authorized and resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURDPT

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1094A**  CHANGE COMMAND FAILED, RC= rc RSN= rsn

**Explanation:** The CHANGE.PART command failed with return code rc and reason code rsn. This problem is usually the result of encountering errors in the RECON data set.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Corrective action depends on whether the messages indicate that there is a problem with the RECON. If there is a correctable problem with the RECON, resubmit the command after the RECON has been repaired. Otherwise, contact IBM Software Support for assistance.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**

**DSP1095A**  DATABASE dbname IS AUTHORIZED

**Explanation:** During DELETE or CHANGE processing for a HALDB or partition, it was determined that the database is authorized.

**System action:** The command fails.

**Programmer response:** When the database is no longer authorized, resubmit the command.

**Problem determination:** 2, 3

**Module:** DSPURDPT, DSPURD10

**Related information:**

**Chapter 2, “IMS problem determination,” on page 13**
DSP1096A  DELETE COMMAND FAILED, RC= rc  
RSN= rsn

**Explanation:** The DELETE.PART command failed with return code rc and reason code rsn. This problem is usually the result of encountering errors in the RECON data set.

**System action:** The command fails and subsequent commands are not processed.

**Programmer response:** Corrective action depends on whether the messages indicate that there is a problem with the RECON. If there is a correctable problem with the RECON, resubmit the command after the RECON has been repaired. Otherwise, contact IBM Software Support for assistance.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

DSP1097E  PARTITION partname CANNOT BE CHANGED WHILE HALDB dbname IS BEING ALTERED

**Explanation:** The definition of a partition cannot be modified while the structure of the HALDB database that contains the partition is being altered.

**System action:** The command fails.

**Programmer response:** After alter processing is complete for the database and the new database structure is activated by the online change function, try to modify the partition definition again.

**Problem determination:** 2, 3

**Module:** DSPURMPT

**Related information:** Chapter 2, “IMS problem determination,” on page 13

DSP1098A  PARTITION dbname partname IS NOT DEFINED TO DBRC

**Explanation:** The partition was not found in the RECON during CHANGE.PART or DELETE.PART command processing.

**System action:** The command fails and subsequent commands are not processed.

DSP messages DSP1101-DSP1150

This topic contains the following messages:
DSP1101I THE DMB LIMIT HAS BEEN EXCEEDED

**Explanation:** An attempt to register a new database with DBRC fails due to the limit of 32,767 already having been reached.

**System action:** The command fails.

**System programmer response:** Use a release of IMS that supports registering databases after the DMB number has reached 32,767. If such a release is unavailable, call IBM Software Support.

**Module:** DSPS10

---

DSP1102I THE DMB LIMIT HAS BEEN REACHED

**Explanation:** The RECON data set has 32,767 databases registered, which is the maximum allowed. The process to register another database in the RECON data set fails. The current data management block (DMB) table record was searched, and all DMB numbers are currently assigned to registered databases.

**System action:** The attempt to register another database with DBRC fails.

**Programmer response:** If this message is received in error, contact IBM Software Support. If the message is correctly issued and old databases no longer in use are still registered in the RECON data set, delete them from the RECON data set.

**Module:** DSPS10

---

DSP1103I OBTAINING THE NEXT DMB NUMBER FROM RECON DMB TABLE FAILED

**Explanation:** DBRC encountered an error trying to obtain the next data management block (DMB) number to assign when registering a database.

**System action:** The command fails.

**Programmer response:** If a prior message was not also issued explaining the error, contact IBM Software Support.

**Module:** DSPS10

---

DSP1104I THE OLRCAP DATABASE CANNOT BE PROCESSED AS REQUESTED IN THIS RELEASE

**Explanation:** The database is capable of undergoing HALDB online reorganization in a higher release of IMS. Utilities such as GENJCL processing, database image copy, database image copy 2, database recovery, database recovery, and change accumulation must be run on a higher release of IMS.

**System action:** The command or utility fails.

**Module:** DSPS10

---

DSP1106A FBFF AND FSPF PARAMETERS CANNOT BE CHANGED WHILE OLR IS ACTIVE OR OWNED

**Explanation:** A request to change the existing partition free space attributes was made, but the partition is currently undergoing HALDB Online Reorganization.

**System action:** The request to change the partition fails. The free space percentage factor and the free block frequency factor are left unchanged for the specified partition. Submit the command again once the HALDB Online Reorganization has completed.

**Programmer response:** Submit the command again once the HALDB Online Reorganization has completed.

**Module:** DSPS110

---

DSP1107E NEW REORG# xxxxx INVALID WITH CURRENT REORG# yyyyyy FOR DATABASE database name

**Explanation:** This message is issued while processing a HALDB partition. The reorganization number xxxxx passed on the REORG call was invalid. Reorganizations might have occurred that did not notify DBRC of the change in reorganization number or the reorganization number was corrupted on the data set. The new reorganization number might only be greater than the current reorganization number to be valid, if the current reorganization number is not zero.

**System action:** The partition reorganization number is not updated. The job fails.

**Programmer response:** Verify the validity of the database and take appropriate problem determination action.

**Problem determination:** 1, 4, 11, 17g, 40

**Module:** DSPURN00

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

DSP1108I REORG# CHANGED FROM xxxxx TO yyyyyy FOR DATABASE database name

**Explanation:** This message is issued while processing a HALDB partition. The reorganization number xxxxx was updated to yyyyyy.

**System action:** The reorganization number was in the RECON.

**Module:** DSPURN00
Related information: *Chapter 2, “IMS problem determination,” on page 13

## DSP1109I  REORG# NOT PASSED FOR DATABASE  
database name

**Explanation:** This message is issued while processing a HALDB partition. The reorganization number was not passed for the database or was zero.

**System action:** The reorganization number was not updated. If the online IMS called DBRC to set the reorganization number, an unexpected logic error has occurred. The control region terminates abnormally with abend 0979. If a call was made to notify DBRC of a reorganization, the current reorganization number is zero and remains zero. The job completes successfully.

**Problem determination:** 1, 4, 11, 17g, 40

**Module:** DSPURN00

**Related information:**
- IMS abend 0979
- Chapter 2, “IMS problem determination,” on page 13

## DSP1110I  REORG# NOT SET FOR DATABASE  
database name

**Explanation:** This message is issued while processing a HALDB partition. The reorganization number was not set for the database. The current reorganization number is zero in the partition database record in RECON.

**System action:** The current reorganization number is zero and remains zero. The job completes successfully.

**Module:** DSPURN00

## DSP1112E  PARAMETER parameter IS INVALID FOR HALDB Defined AS OLNOCAP

**Explanation:** An INIT.PART command with parameter MVDBDS or NOMVDBDS was issued for the partition to create the M-VY data sets for a partition defined as capable of running HALDB Online Reorganization. The parameter is invalid since the HALDB is not defined as capable of running HALDB Online Reorganization.

**System action:** The command fails. Any subsequent commands are not processed.

**User response:** If you want the HALDB to be capable of running HALDB Online Reorganization, issue a CHANGE.DB OLRCAP command against the HALDB and resubmit the command. Otherwise, remove the MVDBDS or NOMVDBDS parameter and resubmit the command.

**Problem determination:** 2,3, and a listing of the RECON data sets

**Module:** DSPURSPT

**Related information:**
- Chapter 2, “IMS problem determination,” on page 13

## DSP1113A  A SUBSYSTEM RECORD FOR ssid WAS FOUND WITHOUT COEXISTENCE SPE APPLIED

**Explanation:** During RECON upgrade, a subsystem record identified by ssid was found in RECON that does not have the required DBRC Migration/Coexistence SPE applied.

**System action:** The RECON upgrade failed.

**Programmer response:** The appropriate DBRC Migration/Coexistence SPE must be applied to each RESLIB accessed by the subsystems listed.

If the subsystem record is no longer valid, you must delete the record from RECON before attempting RECON upgrade. Make sure that the subsystem record is a candidate for deletion.

**Problem determination:** 1, 2, 3, 40

**Module:** DSPUGR00

**Related information:**
- Chapter 2, “IMS problem determination,” on page 13

## DSP1114E  DB QUIESCE IN PROGRESS CHANGE IS NOT ALLOWED FOR DATABASE dbname REASON: reason

**Explanation:** The CHANGE.DB DBQUI or NODBQUI command was issued for the database to change the status of the database. The database identified in the message by dbname is the name used in the command. The reason can be one of the following values:

**MINVERS INVALID**  
The current MINVERS must be at least 11.1 to allow this command.

**BACKOUT NEEDED**  
The database is in need of backout before issuing the command.

**RECOVERY NEEDED**  
The database is in need of recovery before issuing the command.

**BATCH SUBSYSTEM ssid AUTHORIZED**  
A batch subsystem is currently authorized to the database with update access.

**DATABASE IS BEING REORGANIZED**  
The DB Reorg Intent flag is on in the database.

**HALDB ONLINE REORGANIZATION IS ACTIVE**  
Either the database is owned by OLR or the OLREORG CURSOR ACTIVE flag is set on in the database.

**DB QUIESCE IN PROGRESS ALREADY SET**  
The QUIESCE IN PROGRESS flag is already set on or off.

**DB QUIESCE HELD FLAG IS ON**  
The QUIESCE HELD flag is set on. The QUIESCE IN PROGRESS flag cannot be set off unless the QUIESCE HELD flag is also set off.

**INVALID DATABASE TYPE**  
The command is not allowed for this database type. The supported database types are:
RECON data sets

Problem determination: the command again if appropriate.

User response: Correct the error conditions and try the command again if appropriate.

System action: The command fails. The system does not process any subsequent commands.

User response: Correct the error conditions and try the command again if appropriate.

Problem determination: 2, 3, and a listing of the RECON data sets

Module: DSPURM10, DSPURCM8

Related information:

Chapter 2, “IMS problem determination,” on page 13

**Related information**

**Module:** RECON data sets

**Problem determination:**

- The command again if appropriate.

**User response:**

Correct the error conditions and try the command again if appropriate.

**System action:**

- The command fails. The system does not process any subsequent commands.

- The command failed for all the partition databases for this HALDB. If the DBD is a DEDB, the command failed for all the areas. The system does not process any subsequent commands, partitions, or areas.

- The command is not allowed for the database type. The supported database types are:
  - IMS
  - Fast Path
  - HALDB
  - Partition Database

- The database is in need of backout before issuing the command.

- The database is in need of recovery before issuing the command.

- A batch subsystem is currently authorized to the database with update access.

- Either the database is owned by OLR or the OLREORG CURSOR ACTIVE flag is set on in the database.

- The command is not allowed for this database type. The supported database types are:
  - IMS
  - Fast Path
  - HALDB
  - Partition Database

- The command fails. If the DBD is a HALDB, the command failed for all the partition databases for this HALDB. If the DBD is a DEDB, the command failed for all the areas. The system does not process any subsequent commands, partitions, or areas.

- Correct the error conditions and try the command again if appropriate.

- 2, 3, and a listing of the RECON data sets

**Module:**

- DSPURM60, DSPURCM8

</table>

**Remember:** DBRC plays no role in processing GSAM databases, so do not register GSAM data bases in RECON. DBRC does not check the DBDS record for the data set organization for a GSAM.

**System action:**

- The command fails. If the DBD is a HALDB, the command failed for all the partition databases for this HALDB. If the DBD is a DEDB, the command failed for all the areas. The system does not process any subsequent commands, partitions, or areas.

- Correct the error conditions and try the command again if appropriate.

**Problem determination:** 2, 3, and a listing of the RECON data sets
Module: DSPURM10, DSPURCMS

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP117E  DSP117E DB QUIESCE HELD
CHANGE IS NOT ALLOWED FOR
AREA area-name REASON: reason

Explanation: You issued a CHANGE.DB DBQUIH or
CHANGE.DB NODBQUIH command for the area to
change the status of the area. The area identified in the
message by area-name is the name used in the command.
The reason can be one of the following values:
- MINVERS INVALID
  The current MINVERS must be at least 11.1 to
  allow this command.
- RECOVERY NEEDED
  The area is in need of recovery before issuing
  the command.
- DB QUIESCE HELD ALREADY SET
  The QUIESCE HELD flag is already set on or
  off.
- DB QUIESCE HELD FLAG NOT ALLOWED
  You cannot set the QUIESCE HELD flag
  because the QUIESCE IN PROGRESS flag is
  off and the DBQUI parameter was not
  included in the command.

System action: The command fails. The system does
not process any subsequent commands.

User response: Correct the error conditions and retry
the command if appropriate.

Problem determination: 2, 3, and a listing of the
RECON data sets

Module: DSPURM60, DSPURCMS

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP118I  THE REORGANIZATION NUMBER
yyyyyy IS NOT USED FOR DATABASE
xxxxxxxx REASON: reason

Explanation: The REORG parameter was specified for
a NOTIFY.RECOV command, but reorganization
number verification is not active for the RECON data
set.

In the message text:
- yyyy The value specified for NOTIFY.RECOV
  REORG() that is being ignored.
- xxxxxxx The database name that was specified with the
  DBD parameter.

System action: The REORG parameter was ignored
and the command completed successfully. The IMS
system continues normal processing.

Module: DSPURT20

DSP119I  THE REORGANIZATION NUMBER
FOR DATABASE xxxxxxx IS
CHANGED FROM yyyyyy to zzzzzz DUE
TO A RECOVERY

Explanation: A HALDB partition recovery completed
successfully, and the reorganization number for the
database was updated. This message is generated by a
Database Recovery Utility operation.

If the recovery operation was a full recovery, a previous
timestamp recovery operation was run that changed
the reorganization number for the database in the
RECON data set. The full recovery that generated this
message is creating a new version of the data set by
ignoring the changes made by the previous timestamp
recovery.

If the recovery operation was a timestamp recovery,
either this recovery is being done before a
reorganization begins or a previous recovery was run
that changed the reorganization number for the
database in the RECON data set. The timestamp
recovery that generated this message is ignoring the
changes made by the previous recovery.

In the message text:
- yyyyyy The old reorganization number, which is no
  longer valid.
- xxxxxxx The database name that was specified with the
  DBD parameter.
- zzzzzz The new reorganization number for the
database.

System action: The reorganization number in the
partition database record of the RECON data set for
this database is updated to zzzzzz and the system
continues processing.

User response: No action is required.

Module: DSPURT20, DSPURVTR

DSP123I  jjjjjjj DBRC REGISTERED WITH
IMSPLEX ppppp (USING EXIT)

Explanation: DBRC successfully registered with SCI
for the named IMSplex. Automatic RECON loss
notification can be received by this DBRC. If the
message includes USING EXIT, DBRC used the SCI
registration exit to determine the IMSplex name.

In the message text:
- jjjjjjj The job name
- ppppp The IMSplex name
**DSP1124I** **DBRC NOT PARTICIPATING IN IMSPLEX ppppp**

**Explanation:** DBRC is not connected to an IMSplex, but an IMSplex, identified by ppppp, is recorded in the RECON data sets. This situation implies that an IMSplex has been recorded in the RECON data sets since DBRC initialized.

**System action:** DBRC continues operation but cannot receive automatic RECON loss notification from the IMSplex.

**Programmer response:** If you intended to access an IMSplex, no response is necessary.

If the IMSplex was mistakenly recorded in the RECON data sets and an SCI was available for the IMSplex indicated by ppppp, submit a CHANGE.RECON NOPLEX command to revert to a non-IMSplex environment.

**Module:** DSPRLI00

---

**DSP1125A** **IMSPLEX NAME CONFLICT - xxxxx FROM DSPSCIX0, yyyyy FROM IMS**

**Explanation:**
In an online environment, the IMSplex name in the IMS Common Service Layer PROCLIB member (yyyyyy) conflicted with the IMSplex name being used by DBRC (xxxxxx). DBRC obtains the IMSplex name from the SCI registration exit, DSPSCIX0, or from the IMSPLEX parameter on the job step EXEC statement.

In the message text:
- yyyyyy The name of the IMSplex in the IMS Common Service Layer PROCLIB member that conflicts with the name returned by DSPSCIX0, the SCI registration exit.
- xxxxx The name of the IMSplex returned by DSPSCIX0 that conflicts with the name of the IMSplex in the IMS Common Service Layer PROCLIB member.

**System action:** This message is followed by message DSP0300I and abend 2480.

**Operator response:** Either change the IMSplex name in the IMS PROCLIB member or the IMSplex name that DBRC is trying to use.

**Module:** DSPURi30

---

**DSP1126I** **QUIESCE NOTIFICATION RECEIVED FROM xxxxxxx (yyyyyy)**

**Explanation:** DBRC received notification of QUIESCE from job xxxxxxxx for reason yyyyyyy. The reason yyyyyyy can be one of the following:

- **ALLOCFAIL**
  - DBRC is copying to the spare RECON data set because allocation failed for an active RECON data set.

- **BACKUP**
  - A BACKUP.RECON command has been issued.

- **DUAL**
  - DBRC is copying the RECON after running in single RECON mode.

- **IOERR**
  - An I/O error on one of the RECON data sets is being processed.

- **LIST**
  - A LIST command specifying STATIC and QUIESCE is being processed.

- **PRAOFF**
  - Parallel RECON access is being turned off.

- **PRAON**
  - Parallel RECON access is being turned on.

- **REPLACE**
  - A CHANGE.RECON REPLACE command is being processed.

- **RESETGSG**
  - A RESET.GSG command is being processed.

- **RESYNC**
  - DBRC is reopening the RECON data sets in the correct access mode after opening in the incorrect mode during end of QUIESCE processing.

- **SHUNTEDIO**
  - The shunted I/O on one or more of the RECON data sets is being retried.

- **UPGRADE**
  - A CHANGE.RECON UPGRADE command has been issued.

**System action:** DBRC allows job xxxxxxxx to have exclusive access to the RECON data sets.

**System programmer response:** No action is required.

**Problem determination:** 2, 3, 40

**Module:** DSPRLXB0

**Related information:**
- [Chapter 2, “IMS problem determination,” on page 13](#)

---

**DSP1127I** **QUIESCE ACKNOWLEDGED**

**Explanation:** DBRC has acknowledged QUIESCE notification.

**System action:** DBRC has suspended RECON access and is waiting for RECON access to be restored.

**System programmer response:** No action is required.

**Module:** DSPRLN00
**Explanation:** DBRC has received notification that QUIESCE processing is complete.

**System action:** DBRC reestablishes RECON access.

**System programmer response:** No action is required.

**Module:** DSPRLXB0

---

**Explanation:** DBRC has reestablished RECON access after receiving END QUIESCE notification.

**System action:** DBRC proceeds with normal processing.

**System programmer response:** No action is required.

**Module:** DSPRLN00

---

**Explanation:** A period of 30 seconds has elapsed since QUIESCE notification was broadcast, or since the last time this message was issued. The jobs listed have not acknowledged the QUIESCE and are preventing further processing. If *** NO SCI *** is listed, the SCI region is unavailable.

**System action:** DBRC waits for acknowledgment of QUIESCE from the jobs listed.

**System programmer response:** If *** NO SCI *** is listed, restart the SCI region.

**Module:** DSPRLTI0

---

**Explanation:** All DBRC instances have acknowledged QUIESCE notification.

**System action:** DBRC proceeds with normal processing.

**System programmer response:** No action is required.

**Module:** DSPRLN00

---

**Explanation:** The exit identified by exitname could not be located.

**Operator response:** A DBRC Command Authorization Exit must be linked in if your level of DBRC command authorization is set to EXIT or BOTH. If you do not want to use an exit, change your level of command authorization to SAF or NONE using the CHANGE.RECON command.

**Module:** DSPDCAI0

---

**Explanation:** DBRC attempted to register with SCI using IMSplex name mmmmm and failed.

In the message text:

- **mmm m** The name of the IMSplex that failed SCI registration.
- **xxxxxxx** The SCI CSLSCREG return code.
- **yyyyyyyy** The SCI CSLSCREG reason code.
- **jjjjjjjj** The job name.

For more information about how DBRC obtains the IMSplex name, see CSLSCREG: registration request.
System action: RECON access fails.
Operator response: For the appropriate action, see [CSLSCREG: registration request (System Programming APIs)]
Module: DSPRLI00

DSP1136A RECON ACCESS DENIED, IMSPLEX NAME nnnnn NOT VALID, JOB=jjjjjjjj
Explanation: The IMSplex used by DBRC was not the one associated with these RECON data sets. nnnnn identifies the name of the IMSplex that failed RECON access. If nnnnn is *****, it indicates that DBRC is not participating in an IMSplex although the RECONs show that an IMSplex is required.
System action: RECON access fails.
Operator response: Use the correct IMSplex name. In emergency situations, RECON access can be forced by an SCI registration exit, DSPSCIX0. For more information about the use of DSPSCIX0, see [DBRC SCI registration exit routine (DSPSCIX0) (Exit Routines)]
Module: DSPRLI00

DSP1137I IMSPLEX MAY NOT BE CHANGED, DBRC ACTIVE FOR
job1
{job2
{job3
{more}}
Explanation: An attempt was made to change an IMSplex with CHANGE.RECON IMSPLEX()/NOPLEX while the RECONS are in use. In the message text, job1, job2, and job3 indicate which DBRC jobs are active in the RECON. If the job list is longer than three names, MORE is displayed.
System action: The command fails.
Operator response: Wait until no other jobs are using these RECONS.
Module: DSPURI30, DSPURM90

DSP1138I QUIESCE CONFLICT, ABORTING CURRENT QUIESCE
Explanation: During QUIESCE processing, QUIESCE notification was received from another DBRC. QUIESCE conflict resolution determined that the QUIESCE notification would preempt the current QUIESCE process.
System action: The current QUIESCE process is abandoned in favor of the new one. Message DSP1126I is issued after this message, identifying the initiator of the new QUIESCE process.
System programmer response: No action is required.
Module: DSPRLX10

Related concepts:
[CSL SCI requests (System Programming APIs)]

DSP1139A RECON ACCESS DENIED BY DSPSCIX0, JOB=jjjjjjjj
Explanation: The SCI registration exit, DSPSCIX0, issued return code 12. For more information about writing an exit and the effect of the reason code, see [Guidelines for writing IMS exit routines (Exit Routines)]
System action: RECON access fails.
Operator response: No action is required.
User response: Correct the registration exit and rerun.
Module: DSPRLI00

DSP1140A UNEXPECTED RETURN CODE FROM aaaaaaaa REQUEST RC=nnnnnnnn, RSN=rrrrrrrr, JOB=jjjjjjjj
Explanation: A DBRC request for the SCI service (aaaaaaa) failed.
In the message text:

nnnnnnnn The failed SCI service, which can be one of the following services:
CSLSCBFR Returns the SCI buffer to SCI.
CSLSCQRY Queries the SCI registration list.
CSLSCDRY Enables receipt of SCI messages by type.
CSLSCMSG Sends messages to other SCI registrants.
CSLSCDRG Deregisters from SCI.
rrrrrrrr The SCI return code.
jjjjjjjjj The SCI reason code.

System action: For CSLSCBFR and CSLSCQRY requests, DBRC continues processing. All other request failures result in abnormal termination.
Operator response: For the appropriate action, see the SCI return and reason codes.
Module: DSPRLI00, DSPRLN00, DSPRLTR0, DSPRLX10

Related concepts:
[CSL SCI requests (System Programming APIs)]
DSP1141I • DSP1146A

DSP1141I RECON LOSS NOTIFICATION RECEIVED, JOB=jjjjjjjj

Explanation: DBRC received notification of RECON loss. For more information about RECON loss, see RECON loss notification (System Administration).

System action: DBRC closes and then reopens the RECONS. DBRC discards any RECONS it finds that are in error.

Operator response: No action is required.

Module: DSPRLX00

DSP1142A EXIT MODULE exitname FOUND IN UNAUTHORIZED LIBRARY: dsn

Explanation: The exit identified by exitname was found in the data set identified by dsn, which is neither an authorized library nor a member of LINKLST. exitname can be one of:

DSPSCIX0 The SCI Registration Exit
DSPDCAX0 The DBRC Command Authorization Exit

System action: For DSPSCIX0, RECON access fails. For DSPDCAX0, the DBRC command failed. RECON is not updated. Subsequent commands are not processed.

Operator response: Specify an authorized library.

Module: DSPDCAI0, DSPRLI00

DSP1143I RECON ACCESS FORCED BY DSPSCIX0, JOB=jjjjjjjj

Explanation: The SCI registration exit, DSPSCIX0, returned a return code of 8. For information about how to write an exit and the effects of return codes, see IMS Version 13 Exit Routines.

System action: RECON access proceeds without SCI registration regardless of possible RECON use by an IMSplex. RECON data set is accessed in serial mode even if parallel access was turned on.

Operator response: No action is required.

Module: DSPRLI00

Related concepts:
Guidelines for writing IMS exit routines (Exit Routines)

Related reference:
DBRC SCI registration exit routine (DSPSCIX0) (Exit Routines)

DSP1144I IMSPLEX PARAMETER NOT ALLOWED

Explanation: An attempt was made to alter the IMSplex value by issuing the request from an online IMS with the /RMCHANGE command; doing this is not allowed.

System action: The command terminates with return code 12.

Programmer response: To set an initial IMSplex value, stop all DBRC activity and then start new DBRC activity using either the SCI registration exit, DSPSCIX0, or the IMSplex parameter to set the IMSplex value.

To change the IMSplex value, stop all DBRC activity and submit the command using the Database Recovery Control utility, DSPURX00. In either case, only DBRC activity involving the subject RECONS must be stopped.

Module: DSPURM90

DSP1145I RECON LOSS NOTIFICATION NOT SENT, JOB=jjjjjjjj

Explanation: RECON loss notification was not sent because SCI was unavailable.

System action: DBRC continues processing.

Programmer response: SCI must be restarted for RECON loss notification to function.

Module: DSPRLN00

DSP1146A EEQE LIMIT OF 32767 FOR DB DBD=xxxxxxxx

Explanation: The request to add an extended error queue element (EEQE) would cause the limit to be reached for the xxxxxxxx database.

System action: The CHANGE.DBDS command fails.

Operator response: Error messages were issued when each EEQE was written. Since the database was not stopped, the DBRC limit for EEQEs was reached. You need to recover the xxxxxxxx database.

If this appears to be a logic error within DBRC, contact IBM Software Support.

Problem determination: 2, 3, 35, and a listing of RECON

Module: DSPRLI00

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1147I  DBRC REGION WAITING FOR SCI, 
IMSPLEX NAME=ppppp

Explanation: DBRC Automatic RECON Loss 
Notification is active but SCI was unavailable for 
IMSPLEX ppppp.

System action: IMS waits until the user starts an SCI 
region for IMSPLEX ppppp before continuing with 
DBRC initialization.

Programmer response: Start the SCI region for which 
IMS is waiting.

Module: DSPRLI00

---

DSP1150I  LOG RECORD(S) COULD NOT BE 
COMPRESSED, 
RECORD TIME = timestamp1 
compression time = timestamp2

Explanation: DBRC determined that the PRILOG, 
identified by timestamp1, could not be compressed 
while it was running one of the following commands 
or processes:
- DELETE.LOG INACTIVE
- NOTIFY.PRILOG RLDS
- IMS Log Archive utility
- Recording an RSR tracking log
- CLEANUP.RECON

In the message text:
timestamp1
The time stamp for the associated PRILOG.

compression time
Compression time identifies one of the 
following time stamps limiting the 
compression of the log:
- EARLIEST ALLOC TIME
- LOG RETENTION TIME
- EARLIEST CHECK POINT
- RECON CLEANUP TIME

timestamp2
The time stamp for the associated compression 
time. For LOG RETENTION TIME, it is the 
current time minus the Log Retention Period.

System action: Processing continues.

User response: No action is required.

Module: DSPURD60

---

DSP messages DSP1151-DSP1200

This topic contains the following messages:

DSP1154A  DBRC REQUEST AUTHORIZATION 
DENIED BY userexit FOR USER userid 
RESOURCE NAME=resource name RC=rc

or

DBRC COMMAND AUTHORIZATION DENIED BY 
userexit FOR USER userid RESOURCE NAME=resource name RC=rc

Explanation: The user exit identified in the message 
text denied the user ID userid authorization to submit 
the DBRC command or API request that is protected by 
resource name.

In the message text:
userexit The user exit; this string can be one of the 
following exits:
- DSPDCAX0 (DBRC Security exit)
- BPE EXIT (exit routine defined to BPE)
userid The user ID that was denied authorization to 
submit the DBRC command or API request.

resource name The name of the resource protecting the issued 
DBRC command or API request.

rc The exit return code; For DSPDCAX0 return 
code information, see [DBRC Command 
Authorization exit routine (DSPDCAX0) (Exit 
Routines)]

System action: If the problem resulted from a DBRC 
command, the command fails with RC=12. The RECON 
data sets are not updated. Subsequent commands are 
not processed.

If you are running the HALDB Partition Definition 
Utility, the RECON request fails.

If the problem was an application using the DBRC API, 
the requested function fails with RC=12 and a reason 
code unique to the function.

Operator response: No action is required.

Programmer response: Contact your security 
administrator to gain authority to the identified DBRC 
resource.

Module: DSPDCAI0

DSP1157A  USER userid NOT AUTHORIZED FOR 
REQUEST RESOURCE NAME=resource name REQUEST=reqtype SAF RC=safrc 
RACF RC=racfrc RACF REASON=racfrsn

or

USER userid NOT AUTHORIZED FOR COMMAND 
RESOURCE NAME=resource name REQUEST=reqtype SAF RC=safrc RACF RC=racfrc RACF REASON=racfrsn

Explanation: DBRC issued a RACROUTE 
authorization request to determine if the user is 
authorized to issue the DBRC command or DBRC API 
request protected by resource name. The return and 
reason codes from RACF or an equivalent security
product indicate that the user is not authorized.

In the message text:

- **userid**: The user ID not authorized to perform the command.
- **resource name**: The name of the resource protecting the issued command or API request.
- **reqtype**: The type of RACROUTE request.
- **racfr**: A RACF return code that indicates the user is not authorized.
- **racfrsn**: A RACF reason code that indicates the user is not authorized.

For more information about the SAF return code, the RACF return code, and the RACF reason code, see the z/OS Security Server RACROUTE Macro Reference (SA22-7692).

**System action:** The DBRC command or API request failed. DBRC processing ended with RC=12. The RECON data sets were not updated. Subsequent commands are not processed. If this is the HALDB Partition Definition Utility or a DBRC API request, the RECON request fails.

If this was an application using the DBRC API, the requested function fails with RC=12 and a reason code unique to the function.

**Programmer response:** Contact your security administrator to gain authority to the identified DBRC resource.

**Problem determination:** 1, 2, 3, 8, 40

**Module:** DSPDCAI0

**Related reference:**
- z/OS: System authorization facility (SAF)
- z/OS: RACROUTE return codes and reason codes

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPURX00

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**Explanation:** The CMDAUTH keyword was specified with DBRC command authorization option SAF, EXIT, or BOTH. You must specify a high-level qualifier with these options.

**System action:** The command failed. Subsequent commands are not processed.

**Programmer response:** Correct your CMDAUTH keyword values, then reissue the command and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPDCAI0

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**Explanation:** CMDAUTH option NONE was specified with either a high-level qualifier (safhlq option) or with the rcnqual option. Both the high-level qualifier and the rcnqual option are only valid with option SAF, EXIT, or BOTH.

**System action:** The command failed. Subsequent commands are not processed.

**Programmer response:** Correct your CMDAUTH keyword values, then reissue the command and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPURX00

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**Explanation:** You specified the CMDAUTH keyword in the online CHANGE.RECON command (/RMCHANGE). DBRC command authorization does not support online commands. Therefore, you cannot
use an online command to change the command authorization level.

**System action:** The command failed. Subsequent commands are not processed.

**Programmer response:** Change your command authorization level using the DBRC command processor in module DSPURX00.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPURX00

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1162A** DBRC RESOURCE NAME TABLE DEFINITION ERROR FOR COMMAND VERB cmdname MODIFIER modname

**Explanation:** The internal DBRC Resource Name Table either contained no resources for the specified command or none of the resources defined for this command contained a matching qualifier.

**System action:** The command failed. Subsequent commands are not processed.

**Programmer response:** This is an internal DBRC problem. Contact IBM Software Support for assistance.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set

**Module:** DSPDCAI0

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

**DSP1164E** PARALLEL RECON ACCESS CANNOT BE ENABLED: reason

**Explanation:** A CHANGE.RECON ACCESS(PARALLEL) command or an INIT.RECON ACCESS(PARALLEL) command failed for one of the following reasons (reason):

**NOT IN IMSPLEX**

The RECON data set is not associated with an IMSplex or the DBRC SCI registration exit has forced access to the RECON data set without registering with SCI.

**NO SCI FOR ssid**

One or more DBRC instances that are currently using the RECON data set are not registered to the SCI. The subsystem ID of the first active batch subsystem found in the RECON data set that is not registered to the SCI is listed as ssid.

**MINVERS**

MINVERS for the RECON data set was set to allow DBRC for a version earlier than Version 10. The MINVERS reason is not issued for message DSP1164E as of IMS Version 12.

**UNAVAILABLE DATA SET**

At least one of the RECON data sets, RECON1, RECON2, or RECON3, is unavailable.

**RSR TRACKER**

An RSR tracking subsystem record exists in the RECON data set.

**OPEN FAILURE**

DBRC was unable to open two active copies in parallel access mode. Messages DSP0002I or DSP0002W might also be issued to provide more information.

**LOG MODE ERROR**

DBRC was unable to set LOG(UNDO) on one or more of the RECON data sets. Message DSP1172I might also be issued to identify the data sets for which altering the log mode to UNDO failed.

**NO SPARE**

The spare RECON data set is either unavailable or not empty.

**DUPLICATE GROUP ID**

Multiple RECON data sets are in use with the same group ID.

**System action:** The command fails and subsequent commands are not processed.

**System programmer response:** For a CHANGE.RECON ACCESS(PARALLEL) command, ensure that three RECON data sets are available and that the spare data set is empty. If the RECON data set is not associated with an IMSplex, enable automatic RECON loss notification (ARLN) before you enable parallel RECON access. If IMS systems are currently running that were active before automatic RECON loss notification was enabled, parallel RECON access cannot be enabled until those systems have shut down. Parallel RECON access is not supported by an RSR tracking subsystem. If the RSR tracking subsystem is no longer active and will not be restarted, delete the subsystem record from the RECON data set and retry the command. If the RSR tracking subsystem is active, parallel RECON access cannot be used until the RSR tracking subsystem has terminated normally.

For an INIT.RECON ACCESS(PARALLEL) command, ensure that three RECON data sets are available and empty. Enable automatic RECON loss notification (ARLN) before you create RECON data sets in parallel RECON access.

If the reason is DUPLICATE GROUP ID, you must change the DBRC group ID before enabling parallel RECON access using the CHANGE.RECON IMSPLEX command. There can be no active DBRC instances accessing the RECON data set when this command is issued. If another DBRC is active in the same IMSplex using a different RECON data set, these must also be terminated, or take the following steps:
1. Create an alternate SCI registration exit that will force RECON data set access without SCI registration by setting Register 15 - 8.

2. Run a job that issues the CHANGE.RECON IMSPLEX(plexname,group_id) command to change the group ID in the RECON data set. This job must use the alternate SCI registration exit.

3. Update the SCI registration exit to return the new group ID for the RECON data.

For a CHANGE.RECON ACCESS(PARALLEL) command that fails with the reason NO SCI FOR ssid, reissue the command. Timing might have caused the command to fail.

**Module:** DSPURM90, DSPURI02, DSPURS00

**DSP1166E** IMSPLEX NAME CANNOT BE RESET, REQUIRED FOR PARALLEL ACCESS

**Explanation:** Parallel access is active for the RECON. Parallel access requires an IMSplex environment to process a CHANGE.RECON NOPLEX command.

**System action:** The command fails and subsequent commands are not processed.

**System programmer response:** You must turn off parallel access before the IMSplex name associated with the RECON can be cleared.

**Module:** DSPURM90

**DSP1168E** SERIAL RECON ACCESS CANNOT BE ENABLED: reason

**Explanation:** The CHANGE.RECON ACCESS(SERIAL) command failed for one of the following reasons:

**SHUNTED I/O EXISTS**
Some RECON I/O has been shunted by Transactional VSAM. This is indicative of a failure of another DBRC for which Transactional VSAM was unable to back out the updates.

**OPEN FAILURE**
DBRC was unable to open any RECON data sets in serial access mode. Messages DSP0002I or DSP0002W might also be issued to provide more information.

**System action:** The command fails and subsequent commands are not processed.

**System programmer response:** Resolve any open failures before issuing the command again. If shunted I/O exists, issue the command again. If the problem persists, resolve the shunted I/O using the IDCAMS SCHDS RETRY or PURGE commands as needed. See z/OS DFSMS Access Method Services for Catalogs (SC26-7394) for information about using this command. For complete details on shunted URs, see z/OS DFSMSstvs Planning and Operating Guide (SC26-7348).

**Module:** DSPURI02

**DSP1169I** RECON ACCESS MODE IS ALREADY SET

**Explanation:** The ACCESS keyword on the CHANGE.RECON command specified the same access mode, SERIAL or PARALLEL, as the mode currently set for the RECON.

**System action:** The ACCESS keyword is ignored. Other keywords on the command are processed. The return code for the command is 4 (or higher if a subsequent error is found).

**System programmer response:** No action is required.

**Module:** DSPURM90

**DSP1170I** SPECIFICATION OF LOG(ALL) IS NOT SUPPORTED AND WILL BE ALTERED DSN=dsname

**Explanation:** The command or job you ran specified LOG(ALL) in the definition of the identified RECON data set. LOG(ALL) is not supported because DBRC does not support forward recovery (redo) logging for the RECON.

In the message text:

*dsname* The name of the data set that has LOG(ALL) specified.

**System action:** DBRC alters the LOG specification to UNDO if it intends to open the RECON for parallel access, or to NONE if it intends to open the RECON for serial access.

**System programmer response:** No action is required.

**Module:** DSPURI15

**DSP1171I** ALTER OF LOG SPECIFICATION FOR ddbname BEING ATTEMPTED

**Explanation:** The LOG specification for the RECON data set indicated in the message needs to be changed to be appropriate for the access mode (TVS or non-TVSS) to be used to access the RECON data sets. This occurs during CHANGE.RECON ACCESS processing, and can occur during initialization if the LOG specifications do not match.

**System action:** If TVS access to the RECON data sets is required, an attempt to ALTER the log specification to UNDO is performed. If non-TVSS access is required,
an attempt to ALTER the LOG specification to NONE is performed.

**System programmer response:** Review the LOG specification on the DEFINE CLUSTER statements for the RECON data sets to ensure that they are correct for the access mode. If the LOG parameter is specified in the JCL, it should be removed.

**Module:** DSPAMS10

---

**DSP1172W**  
**ALTER OF LOG SPECIFICATION FOR**  
`dbname FAILED RC mnnn`

**Explanation:** An attempt to ALTER the LOG specification for the RECON data set named `dbname` failed.

**System action:** If the ALTER was attempted during CHANGE.RECON ACCESS processing, the command fails, and the access mode remains unchanged. If the ALTER was attempted during INIT.RECON ACCESS processing, the command fails and the RECON data sets are not initialized. Otherwise, the RECON data sets have different LOG attributes and DBRC attempted to alter the LOG attribute of the data set to match the access mode, serial or parallel, that DBRC determined should be used. In this case processing continues; however the RECON data set identified in the message might be unavailable.

**System programmer response:** Issue a LIST.RECON STATUS command to check the status of the RECON data sets and the access setting. Use Access Method Services (AMS) to delete and redefine the RECON data set, or ALTER the LOG specification for the data set as appropriate.

**Module:** DSPAMS10

---

**DSP1174I**  
**RECON DATA SETS INDICATE THAT**  
*type* ACCESS IS REQUIRED

**Explanation:** DBRC attempted to open the RECON data set, but encountered an inconsistency.

In the message text, *type* can be one of the following:

**PARALLEL**

Parallel access is required; however, DBRC opened the RECON data sets for serial (non-TVS) access because the LOG specification is NONE or the LOG attribute was not specified. The information in the RECON data sets indicates that parallel RECON access was turned on.

**SERIAL**

Serial access is required; however, DBRC opened the RECON data sets for parallel access because the LOG specification is UNDO. The information in the RECON data sets indicates that parallel RECON access has not been turned on.

**System action:** DBRC initialization attempts to close the data sets, ALTER the LOG specifications and reopen the RECON data sets in the correct access mode.

**System programmer response:** No action is required.

**Module:** DSPURI10

---

**DSP1175E**  
**RECON COPYn DATA SET NAME MISMATCH**

**THIS DBRC ALLOCATED DSN=xxxx**

**OTHER DBRC USING DSN=dsmn2**

**Explanation:** When opening the RECON data sets, DBRC determined that it is not accessing the same active (COPY1 or COPY2) data sets that the other DBRC instances in the IMSplex are accessing. This situation could mean that this DBRC was unable to allocate one or more of the data sets that the other DBRC instances allocated, or that this DBRC might be accessing incorrect RECON data sets. For parallel RECON access, a RECON data set that is active for one DBRC instance must be active for all DBRC instances in the IMSplex.

In the message text:

COPYn  
*n* is 1 or 2; the copy of the RECON data set that did not match.

`xxxx` This can be a data set name or *NOT AVAILABLE*. If this is a data set name, it identifies the data set that DBRC is using for the COPYn data set. *NOT AVAILABLE* is displayed if no data set could be allocated for this copy.

`dsmn2` This is the data set name used by other DBRC instances for the COPYn data set.

**System action:** If this DBRC region is associated with an online IMS subsystem, message DSP1176A is issued as a WTOR. Otherwise, if the mismatch occurs during DBRC initialization, DBRC initialization fails due to insufficient RECON data sets. If the error mismatch is detected at any other time, then DBRC terminates with a 2480 abend.

**System programmer response:** If the error is caused by a DBRC not having access to all of the RECON data sets, make the RECON data set specified in the message available to this DBRC instance. If the error is due to a DBRC accessing incorrect data sets, take the appropriate action to ensure that the RECON data sets used by the DBRC instance are correct.

**Module:** DSPURI10

**Related information:**

---

**DSP1176A**  
**REQUIRED RECON DATA SETS UNAVAILABLE - REPLY 'RETRY' OR 'CANCEL'

**Explanation:** This message follows a DSP1175E message. DBRC requires access to the RECON data sets named in prior DSP1175E message. This DBRC instance...
cannot continue until the data sets are made available.

**System action:** A RETRY response causes DBRC to attempt to access the data sets again. A CANCEL response causes DBRC to terminate.

**System programmer response:** Take the necessary action to make the data set available to this DBRC instance; then reply with RETRY. If the data set cannot be made available, reply with CANCEL.

**Module:** DSPURI10

**Related information:**

DSP1175E

DSP1177A RECON INDICATES PARALLEL ACCESS WHICH REQUIRES SCI REGISTRATION

**Explanation:** Access to the RECON was attempted in serial mode because DBRC did not register with SCI. However, information in the RECON indicates that parallel RECON access was turned on.

**System action:** DBRC terminates due to unavailable RECON data sets.

**System programmer response:** To access the RECON data sets, ensure that DBRC registers with SCI by specifying the IMSPLEX EXEC parameter in the JCL, or by using an SCI Registration exit routine (DSPSCIX0) to specify the IMSplex name.

**Module:** DSPURI10

**Related information:**

DSP1177E

DSP1178W RECON DATA SET IS UNAVAILABLE: reason DSN=dsname

**Explanation:** The RECON data set, identified by dsname, cannot be used by DBRC for the reason indicated. reason can be one of the following:

- **SHUNTED I/O**
  
  Shunted I/O was detected for the data set. Transactional VSAM was unable to commit or back out data due to a failure (normally an I/O error).

- **NOT A KSDS**
  
  The data set is not a VSAM key-sequenced data set. (KSDS).

**System action:** The data set is discarded by DBRC. The data set is unavailable for use until the user has deleted and redefined the data set and, if necessary, purged the shunted I/O data.

If the reason is SHUNTED I/O when the data set is discarded, DBRC invokes VSAM services to purge the shunted I/O data if a good RECON copy exists. If the purge request fails, message DSP1179W is issued.

If a good RECON data set (for example, all of the RECON data sets have shunted I/O data) does not exist, DBRC does not purge the shunted I/O data and terminates due to insufficient RECON data sets.

**System programmer response:** Delete and redefine the data set to make it available as a spare RECON data set. If message DSP1179W also occurs, issue the VSAM SHCDS PURGE command to purge the shunted I/O data.

**Module:** DSPURI10, DSPURI1P, DSPURI30, DSPURI60, DSPURI70, DSPURI80

**Related information:**

DSP1179W ATTEMPT TO PURGE SHUNTED I/O FAILED, RC=nnnn DSN=dsname

**Explanation:** DBRC attempted to purge the shunted I/O data associated with the identified data set after discarding the data set because shunted I/O data exists. The purge attempt failed.

In the message text:

- **nnnn** The return code from the SHCDS PURGE request
- **dsname** The data set name for which the request was made

**System action:** DBRC continues processing. The data set remains unavailable as long as it has associated shunted I/O data.

**System programmer response:** Issue the VSAM IDCAMS command SHCDS PURGE SPHERE (dsname) to discard the shunted I/O data. Delete and redefine the data set to make it available as a spare RECON data set.

**Module:** DSPURI80

**Related information:**

DSP1181E LOAD OF CALLABLE SERVICE servicename FAILED - RC=nnnn

**Explanation:** DBRC was unable to load the identified callable service.

In the message text:

- **servicename** One of: IGWARLS, ATRBACK, ATRCMIT
- **nnnn** The return code from the LOAD request

**System action:** If the service is IGWARLS, DBRC initialization continues. If the service is ATRCMIT or ATRBACK, then DBRC terminates with a 2480 abend.

**System programmer response:** Determine the cause of the load failure before restarting the IMS subsystem or resubmitting the batch or utility job.

**Module:** DSPURI15, DSPRSYNC

**Related information:**

IMS abend 2480
DSP1182E  CALLABLE SERVICE servicename  FAILED - RC=nnnn RSN=yyyy

Explanation: An unexpected return code was returned from a callable service used by DBRC.

In the message text:

- servicename
  - One of: IGWARLS, ATRBACK, ATRCMIT
- nnnn  The return code from the LOAD request
- yyyy  The reason code, if the service is IGWARLS;
  blanks if the service is ATRBACK or ATRCMIT

DBRC uses the IGWARLS to determine the LOG specification for a RECON data set.

System action: If the service is IGWARLS, processing continues as if the results from IGWARLS had indicated that LOG(NONE) was defined for the RECON data set. If the service is ATRCMIT or ATRBACK, then this DBRC instance terminates with a U2480 abend.

System programmer response: Consult the IGWARLS return codes or the ATRBACK or ATRCMIT return codes to determine the cause of the error and take appropriate action to resolve the situation.

Module: DSPURI15, DSPRSYNC

Related reference:
- [z/OS: IGWARLS return codes](#)
- [z/OS: ATRCMIT return codes](#)
- [z/OS: ATRBACK return codes](#)

DSP1183W  AN RRS COMMIT ERROR WAS ENCOUNTERED nnnn TIMES; RC=rrsrc

Explanation: DBRC has encountered a z/OS Resource Recovery Services commit or backout error and has attempted to recover by trying its processing again. The same error has been encountered during multiple attempts. This message is issued periodically if the same problem persists. You might need to perform some action to correct the cause of the error.

In the message text:

- nnnn  The number of times the error has been encountered
- rrsr  The RRS return code

System action: Processing continues to try the last DBRC request again.

System programmer response: See the ATRBACK or ATRCMIT return codes to determine the cause of the error and take appropriate action to resolve the situation.

Module: DSPRSYNC

Related reference:
- [z/OS: ATRCMIT return codes](#)

DSP1184W  VSAM OPEN|ACCESS ERROR ENCOUNTERED nnnn TIMES RRS=xxxx RSN=yyyy

Explanation: DBRC has encountered a VSAM open or access error and has attempted to recover by trying its processing again. The same error has been encountered during multiple attempts. Action might be required to correct the cause of the error.

In the message text:

- nnnn  The number of times the error has been encountered. If the same error is encountered more than 999 times, nnnn is set to >999.
- xxxx  The VSAM return code.
- yyyy  The VSAM reason code.

System action: Processing continues. If the error continues to be encountered, DBRC continues to try again until it no longer encounters the error.

System programmer response: Refer to z/OS DFSMS Macro Instructions for Data Sets for an explanation of the VSAM Record Management Return and Reason codes. Correct the problem.

Module: DSPURI1P, DSPURI50, DSPURI60

Related reference:
- [z/OS: Record management return and reason codes](#)

DSP1186I  DBRC COMMAND RETRY ATTEMPTED

Explanation: An error that could be retried was detected, and DBRC is attempting to reprocess a command that might have produced external output. DBRC retries the processing, which encountered errors, that it considers capable of being retried (for example, deadlock or timeout). In this instance, data might have been written to a data set (for example, SYSPRINT) or the JCLOUT data sets. Because command processing is retried, ignore the output produced before this message. The output to a JCLOUT data set that is submitted directly to an internal reader might produce duplicate JCL or JCL that does not run.

System action: The command is reprocessed.

Programmer response: If this message was issued by a LIST command that was successful, ignore the output produced before the message was issued.

Module: DSPURX00

DSP1187E  DBRC COMMAND RETRY FAILED

Explanation: An attempt to retry a LIST command that might have produced external output has failed. The command might have written to the SYSPRINT or to some other external data set. The command retry
DSP1188A • DSP1203A

limit has been reached. The system retries DBRC LIST commands only one time.

System action: The command fails.

Programmer response: If you specified the STATIC option (or defaulted to it) and QUIESCE was not specified on the command, using QUIESCE might prevent issuing retry errors.

Module: DSPURX00

DSP1188A RECON ACCESS DENIED, GROUP ID
nnn NOT VALID, JOB=jobname

Explanation: The DBRC group ID used by DBRC is not the one associated with these RECON data sets.

In the message text:

nnn Identifies the ID of the group that failed RECON access. If nnn is ***, a group ID was not specified, although the RECONs show that a group ID is required.

jobname The job name for which access was denied.

System action: RECON access fails.

Programmer response: Specify the correct DBRC group ID on the DBRCCGRP EXEC parameter or through the SCI Registration exit routine (DSPSCIX0). In emergency situations, you can force RECON access by the SCI Registration exit routine (DSPSCIX0).

Module: DSPURI30

DSP1189A VALUES FOR PARAMETER IMSPLEX
HAVE NOT CHANGED

Explanation: You issued a CHANGE.RECON IMSPLEX() command. The values for the IMSPLEX parameter have not changed.

DSP messages DSP1201-DSP2000

This topic contains the following messages:

DSP1202A A RECORD WITH AN INCORRECT RECORD LENGTH WAS ENCOUNTERED

Record key

Explanation: If a LIST command issued this message, one or more records were encountered with an incorrect record length. The listing produces

******incorrect record length****** in the inline listing instead of listing the record.

If a CHANGE.RECON UPGRADE command issued this message, an additional line of output displays the formatted record key.

System action: Processing continues. The completion code is set to return code 4.

Programmer response: If this message was issued by a LIST command, search the output to find the record or records with ******incorrect record length****** in the listing. You might have to delete the record or add it back in with commands.

If this message was issued by a CHANGE.RECON UPGRADE command, the key of the record follows the message. Check the listing of the RECON to verify the records with ******incorrect record length****** in the inline listing. You might have to delete the records or add them back in with commands.

Module: DSPURP00, DSPURU90

DSP1203A LOWEST CROSS DBRC SERVICE LEVEL ALLOWED IS value

Explanation: An attempt was made to change the cross DBRC service level (CDSLID) to a value lower than is allowed for this level of RECON was made. Different
releases of IMS might access this RECON and must coexist at the same minimum cross DBRC service level. The lowest cross DBRC service level is the value set when the RECON was upgraded or initialized for the release.

**System action:** Processing terminates.

**Programmer response:** Use the value indicated in the message for CDSLID and reissue the command.

**Module:** DSPURM90

---

**DSP1204A**  
**DBRC INITIALIZATION FAILED DUE TO INCORRECT MINVERS VALUE**

**Explanation:** An attempt to initialize DBRC was made when the MINVERS value in the RECON is greater than the IMS release attempting to initialize.

**System action:** Processing terminates.

**Programmer response:** Determine if the correct RECON is in use. You might reset the MINVERS level using the appropriate release of IMS. For information about the CHANGE.RECON command, see [CHANGE.RECON command (Commands)](chapter2.html).

**Module:** DSPUIN00

---

**DSP1205E**  
**MINVERS VALUE IS INCONSISTENT WITH DB QUIESCE STATUS FOR DATABASE | AREA dbname\area**

**Explanation:** A CHANGE.RECON MINVERS command was issued to set the new MINVERS value to an IMS release lower than 11.1; the current value was at least 11.1. A database or area was found with QUIESCE IN PROGRESS or QUIESCE HELD flags on. DB QUIESCE functions are only valid when MINVERS is at least 11.1.

This message is issued for each database or area found with at least one of the flags on.

**System action:** The command is terminated and subsequent commands are ignored.

**User response:** Wait until the databases and areas have completed quiesce. If the flags are on in error, issue the CHANGE.DB command to set the QUIESCE IN PROGRESS and QUIESCE HELD flags off.

**Problem determination:** 2, 3, and a listing of the RECON data sets

**Module:** DSPURM90

---

**DSP1206E**  
**PARAMETER parameter-name IS NOT ALLOWED DUE TO INVALID MINVERS VALUE**

**Explanation:** The MINVERS value does not support the parameter that is identified in the message.

The value of the MINVERS level must be 14.1, or 13.1 if the cross-DBRC service level ID (CDSLID) is set to 2, to use the OSAM8G or NOOSAM8G keywords. A CDSLID value of 2 indicates that the appropriate maintenance for HALDB support of 8-GB OSAM data sets has been applied to all IMS Version 13 resident libraries (RESLIBs) that access the RECON data set.

**System action:** The command is terminated, and subsequent commands are ignored.

**Programmer response:** Use the CHANGE.RECON command to correct the value of the MINVERS level, and then resubmit the command.

**Problem determination:** 2, 3, and a listing of the RECON data sets.

**Module:** DSPURM10, DSPURS10

---

**DSP1210E**  
**THE RCNQUAL SPECIFIED IS NOT A SUBSTRING OF THE RECON DSN**

**Explanation:** You issued an INIT.RECON or CHANGE.RECON with the CMDAUTH keyword and a rcnqual string that was not a substring of the RECON data set name, or, if specified with an asterisk (*) at the end, is not the high-level qualifier of the RECON data set name. When using the INIT.RECON or CHANGE.RECON commands to set or change the rcnqual string, rcnqual must be a substring of the RECON COPY1 data set name.

**System action:** The command failed with return code of 12. Subsequent commands are not processed.

**Programmer response:** Correct your CMDAUTH keyword values; then reissue the command and any other commands that were not processed.

**Problem determination:** 2, 3, 8, and listings of the RECON data sets

**Module:** DSPURX00

---

**Related information:**

- [Chapter 2, “IMS problem determination,” on page 13](chapter2.html)

---

Chapter 6. DSP messages (Database Recovery Control) 231
DSP1211W  THE CURRENT COMMAND AUTHORIZATION SETTING WILL NOT BE ENFORCED DUE TO RCNQUAL MISMATCH

**Explanation:** You issued a DBRC command and DBRC determined that the level of command authorization in effect cannot be enforced. The DBRC command authorization was not enforced because the string you specified as the value of rcnqual of the RECON is not a substring of the name of the RECON data set being accessed. Alternatively, if specified with an asterisk (*) at the end, the string was not the high-level qualifier of the RECON DSN. The RECON data set is treated as a copy of the RECON that does not require security.

The mismatch between the value of rcnqual and the name of the RECON data set might be a result of any of the following:

- DBRC is dealing with a copy of the production RECON data set.
- The production RECON data set was renamed and the value of rcnqual was not changed.

**System action:** Processing continues without command authorization checking.

**Programmer response:** If you wanted to have DBRC command authorization security enforced for this copy of the RECON, use the CHANGE.RECON CMDAUTH command with a rcnqual that is a substring of the RECON COPY1 data set name. DBRC command authorization security will be enforced for any commands issued after issuing the command.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPDCAI0

**Related information:**
- “DSP1214I” on page 233
- Chapter 2, “IMS problem determination,” on page 13

DSP1212W  ALL EXISTING IMAGE COPIES FOR DBNAME=dbname DDN=ddname WERE DELETED

**Explanation:** A CLEANUP.RECON command was issued without the LASTIC option. DBRC determined that the last image copy for the specified DBDS or area met the deletion criteria but was not deleted. This message follows message DSP1214I.

In the message text:
- dbname  The name of the database for which the last image copy was not deleted
- ddname  The DD name of the database data set for which the last image copy was not deleted
- area The name of the area for which the last image copy was not deleted

**System action:** Processing continues.

**Programmer response:** Determine whether this database is still valid or in use. If the database is still valid, consider whether a new image copy is needed. If the database itself is obsolete, you can choose to delete the entire database from the RECON.

**Module:** DSPURC00

**Related information:**
- “DSP1214I” on page 233
- Chapter 2, “IMS problem determination,” on page 13

DSP1213I  THE LAST IMAGE COPY FOR DBNAME=dbname DDN=ddname WAS RETAINED BECAUSE THE LASTIC OPTION WAS NOT SPECIFIED or

THE LAST IMAGE COPY FOR DBNAME=dbname AREA=areaname WAS RETAINED BECAUSE THE LASTIC OPTION WAS NOT SPECIFIED

**Explanation:** A CLEANUP.RECON command was issued without the LASTIC option. DBRC determined that the last image copy for the specified DBDS or area met the deletion criteria but was not deleted. This message follows message DSP1214I.

In the message text:
- dbname  The name of the database for which the last image copy was not deleted
- ddname  The DD name of the database data set for which the last image copy was not deleted
- area The name of the area for which the last image copy was not deleted

**System action:** Processing continues.

**Programmer response:** Determine whether this database is still valid or in use. If the database is still valid, consider whether a new image copy is needed. If the database itself is obsolete, you can choose to delete the entire database from the RECON.

**Module:** DSPURC00

**Related information:**
- “DSP1214I” on page 233
DSP1214I  RECON INFORMATION WAS
DELETED FOR DBNAME=dbname
DDN=ddname

or

RECON INFORMATION WAS DELETED FOR
DBNAME=dbname AREA=areaname

Explanation: A CLEANUP.RECON command was
issued to delete obsolete recovery-related information
from the RECON data set. Based on the options
specified in the CLEANUP.RECON command, DBRC
determined that the recovery-related records listed are
obsolete and has deleted them.

In the message text:
dbname The name of the database for which
recovery-related information was deleted
ddbname The DD name of the database data set for
which recovery-related information was deleted
areaname The name of the area for which
recovery-related information was deleted

System action: If the LISTDL option is in effect,
information about all the records that were deleted is
displayed. The output displayed includes the following
information:

<table>
<thead>
<tr>
<th>RECORD</th>
<th>TIME</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOC</td>
<td>time stamp</td>
</tr>
<tr>
<td>IMAGE</td>
<td>time stamp</td>
</tr>
<tr>
<td>RECOV</td>
<td>time stamp</td>
</tr>
<tr>
<td>REORG</td>
<td>time stamp</td>
</tr>
</tbody>
</table>

If image copies are deleted, the output also includes the
following information after each IMAGE line, where
icdsr is the data set name:

1. db-rename
2. DB-rename (if a secondary IC exists)

User image copies have no associated DSN information to
display. The system might repeat this message to list
all the DBDSs affected.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and listings of the
RECON data sets

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1215I  NO DBDS INFORMATION WAS
DELETED

Explanation: During CLEANUP.RECON processing,
the system determined that there was no obsolete
recovery-related information to delete for any of the
DBDSs that were processed.

System action: Processing continues.

DSP1216I  THE PRILOG FAMILY WITH
TIME=time-stamp AND SSID=ssid WAS
DELETED

Explanation: While executing a CLEANUP.RECON or
DELETE.LOG command, the entire PRILOG was
deleted along with any related SECLOG, PRISLD,
SECSLD, and LOGALL. One or more DFS1047I
messages follow this message if you specified the
LISTDL option.

In the message text:
time-stamp
ssid

System action: Processing continues.

Programmer response: No action is required.

Module: DSPURD60

DSP1217E  THE LASTDB VALUE MUST BE
GREATER THAN THE FIRSTDB VALUE

Explanation: A CLEANUP.RECON command was
issued with the DBRANGE option. However, the value
you provided for the firstdb parameter was greater than
the value provided for the lastdb. DBRC evaluates the
range in alphanumeric order. The DBRANGE keyword
allows a range of databases; however the values for the
range must be valid and must not wrap.

System action: The command failed with return code
of 12. Subsequent commands are not processed.

Programmer response: Examine the values provided as
the firstdb and lastdb parameters. Make sure that the
lastdb value provided is equal or greater than the firstdb
value provided.

Problem determination: 2, 3, 8, and listings of the
RECON data sets

Module: DSPURC00

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1223E  THE REORGANIZATION NUMBER
yyyyyy IS INVALID FOR DATABASE
xxxxxxx
REASON: reason

Explanation: The NOTIFY.RECOV command was
issued with the REORG parameter and subsequently
failed, or the Database Recovery Utility passed a
reorganization number to DBRC that did not result in a
new version of the data set.

In the message text:
DSP1225I • DSP1229A

yyyy The reorganization number that was specified with the REORG parameter.

xxxxxxx The database name that was specified with the DBD parameter.

Programmer response: No action is required.

Problem determination: 2, 3, 8, and the listing of the RECON data sets

Module: DSPURC00

DSP1227E THE LASTCAG VALUE MUST BE GREATER THAN THE FIRSTCAG VALUE

Explanation: A CLEANUP.RECON command was issued with the CAGROUP keyword. However, the value that was specified for the firstcag parameter was greater than the value that was specified for the lastcag parameter. DBRC evaluates the range in alphanumeric order. The values for the range must be valid and must not wrap.

System action: The command failed with a return code of 12. Subsequent commands are not processed.

Programmer response: Examine the values provided as the firstcag and lastcag parameters. Ensure that the value specified for the lastcag parameter on the CAGROUP keyword is greater than or equal to the value specified for the firstcag parameter.

Module: DSPURC00

DSP1228I NO CHANGE ACCUMULATION INFORMATION WAS DELETED

Explanation: During the CLEANUP.RECON command processing, the system determined that there was no obsolete change accumulation information to delete for any of the CA groups that were processed.

System action: The command completes successfully.

User response: No action is required.

Module: DSPURC00

DSP1229A THE CHANGE ACCUMULATION DATA SET IS WITHIN THE RECOVERY PERIOD AND CANNOT BE REUSED FOR CA GROUP GRPNAME=cagrp RUNTIME=oldest_ca_time

Explanation: Before running the Change Accumulation utility, DBRC determined that the following three events occurred:

• The value specified on the GRPMAX keyword was reached.
• The oldest change accumulation is within the recovery period and cannot be reused.
• No available change accumulation data sets exist.

System action: Processing is terminated.

Programmer response: Issue the INIT.CA command to

In the message text:

cagrp The name of the change accumulation group for which change accumulation data set information was deleted.

System action: If the LISTDL option is in effect, information about all the records that were deleted is displayed. The output displayed will include the following information:

<table>
<thead>
<tr>
<th>RECORD</th>
<th>TIME</th>
<th>STAMP</th>
<th>DSN</th>
</tr>
</thead>
<tbody>
<tr>
<td>CA</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Messages and Codes, Volume 2: Non-DFS Messages
define an available change accumulation data set or
issue the CHANGE.CAGRP command to change the
recovery period.

Problem determination: 2, 3, 8, and the listings of the
RECON data sets

Module: DSPUGP00

DSP1230I  THE LAST CHANGE
ACCUMULATION EXECUTION
RECORD FOR CA GROUP
GRPNAME=cagrp WAS RETAINED
BECAUSE THE LASTCA OPTION WAS
NOT SPECIFIED

Explanation: A CLEANUP.RECON command was
issued without the LASTCA keyword. DBRC
determined that the last change accumulation execution
record for the specified CA group met the deletion
criteria but the record was not deleted. This message
follows message DSP1225I.

In the message text:
cagrp  The name of the change accumulation group
for which the last change accumulation
execution record was retained.

System action:  Processing continues.

Programmer response:  Determine whether this change
accumulation execution record is still valid. If the CA
group is still valid, determine whether a new change
accumulation is needed. If the CA group is obsolete, you can delete it from the RECON
data set.

Problem determination: 2, 3, 8, and listings of the
RECON data sets

Module: DSPURC00

Related information:
"DSP1225I" on page 234

DSP1231W  ALL EXISTING CHANGE
ACCUMULATION EXECUTION
RECORDS FOR CA GROUP
GRPNAME=cagrp WERE DELETED

Explanation:  A CLEANUP.RECON command was
issued with the LASTCA keyword. DBRC determined that all the existing change accumulation execution
records for the specified change accumulation (CA)
group were obsolete and deleted them. This message
follows message DSP1225I.

In the message text:
cagrp  The name of the change accumulation group
for which the last change accumulation
execution record was deleted.

System action:  Processing continues.

Programmer response:  Examine the CA group
identified in the message text to determine if it is still
valid. If the CA group is valid, determine whether a
new change accumulation group is needed. If the CA
group is obsolete, you can delete it from the RECON
data set.

Module: DSPUGP00

Related information:
"DSP1225I" on page 234

DSP1231W  THE CHANGE ACCUMULATION
DATA SET IS WITHIN THE
RECOVERY PERIOD AND CANNOT
BE DELETED FOR CA GROUP
GRPNAME=cagrp RUNTIME=oldest CA
time

Explanation:  This message is issued because one of
the following events occurred:

• Before running the Change Accumulation utility,
DBRC determined that the oldest change
accumulation execution record in the RECON data
set could not be deleted for the specified CA group
that was defined as having the NOREUSE attribute.
The GRPMAX value has been reached, but the
recovery period has not been exceeded.

• During the execution of the CHANGE.CAGRP
command, the change accumulation execution record
within the recovery period could not be deleted to
meet the value of GRPMAX that is being changed by
the CHANGE.CAGRP command. The new GRPMAX
value was recorded.

System action:  The processing continues.

If the Change Accumulation utility issued the message,
the new change accumulation execution record is
recorded in the RECON data set and the number of change accumulation data sets will exceed the GRPMAX value.

**Programmer response:** The current RECOVPD value for the CA group might result in more change accumulation records maintained by DBRC than specified by the GRPMAX value. Check your RECOVPD and GRPMAX values and use the CHANGE.CAGRP command to adjust them if necessary.

**Problem determination:** 2, 3, 8, and the listings of the RECON data set

**Module:** DSPUGP00

---

**DSP1238I**  
RECON UPGRADE CHECKUP IS BEGINNING

**Explanation:** The CHANGE.RECON UPGRADE CHECKUP command is verifying that the RECON data set is in a state that allows upgrade. No RECON data set records will be changed.

**System action:** Processing continues.

**Operator response:** No action is required.

**User response:** No action is required.

**Programmer response:** No action is required.

**Module:** DSPUGR00

---

**DSP1239I**  
RECON UPGRADE CHECKUP COMPLETED WITH NO ERRORS FOUND

**Explanation:** The CHANGE.RECON UPGRADE CHECKUP command processing did not find any conditions that would cause the RECON upgrade to fail.

**System action:** The command completed.

**Operator response:** No action is required.

**User response:** None.

**Programmer response:** No action is required.

**Module:** DSPUGR00

---

**DSP1240E**  
RECON UPGRADE CHECKUP COMPLETED AND FOUND ERRORS

**Explanation:** The CHANGE.RECON UPGRADE CHECKUP command processing found error conditions that would cause a RECON upgrade to fail. Previous messages have already been issued for each error condition.

Return code 12 is set.

---

**DSP1241W**  
WAITING FOR NOTQUIESCED NOTIFICATION FROM

```plaintext
job1
(job2
(job3
(more))
```

**Explanation:** A period of 30 seconds elapsed since DBRC registered with the Structured Call Interface (SCI), or since the last time this message was issued. DBRC has not received notification that the RECONs are not quiesced. Either the RECONs are quiesced or the other DBRC instances are being unresponsive for some other reason. The jobs listed are currently active DBRC jobs in the same IMSplex according to SCI.

**System action:** DBRC waits for notification from the jobs listed.

**System programmer response:** If the RECONs are not quiesced, check that all SCI instances are running and connected and that the DBRC instances are running properly.

**Module:** DSPURG00

---

**DSP1242W**  
AN INVALID READ INTEGRITY OPTION OF nnn WAS FOUND WHEN LOCATING A RECORD

**Explanation:** An invalid read integrity option was specified when locating a record in a RECON data set that uses parallel RECON access (PRA).

In the message text, `nnn` identifies the integrity option. Valid options are 1-4.

**System action:** The read integrity option is changed to a consistent read explicit (3), and processing continues.

**User response:** The source of the invalid integrity option is most likely caused by a vendor product that calls the DBRC I/O module directly to locate a record. Contact the vendor or IBM Software Support to determine the source of the invalid read integrity option.

**Problem determination:** 1, 2, 3, 8, 36

**Module:** DSPURI00
DSP1249E  MINVERS VALUE IS INCONSISTENT WITH THE HALDB ALTER STATUS FOR DATABASE database_name ALTER COUNT=xxxxx ALTER COMPLETE COUNT=xxxxx

Explanation: A CHANGE.RECON MINVERS() command was issued to set the new MINVERS value to an IMS release lower than 13.1. The current value was at least 13.1. Altering a HALDB is only valid when MINVERS is at least 13.1.

The message is issued when a HALDB record is found with HALDB alter active for its partition databases.

In the message text:
- **ALTER COUNT=xxxxx**: The total number of partitions to be altered.
- **ALTER COMPLETE COUNT=xxxxx**: The number of partitions that have completed the HALDB alter process.

**System action:** The command fails and subsequent commands are not processed.

**Operator response:** Wait for the HALDB Online Reorganization altering the HALDB to finish for all partition databases. If the alter-in-progress flags are on in error, issue the CHANGE.DB command to set off the alter-in-progress flag for each partition database.

**Problem determination:** 2, 3

**Module:** DSPURM90

**Related information:**

DSP1251E  MINVERS VALUE IS INCONSISTENT WITH THE DEDB ALTER STATUS FOR DEDB dedb_name ALTER COUNT=xxxxx

Explanation: A CHANGE.RECON MINVERS() command was issued to set the new MINVERS value to an IMS release lower than 13.1. The current value was at least 13.1. The DEDB specified in the message has a DEDB Alter process in progress. Altering a DEDB is only valid when MINVERS is at least 13.1.

The message is issued for each partition database that has a HALDB alter process in progress.

**System action:** The command fails and subsequent commands are not processed.

**Operator response:** Wait for the structure changes to complete or take appropriate actions to remove the DEDB Alter status.

**Problem determination:** 2, 3

**Module:** DSPURM90

**Related information:**
- [Chapter 2, “IMS problem determination,” on page 13](#)

---

DSP1252E  RECOVERY NOT VALID FOR THIS INACTIVE DATA SET DBD=dbname DDN=ddname THE OLR RUNTIME= time_stamp

Explanation: A NOTIFY.RECOV command was issued to add information about recovery of a database data set to the RECON data sets. The RCVTIME() value that was specified in the command is not valid according to the information in the RECON data set. The value must be a time when this data set was active.

In the message text,
- **dbname** The name of the database being recovered.
- **ddname** The DD name of the database data set being recovered.
- **time_stamp** Indicates the runtime time stamp of the HALDB Online Reorganization record that resulted in this data set being inactive. The value is in standard time stamp format.

**System action:** The NOTIFY.RECOV command failed, and subsequent commands were not processed.

**Programmer response:** Correct the RCVTIME value that was specified in the NOTIFY.RECOV command, and reissue the command with any other commands that were not processed.

**Problem determination:** 2, 3, 8, and the listings of the RECON data sets

**Module:** DSPURT20

Chapter 6. DSP messages (Database Recovery Control) 237
DSP1256E • DSP1268E

Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1256E MINVERS VALUE IS INVALID FOR HALDB dbname WHICH HAS AN 8-GB OSAM DATA SET ORGANIZATION

Explanation: A CHANGE.RECON MINVERS() command was issued to set MINVERS to one of the following values:
- 13.1 with a cross-DBRC service level ID (CDSLID) value that is lower than 2
- 12.1

For either of these MINVERS values, the maximum size of the OSAM PHDAM or PHIDAM data sets for HALDB databases can only be 4 GB. The HALDB that is identified in the message is defined as using 8-GB OSAM data sets.

System action: The command fails and subsequent commands are not processed. The command checks all the HALDBs for the option of 8-GB OSAM data sets. Message DSP1256E is issued for each HALDB that uses 8-GB OSAM data sets.

Programmer response: If you do not need to fall back from IMS 14 to an earlier version and want to keep using the 8-GB OSAM data sets, do not set the CSDLID value to be lower than 2.

If you do need to fall back and do need to set the CSDLID to a value that is lower than 2, change the maximum size of the OSAM data sets from 8 GB to 4 GB for each HALDB database that is identified by message DSP1256E. (For instructions, see Chapter 2, “IMS problem determination,” on page 13).

Problem determination: 2, 3
Module: DSPURM90
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1262I DBD=dbd DDN=ddn FOR DELETE COMMAND HAS BEEN PROCESSED

or

DBD=dbd AREA=area FOR DELETE COMMAND HAS BEEN PROCESSED

Explanation: This database data set (DBDS) has been processed with deletion for the DELETE.DB command.

System action: Processing continues.

Programmer response: No action is required.
Module: DSPURCM6

DSP1267E THE CROSS-DBRC SERVICE LEVEL ID IS INVALID FOR HALDB dbname WHICH HAS AN 8-GB OSAM DATA SET ORGANIZATION

Explanation: A CHANGE.RECON CDSLID() command was issued to set the cross-DBRC service level ID to a value that is lower than 2 when either the MINVERS value is 13.1 or is being lowered to 13.1 in the same CHANGE.RECON command. The HALDB database that is identified in the message is defined as using 8-GB OSAM PHDAM or PHIDAM data sets. The use of 8-GB OSAM data sets is allowed only when MINVERS is 14.1 or MINVERS is 13.1 with the CDSLID value set to 2.

A CSDLID value of 2 indicates that the appropriate maintenance for HALDB support of 8-GB OSAM data sets has been applied to all IMS Version 13 resident libraries (RESLIBs) that access the RECON data set.

System action: The command fails and subsequent commands are not processed. The command checks all the HALDBs for the option of using 8-GB OSAM data sets. Message DSP1267E is issued for each HALDB that uses 8-GB OSAM data sets.

Programmer response: If you do not need to fall back from IMS 14 to an earlier version and want to keep using the 8-GB OSAM data sets, do not set the CSDLID value to be lower than 2.

If you do need to fall back and do need to set the CSDLID to a value that is lower than 2, change the maximum size of the OSAM data sets from 8 GB to 4 GB for each HALDB database that is identified by message DSP1267E. (For instructions, see Chapter 2, “IMS problem determination,” on page 13).

Problem determination: 2, 3
Module: DSPURM90
Related information:
Chapter 2, “IMS problem determination,” on page 13

DSP1268E PARAMETER parameter-name IS NOT ALLOWED DUE TO INVALID CROSS-DBRC SERVICE LEVEL ID

Explanation: The cross-DBRC service level ID (CSDLID) value in the RECON data set does not support the parameter that is identified in the message.

To use the OSAM8G or NOOSAM8G keywords, the value of CSDLID must be 2 when the MINVERS value is 13.1 A CSDLID value of 2 indicates that the appropriate maintenance for HALDB support of 8-GB OSAM data sets has been applied to all IMS Version 13 resident libraries (RESLIBs) that access the RECON data set.

System action: The command is terminated, and subsequent commands are ignored.

Programmer response: If the appropriate maintenance for HALDB support of 8-GB OSAM data sets has been applied, submit a CHANGE.RECON CDSLID(2) command to change the CSDLID value. Or, submit a CHANGE RECON MINVERS('14.1') command to set
the MINVERS value to 14.1.
After adjusting the CDSLID or the MINVERS value, resubmit the CHANGE.DB or INITDB command.

**Problem determination:** 2, 3, and a listing of the RECON data sets.

---

**DBRC INITIALIZATION ERROR IN modulename servicename RC=rc RSN=rsn**

**Explanation:** An error occurred during the initialization of a DBRC address space. The initialization error can occur while processing a service or validating a parameter in a PROCLIB.

In the message text:
- **modulename**
  The name of the module that issued the error
- **servicename**
  The name of the service that detected the error. The service can be:
  - **BPEservicename**
    A BPE service; see the information about BPE service return codes.
  - **MVSservicename**
    Service can also be provided by z/OS; for information on z/OS services, see z/OS MVS Programming: Authorized Assembler Services Reference, Volumes 1-4 (SA22-7609, SA22-7610, SA22-7611, SA22-7612).
- **rc**
  The return code for the failing service
- **detail**
  Provides additional information about the error
- **rsn**
  The reason code from the failing service

**DBRC ALREADY EXISTS FOR IMS**

A DBRC region for the IMSID specified on the DBRC startup execution parameter already exists.

**System action:** The DBRC address space terminates abnormally with the abend 2490.

**Operator response:** Check the code in register 15 for the 2490 abend to determine the reason for the problem.

If an invalid DBRC TYPE 4 SVC was found, install the correct DBRC TYPE 4 SVC and restart DBRC. If you are unable to resolve the problem, save the SYSLOG and the dump, and call IBM Software Support for assistance.

**Module:** DSPBINP0, DSPBIN00, DSPBIN40, DSPBRQ00

**Related reference:**

</table>
Programmer response: Resolve the problems with DBRC. There might also be problems with the RECON data sets.

Problem determination: If the SYSPRINT file is displayed, respond to the messages it displays. If no SYSPRINT file exists, look in the MVS SYSLOG file for information on additional messages.

Module: DSPXPDDU

DSPM007I  Duplicate partition IDs were encountered. id = id

Explanation: The ID that was encountered during IMPORT has already been defined for this database.

System action: Only the first partition with the duplicated ID is displayed.

Programmer response: If the IMPORT command for partition definitions was issued and the STOP ON FIRST ERROR option was specified, select the TRY ALL PARTITIONS option to import the remaining partitions.

Problem determination: A partition ID must be unique within the database. If there are duplicate partition IDs, make sure that the import data set was created for this database.

Module: DSPXPDDU

DSPM008I  Table add error: not all partitions can be displayed. tbadd rc = rc

Explanation: The list of partitions might not be complete. An error occurred while composing the list for display.

System action: The new partition is not included in the list of displayed partitions.

Programmer response: Check the TBADD return code shown in the message for an indication of the cause of the error. For additional information, see the OS/390 Interactive System Productivity Facility (ISPF): Services Guide

Problem determination: The TBADD return code indicates the type of problem encountered. A typical problem is duplicate table rows.

Module: DSPXPDDU

DSPM009I  Database dbname is not a partitioned database.

Explanation: The database in the message, as indicated by dbname, has not been defined as a HALDB.

System action: The previous panel is displayed again.

Programmer response: Select another database or check the DBD generation to make sure the selected database is defined as a HALDB.

Problem determination: Make sure that the DBD generation defines this database as a HALDB. Make sure that the correct definition is in the DBDLIB data sets that are allocated in the IMS file name.

Module: DSPXPDDU

DSPM010I  Changes to the partition were canceled by the CANCEL command.

Explanation: The partition definition panel or the partition modification panel was displayed but instead of pressing the Enter key to process, the Cancel key was pressed.

System action: The partition was not defined or modified. Any data typed into the panel is discarded when the Cancel key is pressed.

Module: DSPXPDDU

DSPM011I  Partition name was added successfully.

Explanation: DBRC successfully added the new partition.

Module: DSPXPDDU

DSPM012I  Partition name was changed successfully.

Explanation: DBRC successfully processed the changes to the partition definition.

Module: DSPXPDDU

DSPM013I  Partition name was deleted successfully.

Explanation: The partition was successfully deleted from the RECON data set.

Module: DSPXPDDU

DSPM014I  Count partitions were added successfully.

Explanation: New partitions were added. Count represents the number of partitions that were added.

Module: DSPXPDDU

DSPM015I  Count partitions were deleted.

Explanation: Several partitions were deleted. Count represents the number of partitions that were deleted.

Module: DSPXPDDU

DSPM016I  Information about partition name was printed successfully.

Explanation: Information about the partition was saved to the ISPF list file.

Module: DSPXPDDU
DSPM017I  Information about count partitions were printed.

Explanation: Information about several partitions was saved to the ISPF list file. Count represents the number of partitions that were processed.

Module: DSPXPDDU

DSPM018I  Changes to the database were canceled by CANCEL command.

Explanation: Changes to the HALDB master information were not confirmed by pressing the Enter key. The Cancel key was pressed instead.

System action: The information was not saved to the RECON data sets.

Module: DSPXPDDU

DSPM019I  Table member was created successfully to data set dname.

Explanation: The export function saved information about the HALDB as a member of the partitioned data set.

Module: DSPXPDDU

DSPM020I  Database definition was canceled by the CANCEL command.

Explanation: The database definition panel was displayed but the user pressed the Cancel key instead of the Enter key.

System action: The database was not defined in the RECON data set.

Programmer response: If the Cancel key was pressed by mistake, you must define the database attributes again and press the Enter key.

Module: DSPXPDDU

DSPM021I  Partition name was not added to the list displayed by ISPF. TBADD rc = rc

Explanation: The partition, indicated by name, was defined successfully in the RECON data set, but could not be added to the list of displayed partitions.

System action: When the partition list is displayed, it does not contain the partition indicated by name.

Programmer response: There was an error in the ISPF services used to display the partition list. Try exiting ISPF or logging off the system, then restart the Partitioned Database Definition Utility.

Problem determination: The TBADD return code indicates the type of problem encountered. A typical problem is duplicate table rows. Check the return code, indicated by rc, in the z/OS Interactive System Productivity Facility manuals for an indication of the problem.

Module: DSPXPDDU

Related reference:

 DSPM022I  Partition name was not changed on the list displayed by ISPF. TBMOD rc = rc

Explanation: The partition was changed successfully in the RECON data set, but could not be changed in the list of displayed partitions.

System action: When the partition list is displayed, it does not show the changes to the partition indicated by name.

Programmer response: There was an error in the ISPF services used to display the partition list. Try exiting ISPF or logging off the system, then restart the Partitioned Database Definition Utility.

Problem determination: The TBMOD return code indicates the type of problem encountered. A typical problem is duplicate table rows. Check the return code, indicated by rc, in the z/OS Interactive System Productivity Facility manuals for an indication of the problem.

Module: DSPXPDDU

Related reference:

 DSPM023I  Partition name was not deleted from the list displayed by ISPF. TBDELETE rc = rc

Explanation: The partition was deleted successfully from the RECON data set, but could not be deleted from the list of displayed partitions.

System action: When the partition list is displayed, it shows the partition indicated by name.

Programmer response: There was an error in the ISPF services used to display the partition list. Try exiting ISPF or logging off the system, then restart the Partitioned Database Definition Utility.

Problem determination: The TBDELETE return code indicates the type of problem encountered. A typical problem is duplicate table rows. Check the return code, indicated by rc, in the z/OS Interactive System Productivity Facility manuals for an indication of the problem.

Module: DSPXPDDU

Related reference:
DSPM024I  Unknown line command or action bar combination. line command: command

Explanation: A line command was typed in the partition list panel but was not recognized as a valid command.

Programmer response: Display the help text by pressing F1. Determine which line commands are available. Enter the line command in the Act column.

Module: DSPXPDDU

DSPM025I  Enter a numeric value between low and high

Explanation: The field requires a numeric value within a specific range, indicated by low and high.

Module: DSPXPDDU

DSPM026I  New table member was not created. TBSAVE rc = rc

Explanation: The new table was not created. rc is the return code from the ISPF tbsave service.

System action: The table is not saved into the specified data set. The Export a Database panel remains displayed.

Programmer response: Make sure that the output data set exists, that it is a partitioned data set, and that it is fixed-block with 80 byte records.

Problem determination: The TBSAVE return code indicates the type of problem encountered. A typical problem is duplicate table rows. Check the return code, indicated by rc, in the z/OS Interactive System Productivity Facility manuals for an indication of the problem.

Module: DSPXPDDU

Related reference: [z/OS: TBSAVE return codes]

DSPM027I  Data set dsname is not cataloged. libdef rc = rc

Explanation: The data set indicated by dsname is not cataloged.

System action: The export or import is not performed. The message is displayed and the panel continues to be displayed.

Programmer response: Make sure that the name of the data set specified in the panel is spelled correctly, and that the data set actually exists.

Module: DSPXPDDU

DSPM028I  Changes for changed of total partitions processed.

Explanation: More than one partition was changed. In the message text:

changed Indicates the number of partitions that were changed.

total If the CHANGE ALL PARTITIONS option was specified, total identifies the number of defined partitions. If the CHANGED SELECTED PARTITIONS option was selected, total indicates the number of partitions that were selected.

Module: DSPXPDDU

DSPM029I  Changes for changed of total partitions processed. Count errors encountered.

Explanation: More than one partition was selected to be changed, but some of the specified changes were not performed.

In the message text:

changed Indicates the number of partitions that were changed.

total If the CHANGE ALL PARTITIONS option was specified, total identifies the number of defined partitions. If the CHANGED SELECTED PARTITIONS option was selected, total indicates the number of partitions that were selected.

Count Indicates the number of partitions that were not changed.

System action: The partition list is displayed again.

Programmer response: Make sure that the partitions are available for use, then attempt the change again.

Module: DSPXPDDU

DSPM030I  Database definition was not performed. DBRC rc = rc reason = code.

Explanation: The database was not defined in RECON. An internal error in the IMS Partitioned Database Definition Utility was detected. rc and code indicate the nature of the error. Generally, the values have meaning only to IBM service representatives.

System programmer response: If the problem persists, contact the IBM Support Center for assistance.

Module: DSPXPDDU

DSPM031I  Partition name was not added. DBRC rc = rc reason = code.

Explanation: The new partition could not be defined in RECON. An internal error in the IMS Partitioned Database Definition Utility was detected. rc and code indicate the nature of the error. Generally, the values have meaning only to IBM service representatives.
System programmer response: If the problem persists, contact the IBM Support Center for assistance.

Module: DSPXPDDU

DSPM032I Partition name was not changed. DBRC rc = rc reason = code.

Explanation: The partition could not be changed in DBRC. An internal error in the IMS Partitioned Database Definition Utility was detected. rc and code indicate the nature of the error. Generally, the values have meaning only to IBM service representatives.

System programmer response: If the problem persists, contact the IBM Support Center for assistance.

Module: DSPXPDDU

DSPM033I Partition name was not deleted. DBRC rc = rc reason = code.

Explanation: The partition could not be deleted from RECON. An internal error in the IMS Partitioned Database Definition Utility was detected. rc and code indicate the nature of the error. Generally, the values have meaning only to IBM service representatives.

System programmer response: If the problem persists, contact the IBM Support Center for assistance.

Module: DSPXPDDU

DSPM034I Database dbname was not deleted. DBRC rc = rc reason = code.

Explanation: The database indicated by dbname was not deleted from the RECON data set. rc and code indicate the nature of the error. Generally, the values have meaning only to IBM service representatives.

System programmer response: If the problem persists, contact the IBM Support Center for assistance.

Module: DSPXPDDU

DSPM035I Database name was deleted successfully.

Explanation: The database was deleted from the RECON data set.

Module: DSPXPDDU

DSPM036I You must type '/' to confirm the deletion of the database.

Explanation: You did not enter / for confirmation.

Module: DSPXPDDU

DSPM037I ISPFP table error: the change can not be performed. tbquery rc = rc.

Explanation: An internal error occurred while the partition information was being processed for display.

System action: The partition information is not displayed.

Programmer response: Restart the partitioning application.

Module: DSPXPDDU

DSPM038I Group information has not been set. Use the 'groups' function key to set it.

Explanation: The partition is defined with multiple data set groups, but not all of the groups are defined.

System action: The panel displays until the Groups or Cancel key is pressed.

Programmer response: Set or confirm Information for each group.

Module: DSPXPDDU

DSPM039I Database dbname has an access method of 'type'. Partitioning is not supported for that access method.

Explanation: The Partitioned Database Definition Utility does not support the access method listed.

System action: No processing is performed.

Programmer response: Make sure the access method in the DBD generation is correct.

Problem determination: Make sure the database name is correct and that the access method is specified correctly in the DBD generation. Make sure that the correct DBDLIB data set is in the IMS file name.

Module: DSPXPDDU

DSPM040I Enter a numeric value, 0 or a value between 2 and 100.

Explanation: The value for the free block frequency factor (FBFF) was not valid.

Programmer response: Enter a number between 0 and 100, except for 1.

Module: DSPXPDDU

DSPM041I Enter an even numeric value for block size, less than 32766.

Explanation: The value for the block size can only be an even number. The maximum value is 32766.

Programmer response: Enter an even numeric value for the block size, less than 32766.
DSPM042I  The maximum number of partitions has been reached.

Explanation: The number of partitions for a database has been reached.

System action: The specified partition was not defined.

Programmer response: Delete obsolete partitions to keep from exceeding the maximum, then define new partitions.

DSPM043I  The partition high key length of keylength is longer than the root key length of rootlength at line line.

Explanation: The partition high key is too long. The high key is longer than the root key length specified during DBDGEN.

System action: The partition is not created or modified if the key is too long.

Programmer response: Reduce the length of the high key to less than or equal to the length of the root key.

DSPM044I  Duplicate high key values were encountered.

Explanation: The partition high key values must be unique for each partition when the database does not have a Partition Selection exit routine.

System action: The partition is not created or modified if a partition with the same key already exists.

Programmer response: Change the partition high key to a unique value.

Problem determination: If you are unsure of the keys that are already in use, return to the Database Partitions panel and display the partition high keys. When you create a new partition, select a key that is unique.

DSPM045I  The value for ‘Recoverable?’ must be Y (Yes), N (No) or blank.

Explanation: Specifies whether or not the Database Image Copy utility or the Online Database Image Copy utility are to reuse previously defined image copy data sets.

System action: The panel displays until an acceptable value is entered.

Programmer response: Enter a valid value:
YES The database is recoverable.
NO The database is not recoverable.
blank If the value is left blank, it defaults to YES.

You can spell out YES or NO, or use the first letter of the word. YES is the default. If a global service group is specified, the recoverable field must be YES.

DSPM046I  Enter Y (Yes) or N (No).

Explanation: Provide a yes or no value to select processing for the AUTOMATIC DEFINITION or USE DEFAULTS FOR DS GROUPS options. The cursor location identifies which field is required.

YES Specifying YES for AUTOMATIC DEFINITION allows multiple partitions to be created without intervention. Specifying YES for USE DEFAULTS FOR DS GROUPS allows partitions to be created with defaults from the data set group information.

NO Specifying NO for AUTOMATIC DEFINITION allows the user to serially create partitions. Specifying NO for USE DEFAULTS FOR DS GROUPS forces the user to provide data set group information.

System action: The panel displays until you enter a value.

Programmer response: Enter a valid value. You can spell out YES or NO, or use the first letter of the word.
### DSPM049I
The partition name model will not allow count partitions to be created.

**Explanation:** The input data set contained more high key values or partition selection strings than the model allows.

**System action:** No partitions are created until the model supports the number of partitions identified in the input data set.

**Programmer response:** Take one of the following actions:
- Add additional '%' characters to the model
- Remove unnecessary keys from the input data set

**Module:** DSPXPDDU

---

### DSPM050I
There are too many data lines. Only one line is acceptable.

**Explanation:** The key string can only be on one line in the editor.

**System action:** The key string cannot be saved until the extra lines are removed.

**Programmer response:** Scroll to the right to add more information on the first line. You can use the TF (text flow) line command in the editor line command area to combine multiple lines into one.

**Module:** DSPXPDDU

---

### DSPM messages DSPM051I-DSPM100W

This topic contains the following messages:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSPM051I</td>
<td>The value is not a valid hex string.</td>
</tr>
<tr>
<td><strong>Explanation:</strong></td>
<td>The key string is declared as a hexadecimal string, but it contains values that are not valid characters. The hexadecimal format is in the form of X’nn’ or ‘nn’X; X’nn’ can contain characters 0 through 9, A through F, and a through f.</td>
</tr>
<tr>
<td><strong>System action:</strong></td>
<td>The key string is not saved until the syntax is corrected.</td>
</tr>
<tr>
<td><strong>Programmer response:</strong></td>
<td>Enter valid hexadecimal characters for the key string.</td>
</tr>
<tr>
<td><strong>Module:</strong></td>
<td>DSPXPDDU</td>
</tr>
</tbody>
</table>

| DSPM052I | A hex string must have an even number of hex digits. |
| **Explanation:** | The key string is declared as a hexadecimal string; there must be an even number of hexadecimal characters within the string value but there are not. The hexadecimal format is in the form of X’nn’ or ‘nn’X; X’nn’ can contain characters 0 through 9, A through F, and a through f. |
| **System action:** | The key string is not saved until the syntax is corrected. |
| **Programmer response:** | Change the key string so that it contains an even number of hexadecimal characters, for example: X’34’ |
| **Module:** | DSPXPDDU |

| DSPM053I | There are conflicting string types: prefix and suffix |
| **Explanation:** | A key string type can be in either character or hexadecimal format. The type of format can be identified by the leading or trailing character. In this case, the type could not be determined. |
| **System action:** | The key string is not saved until the syntax is corrected. |
| **Programmer response:** | Change the syntax of the key string so that it does not contain both prefix and suffix characters. |
| **Module:** | DSPXPDDU |

| DSPM054I | Unknown prefix: prefix |
| **Explanation:** | The format for a key string could not be determined. A key string type can be in either character or hexadecimal format. |
| **System action:** | The key string is not saved until the syntax is corrected. |
| **Programmer response:** | Define the format for the key string by using the character C for character or X for hexadecimal. |
| **Module:** | DSPXPDDU |

| DSPM055I | Unknown suffix: suffix |
| **Explanation:** | The format for a key string could not be determined. A key string type can be in either character or hexadecimal format. |
| **System action:** | The key string is not saved until the syntax is corrected. |
| **Programmer response:** | Define the format for the key string by using the character C for character or X for hexadecimal. |
| **Module:** | DSPXPDDU |

| DSPM056I | There is an unrecognized string type at end of string: suffix |
| **Explanation:** | The format for a key string could not be |
A key string type can be in either character or hexadecimal format.

**System action:** The key string is not saved until the syntax is corrected.

**Programmer response:** Define the format for the key string by using the character C for character or X for hexadecimal.

**Module:** DSPXPDDU

---

**DSPM057I** The high key value or partition selection string was longer than 256 bytes.

**Explanation:** The data for the high key value or partition selection string was too long. The maximum length is 256 bytes.

**System action:** The key string is not saved until the syntax is corrected.

**Programmer response:** Change the key string so that it is only 256 bytes long.

**Module:** DSPXPDDU

---

**DSPM058I** Enter an RSR tracking type of Dbtrack or Rcvtrack.

**Explanation:** The RSR tracking type is an optional parameter. The two types of RSR tracking are: DBTRACK or RCVTRACK.

**System action:** DBTRACK is used as the default if no type is provided.

**Programmer response:** Specify an RSR tracking type of Dbtrack or Rcvtrack. You can use the abbreviations of D or R to specify the type.

**Module:** DSPXPDDU

---

**DSPM059I** An RSR tracking type was specified but a global service group was not.

**Explanation:** The RSR tracking type is an optional parameter and is used to specify the type of RSR tracking (shadowing) for an area assigned to a global service group. The type, RCVTRACK or DBTRACK, cannot be specified without an RSR Global Service Group being defined for the HALDB master.

**System action:** The HALDB information is not saved until the RSR Global Service Group field is filled in or the RSR tracking type is blank. The global service group must be registered to the RECON data sets in use.

**Programmer response:** Take one of the following actions:
- Provide a global service group
- Remove the RSR tracking type

**Module:** DSPXPDDU

---

**DSPM060I** Chars 'text' - not found in any partition.

**Explanation:** The find command did not find the desired text. The find command searched from the current table position to the bottom of the partition list.

**Programmer response:** Press the PF5 key to repeat the search from the top of the list. If the search string is not found in any partition, make sure the search string is correct.

**Module:** DSPXPDDU

---

**DSPM061I** Duplicate partition named partition already exists.

**Explanation:** Partition names must be unique. The partition name indicated by partition has already been defined for this database.

**System action:** The partition is not created and the panel continues to display.

**Programmer response:** Change the partition name so that it is unique.

**Module:** DSPXPDDU

---

**DSPM062I** The input data set, inputds, contains no key or string values.

**Explanation:** The input data set must contain records with key or string values. The input data set indicated by inputds did not have any records containing key or string values.

**System action:** No partitions are created until the input data set contains valid records.

**Programmer response:** Use the editor to add new records.

**Module:** DSPXPDDU

---

**DSPM063I** The input data set, inputds, contains blank lines.

**Explanation:** The input data set indicated by inputds contains lines which have no key or string values.

**System action:** No partitions are created until the input data set contains valid records.

**Programmer response:** Use the editor to remove the empty lines or add an asterisk to turn them into comment lines.

**Module:** DSPXPDDU

---

**DSPM064I** THE DATABASE dbname, IS NOT DEFINED IN RECON

**Explanation:** The name of the database you specified was not defined in RECON as a HALDB.

**Programmer response:** Verify that the data set name is
specified correctly. If the name is correct, make sure the proper RECON data sets are being used.

**Module:** DSPXPDDU

---

**DSPM065W** A problem exists with import data set

**Explanation:** The import data set indicated by `name` cannot be processed. The message displays information returned by the SYSDSN function of the REXX language.

**System action:** The import is not performed because there is a problem with the import data set.

**Programmer response:** Resolve the problem that is identified in the message. If the data set does not exist, make sure you specified the name correctly.

**Module:** DSPXPDDU

---

**DSPM066I** Search for `string` was successful.

**Explanation:** The search found the specified character.

**Module:** DSPXPDDU

---

**DSPM067I** `string` was not found. Press RFIND key to continue from top.

**Explanation:** The search did not find the specified character.

**Programmer response:** Press the RFIND key to continue the search from the top of the partition list.

**Module:** DSPXPDDU

---

**DSPM068I** Find cancelled by the cancel command.

**Explanation:** The find request was not processed because the user pressed the Cancel key.

**Module:** DSPXPDDU

---

**DSPM069I** Group information has been set.

**Explanation:** The group information has been set as part of the definition of a partition or as part of the partition defaults; however, the information is not actually saved until the partition is saved.

**Module:** DSPXPDDU

---

**DSPM070I** Database `dbname` is already registered in RECON, but not as a partitioned database.

**Explanation:** The database is already registered in the RECON data set; however, it is not defined in RECON as a HALDB.

**System action:** The HALDB is not defined in the RECON data set.

**Programmer response:** Remove the database from RECON, define it as a HALDB, then add the database back to RECON.

**Module:** DSPXPDDU

---

**DSPM072W** Character or hex string does not start or end properly at line `linenum`.

**Explanation:** The key string started with C' or X' but did not end with a quote character, or the key string started with a quote character but did not end with a 'C or 'X.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** Change the key string at the line specified in the message so that it contains the proper syntax.

**Module:** DSPXPDDU

---

**DSPM073W** Hex string contains characters other than a/f, A/F or 0/9 at line `linenum`.

**Explanation:** The hexadecimal string contains an illegal character at the line indicated by `linenum`.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** Enter valid hexadecimal characters for the hexadecimal string. Valid characters are A-F, a-f, and 0-9.

**Module:** DSPXPDDU

---

**DSPM074W** Null string is found at line `linenum`.

**Explanation:** A null string (a string with no contents) is not allowed.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** You can delete the line, add a character to the string, or put an asterisk in column 1 (to make it a comment).

**Module:** DSPXPDDU

---

**DSPM075W** A blank line is found at line `linenum`.

**Explanation:** A blank line is not allowed in the input file.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** Remove the blank line or replaced it with valid data.

**Module:** DSPXPDDU

---

[Chapter 7. DSPM messages (HALDB Partition Definition utility) 249]
**DSPM076W** Length of character key > 256 or hex key > 512 at line linenum.

**Explanation:** The length of a key string exceeds the maximum value allowed.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** The key string was too long. Change the key string so that the length is less than or equal to 256 characters.

**Module:** DSPXPDDU

---

**DSPM077W** Hex string does not contain even numbers of characters at line linenum.

**Explanation:** A hexadecimal string was encountered that contains an odd numbers of characters. Even numbers of characters are required.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** Change the hexadecimal string so that there are an even number of hexadecimal digits.

**Module:** DSPXPDDU

---

**DSPM078W** x/X for hex string or c/C for character string appear at both start and end of the string at line linenum.

**Explanation:** Only one x/X or c/C character is allowed in the string in only one location, at the start or end of the string.

**System action:** Partitions are not created until the input data set is correct.

**Programmer response:** Remove the leading or trailing key string identifier (an X or a C). It is usually easier to remove the trailing identifier.

**Module:** DSPXPDDU

---

**DSPM080W** OPEN table failed. Check data set/member name specified on the panel.

**Explanation:** Data set or data member specified on the panel cannot be found, or the member specified is not a valid table name.

**System action:** The table could not be opened. The import is not performed.

**Programmer response:** Make sure that the data set and member exist. Make sure that the data set is not in use by someone else.

**Module:** DSPXPDDU

---

**DSPM081W** Import failed for partition name because of DBRC rc = code

**Explanation:** The import failed because DBRC detected an error while processing the database indicated by name. An internal error in the IMS Partitioned Database Definition Utility was detected. code indicates the nature of the error. Generally, the values have meaning only to IBM service representatives.

**System action:** The import is not performed for the partition. Other partitions might have been imported successfully.

**Programmer response:** There is usually a more specific message describing the error in the log file. If the problem persists, contact the IBM Support Center for assistance.

**Module:** DSPXPDDU

---

**DSPM082I** Count of a total count2 partitions from table name were imported to database successfully.

**Explanation:** The partitions were successfully imported into the database. In the message text:

- **Count** The number of partitions successfully imported into the database
- **count2** The total number of partitions from the table

**Module:** DSPXPDDU

---

**DSPM083I** Start Import to DBN=DBNAME. from MEM=member in DSN=dataset. Options=option.

**Explanation:** This is a status message that appears near the beginning of message log that informs users' of DBN, DSN, and MEM options.

In the message text:

- **DBNAME** The name of the database being imported.
- **member** The name of the PDS member that will be used as input for the import.
- **dataset** The name of the data set that contains the member.
- **option** The option selected for import processing:
  - 1 Indicates that import processing should stop when there is a problem.
  - 2 Indicates that the import process should continue importing the remaining partitions even when some partitions cannot be imported.

**Module:** DSPXPDDU
DSPM084I  Import successful for partition name.
Explanation: The import was successful for the partition indicated by name. No errors were found.
Module: DSPXPDDU

DSPM085I  Imports start at date time.
Explanation: The imports began at the time indicated by date time.
Module: DSPXPDDU

DSPM086W  Enter a value between 1 and 2.
Explanation: You must specify one of the following types of import processing:
1 Indicates that import processing should stop when there is a problem.
2 Indicates that the import process should continue importing the remaining partitions even when some partitions cannot be imported.
Module: DSPXPDDU

DSPM087W  Import process terminated on detection of first error from DBRC.
Explanation: The import process terminated after DBRC detected an error. Terminating the import after detection of an error is an option that was specified by the user.
System action: The import was terminated.
Programmer response: Examine the import log for preceding messages that indicated the type of problem encountered. Resolve the error indicated by that message.
Module: DSPXPDDU

DSPM088E  Program DSPXPDDU cannot execute outside of ISPF.
Explanation: The DSPXPDDU program cannot be executed outside of ISPF.
System action: HALDB or DSPXRUN terminates without performing any action.
Programmer response: Start ISPF and execute the HALDB command. For batch import, use the ISPSTART command to start ISPF.
Module: DSPXPDDU

DSPM089W  The IMPORT operands specified are invalid or missing.
Explanation: The IMPORT command syntax is not correct. Keywords DSN, DBN, or MEM might be missing or values specified for them are not correct or not enclosed in parenthesis. For the OPT keyword, the only valid values are 1 and 2:
1 Indicates that import processing should stop when there is a problem.
2 Indicates that the import process should continue importing the remaining partitions even when some partitions cannot be imported.
System action: No import is performed.
Programmer response: Provide proper command syntax for the IMPORT command.
Module: DSPXPDDU

DSPM090E  A problem exists with DBD data set name: description.
Explanation: The DBD data set indicated by name cannot be processed. The information indicated by description is returned by the SYSDSN function of the REXX language.
System action: The configuration is not saved.
Programmer response: Try to resolve the problem identified in the message. Use ISPF 3.2 or a similar utility to list data set information and verify that the data set exists and is available.
Module: DSPXPDDU

DSPM091E  A problem exists with the RECON data set name: description.
Explanation: The RECON data set indicated by name cannot be processed. This information indicated by description is returned by the SYSDSN function of the REXX language.
System action: The configuration is not saved.
Programmer response: Try to resolve the problem identified in the message. Use ISPF 3.2 or a similar utility to list data set information and verify that the data set exists and is available.
Module: DSPXPDDU

DSPM092E  File allocation failed for file in configuration cfgname: message
Explanation: An error occurred while issuing the ALLOCATE command for the file indicated by file. See the additional description at the end of the message for more information.
In the message text:
file  The file for which the ALLOCATE command failed.
cfgname  The configuration name specified in the panel.
message  The message indicates the problem. For example, ‘dataset not found’.
System action: The configuration is not saved.
Programmer response: Try to resolve the problem identified in the message. Use ISPF 3.2 or a similar utility to list data set information and verify that the data set exists and is available.

Module: DSPXPDDU

DSPM093W An enqueue failed for dbname, using RECON data set recon. This will prevent you from modifying the database.

Explaination: The database is in use by another person. You can only display partition information and will not be allowed to modify the information.

Module: DSPXPDDU

DSPM094W A modify is not allowed: someone else is using database dbname

Explanation: The database is in use by another person. You cannot modify any partitions. Message DSPM093W appeared previously as a warning.

Module: DSPXPDDU

DSPM095I The specified global service group does not exist.

Explanation: The global service group is not currently defined in the RECON data set you are using.

System action: The HALDB master information will not be saved until a defined global service group is specified.

Programmer response: Use an existing global service group or create a new one. Use the LIST.GSG ALL DBRC command to list the defined groups or use the INIT.GSG command to create a new group.

Module: DSPXPDDU

DSPM096I The master database information for DBNAME was defined successfully.

Explanation: The HALDB master information for the database you are defining was saved to the RECON data set.

Module: DSPXPDDU

DSPM messages DSPM101W-DSPM145I

This topic contains the following messages:

DSPM101W Open failed for data set.

Explanation: The input data set could not be opened.

System action: Processing is not performed.

Programmer response: Make sure the input data set exists and that it is not being used.

Module: DSPXPDDU

DSPM102W A member was specified but data set is a sequential data set.

Explanation: A member name was specified but the data set is a sequential data set.

System action: Processing is not performed.
Programmer response: If the data set is sequential, remove the member name.
Module: DSPXPDDU

DSPM103W Dataset has an unsupported record format.
Explanation: The input data set has an unsupported record format. Only fixed-block and variable-block records are supported.
System action: Processing is not performed.
Programmer response: Specify a data set that is fixed block or variable blocked.
Module: DSPXPDDU

DSPM104W Dataset has an unsupported data set organization.
Explanation: The input data set has an unsupported data set organization. Only partitioned and sequential data sets are supported.
System action: Processing is not performed.
Programmer response: Specify a data set that is sequential or partitioned.
Module: DSPXPDDU

DSPM105W Member member was not found in data set.
Explanation: The member name you specified was not a member of the input data set.
System action: Processing is not performed.
Programmer response: Verify that the member name was the correct one and that it exists in the specified data set.
Module: DSPXPDDU

DSPM106W The data set data set has records longer than 540.
Explanation: The input data set must have record lengths less than 540 bytes.
System action: Processing is not performed.
Programmer response: Use a data set that has record lengths less than or equal to 540.
Module: DSPXPDDU

DSPM107W The input data set, data set, contains errors.
Explanation: An error was found in the records of the input data set.
System action: Processing is not performed.

Programmer response: Examine the messages in the displayed file for more information about the errors. The errors will be related to the key string values or the syntax.
Module: DSPXPDDU

DSPM108I No changed fields were detected. Use the CANCEL command to leave.
Explanation: No fields were changed on the panel.
System action: No processing is performed when you press the Enter key.
Programmer response: Use the Cancel function key to leave the panel.
Module: DSPXPDDU

DSPM109I Changes to the master database information were successful.
Explanation: The changes to the HALDB master information were saved to the RECON data sets.
Module: DSPXPDDU

DSPM110E File deallocation failed for ddbname: freemsg
Explanation: An error occurred when DSPXXALX issued the FREE command for the file identified in ddbname.
ddbname The file for which the FREE command failed.
freemsg The TSO message returned by the FREE command.
Programmer response: Try to resolve the problem identified in the message. For example, use the TSO LISTA command to see if the IMS RECON or DBDLIB data sets are still allocated. From the ISPF command shell, option 6, issue the TSO FREE command for the IMS and RECON ddnames to free the data sets.
Module: DSPXPDDU

DSPM111I Invalid Partition High key value. The partition high key length of keylength is longer than the root key length of rootlength.
Explanation: The high key value specified is longer than the length specified in the DBD gen. A longer key is not allowed.

In the message text:
keylength The length of the key that you specified.
rootlength The maximum key length specified during the DBD generation.
System action: Processing is not performed.
Programmer response: Change the high key value so that its length is less than or equal to the maximum allowable length. Keys that are shorter than the allowable key length are padded with X'FF'.

Module: DSPXPDDU

DSPM112W  Invalid Partition High key value. Character or hex string does not start/end properly.

Explanation: The syntax of the high key value is incorrect.

System action: Processing is not performed.

Programmer response: Change the key string so that it adds or ends correctly. Make sure that the string starts or ends with a quote.

Module: DSPXPDDU

DSPM113W  Invalid Partition High key value. Hex string contains characters other than a/f, A/F or 0/9.

Explanation: The hexadecimal string contains non-hexadecimal characters.

System action: Processing is not performed.

Programmer response: Make sure that the string only contains valid hexadecimal characters.

Module: DSPXPDDU

DSPM114W  Invalid Partition High key value. Null string is found.

Explanation: Blank lines are not allowed.

System action: Processing is not performed.

Programmer response: Remove the blanks lines from the input file or add an asterisk in the first column to turn the blank lines into comments.

Module: DSPXPDDU

DSPM115W  Invalid Partition High key value. Comments are not allowed.

Explanation: Comments are not allowed in the high key field.

System action: Processing is not performed.

Programmer response: Replace the asterisk that is in the first character position with a different character.

Module: DSPXPDDU

DSPM116W  Invalid Partition High key value. Length of character key > 256 or hex key > 512.

Explanation: The partition high key value is longer than the supported length of 256.

System action: Processing is not performed.

Programmer response: Delete characters from the high key value so that it is no longer too long.

Module: DSPXPDDU

DSPM117W  Invalid Partition High key value. Hex string does not contain even numbers of characters.

Explanation: There must be an even number of hexadecimal numbers.

System action: Processing is not performed.

Programmer response: Change the hexadecimal string so that there are an even number of hexadecimal digits.

Module: DSPXPDDU

DSPM118W  Invalid Partition High key value. x/X for hex string or c/C for character string appear at both start/end of the string.

Explanation: Only one x/X or c/C character is allowed in the string in only one location, at the start or end of the string.

System action: Processing is not performed.

Programmer response: Remove the leading or trailing key string identifier (an X or a C). It is usually easier to remove the trailing identifier.

Module: DSPXPDDU

DSPM119W  Recoverable? must be yes if a global service group is specified.

Explanation: The value of the 'recoverable?' field must be YES if a global service group is specified.

System action: Processing is not performed.

Programmer response: Change the value of Recoverable? from NO to YES or remove the global service group name.

Module: DSPXPDDU

DSPM120E  The saved definition does not match the DBDLIB: group count

Explanation: The HALDB master definition being imported differs from the definition in the DBDLIB member. The data set group count is different.

System action: The import function does not process the partitions.
Programmer response: Change the DBD definition to match the database being imported. Use the same data set group count.
Module: DSPXPDDU

**DSPM121E** The saved definition does not match the DBDLIB: access method

Explanation: The HALDB master definition being imported differs from the definition in the DBDLIB member. The access method is different.
System action: The import function does not process the partitions.
Programmer response: Change the DBD definition to match the database being imported. Use the same access method.
Module: DSPXPDDU

**DSPM122E** The saved definition does not match the DBDLIB: database name

Explanation: The HALDB master definition being imported differs from the definition in the DBDLIB member. The database name is different.
System action: The import function does not process the partitions.
Programmer response: Change the DBD definition to match the database being imported. Use the same database name.
Module: DSPXPDDU

**DSPM123E** The function 'function' is not supported.

Explanation: A batch function other than IMPORT was specified. No other functions are allowed.
System action: No processing is performed.
Programmer response: Make sure that "import" is spelled correctly and is the first word following the DSPXRUN command.
Module: DSPXPDDU

**DSPM124W** The database cannot be deleted. A partition is currently authorized.

Explanation: A partition is currently being used by IMS or another utility and cannot be deleted.
Programmer response: Make sure the database and all of its partitions are stopped.
Module: DSPXPDDU

**DSPM125W** The partition is currently authorized and cannot be deleted.

Explanation: A partition is currently being used by IMS or another utility and cannot be deleted.
Programmer response: Make sure the partition is stopped.
Module: DSPXPDDU

**DSPM126W** IMS configurations need to be saved to the ISPTABL file, but it is not allocated.

Explanation: An ISPTABL data set must be allocated before you can use the IMS configurations panels. The same data set must also be in your ISPTLIB data set.
System action: Processing is not performed.
Programmer response: Allocate the ISPTABL data set outside of ISPF and allocate the same data set in your ISPTLIB data set.
Module: DSPXPDDU

**DSPM127W** Changes to this partition affect another partition that is in use.

Explanation: A change being made to a partition affects another partition that is currently in use. All affected partitions must be unauthorized. This message might display when a partition will be added, changed, or deleted.
System action: Processing is not performed.
Programmer response: Make sure that the affected partition is stopped. Keep in mind that the partition that is still in use is not the partition that was being modified.
Module: DSPXPDDU

**DSPM128W** The data set prefix name cannot contain quote characters.

Explanation: The data set name prefix is not a data set; it is the prefix for a name that will be dynamically built. The actual name will consist of this prefix, the partition ID, and the type of data set. Because the data set prefix is not a data set name, it cannot be fully qualified; that is, it cannot contain quotes.
System action: Processing is not performed.
Programmer response: Remove the quote characters from the data set name prefix and press the Enter key to continue.
Module: DSPXPDDU
DSPM130W  The name is missing or invalid.

Explanation: The field requires a valid name. One of the following is true:
• The name is missing.
• The name contains invalid characters.

System action: Processing is not performed.

Programmer response: Ensure the name is spelled correctly and follows normal name syntax. Correct the problem and press the Enter key to continue processing.

Module: DSPXPDDU

DSPM131W  The value contains imbedded blanks.

Explanation: The value should appear as a single word or number, with no blank characters in the middle.

System action: The panel is displayed again.

Programmer response: Ensure the name is spelled correctly and follows normal name syntax. Correct the problem and press the Enter key to continue processing.

Module: DSPXPDDU

DSPM132W  The name must be an alphanumeric value.

Explanation: The name entered contains characters that cannot be used in a name.

System action: The panel is displayed again.

Programmer response: Ensure the name is spelled correctly and follows normal name syntax. Correct the problem and press Enter to continue processing.

Module: DSPXPDDU

DSPM133W  The first character must be alphabetic

Explanation: The first character of a name must be an alphabetic or national character.

System action: The panel is displayed again.

Programmer response: Ensure the name is spelled correctly and follows normal name syntax. Correct the problem and press Enter to continue processing.

Module: DSPXPDDU

DSPM134W  The value is not correct, type = code

Explanation: The field failed validity checking, however, an internal error prevents a specific message from being displayed. The code value indicates the type of the error. Generally, the value has meaning only to IBM service representatives.

System action: The panel is redisplayed.

Programmer response: If the problem persists, contact the IBM Support Center and report the error and type value. The value only has meaning to IBM personnel.

Module: DSPXPDDU

DSPM135W  The only partition status value you can type is 'DISABLE'.

Explanation: The partition status field is normally blank. The only value you can type at this time is DISABLE. There are no abbreviations.

System action: The panel is redisplayed.

Programmer response: Remove the information from the field and press the Enter key. If you want to disable the partition, type DISABLE and press the Enter key.

Module: DSPXPDDU

DSPM136W  Enter a numeric value greater than zero.

Explanation: Either a blank field was entered or a zero was typed in a field expecting a numeric value.

System action: The panel is displayed again.

Programmer response: Type a numeric value and press the Enter key to continue processing.

Module: DSPXPDDU

DSPM137W  Set the partition status to 'ENABLE' or press the Cancel key.

Explanation: The partition status is currently 'disabled'. The only value you can enter on this panel is ENABLE. No abbreviations are accepted.

System action: The panel is redisplayed.

Programmer response: If you want to enable the partition, type ENABLE and press the Enter key. If you do not want to enable the partition, press the Cancel key.

Module: DSPXPDDU

DSPM138I  The partition high key contains non-display characters.

Explanation: The partition high key or selection string contains non-display characters. The characters consist of hexadecimal number combinations that do not represent valid keyboard characters.

The INFO line contains the high key value in a different format. To use that line, delete the first data line and type 'MD' in the line command column, to the left of the INFO line.

System action: The ISPF editor displays the high key in HEX ON mode.

Programmer response: You can overtype displayed
characters in the data line, or type hexadecimal values in the hexadecimal line.

To use the INFO line, delete the first data line and type 'MD' in the line command column, to the left of the INFO line. Edit the hexadecimal string as required. Press F3 to save, or use the CANCEL command to leave without changing the value.

**Module:** DSPXPDDU

---

**DSPM139I**  
**Update in HEX mode, or use MD command to edit the 'info' line.**

**Explanation:** Edit the high key value using the ISPF editor commands valid in HEX ON mode. You can type over displayed characters or type hexadecimal values in the lines showing the hexadecimal representation of the high key value.

The INFO line contains the high key value in a different format. To use that line, delete the first data line and type 'MD' in the line command column, to the left of the INFO line.

**System action:** The editor shows the high key in HEX ON mode.

**Programmer response:** You can overtype displayed characters in the data line, or type hexadecimal values in the hexadecimal line.

To use the INFO line, delete the first data line and type 'MD' in the line command column, to the left of the INFO line. Edit the hexadecimal string as required. Press F3 to save, or use the CANCEL command to leave without changing the value.

**Module:** DSPXPDDU

---

**DSPM140I**  
**The partition list has been refreshed.**

**Explanation:** The user used the action bar to select 'View' and 'Refresh'.

**System action:** The partition list was retrieved from the RECON data sets and redisplayed.

**Programmer response:** No action is required.

**Module:** DSPXPDDU

---

**DSPM141W**  
**This application will not work properly with keylists turned off.**

**Explanation:** The KEYLIST OFF command was used for the global ISPF function key settings.

**Tip:** Reset the keylist setting by using the KEYLIST ON command in the ISPF command line. Some panels have function keys set to unique commands and if keylists are turned off, the function requested may not work properly.

**System action:** The Partition Definition Utility will continue to operate with KEYLIST OFF setting.

**Programmer response:** To use the function keys defined for this application, type the KEYLIST ON command in the command line and press the Enter key.

**Module:** DSPXPDDU

---

**DSPM142I**  
**Start export to MEM=dspxmem in DSN=dspxdsn from DBN=DBNAME.**

**Explanation:** The user requested the export of the database.

**System action:** The information about the database is saved in the data set specified.

**Programmer response:** No action is required.

**Module:** DSPXPDDU

---

**DSPM143I**  
**The export file contains partition partname.**

**Explanation:** The user requested the export of the database. The partition names are listed as an aid if there are subsequent problems.

**System action:** The information about the database is saved in the data set specified. While each partition is listed individually, the save is done for the entire list at one time.

**Programmer response:** No action is required.

**Module:** DSPXPDDU

---

**DSPM144W**  
**PARTITION IS BEING REORGANIZED BY OLR**

**Explanation:** The user requested to change the partition free space attributes, but the partition is currently undergoing HALDB Online Reorganization.

**System action:** The request to change the partition fails. The free space percentage factor and the free block frequency factor are left unchanged for the specified partition.

**Programmer response:** No action is required.

**Module:** DSPXPDDU

---

**DSPM145I**  
**THE INPUT DATASET HAS A DUPLICATE KEY AT LINE xx.**

**Explanation:** There is a duplicate high key at line number xx in the key data set. The Partition Definition utility checks for duplicate keys in the first 1001 key entries. The utility does not accept duplicate keys.

**System action:** Processing is not performed.

**Programmer response:** Modify the high key data set so that all the keys are unique. Then run Partition Definition utility again.

**Module:** DSPXPDDU
Chapter 8. DXR messages (IRLM)

Internal resource lock manager (IRLM) messages have a prefix of DXR.

IRLM messages and codes are available in IBM Knowledge Center.
Chapter 9. ELX messages (Transport Manager Subsystem)

Messages issued by the Transport Manager Subsystem (TMS) begin with the prefix ELX.

When you issue a TMS command from the SYSIN data set, any messages are output to the SYSOUT data set. When you issue a TMS command from TSO, any messages are output to the z/OS console.

ELX messages ELX0001 - ELX1100

Operator response: Check the command syntax and reenter the command.

Module: ELXCSTA0, ELXCSTO0, ELXCSET0, ELXDEF0, ELXDIS0

ELX0101W 'ALL' WAS SPECIFIED FOR START | STOP SYSTEM. LIST OF SYSTEM NAMES IGNORED

Explanation: The ALL keyword, as well as a list of subsystem names, has been specified in the input command; the system names list is ignored and the command operation is performed for all connected subsystems. Command could either be START or STOP.

System action: The command is processed for ALL keyword.

Module: ELXCSTA0, ELXCSTO0

ELX0102W NO SYSTEMS HAVE BEEN DEFINED: START SYSTEM NOT DONE.

Explanation: When the ALL parameter is specified for a START command, the subsystem starts all Transport Manager Subsystems (TMS) connected to the subsystem under the condition that TMS has been defined.

System action: The command is rejected.

Operator response: Define the subsystem before entering the command.

Module: ELXCSTA0, ELXCSTO0

ELX0103I 'cmd' FOR ALL 'cmd'ABLE SYSTEMS INITIATED.

Explanation: When the subsystem has been defined and the ALL keyword specified for the input command, the subsystem performs the specified action for the Transport Manager subsystem under the condition that TMS is in the right state. cmd could be either START or STOP.

System action: The command is processed as requested.

Module: ELXCSTA0, ELXCSTO0

ELX0104A NO VALID OBJECTS FOR THE 'cmd' COMMAND WERE FOUND

Explanation: There is no keyword for the input command. cmd could be either START or STOP.

System action: The command is rejected.

Operator response: Check keyword for this command and reenter the command.

Module: ELXCSTA0, ELXCSTO0

ELX0105I SYSTEM ssss IS BEING 'cmd'ED.

Explanation: The specified subsystem is performing the specified action. ssss is the subsystem name which you specified in the command line. Command could be START or STOP; 'cmd'ed is either STARTED or STOPPED.

System action: The command is processed as requested.

Module: ELXCSTA0, ELXCSTO0

ELX0106A SYSTEM ssss NOT 'cmd'ED, IT IS NOT DEFINED

Explanation: The specified subsystem cannot perform the specified action because it has not yet been defined. ssss is the subsystem name specified in the command line. Command could be either START or STOP. 'cmd'ed is either STARTED or STOPPED.

System action: The command is rejected.

Operator response: Define the subsystem before entering the command.

Module: ELXCSTA0, ELXCSTO0

ELX0107I TMS NOT STARTED: ALREADY STARTED OR STARTING

Explanation: TMS start is not allowed when it has already performed the function or it is in the process of executing the command.

System action: The command is rejected.

Module: ELXCSTA0

ELX0108I TMS IS BEING STARTED

Explanation: This is an informational message if TMS is performing the function specified in the command line.

System action: The command is processed as requested.

Module: ELXCSTA0

ELX0109I xxxx NOT STARTED: TMS NOT STARTED OR STOPPING

Explanation: Transport Manager Subsystem (TMS) has to be started before xxxx. xxxx could be either SYSTEM or ILS keyword on the START command.

System action: The command is rejected.

Operator response: Recheck the state of the Transport Manager Subsystem.

Module: ELXCSTA0
**ELX011A**  NOTHING HAS BEEN SET

**Explanation:** This message indicates that no subsystem has been set. There should be other error messages before this one. The error could be the keywords of SET command are not correct or there is a conflict with current subsystem state.

**System action:** The command is rejected.

**Operator response:** Check the value of APPLCOUNT and reenter the command.

**Module:** ELXCSET0

---

**ELX012I**  SYSTEM sssss RETRY IS STOPPED

**Explanation:** Conversation allocation retry is automatically initiated after a conversation is successfully established with the specified subsystem. You can stop a retry for a particular subsystem and the conversation allocation retry will be stopped for the specified subsystem. sssss is the specified system name.

**System action:** The command is rejected.

**Operator response:** Check the name of APPLID and reenter the command.

**Module:** ELXCSET0

---

**ELX013A**  UNABLE TO SET APPLID|INSTANCE IN CURRENT SYSTEM STATE

**Explanation:** The keyword APPLID or INSTANCE of the SET command cannot be set if Transport Manager subsystem has already requested start or started.

**System action:** The command keyword is ignored.

**Operator response:** Recheck the state of the subsystem.

**Module:** ELXCSET0

---

**ELX014I**  xxxxx KEYWORD FOR TMS SET COMMAND HAS BEEN SET

**Explanation:** This is an informational message if one of the keywords of SET command has been set. xxxxx is one of APPLID, INSTANCE, PASSWORD, APPLCOUNT and TIMER.

**System action:** The command is processed as requested.

**Module:** ELXCSET0

---

**ELX015I**  APPLCOUNT VALUE IS INVALID

**Explanation:** APPLCOUNT is the number of VTAM APPLIDs that are defined to VTAM for use by the Transport Manager subsystem. The number must exceed by at least 2 the maximum number of IMS subsystems ever expected concurrently to execute on this CPC.

**System action:** The command is rejected.

**Module:** ELXCDEF0

---

**ELX016A**  APPLID INVALID, MATCHES A SYSTEM NAME

**Explanation:** APPLID is matched with the remote Transport Manager Subsystem (TMS) name. APPLID is a one- to five-character name that consists of the first portion of the series of VTAM APPLIDs used by TMS and related IMS subsystems. This keyword is rejected if the TMS is connected to VTAM.

**System action:** The command is rejected.

**Operator response:** Check the name of APPLID and reenter the command.

**Module:** ELXCSET0

---

**ELX018A**  sssssss IS ALREADY DEFINED AS LOCAL|REMOTE TMS

**Explanation:** The system sssssss has been already defined as either local Transport Manager Subsystem (TMS) or remote TMS.

A subsystem name that matches the APPLID of this TMS results in a message such that sssssss is already defined as LOCAL TMS.

A duplicate subsystem name specified with DEFINE command results in a message such that sssssss is already defined as a REMOTE TMS.

**System action:** Processing of other subsystem names continues.

**Module:** ELXCDEF0

---

**ELX019I**  TMS DEFINE COMMAND FAILED

**Explanation:** No subsystems were defined during the process of the DEFINE command. This message is issued in the following possible circumstances:

- No subsystem name has been entered with DEFINE command.
- All the subsystem names entered with DEFINE command are already defined as LOCAL, that is they match the APPLIDs of this transport manager.

**System action:** The command is rejected.

**Module:** ELXCDEF0

---

**ELX020I**  SYSTEM sssssss HAS BEEN DEFINED

**Explanation:** Each time a subsystem is defined during the process of DEFINE command, this informational message is issued.
System action: Processing of other subsystem names continues.

Module: ELXCDEF0

**ELX0122I** SYSTEM sssss NOT STARTED DUE TO STATE: yyyy

Explanation: sssss is the specified subsystem name. yyyy could be RSTA (start requested), STA (started), RSTO (stop requested) or STO (stopped). The subsystem will not perform the specified function if the subsystem is not in the proper state.

System action: The command is rejected.

Operator response: Check the subsystem state and reenter the command.

Module: ELXCST00

**ELX0128I** TMS NOT STOPPED: ALREADY STOPPED OR IS STOPPING

or

TMS NOT STOPPED: TMS STARTING IS IN PROGRESS

Explanation: TMS stop is not allowed when it has already performed the function or it is in the process of executing the command.

System action: The command is rejected.

Module: ELXCST00

**ELX0129I** TMS IS BEING STOPPED

Explanation: This is an informational message if TMS is performing the function specified in the command line.

System action: The command is processed as requested.

Module: ELXCST00

**ELX0130I** SYSTEM sssss NOT STOPPED DUE TO STATE: yyyy

Explanation: sssss is the specified subsystem name. yyyy could be RSTA (start requested), STA (started), RSTO (stop requested) or STO (stopped). The subsystem will not perform the specified function if the subsystem is not in the proper state.

System action: The command is rejected.

Operator response: Check the subsystem state and reenter the command.

Module: ELXCST00

**ELX0150I** STOP RETRY SYSTEM sssssss CAN NOT BE PERFORMED, IT IS NOT DEFINED

Explanation: A remote system has to be defined before you can stop a conversation retry.

System action: The command is rejected.

Operator response: Define remote system before issuing this command.

Module: ELXCST00

**ELX0170I** TRANSPORT MANAGER DISPLAY:

dd.ddtt.tt.tt.t

Explanation: This informational message is issued after the validity of the DISPLAY command line is confirmed, and shows the date dd.ddt and time tt.tt.t of the display. After this message, the output of DISPLAY command follows.

System action: Processing of other keywords continues.

Module: ELXCST00

**ELX0171A** NO VALID OBJECTS FOR THE TMS DISPLAY COMMAND WERE FOUND

Explanation: The DISPLAY command has been entered without any object keywords.

System action: The command is rejected.

Operator response: Reenter the command with the appropriate object keywords.

Module: ELXCST00

**ELX0181A** TMS ALLOCATE FAILURE FOR SYSTEM sid, R15=aa R0=bb

Explanation: An attempt by the Transport Manager Subsystem (TMS) to allocate a conversation to a remote system failed with return code aa in register 15 and bb in register 0. The low order byte of the register 15 and register 0 values returned by the ALLOC request are shown in hexadecimal format. The system name is specified by sid.

System action: No conversation is established.

Operator response: Check the return code of the TMS ALLOC request, the TMS input on SET, DEFINE, or START command, and VTAM GEN definitions.

Module: ELXTI100

**ELX0183A** TMS ACCEPT FAILURE FOR SYSTEM sid, R15=aa R0=bb

Explanation: An attempt by the Transport Manager Subsystem (TMS) to accept a conversation from a remote system failed with return code aa in R15 and bb
In R0. The low order byte of the register 15 and register 0 values returned by the ACCEPT request are shown in hexadecimal format. The system name is specified by *sid*.

**System action:** No conversation is established.

**Operator response:** Check the return code of the TMS ACCEPT request, the TMS input on the SET, DEFINE, or START command, and VTAM GEN definitions.

**Module:** ELXTI100

---

**ELX0184I**  
**TMS ALLOCATE REQUEST FROM APPLID applid REJECTED: text**

**Explanation:** Either the applid is not defined to this TMS, or the requested TMS is not started. The content of text is either NO LOCAL DEFINITION, or SYSTEM NOT STARTED.

**System action:** No conversation is established.

**Operator response:** Use a TMS DEFINE or START command to allow communication with the requesting TMS.

**Module:** ELXTITX0

---

**ELX0185I**  
**TMS ACCEPT FAILED FOR SYSTEM sid REASON: rr**

or

**TMS ALLOCATE FAILED FOR SYSTEM sid REASON: rr**

**Explanation:** The Transport Manager Subsystem (TMS) asynchronous event, STATUS exit, driven by ACCEPT or ALLOCATE request, fails with reason code *rr*. The system name is specified by *sid*.

**System action:** No conversation is established.

**Operator response:** Notify the system programmer. Check the return code of STATUS exit, the TMS input on the SET, DEFINE, or START command, and VTAM GEN definitions.

**Module:** ELXTI100

---

**ELX0187I**  
**TMS CONVERSATION TO TMS ON SYSTEM sid CONNECTED**

**Explanation:** The message shows the status of the Transport Manager Subsystem (TMS) interface to another TMS. The system name is specified by *sid*. This message implies that the conversation is allocated between the two TMSs.

**System action:** Processing continues.

**Module:** ELXTI100

---

**ELX0188I**  
**TMS CONVERSATION TO TMS ON SYSTEM sid DISCONNECTED**

**Explanation:** The message shows the status of the Transport Manager Subsystem (TMS) interface to another TMS. The system name is specified by *sid*. This message implies that the conversation is deallocated between the two TMSs.

**System action:** Processing continues.

**Module:** ELXTI100

---

**ELX0189I**  
**TMS CONVERSATION TO TMS ON SYSTEM sid STOPPED**

**Explanation:** The message shows the status of the Transport Manager Subsystem (TMS) interface to another TMS. The system name is specified by *sid*. This message implies that there is no conversation between the two TMSs.

**System action:** Processing continues.

**Module:** ELXTI100

---

**ELX0200I**  
**TMUSER ssid: ACB OPEN FAILED, ERROR CODE=aa APPLID applid**

**Explanation:** The Transport Manager Subsystem (TMS) issued a VTAM OPEN ACB request, which failed with error code *aa* for APPLID *applid*. The hexadecimal value error code *aa* can be found as ACBERFLG in the ACB DSECT (IFGACB). The subsystem *ssid* can either be the TMS job name, IMS online system ID, or the batch job name.

The most probable cause of this message is that VTAM cannot find the applid from the APPL definition, or an incorrect VTAM LIST was used.

**System action:** VTAM OPEN ACB is rejected for the transport manager IDENTIFY request.

**Operator response:** See the information on OPEN ACB for the meaning of ACBERFLG. Also check the TMS input and VTAM GEN definitions.

**Module:** ELXTM00, ELXUIID0

**Related reference:**

zos:open:open one or more ACBs

---

**ELX0201W**  
**TMUSER ssid: APPLID applid BUSY, CANNOT BE USED**

**Explanation:** As a result of an IDENTIFY request by a subsystem *ssid*, a VTAM application identifier *applid*, defined as available to Transport Manager Subsystem (TMS), was used in an OPEN ACB request. The OPEN failed with return code ACBOPAA indicating that the *applid* was already in use or had been opened for use already. The subsystem *ssid* can either be the TMS job name, IMS online system ID, or the batch job name.
System action: The listed applid is marked as not available and TMS attempts to use another name. This can reduce the number of available names to such a point that can cause operational problems. 

Operator response: Use a D NET,ID=applid command to determine which job or task is using the applid.

The most probable cause of this message is that the applid is in use by another copy of TMS or a user of another copy of TMS. A user might still be using an applid even though the TMS job it was dealing with has terminated. Having two active copies of TMS using the same APPLID at the same time is a procedural error.

Another possible cause is a definitional error where the same applid is being used by two different programs. In this case, notify your system programmer.

Module: ELXUTM00, ELUXUIID0

Module: ELXUTM00, ELUXUIID0

Module: ELXUTM00, ELXUVX50

Module: ELXUTM00, ELXUTM00

Module: ELXUTM00

Module: ELXUTM00

Module: LXUTM00
**System action:** The conversation is deallocated.

**Operator response:** Contact your system programmer. This error normally results when the VTAM IOBUF pool is too small for the workload.

**Module:** ELXUTM00

---

**ELX0210A**  
**TMS IDENTIFY FAILED, RC=nn (nn text) REASON=rrr (rrr text).**

**Explanation:** Transport Manager Subsystem (TMS) IDENTIFY process fails with return code nn, reason code rrr.

**System action:** The START TMS command fails.

**Operator response:** Check the TMS on SET, DEFINE, or START command, and VTAM GEN definitions.

**Module:** ELXITM00

---

**ELX02111**  
**TMS version STARTED**

**Explanation:** Transport Manager is started with the version number specified by version.

**System action:** Processing continues.

**Module:** ELXITM00

---

**ELX0212A**  
**TMS IDENTIFY ASYNCH FAILURE aa**

**Explanation:** The Transport Manager Subsystem (TMS) asynchronous event, STATUS exit, driven by IDENTIFY request fails. The STATUS exit reason code is specified as aa.

**System action:** The START TMS command fails.

**Operator response:** Notify the system programmer. Check the reason code of STATUS exit, the TMS input, and VTAM GEN definitions. Correct the problem and issue START TMS.

**Module:** ELXITM00

---

**ELX0213A**  
**REQUESTED VTAM APPLID applid IS BUSY, TMS START FAILED**

**Explanation:** Transport Manager Subsystem (TMS) attempted to use the first VTAM application identifier assigned to it by the SET command, applid. The applid was not available but TMS requires it to complete initialization. Refer to message ELX0201W for additional information.

**System action:** The internal initialization of TMS fails to complete.

**Operator response:** Note that this situation is probably caused by a definitional or operational error. Identify the job or task using the specified applid using the VTAM command D NET,ID=applid and take appropriate action to free up the applid. Once the applid is available, issue a TMS START TMS command.

**Module:** ELXACTL0

---

**Module:** ELXITM00

---

**ELX600A**  
**TMSS (ELXKSTAR) IS NOT AUTHORIZED**

**Explanation:** While processing TMS procedure with PARM='ELX' on the EXEC statement, the module ELXKSTAR is not authorized by z/OS system. Abend 3430 is issued.

**System action:** The procedure of TMS is terminated abnormally.

**Operator response:** Contact your system programmer to authorize the ELXKSTAR.

**Module:** ELXKSTAR

---

**ELX1001E**  
**TRANSPORT MANAGER SUBSYSTEM NOT FOUND. Formatting terminates.**

**Explanation:** No Transport Manager Subsystem (TMS) was found in the memory dump matching the name specified on the SYSTEM verb exit parameter.

**System action:** The IMS Offline Dump Formatter terminates.

**Operator response:** Invoke the formatter verb exit again with the correct SYSTEM parameter. Be sure to specify exactly four characters, which might require padding the subsystem name with blanks. The IPCS SUMM JOBS command can help identify the TMS name.

**Module:** ELXACTL0

---

**ELX1002I**  
**SUBSYSTEM ssss WILL BE FORMATTED AS TRANSPORT MANAGER.**

**Explanation:** The SYSTEM parameter was not specified on the IMS Offline Dump Formatter invocation to select a particular Transport Manager Subsystem (TMS). However, the formatter found a subsystem that appears to be a TMS, and attempts to format that subsystem.

**System action:** The dump formatter searches all subsystems in the memory dump and formats the first one that appears to be a TMS.

**Operator response:** If the subsystem chosen by the formatter is incorrect, invoke the dump formatter again specifying the correct 4-letter subsystem name with the verb exit parameter SYSTEM.

**Module:** ELXACTL0

---

**ELX1003W**  
**FORMATTER VERSION xxxxxxxx DOES NOT MATCH DUMPED TMS VERSION yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy yyyy
at the same release level as the Transport Manager Subsystem (TMS) being formatted. This can lead to invalid output data and error messages issued by the formatter due to inconsistent control block mappings.

**System action:** Formatting continues.

**Operator response:** Use a version of the dump formatter consistent with the release level of the TMS as indicated by yyyy yyyy.

**Module:** ELXACTL0

---

**ELX1004W** STORAGE OBTAIN FOR xxxxxxxx BYTES FAILED WITH RC=nnnnnnnn

**Explanation:** A STORAGE OBTAIN request issued by the IMS Offline Dump Formatter failed with the indicated return code.

If the formatter appears to be in a loop, a control block chain that it is attempting to follow might be chained in a loop. If no loop is apparent, the problem might be insufficient working storage.

**System action:** The dump formatter skips formatting that depends on data in the storage block.

**Operator response:** Increase your region size to give the formatter more working storage.

---

**ELX messages ELXC100 - ELXC500**

This topic contains the following messages:

**ELXC106I** THE REQUEST IS ENDED WITHOUT ERROR

**Explanation:** This is an informational message for the requestor to indicate the request is completed without error. For the command request, this message is suppressed.

**System action:** The ELXKCRQM continues to process the request blocks on the queue.

**Module:** ELXKCRQM

**ELXC109I** THE REQUEST IS TERMINATED WITH ERROR

**Explanation:** This is an informational message for the requestor to indicate the request is completed with an error. For the command request, this message is suppressed.

**System action:** The ELXKCRQM continues to process the request blocks on the queue.

**Operator response:** Contact your system programmer to find the requestor.

**Module:** ELXKCRQM

**ELXC112A** UNABLE TO OBTAIN STORAGE FOR REQWORK AREA

**Module:** ELXKCRQM

---

**ELX1005W** DUMP STORAGE AT ADDRESS aaaaaaaaa FOR xxxxxxxx BYTES IS UNAVAILABLE

**Explanation:** The specified storage block was not found in the dump.

Some or all of the referenced storage was not dumped. Possibly an incorrect pointer led the dump formatter to retrieve invalid storage.

**System action:** The IMS Offline Dump Formatter skips formatting that depends on data in the storage block.

**Module:** ELXACCSI

---

**ELX1010I** INTERNAL ABEND DETECTED, FORMATTING TERMINATES.

**Explanation:** The IMS Offline Dump Formatter experienced a fatal internal error.

**System action:** Formatting terminates.

**Module:** ELXASTA0

---

**ELX messages ELXC160 - ELX199**

This topic contains the following messages:

**Explanation:** While processing the request, the ELXKCRQH issues GETMAIN to get a request work area and GETMAIN returns nonzero return code.

**System action:** The command is not processed.

**Operator response:** Contact your system programmer to analyze the problems and increase the region size.

**Module:** ELXKCRQH

**ELX160I** THE FOLLOWING INPUT FROM SYSIN USED IN REPLY:

**Explanation:** This is an informational message which indicates the input from the SYSIN data set is used for a reply.

**System action:** The ELXKCSYS puts this message and the input request in the SYSOUT data set.

**Module:** ELXKCSYS

**ELX161I** THE FOLLOWING SYSIN REQUEST QUEUED FOR PROCESSING

**Explanation:** This is an informational message which indicates the input from the SYSIN data set is queued for processing.

**System action:** The ELXKCSYS puts this message and the input request in the SYSOUT data set.
Module: ELXKCSYS

**ELXC162A**  
REPLY REQUIRED BUT  
EODAD/SYNAD ON SYSIN

**Explanation:** This is an informational message which indicates the input from SYSIN is queued for processing. This can only occur with the test tool (when the TMS subsystem is tailored with CLIST code).

**System action:** The ELXKCSYS puts this message and the input request in the SYSOUT data set.

Module: ELXKCSYS

**ELXC181I**  
OS CONSOLE TASK IS STOPPED,STOP REQ IGNORED

**Explanation:** While processing the input from MODIFY command, the ELXKCOSM detected that the console task which is running under the TMS dispatcher is stopped.

**System action:** The ELXKCOSM ignores all inputs from the MODIFY command and returns control to the TMS dispatcher.

**Operator response:** Contact your system programmer.

Module: ELXKCOSM

**ELXC315I**  
MAIN TASK ACTIVE: 

```
mmmmmmmmdddddpppppppppp
```

**Explanation:** During ESTAE processing, if the module ID is available, the TMS dispatcher ESTAE issues this message to inform you of the last module logically active.

In the message text:
- `mmmmmmmm` is the module name
- `ddddd` is the date with the format mm/dd/yy
- `pppppppp` is the PTF number or blank

**System action:** If the TMS is not canceled by the operator without the dump option (abend 0222), the TMS is abended with an SDUMP.

**Operator response:** Contact your system programmer. Using the appropriate abend code, attempt to determine what action was taken by the abend before failure and then take appropriate action.

Module: ELXKCDSP
Chapter 10. FRP messages (Repository Server)

Messages issued by the Repository Server have the prefix FRP.

FRP0001E  Server terminating due to an error condition.
Feedback: feedback_word1 feedback_word2 feedback_word3

Explanation: An unsupported error condition has occurred. The Repository Server must terminate because its integrity is unknown.

In the message text, feedback words provide IBM diagnostic and debugging information. The three feedback words indicate the module ID and the internal reason code for the module in which the error was generated.

User response: Contact IBM Software Support with the feedback information to diagnose the error.

Module: FRPSINIT FRPSINTQ FRPSIOCQ FRPSIORQ FRPSIOVA

FRP0002E  The server experienced an error condition.
Feedback: feedback_word1 feedback_word2 feedback_word3

Explanation: An unsupported error has occurred in the Repository Server. The server can continue processing.

In the message text, feedback words provide IBM diagnostic and debugging information. The three feedback words indicate the module ID and the internal reason code for the module in which the error was generated.

System action: Processing ends for the affected thread, but the server attempts to continue processing.

User response: Contact IBM Software Support with the feedback information to diagnose the error.

Module: FRPSAUD FRPSAUDQ FRPSCOMQ FRPSHSH FRPSINIT FRPSINTQ FRPSIOCQ FRPSIOH FRPSIORQ FRPSIOU FRPSIOV FRPSIOVA FRPSLCR FRPSREQQ FRPSSCMD FRPSSDA FRPSSDMP FRPSEC FRPSHUT FRPSTCPQ FRPSTCPT FRPSTCPT FRPSTDMP FRPSTERM FRPSXCT.

FRP0003E  Repository initialization error in modname, rqstname RC=rc RSN=rsn

Explanation: An unsupported error condition occurred in module for the request name specified in the message. The error return and reason codes from the request are listed in the message.

In the message text, modname
Indicates the name of the module in error.

rqstname
Indicates the name of the request in error. The supported value is CSLSCREG.

rc
Indicates the return code from the request in error. For the CSLSCREG request, see macro CSLSRR for the meaning of the return code.

rsn
Indicates the reason code from the request in error. For the CSLSCREG request, see macro CSLSRR for the meaning of the reason code.

System action: The server continues processing.

User response: Fix the error for the request in error and restart the Repository Server.

Module: FRPSINIT FRPSINTQ

FRP0006E  Unable to load Catalog Search Interface routine IGGCSI00.
Info=LOAD_abend_code / LOAD_reason_code

Explanation: As part of server initialization, the server attempted to load the z/OS Catalog Search Interface (CSI) routine, and this load operation failed.

In the message text:

LOAD_abend_code
Identifies the abend code returned by the failing LOAD macro.

LOAD_reason_code
Identifies the reason code returned by the failing LOAD macro.

System action: Processing ends unconditionally, and the server terminates.

User response: See the response and reason codes for the IGGCSI00 subroutine, and take appropriate action.

Module: FRPSIOV.

z/OS DFSMS: Catalog Search Interface User's Guide

FRP0007E  Repository data set not found.
DSN=data_set_name

Explanation: During repository open processing, a
repository data set was not found.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

**User response:** Ensure that the data set name is correct and that the data set is cataloged on the z/OS system.

**Module:** FRPSIOVA

---

**FRP0008E**  
Invalid repository data set name.  
**DSN=**data_set_name

**Explanation:** During repository open processing, a repository data set **data_set_name** was found to be an invalid VSAM KSDS name.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

**User response:** Ensure that the data set conforms to the naming rules for a VSAM KSDS.

**Module:** FRPSIOVA

---

**FRP0009E**  
Repository data set invalid.  
Non-spanned VSAM KSDS required.  
**DSN=**data_set_name

**Explanation:** During repository open processing, a repository data set was found not to be a VSAM key-sequenced data set (KSDS), or it was found to be a VSAM KSDS that allows spanned records.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

**User response:** Enter the name of a valid VSAM KSDS, or correct the data set definition.

**Module:** FRPSIOVA

---

**FRP0010E**  
Repository data set DYNALLOC error  
R**C=rc RSN=rsn,**  
**DSN=**data_set_name

**Explanation:** During repository open processing, an attempt to dynamically allocate (DYNALLOC) a repository data set failed.

In the message text:
- **rc** Identifies the reason code returned by DYNALLOC.
- **rsn** Identifies the reason code returned by DYNALLOC.
- **data_set_name** Identifies the repository data set name.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

**User response:** Use this information to help diagnose and correct the error associated with the FRP0010E message.

**Module:** FRPSIOVA

---

**FRP0011I**  
Variable_information_from_DYNALLOC.

**Explanation:** This information message accompanies error message FRP0010E. This information was returned by DYNALLOC about the request failed, and is reformatted as a Repository Server information message.

**System action:** See the information about the system action for FRP0010E.

**User response:** Use this information to help diagnose and correct the error associated with the FRP0010E message.

**Module:** FRPSIOVA

---

**FRP0012E**  
Insufficient access authority to repository data set.  
**DSN=**data_set_name

**Explanation:** During repository open processing, an attempt to access a repository data set failed because the server has insufficient RACF (or similar) privileges.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

**User response:** Change the data set access privileges as necessary.

**Module:** FRPSIOVA

---

**FRP0013E**  
Invalid repository data set. **REUSE** attribute is required.  
**DSN=**data_set_name

**Explanation:** During repository open processing, a repository data set without the **REUSE** attribute was found.

**System action:** The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.
User response: Enter the name of a valid VSAM KSDS, or adjust the data set definition to include the REUSE attribute.

Module: FRPSIOV

FRP0014E Repository data set call error
RC=VSAM_return_code
ACBERFLG=access_control_blk_error_flag,
DSN=data_set_name

Explanation: An unsupported error condition occurred on a VSAM data set OPEN or CLOSE call.

In the message text:
call Identifies the type of VSAM function that was attempted (OPEN or CLOSE).
VSAM_return_code The VSAM return code.
access_control_blk_error_flag Identifies the reason code in the ACBERFLG field of the ACB.
data_set_name Identifies the name of the repository data set.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: Redefine the repository member data set with KEYS(12 0).

Module: FRPSIORQ

FRP0017E Invalid RID data set. Use
RECORDSIZE(282,282).
Repository:repository_name
Data set namedata_set_name

Explanation: During repository open processing, data set validation identified a repository index data set with an invalid maximum RECORDSIZE value.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: Redefine the repository index data set with RECORDSIZE(282,282).

Note: Repository index data set records have a fixed length. Therefore, specify the same value for the average and maximum record sizes.

Module: FRPSIORQ

FRP0018E Invalid RMD data set. Use max
RECORDSIZE >= 51 bytes.
Repository:repository_name
Data set namedata_set_name

Explanation: During repository open processing, data set validation identified a repository member data set (RMD) with an invalid maximum RECORDSIZE value.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: Redefine the repository member data set with a maximum RECORDSIZE of at least 51 bytes.

Remember: 51 bytes is the minimum value. It is not the recommended value.

Module: FRPSIORQ

FRP0019E Invalid repository data set
SHAREOPTIONS. Use (2 3) or (1 3).
Repository:repository_name
Data set namedata_set_name

Explanation: During repository open processing, data set validation identified a repository data set with an invalid SHAREOPTIONS value.

System action: The repository is placed in stopped
state and cannot be accessed. If the repository is the
Repository Server (RS) catalog repository, the RS
terminates.

User response: Redefine the repository data set with
SHAREOPTIONS (2 3) or SHAREOPTIONS(1 3).

Module: FRPSIORQ

FRP0020E Inconsistent repository data set
SHAREOPTIONS.
Share options: DATA (data_op1 data_op2),
INDEX (idx_op1 idx_op2)
Repository:repository_name
Data set name: data_set_name

Explanation: During repository open processing, data
set validation identified a repository data set with
inconsistent SHAREOPTIONS values for the DATA and
INDEX components.

System action: The repository is placed in stopped
state and cannot be accessed. If the repository is the
Repository Server (RS) catalog repository, the RS
terminates.

User response: Change the data set definitions for the
INDEX and DATA components to make them
consistent. Use SHAREOPTIONS(2 3) or
SHAREOPTIONS(1 3) for both components.

Module: FRPSIORQ

FRP0021E Invalid repository data set control
record.
Repository:repository_name
Data set name: data_set_name

Explanation: During repository open processing, data
set validation identified a repository data set with a
missing or invalid control record.

System action: The repository is placed in stopped
state and cannot be accessed. If the repository is the
Repository Server (RS) catalog repository, the RS
terminates.

User response: The given repository data set is
invalid. The likely causes are that an incorrect data set
was specified, or that the data set is required to be
emptied by the IDCAMS DELETE or DEFINE
command.

Module: FRPSIORQ

FRP0022E Inconsistent type data set maximum
RECORDSIZE.
Record size: PRI=primary_type_recordsize,
SEC=secondary_type_recordsize
Repository:repository_name

Explanation: During repository open processing, data
set validation found primary and secondary repository
data sets (either repository index data sets (RIDs) or
repository member data sets (RMDs)) with inconsistent
maximum RECORDSIZE values.

In the message text:

- type Either RID or RMD.
- primary_type_recordsize
  Identifies the RECORDSIZE option of either
  the primary RID or RMD (depending on type).
- secondary_type_recordsize
  Identifies the RECORDSIZE option of either
  the secondary RID or RMD (depending on
  type).
- repository_name
  Identifies the name of the repository.

System action: The repository is placed in stopped
state and cannot be accessed. If the repository is the
Repository Server (RS) catalog repository, the RS
terminates.

User response: Define the primary and secondary RID
or RMD data sets with the same maximum
RECORDSIZE values.

Module: FRPSIORQ

FRP0023I Recoverable data set combination
identified.
Repository: repository_name
Primary RID: primary_rid_data_set_state
Primary RMD: primary_rmd_data_set_state
Secondary
RMD: secondary_rmd_data_set_state
Secondary
RMD: secondary_rmd_data_set_state

Explanation: During IMSRSC repository open
processing, data set analysis found that one or more
data sets must be recovered and that recovery
processing is viable.

In the message text:

- repository_name
  Indicates the name of the repository.
- primary_rid_data_set_state
  Indicates the state of the primary repository
  index data set (RID).
- primary_rmd_data_set_state
  Indicates the state of the primary repository
  member data set (RMD).
- secondary_rid_data_set_state
  Indicates the state of the secondary repository
  index data set.
- secondary_rmd_data_set_state
  Indicates the state of the secondary repository
  member data set.

System action: The Repository Server (RS) proceeds
with recovery processing of the repository data set.

User response: No action is required.

Module: FRPSIORQ
FRP0024E  Non-recoverable data set combination identified.

Repository:...repository_name
Primary RID:primary_rid_data_set_state
Primary RMD: primary_rmd_data_set_state
Secondary RID:secondary_rid_data_set_state
Secondary RMD:secondary_rmd_data_set_state

Explanation: During repository open processing, data set analysis found that recovery of one or more data sets was required. However, it concluded that recovery processing was not viable with the data sets in their current state.

In the message text, repository_name indicates the name of the repository.

primary_rid_data_set_state
Indicates the state of the primary repository index data set (RID).

primary_rmd_data_set_state
Indicates the state of the primary repository member data set (RMD).

secondary_rid_data_set_state
Indicates the state of the secondary repository index data set.

secondary_rmd_data_set_state
Indicates the state of the secondary repository member data set.

The state can be one of the following:

Empty data set detected
One or more data sets are empty.

Update-in-progress state
One or more of the data sets appear to have had an incomplete write operation.

Data set consistency token token
The data sets do not have the same consistency tokens, which suggests that one or more of the data sets belong to another repository. A recovery will not be attempted.

Last-update timestamp timestamp
The last-update time stamp of the repositories is inconsistent, which suggests an incomplete write operation. The time stamp format is: YYYY/MM/DD HH:MM:SS..thmjdj

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: If you want to try recovering data from the repository data sets, take a copy. Then, correct these data sets by reinitializing them or by recovering them from backups if available.

Attention: Reinitializing the repository data sets will result in total loss of data.

Module: FRPSIORQ

FRP0025I  Repository data set initialization successful.

Repository:...repository_name

Explanation: During IMSRSC repository open processing, all repository data sets were found to be empty and have subsequently been initialized successfully.

In the message text, repository_name indicates the name of the repository.

System action: Repository open processing continues.

User response: No action is required.

Module: FRPSIORQ

FRP0026I  Recovery of the data_set_type data set successful.

Repository:...repository_name

Explanation: The IMSRSC repository specified was successfully recovered. The data set that was recovered can be found by identifying which data set is used for the data_set_type of that repository.

In the message text:

data_set_type
Indicates whether the data set was the primary or secondary, the repository index data set or the repository member data set.

repository_name
Indicates the name of the repository.

System action: Repository open processing continues.

User response: No action is required.

Module: FRPSIORQ

FRP0027I  Error during phase n of the repository update process.

Repository:...repository_name

Explanation: An error occurred during the two-phase update process for the specified IMSRSC repository data set.

In the message text:

n
Indicates the phase number of the repository update process. n can be either 1 or 2.

repository_name
Indicates the name of the repository.

System action: The given repository is stopped, and needs to be recovered. The server will attempt to restore data set integrity when the repository is restarted.

If the failure was in phase 1, the primary repository index data set and the primary repository member data set are in error, and the unit of work (UOW) being committed at the time of error is rolled back.
If the failure was in phase 2, the secondary repository index data set and the secondary repository member data set are in error, and the unit of work being committed at the time of error was successful.

User response: This message accompanies an error message that explains the reason for the failure. Correct the problem and restart the repository.

Module: FRPSIOCQ

FRP0028E VSAM function error: function
RC=VSAM_return_code
RPLERRCD=RPL_error_code.
DSN=data_set_name

Explanation: An unsupported error condition occurred on a VSAM function call function.

In the message text:
function Indicates the type of VSAM function performed. The value can be one of the following:
  VERIFY
  POINT
  GET
  PUT
  ERASE
  WRTBFR
VSAM_return_code Indicates the VSAM return code.
RPL_error_code Indicates the RPL error code.
data_set_name Indicates the repository data set name.

System action: The repsonitory indicated in the message is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: For a detailed description of the VSAM error, see z/OS DFSMS Macro Instructions for Data Sets.

Module: FRPSIOV
Related information:
  z/OS: VSAM macro return and reason codes

FRP0031E VSAM resource pool build failure: description

Explanation: An error occurred on build VSAM resource pool (BLDVRP) during server initialization.

In the message text, description can be one of the following:
  Insufficient virtual storage
  BLDVRP macro_return_code

System action: The Repository Server terminates.

User response: For a complete description of the BLDVRP error, see z/OS DFSMS Macro Instructions for Data Sets. Correct the issue and restart the server.

If the problem is insufficient virtual storage, ensure that there is enough free virtual storage to accommodate the VSAM LSR pool buffers used for repository I/O. Take one of the following actions: Allocate more virtual storage, decrease the number of buffers (VSAM_BUFSIZE), or decrease the size of each buffer (VSAM_BUFNO).

Module: FRPSIOV
Related information:
z/OS: VSAM macro return and reason codes

FRP0032E  Repository data set control interval exceeds VSAM_BUFSIZE.
          DSN=data_set_name

Explanation: During repository open processing, a repository data set was found to have a control interval size that exceeded the VSAM shared pool buffer size.

In the message text, data_set_name indicates the name of the repository data set.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: Ensure that the data set name is correct, or modify the VSAM_BUFSIZE configuration parameter so that the buffer size is equal to or larger than the CI size of the indicated repository data set.

Remember: Consideration must be given to both the DATA and INDEX components of the data set.

Module: FRPSIOV

FRP0033E  Error during CONTROL SET function processing.
          Repository...repository_name

Explanation: An error occurred during control set processing for the IMSRSC repository data set repository_name, leaving the repository control data (the audit rule table, history retention table, and security/search fields tables) potentially inconsistent.

System action: The specified repository is stopped.

User response: Restart the repository to reestablish the integrity of the control data.

Module: FRPSIORQ

FRP0034E  Repository data set in use by another job or user.
          DSN=data_set_name

Explanation: During repository open processing, a repository data set was found to be unavailable.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: Retry after ensuring that the data set is available.

Module: FRPSIOV, FRPSIOVA

FRP0035E  VSAM unable to extend data set:
          RC=VSAM_return_code
          RPLERRCD=RPL_err_code.
          DSN=data_set_name

Explanation: A repository data set could not be extended, causing the repository update process to fail.

In the message text,

VSAM_return_code  Indicates the VSAM return code
RPL_err_code      Indicates the RPL error code.
data_set_name     Indicates the repository data set name.

System action: The repository is placed in stopped state and cannot be accessed. If the repository is the Repository Server (RS) catalog repository, the RS terminates.

User response: See a detailed description of the VSAM error, resolve the cause of the data set extension failure, and then restart the repository.

Module: FRPSIOV

Related information:

FRP0036E  Invalid SPARE RDS data sets. RDSn is now discarded.
          Repository...repository_name
          Description...description

Explanation: Data set validation failed for a repository data set (RDS) that is nominated as a SPARE.

In the message text,

RDSn  Indicates the repository data set number: 1, 2, or 3.
repository_name  Indicates the name of the IMSRSC repository.

description Can be one of the following text:
  Data set open-time error
  Data sets not empty
  RECORDSIZE inconsistent with other RDS

System action: The repository data set is discarded.

User response: Correct the data set issues that caused the repository data set to be discarded. You can then use the DSCHANGE batch command to change the repository data set status from DISCARD to SPARE.

Module: FRPSIORQ

Related reference:

DSCHANGE command for FRPBATCH (System Programming APIs)
FRP0037I  RDSn status has been changed to status.  
Repository...repository_name

Explanation: The status of an IMSRSC repository data set pair has been changed to SPARE or DISCARD. The status change can occur when an ADMIN command is used, or dynamically in a repository error scenario (such as a physical I/O error during a two-phase update).

In the message text, 
RDSn Indicates the repository data set number: 1, 2, or 3.  
status SPARE or DISCARD.  
repository_name Indicates the name of the repository.  

System action: The server continues.  
User response: No action is required.  
Module: FRPSIORQ, FRPSREQQ

FRP0038I  VSAM_physical_error_message_text

Explanation: Supporting information is printed when an FRP0028E message, which represents a VSAM physical error (RC=12), is issued.

System action: See the information on message FRP0028E.

User response: Refer to z/OS DFSMS Macro Instructions for Data Sets for a complete description of the VSAM error.

Module: FRPSIOV

Related information:
"FRP0028E" on page 276  
z/OS: VSAM macro return and reason codes

FRP0039I  Spare RDSn has been assigned status.  
Repository...repository_name

Explanation: A SPARE repository data set pair has been assigned COPY1 or COPY2 status. This assignment occurs as part of repository recovery when COPY1 or COPY2 has previously been discarded.

In the message text, 
RDSn Indicates the IMSRSC repository data set number: 1, 2, or 3.  
status COPY1 or COPY2.  
repository_name Indicates the name of the repository.  

System action: The server continues.  
User response: No action is required.  
Module: FRPSIORQ

FRP0040E  Repository cannot be started: reason.  
Repository...: repository_name  
RDS1 status: status  
RDS2 status: status  
RDS3 status: status

Explanation: The IMSRSC repository cannot be started. The reason for the problem is identified by reason.

In the message text, reason Indicates the reason of the error. reason can be:  
Spare RDS required  
During repository start or open processing, it was found that the repository cannot be started because a COPY1 or COPY2 repository data set (RDS) must be recovered. However, there is no spare repository data set to facilitate this recovery.  
No COPY1 or COPY2 RDS  
This case represents a Repository Server error. During repository start or open processing, it was found that the repository cannot be started because no repository data set has COPY1 or COPY2 status.

repository_name Indicates the name of the repository.  
status COPY1, COPY2, SPARE, or DISCARD.  

System action: The repository is placed in stopped state and cannot be accessed.

User response: If reason is Spare RDS required, reset the discarded data sets and change the associated repository data set status to SPARE. Consider increasing the size of the data sets if they were discarded because they could not be extended.

If reason is No COPY1 or COPY2 RDS, correct the repository data sets by the following procedure.

Attention: Reinitializing the repository data sets results in total loss of data. If you want to try recovering data from the data sets, take a copy before performing the following steps.

Either reinitialize the data sets, or recover them from backups if available. Then, redefine the user repository to establish RDS1=COPY1 and RDS2=COPY2.

Module: FRPSINTQ, FRPSIORQ

FRP0041W  IMSPLEX(NAME=) is ignored as RSNAME= is not specified

Explanation: The IMSPLEX(NAME=) keyword was specified without the RSNAME= keyword. The IMSPLEX(NAME=) keyword is ignored because the RSNAME= keyword was not specified to generate the repository ID (REPOID) to register to the Structured Call Interface (SCI) with.
When both IMSPLEX(NAME=) and RSNAME= keywords are specified, the Repository Server (RS) address space registers to the local Structured Call Interface (SCI) by using the repository ID created from the RSNAME parameter as the SCI member name. Specifying IMSPLEX() and REPONAME= keywords allows the RS to be shown on the output of the QUERY IMSPLEX command.

System action: The repository continues initialization without registering to SCI.

User response: Modify the FRPCFG member of the IMS PROCLIB data set to remove the IMSPLEX() keyword or add the RSNAME= keyword.

Module: FRPSINIT

Related reference:
- FRPCFG member of the IMS PROCLIB data set

FRP1001E  Configuration error: description

Explanation: There was an error in the JCL initialization script, that prevented the Repository Server from being initialized.

In the message text:
- description
  Description of the error, which can be one of the following:
  - FRPCFG keyword is missing; check the parameter in JCL
  - FRPCFG parameter is missing; check the parameter in JCL
  - FRPCFG parameter must specify a PDS member name

System action: The server terminates.

User response: Check the startup JCL to ensure that all parameters are valid, and rerun the job.

Module: FRPSINIT

FRP1002E  Error processing PROCLIB member

Description: description

Explanation: The server configuration parameter member was in error.

In the message text:
- member
  Indicates the name of the FRPCFG member of the IMS PROCLIB data set.
- description
  Description of this error, which can be one of the following:
  - Error reading PROCLIB member
  - Open failed for PROCLIB PDS
  - PROCLIB PDS not in fixed format
  - PROCLIB member not found

System action: The server terminates.

User response: Check the startup JCL to ensure that all parameters are valid, and rerun the job.

Module: FRPSINIT

Related reference:
- BPEPARSE codes (Messages and Codes)
- FRPCFG member of the IMS PROCLIB data set

FRP1005E  Error parsing PROCLIB member member, BPEPARSE RC=rc

Explanation: The server configuration parameter member was in error. BPE0003E messages are issued with details of the error.

In the message text:
- member
  Indicates the name of the FRPCFG member of the IMS PROCLIB data set.
- rc
  Indicates the BPEPARSE return code.

System action: The server terminates.

User response: Check the startup JCL to ensure that all parameters are valid, and rerun the job.

Module: FRPSINIT

Related reference:
- BPE0003E on page 19

FRP1007E  Invalid XCF group name specified: group

Explanation: The XCF_GROUP_NAME server configuration parameter value was invalid.

In the message text:
- group
  Indicates the name of the z/OS cross-system coupling facility (XCF) group specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.

User response: Correct the parameter value, and rerun the job.

Module: FRPSINIT

Related reference:
- FRPCFG member of the IMS PROCLIB data set

FRP1008E  Invalid number of XCF threads specified: nn. Valid range is 4 through 99.

Explanation: The XCF_THREADS server configuration parameter value was invalid. If specified, the value must be in the range of 4 - 99. By default, eight z/OS
cross-system coupling facility (XCF) threads are used. In the message text:

Indicates the XCF thread value specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.
User response: Correct the parameter value, and rerun the job.

Module: FRPSINIT
Related reference:

FRP1009E Invalid core size specified: nnnn. Valid range is 64 through 4096 (K).
Explanation: The MBR_CORE_MAX server configuration parameter value was invalid. If specified, the value must be in the range of 64 - 4096 (K). By default, a maximum value of 1024K is used.

In the message text:

Indicates the MBR_CORE_MAX value specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.
User response: Correct the parameter value, and rerun the job.

Module: FRPSINIT
Related reference:

FRP1010E Invalid SA class name specified: name
Explanation: The specified z/OS System Authorization Facility (SAF) class was not a valid SAF class name.

In the message text:

Indicates the SAF_CLASS value specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.
User response: Make sure that the SAF_CLASS value is a valid SAF class name and specifies a defined resource class.

Module: FRPSINIT
Related reference:

FRP1015E SAF class not defined: name
Explanation: The z/OS System Authorization Facility (SAF) class could not be identified. Possible reasons are:

- SAF-enabled security (RACF or similar) is not installed.
- The class was not defined.

In the message text:
name Indicates the SAF_CLASS value specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.

User response: Correct the parameter in the FRPCFG member of the IMS PROCLIB data set if the SAF class is not as expected, or make sure that the SAF class is defined.

Module: FRPSINIT, FRPSREQQ

Related reference:

FRP1016E Invalid DSN specified: description

Explanation: A server configuration parameter that specifies one of the Repository Server (RS) catalog repository data set names was invalid. The value specified was not a valid data set name.

In the message text:

description Indicates the RS catalog repository data set whose name is invalid.

System action: The server terminates.

User response: Correct the parameter value and rerun the job.

Module: FRPSINIT

FRP1018E Invalid AUDIT_LOGNAME specified: logname

Explanation: The value specified by the AUDIT_LOG server configuration parameter is not a valid audit log stream name.

In the message text:

logname Indicates the AUDIT_LOG value specified in the FRPCFG member of the IMS PROCLIB data set.

System action: The server terminates.

User response: Correct the parameter value and rerun the job.

Module: FRPSINIT

Related reference:

**FRP2003I**  Attempting to become master repository server

**Explanation:** No master Repository Server (RS) was present for the given z/OS cross-system coupling facility (XCF) group, so this subordinate server is attempting to attain master Repository Server status.

**System action:** The server attempts to join the given XCF group as the master Repository Server. If it is successful, master server startup proceeds and message FRP2002I is then issued. If another Repository Server has already attained master Repository Server status, message FRP2001I is issued.

**User response:** No action is required.

**Module:** FRPSINTQ

**Related concepts:**
- Recovery in an IMSplex (System Administration)

**Related information:**
- “FRP2001I” on page 281
- “FRP2002I” on page 281

**Related tasks:**
- Starting the Repository Server (Operations and Automation)

**Related information:**
- Chapter 2, “IMS problem determination,” on page 13

---

**FRP2004I**  FRPPRINT DD not defined. Output to this file will be suppressed.

**Explanation:** An optional FRPPRINT DD was not present. Output to this file, including the server configuration parameter report, DUMPTRACE output, and DUMPSTATS output, is suppressed.

**System action:** Server startup continues.

**User response:** No action is required.

**Module:** FRPSSINIT

---

**FRP2005I**  Shutdown command received, server terminating

**Explanation:** The Repository Server received a SHUTDOWN command and started the server termination process.

**System action:** Server termination continues.

**User response:** No action is required.

**Module:** FRPSTERM

---

**FRP2006I**  Server starting: Release relnum, XCF group xcfgrpname

**Explanation:** The Repository Server (RS) is being initialized. This message is issued during server startup of both the active server and the subordinate server.

In the message text,
- `relnum` indicates the release number of the RS.
- `xcfgrpname` indicates the z/OS cross-system coupling facility (XCF) group name of the RS.

---

**FRP2007I**  Shutdown command received, notifying all repository servers to shut down

**Explanation:** The Repository Server received a SHUTDOWN ALL command and has started the server termination process. Any subordinate servers in the same z/OS cross-system coupling facility (XCF) group is also notified to terminate.

**System action:** Server termination continues.

**User response:** No action is required.

**Module:** FRPSSCMD

---

**FRP2011E**  Shutdown command rejected, shutdown in progress

**Explanation:** The Repository Server received a SHUTDOWN command after starting the server termination process.

**System action:** Server termination continues.

**User response:** No action is required.

**Module:** FRPSTERM

---

**FRP2012I**  Opening repository: repository

**Explanation:** The Repository Server (RS) has started opening the named IMSRSC repository.

In the message text:
- `repository` indicates the name of the repository.

**System action:** The repository open process continues.

**User response:** No action is required.

**Module:** FRPSREQQ

---

**FRP2013I**  Closing repository: repository

**Explanation:** The Repository Server (RS) has started closing the named IMSRSC repository.

In the message text:
- `repository` indicates the name of the repository.
System action: The repository close process continues.
User response: No action is required.
Module: FRPSINTQ

FRP2014I Repository start request initiated: repository

Explanation: The Repository Server (RS) received a request to start the named IMSRSC repository. An asynchronous process to perform this action has been initiated.

In the message text:
repository
   Indicates the name of the repository.

System action: The issuer of the start request is informed that the request has been accepted. The asynchronous process to perform the start action continues.
User response: No action is required.
Module: FRPSSCMD

FRP2015I Repository stopped: repository

Explanation: An ADMIN STOP request for the named IMSRSC repository was issued from the console. The named repository has been stopped.

In the message text:
repository
   Indicates the name of the repository.

System action: None.
User response: No action is required.
Module: FRPSINTQ

FRP2016I Repository opened: repository

Explanation: The IMSRSC repository identified in the message has been opened successfully.

In the message text:
repository
   Indicates the name of the repository.

System action: None.
User response: No action is required.
Module: FRPSIORQ

FRP2017I Repository closed: repository

Explanation: The IMSRSC repository identified in the message was successfully closed.

In the message text:
repository
   Indicates the name of the repository.

System action: None.
User response: No action is required.
Module: FRPSINTQ

FRP2018E Unable to open repository.
   Repository...: repository
   Description...: repository definition in use

Explanation: The Repository Server (RS) was unable to open the IMSRSC repository identified in the message because the repository definition in the RS catalog repository data set was in use.

In the message text:
repository
   Indicates the name of the repository.

System action: None.
User response: Wait until the definition is available, and then retry the request.

---

FRP2020I Repository stop request initiated: repository

Explanation: The Repository Server (RS) received a request to stop the IMSRSC repository identified in the message. An asynchronous process to perform this action was initiated.

In the message text:
repository
   Indicates the name of the repository.

System action: The issuer of the stop request is informed that the request has been accepted. The asynchronous process to perform the stop action continues.
User response: No action is required.
Module: FRPSSCMD

FRP2021I Repository started: repository

Explanation: An ADMIN START request for the IMSRSC repository identified in the message was issued from the console. The named repository was started.

In the message text:
repository
   Indicates the name of the repository.

System action: Processing continues.
User response: No action is required.
Module: FRPSINTQ
FRP2022E  Repository unavailable: repository
Explanation: If the Repository Server (RS) catalog repository was found to be unavailable during server initialization, this message is issued and the server terminates. Otherwise, this message indicates that a console-driven ADMIN request for the named user repository has been suppressed. This situation occurs when a user repository is temporarily unavailable because of an in-progress state change; for example, if the repository is in the process of being stopped.

In the message text:
repository  Indicates the name of the repository.
System action: Processing continues.
User response: Check the status of the named repository, and reissue the command if applicable.
Module: FRPSINTQ

FRP2023E  Repository not found: repository
Explanation: An ADMIN request for the named IMSRSC repository was issued from the console, but the request failed because the repository was unknown.

In the message text:
repository  Indicates the name of the repository.
System action: The request fails.
User response: Correct the repository name and reissue the request.
Module: FRPSINTQ

FRP2024E  Request ignored, repository already started: repository

FRP2025I  Server start completed
Explanation: The server is now ready to accept client connections.

The FRP2025I message is issued during RS initialization by the master RS when it is ready to accept client connections. The message is also issued after a subordinate RS becomes a new master RS (after the termination of the old master RS) and is ready to accept client connections.

System action: Processing continues.
User response: No action is required.
Module: FRPSINTQ

FRP2026I  XCF group group joined successfully
Explanation: The server now accepts z/OS cross-system coupling facility (XCF) registrations and connections for the specified group.

In the message text, group  Indicates the XCF group name in the FRPCFG member of the IMS PROCLIB data set.
System action: Processing continues.
User response: No action is required.
Module: FRPSINTQ
Related reference:  FRPCFG member of the IMS PROCLIB data set (System Definition)

FRP2027E  Unable to connect to audit log stream, server terminating
Explanation: The log stream was unavailable, and AUDIT_FAIL=ABORT was specified in the server configuration parameters.

System action: The server terminates.
User response: Ensure that a valid log stream name is specified in the AUDIT_LOG parameter and that the log stream is set up correctly. Optionally, bypass the audit log by setting AUDIT_FAIL=CONTINUE or AUDIT=NO.
Module: FRPSAUDQ
Related reference:  FRPCFG member of the IMS PROCLIB data set (System Definition)

FRP2028E  DUMPTRACE command ignored because FRPPRINT DD not allocated

or
DUMPSTATS command ignored because FRPPRINT DD not allocated

Explanation: A DUMPTRACE or DUMPSTATS modify command was issued, but the DD name FRPPRINT was not found or was not open.

System action: The command is ignored. The server continues.

User response: Ensure that the data set specified by the FRPPRINT DD statement is available on the next restart of the server.

Module: FRPSSDMP, FRPSTDMP

FRP2029E Log stream connection failed RC=rc RSN=rsn

Explanation: Log stream connection through the IXGCONN request failed.

In the message text, 
rc Indicates the IXGCONN return code.
rsn Indicates the IXGCONN reason code.

System action: If AUDIT_FAIL=ABORT is specified, the server terminates.

User response: Check the return and reason codes to determine the cause of the error. Optionally, bypass the audit log by setting AUDIT_FAIL=CONTINUE or AUDIT=NO.

Module: FRPSAUDQ

Related reference:

FRPCFG member of the IMS PROCLIB data set
z/OS: Return and reason codes for the IXGCONN macro

FRP2030E ENF listener activation failed RC=rc

Explanation: The ENF listener activation (ENFREQ) failed.

In the message text:
rc Indicates the ENFREQ return code.

System action: If AUDIT_FAIL=ABORT is specified, the server terminates.

User response: Check the return code to determine the cause of the error. You can optionally bypass the audit log by setting AUDIT_FAIL=CONTINUE or AUDIT=NO.

Module: FRPSAUDQ

Related reference:

FRPCFG member of the IMS PROCLIB data set
z/OS: Return and reason codes for the ENFREQ macro

FRP2031I Audit logging suspended due to CONNECT RC=rc RSN=rsn

or

Audit logging suspended due to WRITE RC=rc RSN=rsn

Explanation: Audit logging was suspended due to an outstanding error while connecting to or writing to the log stream (IXGCONN REQUEST=CONNECT or IXGWRITE). If AUDIT_TERM=ABORT is specified, the server waits until the problem is fixed (temporary error), the server is stopped, or a z/OS MODIFY AUDIT RESTART command is successful.

In the message text,
rc Indicates the IXGCONN REQUEST=CONNECT or IXGWRITE return code.
rsn Indicates the IXGCONN REQUEST=CONNECT or IXGWRITE reason code.

System action: No logging is performed until the problem is resolved.

User response: Fix the logging problem and issue a MODIFY AUDIT RESTART command to reset the logging service.

Module: FRPSINTQ

Related reference:

FRPCFG member of the IMS PROCLIB data set

z/OS: IXGWRITE macro return and reason codes
reposervername,AUDIT (Commands)

FRP2034I Lost XCF client Sysname=MVS_system Jobname=client_job_name, response discarded

Explanation: The response to a z/OS cross-system coupling facility (XCF) client request could not be sent by the Repository Server (RS) and has been discarded. This error occurs if the client fails (for example, the client is canceled) while the Repository Server is processing the request on behalf of the client.
FRP2100I • FRP2102I

In the message text:

*MVS_system*
Indicates the MVS system name of the XCF client.

*client_job_name*
Indicates the job name of the XCF client.

**System action:** None.

**User response:** For more information, look up RC=8, RSN=IXCMSGORSNTARGETNOTVALID for the IXCMSGO macro.

**Module:** FRPSCOMQ

**Related reference:**
- FRPCFG member of the IMS PROCLIB data set (System Definition)

**FRP2100I** ADMIN DISPLAY repository repository
- Last updated date/time : date_time
  userID
- Status . . . . . . . . : status
- Auto-open . . . . . . : autoopen_flag
- Security Class . . . . : class

**Explanation:** This message shows the result of the following console z/OS MODIFY ADMIN command:

```
F server,ADMIN DISPLAY(repository)
```

In the message text:

*repository*
Indicates the name of the IMSRSC repository.

*date_time*
Indicates the date and time the repository was last updated.

*userID*
Indicates the user ID of the user who last updated the repository.

*status*
Indicates the status of the repository.

*autoopen_flag*
Indicates whether the repository data set is allocated when the repository is started.

*class*
Indicates the name of the security class.

**System action:** Processing continues.

**User response:** No action is required.

**Module:** FRPSINTQ

**Related reference:**
- F reposervername,ADMIN (Commands)

**FRP2102I** repository repository_status update_date
  update_userID RDS1_status RDS2_status RDS3_status

**Explanation:** This message shows the result of the following console z/OS MODIFY ADMIN command:

```
F server,ADMIN DISPLAY()
```

This message is repeated for each IMSRSC repository.

In the message text:

*repository*
Indicates the name of the repository.

*repository_status*
Indicates the current status of the repository.

$update_date$
Indicates the last updated date of the repository.

$update_userID$
Indicates the user ID by which the repository was last updated.

*RDS1_status*
Indicates the status of RDS1.

*RDS2_status*
Indicates the status of RDS2.

*RDS3_status*
Indicates the status of RDS3.

**System action:** Processing continues.

**User response:** No action is required.

**Module:** FRPSINTQ
**FRP2103I**  
Audit level changed from `old_level` to `new_level`  

**Explanation:**  
This message shows the result of the following console z/OS MODIFY AUDIT command:  
`F server,AUDIT LEVEL(new_level)`  

In the message text:  
- `old_level` indicates the old audit level of the repository.  
- `new_level` indicates the new audit level of the repository.  

**System action:** Processing continues.  
**User response:** No action is required.  
**Module:** FRPSINTQ  
**Related reference:**  
- [F reposervername,AUDIT (Commands)](#)  

---

**FRP2104I**  
Audit level unchanged from `old_level`  

**Explanation:**  
This message shows the result of the following console z/OS MODIFY AUDIT command:  
`F server,AUDIT LEVEL(new_level)`  

In the message text:  
- `old_level` indicates the old audit level of the IMRSRC repository.  

**System action:** Processing continues.  
**User response:** No action is required.  
**Module:** FRPSINTQ  
**Related reference:**  
- [F reposervername,AUDIT (Commands)](#)  

---

**FRP2105I**  
In-core user security profiles refreshed  

**Explanation:**  
This message shows the result of the following console z/OS MODIFY SECURITY command:  
`F server,SECURITY REFRESH`  

**System action:** The command is not processed.  
**User response:** View the IMRSRC repository details by using the ADMIN DISPLAY command, and examine the status of the repository data set before reissuing the command.  
**Module:** FRPSINTQ  
**Related reference:**  
- [F reposervername,SECURITY (Commands)](#)  

---

**FRP2106E**  
Security request rejected, CLASS not defined  

**Explanation:**  
This message shows the result of the following console z/OS MODIFY SECURITY command:  
`F server,SECURITY REFRESH`  

Security settings cannot be refreshed because security is not active for this IMRSRC repository.  
**System action:** Processing continues, but the security settings are not refreshed.  
**User response:** Specify a security class in the SAF_CLASS parameter in the FRPCFG member of the IMS PROCLIB data set. Then, restart the server.  
**Module:** FRPSINTQ  
**Related reference:**  
- [F reposervername,SECURITY (Commands)](#)

**FRP3101E**  
XCF SRB FAILURE: FRPCMSRB - Txxxx REASON=xxxxxxx  

**Explanation:**  
A failure occurred in the client-side z/OS cross-system coupling facility (XCF) message exit (FRPCMSRB). The functional recovery routine (FRR) of the service request block (SRB) trapped the abend in
order to record the event by using this message.

In the message text:

*xxxx* Indicates the abend code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB. The client might be placed in wait state.

**User response:** Contact IBM Software Support.

---

**FRP3102E**  
**XCF SRB FAILURE: FRPCGSRB - Txxxx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in the client-side z/OS cross-system coupling facility (XCF) message exit (FRPCGSRB). The functional recovery routine (FRR) of the service request block (SRB) trapped an abend in order to record the event by using this WTO message.

In the message text:

*xxxx* Indicates the abend code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB.

**User response:** Contact IBM Software Support.

---

**FRP3103E**  
**XCF SRB FAILURE: FRPSMSRB - Txxxx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in the server-side z/OS cross-system coupling facility (XCF) message exit (FRPSMSRB). The functional recovery routine (FRR) of the service request block (SRB) trapped an abend in order to record the event by using this WTO message.

In the message text:

*xxxx* Indicates the abend code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB.

**User response:** Contact IBM Software Support.

---

**FRP3104E**  
**XCF SRB FAILURE: FRPSGSRB - Txxxx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in the server-side XCF group exit (FRPSGSRB). The functional recovery routine (FRR) of the service request block (SRB) trapped an abend in order to record the event by using this WTO message.

In the message text:

*xxxx* Indicates the abend code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB.

**User response:** Contact IBM Software Support.

---

**FRP3105E**  
**XCF SRB FAILURE: FRPSSSRB - Txxxx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in the subordinate-server XCF group exit (FRPSSSRB). The functional recovery routine (FRR) of the service request block (SRB) trapped an abend in order to record the event by using this WTO message.

In the message text:

*xxxx* Indicates the abend code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB.

**User response:** Contact IBM Software Support.

---

**FRP3106E**  
**XCF ERROR: module - MSGX RC=xx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in an XCF member exit. Either an IXCMSGI (XCF input message) or an IXCMSGO (XCF output message) macro has failed. Because this error is not expected to occur, this SRB event is recorded by using this message.

In the message text:

*module* Indicates the module in which the failure occurred. *module* can be either FRPCMSRB (client-side exit) or FRPSMSRB (server-side exit).

*xx* Indicates the return code for this error.

xxxxxxx Indicates the reason code for this error.

**System action:** Processing ends for the affected SRB.

**User response:** Contact IBM Software Support.

---

**FRP3107E**  
**XCF SRB FAILURE: module - CB=xxxx**  
**ARCLEV=xx**

**Explanation:** A failure occurred in a cross-system coupling facility (XCF) member exit. The service request block (SRB) has encountered an unsupported architecture level or control block.

In the message text:

*module* Indicates the module in which the failure occurred. *module* can be either FRPCMSRB (client-side exit) or FRPSMSRB (server-side exit).

*xxxx* Indicates the data that was found in the control block where a control block eye-catcher was expected.

*xx* Indicates the extracted architecture level that is not supported. The architecture level (ARCLEV) value is displayed if the eye-catcher represents a valid block.

**System action:** Processing ends for the affected SRB.

**User response:** Check that the client and the server are both running at the same maintenance level.
Contact IBM Software Support.

---

**FRP3108E**  
**ENF ERROR: FRPSENF - MSG=xx RC=xx**  
**REASON=xxxxxxxx**

**Explanation:** A failure occurred in the server-side ENF listener exit (FRPSENF). The functional recovery routine (FRR) of the service request block (SRB) has trapped the abend in order to report the event by using this message.

**System action:** Processing ends for the affected SRB.

**User response:** Check that the client and the server are both running at the same maintenance level. Contact IBM Software Support.

---

**FRP3109E**  
**XCF SRB FAILURE: FRPCMSRB - SLOT MISMATCH**

**Explanation:** A failure occurred in the client-side XCF member exit (FRPCMSRB). The service request block (SRB) identified a consistency token mismatch between a server response and the associated client slot.

**System action:** Processing ends for the affected SRB. The client might be placed in wait state.

**User response:** Contact IBM Software Support.

---

**FRP3110E**  
**XCF SRB FAILURE: FRPCMSRB - BAD SLOT STATE FLAG1=xx**

**Explanation:** A failure occurred in the client-side XCF member exit (FRPCMSRB). The SRB identified an issue while processing a server response. The state of the associated client slot was not as expected.

In the message text:

- **xx** Indicates the slot state flag byte. This value is returned for diagnostic purposes.

**System action:** Processing ends for the affected SRB. The client might be placed in wait state.

**User response:** Contact IBM Software Support.

---

**FRP3111I**  
**RESMGR FRPSRV RC=rc rsn FC=fc FDBK=xxxxxxxx xxxxxxx xxxxxxx**

**Explanation:** While attempting Repository Server (RS) client object cleanup, the RS client-side RESMGR exit (FRPCRMGR) issued an RS stacking PC (FRPCXCF2) request, but this request failed.

In the message text:

- **rc** Indicates the return code for this error.
- **rsn** Indicates the reason code for this error.
- **fc** Indicates the CSSP function code. This code is not defined in an API macro and is only of value to IBM Software Support.

**User response:** Continue.

**System action:** RESMGR processing attempts to continue.

---

**FRP4000E**  
**Function func failed with reason code rsn**  
**Feedback: feedback_word1 feedback_word2 feedback_word3**

**Explanation:** The function **func** received an error with reason code **rsn**.

In the message text:

- **func** Indicates the Repository Server batch ADMIN function.
- **rsn** Indicates the reason code for this error.
FRP4001E  FRPSSID subsystem not found

Explanation: The subsystem is not installed. In the message text:
FRPSSID

Indicates the FRP subsystem ID.

System action: No action is required.

User response: Check that the installation of the subsystem was performed successfully.

Module: FRPBATCH

FRP4002E  XCF group group not found

Explanation: The z/OS cross-system coupling facility (XCF) group name that was specified on the EXEC statement cannot be found.

In the message text:
group  Indicates the XCF group name as specified in the PARM parameter on the EXEC statement.

System action: None.

User response: Check that the XCF group name specified in the Repository Server configuration matches the name specified in the job parameters. Check that the Repository Server started successfully.

Module: FRPBATCH

FRP4003E  No FRP server is active in the XCF group group

Explanation: The Repository Server was not found in the z/OS cross-system coupling facility (XCF) group specified on the EXEC statement.

In the message text:
group  Indicates the XCF group name as specified in the PARM parameter on the EXEC statement.

System action: None.

User response: Check that the XCF group name specified in the Repository Server configuration matches the name supplied in the job parameters. Check that the Repository Server started successfully.

Module: FRPBATCH

FRP4004E  The FRP server is in shutdown mode

Explanation: Either an error occurred and the server was in the process of shutting down, or a shutdown command was issued for the server and the server was in the process of shutting down.

System action: Processing is stopped at the point of error.

User response: Check the server message log for error messages or shutdown request messages.

Module: FRPBATCH

FRP4005E  The FRP server has shutdown or has failed

Explanation: Either an error occurred in the server or a shutdown command was issued for the server, and the server is no longer active.

System action: Processing is stopped at the point of error.

User response: Check the server message log for error messages or shutdown request messages.

Module: FRPBATCH

FRP4006E  The FRP server is busy, try again later

Explanation: The FRP server is busy.

System action: Processing is stopped at point of error.

User response: Try resubmitting the JCL.

Module: FRPBATCH

FRP4008E  repository_name repository not found

Explanation: The server could not find the IMSRSC repository identified in the message.

System action: Processing is stopped at the point of error.

User response: Check that the repository name supplied is correct. Check the server message log for error messages.

Module: FRPBATCH

FRP4009E  repository_name repository not available

Explanation: The IMSRSC repository identified in the message might be stopped, stopping, or in error.

System action: Processing is stopped at the point of error.

User response: Check the server message log to examine the cause of the error. If the repository is in stopped status, it can be started again with a START command. If the cause is due to an error, contact IBM Software Support.
Module: FRPBatch

FRP4010E  User has insufficient access
Explanation: Function call was rejected by the z/OS System Authorization Facility (SAF) due to lack of authority.
System action: No action is required.
User response: Check the server job log for SAF error messages that report the nature of the security violation. Verify that you have defined the SAF security as required. Restart the server or run the SECURITY REFRESH operator command to load the latest security settings.
Module: FRPBatch

FRP4022E  Repository repository_name already defined in the catalog
Explanation: An attempt was made to add a repository to the Repository Server (RS) catalog repository, but a repository of the same name already exists.
System action: Processing is stopped.
User response: Specify a unique repository name and retry.
Module: FRPBatch

FRP4031E  Catalog busy, repository definition entry repository_name is not available
Explanation: The entry in the Repository Server (RS) catalog repository for the IMSRSC repository repository_name is not currently available. The RS catalog repository was in the process of making another, conflicting update.
System action: The command was rejected.
User response: Try again later.
Module: FRPBatch

FRP4032E  Repository repository_name is not in stopped status
Explanation: An IMSRSC repository must be stopped before you can attempt to update or delete it.
System action: Processing is stopped.
User response: Issue a stop request against the repository. Check the server message log for the stop completed message.
Module: FRPBatch

FRP4040W  Repository repository_name RDS status is unchanged
Explanation: Repository data set (RDS) status is unchanged. The repository data set is already in the required state.
System action: Processing continues.
User response: No action is required.
Module: FRPBatch

FRP4041E  Repository repository_name RDS status not applicable
Explanation: The status of the IMSRSC repository data set (RDS) is not applicable to this request. This message is issued when, for example, you attempt to use a repository data set that has a status of COPY1 or COPY2 as a SPARE data set.
System action: Processing is stopped.
User response: Display the repository information and check its current state. Check the server message log for error messages.
Module: FRPBatch

FRP4042E  Repository repository_name DISCARD rejected, need SPARE RDS
Explanation: A discard request was rejected because a SPARE repository data set is not available. This message is issued when, for example, you attempt to discard a COPY1 or COPY2 IMSRSC repository data set (RDS) when there is no SPARE repository data set available.
System action: Processing is stopped.
User response: Display the repository information and check its current state. Check the server message log for error messages.
Module: FRPBatch

FRP4043E  Repository repository_name DISCARD rejected, last COPY RDS
Explanation: A discard request was rejected because this is the last available COPY repository data set (RDS). This message is issued when, for example, you attempt to discard a COPY1 repository data set when there is no COPY2 repository data set.
System action: Processing is stopped.
User response: Display the repository information and check its current state. Check the server message log for error messages.
Module: FRPBatch
FRP4044E Repository repository_name RDS data sets invalid

Explanation: IMSRSC repository data sets are invalid. This message is issued when, for example, you attempt to copy a discarded repository data set (RDS) to the SPARE repository data set but the basic validation for the data sets fails.

System action: Processing is stopped.

User response: Display the repository information and check its current state. Check the server message log for error messages.

Module: FRP BATCH

---

FRP4045E Repository repository_name RDS data sets not empty

Explanation: IMSRSC repository data sets are not empty. This message is issued when, for example, you attempted to change the status of a repository data set pair (RDS) from DISCARD to SPARE but the data sets are not empty. In this case, the status of the RDS is not changed and remains in a discarded state.

System action: Processing is stopped.

User response: Display the repository information and check its current state. Check the server message log for error messages.

Module: FRP BATCH

---

FRP4046E Resultant repository definition is invalid. Request rejected.

Explanation: An ADD or UPDATE batch request for IMSRSC repository definition was rejected because an error was detected during validation of the repository definition.

System action: Processing is stopped.

User response: Review the parameter values that are specified in the request, correct any errors, and try the request again. If this is an UPDATE request, then the specified parameter values must be considered in the context of the current repository definition.

Module: FRP BATCH

| ADD command for FRP BATCH (System Programming APIs) |
| UPDATE command for FRP BATCH (System Programming APIs) |

---

FRP4273E Server error.

Feedback: feedback_word1 feedback_word2 feedback_word3

Explanation: An unexpected error occurred on the server.

In the message text:

feedback_word1 feedback_word2 feedback_word3

Indicates the IBM diagnostic and debugging information. The three feedback words provide the module ID and internal reason code for the module in which the error was generated.

System action: Processing is stopped at point of error.

User response: Contact IBM Software Support.

Module: FRP BATCH

---

FRP4700E SYSPRINT DD is missing

Explanation: SYSPRINT DD was not specified in the JCL.

System action: Processing is stopped immediately.

User response: Specify SYSPRINT DD in the JCL and retry.

Module: FRP BATCH

---

FRP4701E Error opening SYSPRINT file, RC=rc

Explanation: Error opening SYSPRINT file. In the message text:

rc

Indicates the DFSMS return code.

System action: Processing is stopped immediately.

User response: See the information about OPEN macro return codes.

Module: FRP BATCH

Related reference:

z/OS: OPEN return and reason codes for non-VSAM macro instructions

---

FRP4702E SYsin file missing

Explanation: SYsin DD was not specified in the JCL.

System action: Processing is stopped immediately.

User response: Specify SYsin DD in the JCL and retry.

Module: FRP BATCH

---

FRP4703E Error opening SYsin file. RC=rc

Explanation: An error occurred while opening the SYsin file. In the message text:

rc

Indicates the DFSMS return code.

System action: Processing is stopped immediately.
User response: See the information about OPEN macro return codes.

Module: FRPBATCH

Related reference:

z/OS: OPEN return and reason codes for non-VSAM macro instructions

FRP4704E Virtual storage obtain request failed.

Length=storage_length

Explanation: The specified amount of storage could not be obtained.

In the message text:

storage_length Indicates the amount of storage that you failed to obtain.

System action: Processing is stopped immediately.

User response: Increase the region size of your job. If the problem persists, contact IBM Software Support.

Module: FRPBATCH

FRP4705E XCFGROUP must be supplied in the PARM parameter on the job EXEC statement

Explanation: You must specify an XCFGROUP name in the PARM parameter of the EXEC statement.

System action: Processing is stopped immediately.

User response: Specify the required parameter in the EXEC statement and retry.

Module: FRPBATCH

FRP4706E The parm parameter is invalid

Explanation: The parameter value specified in the PARM parameter was invalid.

System action: Processing is stopped immediately.

User response: Correct the required parameter in the EXEC statement and retry.

Module: FRPBATCH

FRP4710E The command command is unknown

Explanation: An unrecognized command command was found in SYSIN data.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH

FRP4711E The parameter parm is unknown

Explanation: The named parameter parm is not valid for the current command.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH

FRP4712E parm parameter parentheses error

Explanation: Parameter values must be enclosed in parentheses.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH

FRP4713E parm parameter length error

Explanation: An error was detected in the specification of parm parameter length.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH

FRP4714E parm parameter value error

Explanation: An invalid parameter value for the specified parameter was entered.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH

FRP4715E Too many values specified for parameter parm

Explanation: You specified too many values for parameter parm.

System action: Checking of input parameters continues, but no processing is performed.

User response: Correct the input statement in SYSIN data.

Module: FRPBATCH
FRP4716E  parm parameter requires a value
Explanation: You did not specify a value for the parameter parm. This parameter requires a value.
System action: Checking of input parameters continues, but no processing is performed.
User response: Correct the input statement in SYSIN data.
Module: FRPBATCH

FRP4717E  The parameter parm is required
Explanation: The named parameter is required for the current command.
System action: Checking of input parameters continues, but no processing is performed.
User response: Correct the input statement in SYSIN data.
Module: FRPBATCH

FRP4718E  The repository name CATALOG is reserved and cannot be used
Explanation: The name CATALOG is reserved. You cannot use it as a name for an IMSRSC repository.
System action: Checking of input parameters continues, but no processing is performed.
User response: Choose another repository name and retry.
Module: FRPBATCH

FRP4719E  Specify either STATUS or a repository name
Explanation: You cannot specify both STATUS and an IMSRSC repository name.
System action: Checking of input parameters continues, but no processing is performed.
User response: To list the status of all repositories, specify STATUS only. To display the details of a single repository, specify the repository name only.
Module: FRPBATCH

FRP4720E  Parameter parm already specified
Explanation: Only one occurrence of the named parameter (parm) is allowed for the command.
System action: Checking of input parameters continues, but no processing is performed.
User response: Correct the input statement in the SYSIN data and resubmit the job.
Module: FRPBATCH

FRP4721E  No command parameters specified
Explanation: You did not specify any parameters for command command.
System action: Checking of input parameters continues, but no processing is performed.
User response: Correct the input statement in the SYSIN data and resubmit the job.
Module: FRPBATCH

FRP4730E  Cannot connect to the CATALOG
Explanation: An attempt to connect to the Repository Server (RS) catalog repository failed. The reason is described in the message that follows this message.
System action: No action is required.
User response: Check the message that follows, correct the problem, and retry.
Module: FRPBATCH

FRP4733W  Repository repository_name is already started
Explanation: An attempt was made to change the state of the IMSRSC repository repository_name to started, but it is already in started state.
System action: Processing is continued.
User response: No action is required.
Module: FRPBATCH

FRP4734W  Repository repository_name is already stopped
Explanation: An attempt was made to change the state of the IMSRSC repository repository_name to stopped, but it is already stopped.
System action: Processing is continued.
User response: No action is required.
Module: FRPBATCH

FRP4736W  No repositories are defined in the CATALOG
Explanation: No IMSRSC repository is currently defined in the Repository Server (RS) catalog repository.
System action: None.
User response: None.
Module: FRPBATCH
• FRP4737I The repository START request has been scheduled successfully

or

The repository STOP request has been scheduled successfully

Explanation: The IMSRSC repository request (START or STOP) was scheduled successfully.

System action: Processing continues.

User response: No action is required.

Module: FRP4737I

FRP4737I The repository START request has been scheduled successfully

or

The repository STOP request has been scheduled successfully

Explanation: The IMSRSC repository request (START or STOP) was scheduled successfully.

System action: Processing continues.

User response: No action is required.

Module: FRP4737I

FRP4739W Repository repository_name is not state, processing continues

Explanation: A START or STOP request for the IMSRSC repository repository_name has not completed successfully within the MAXWAIT time, and the CONTINUE processing option was specified.

In the message text:

repository_name

Indicates the name of the repository.

state

Indicates the repository state. state can be one of the following: started, stopped, or started/open.

System action: Processing continues.

User response: Display the repository information and check its current state. Check the server message log for error messages. If necessary, increase the MAXWAIT time.

Module: FRP4739W

FRP4740E Repository repository_name is not state, processing is aborted

Explanation: A repository request has not completed successfully within the MAXWAIT time, and the ABORT processing option was specified.

In the message text:

repository_name

Indicates the name of the IMSRSC repository.

state

Indicates the state of the repository. state can be either START or STOP.

System action: Processing stops.

User response: Display the repository information and check its current state. Check the server message log for error messages. If necessary, increase the MAXWAIT time or change the processing option from ABORT to CONTINUE.

Module: FRP4740E

FRP4741W repository_name repository not found

Explanation: The server could not find the named IMSRSC repository.

In the message text:

repository_name

Indicates the name of the repository.

System action: Processing continues.

User response: Make sure that the repository name that you provided is correct. Check the server message log for error messages.

Module: FRP4741W

FRP4750I command_name command processing completed successfully

Explanation: Command processing completed successfully.

In the message text:

command_name

Indicates the name of the command.

System action: None.

User response: No action is required.

Module: FRP4750I

FRP4751I command_name command processing completed with errors

Explanation: Command processing completed with errors.

In the message text:

command_name

Indicates the name of the command.

System action: Processing is stopped at the point of error.

User response: Locate the command in error by checking previous messages. Correct the errors and resubmit JCL statements from this point onwards.

Module: FRP4751I

FRP4752I No commands processed due to control statement errors

Explanation: An error was found during syntax checking of the SYSIN input. No commands were processed.

System action: No processing is performed.

User response: Check previous errors and correct SYSIN data.

Module: FRP4752I
FRP4753I

FRP4753I  command_name command processing completed with warnings

Explanation:  Command processing completed with warnings.

In the message text:
command_name
Indicates the name of the command.

System action:  Processing continues.

User response:  Locate the command with warnings by checking previous messages. If warnings are significant, correct the errors and resubmit JCL statements from this point onwards.

Module:  FRPBATCH
Chapter 11. G messages (system definition)

Messages associated with system definition begin with the prefix G.

Error messages indicate that the Stage 2 job stream is not produced because of the error condition. Where additional explanations are required, see IMS system definition information.

G messages G000-G100

This topic contains the following messages:

G000  IMSCTRL MUST BE 1ST STMT, IMSGEN MUST BE LAST.

Explanation: The sequence of input to IMS system definition requires the IMSCTRL statement to be the first statement and the IMSGEN statement to be the last. This message is issued by other Stage 1 macros also.

G001  MORE THAN ONE IMSCTRL STMT SPECIFIED.

Explanation: Only one IMSCTRL statement can be specified for an IMS system definition.

G002  FOLLOWING OPERAND(S) OMITTED OR INVALID:

Explanation: The list can include one or more of the following: DBRC, ETOFEAT, IRLMNM, IMSID, MAXCLAS, MAXIO, MAXREGN, MSVID, or SYSTEM.

By operand, one of the listed errors was detected as follows:

DBRC
- More than one parameter was specified.
- The parameter was not specified as 'YES' or 'NO'.

ETOFEAT
- More than three subparameters were specified.
- The first parameter was not YES, NO, or null.
- The second parameter was not ALL or ONLY.
- A second parameter was specified when the first parameter was NO.
- The third subparameter was not ALL, NO, or ONLY.

IRLMNM
- More than one parameter was specified.
- The parameter was not 1 to 4 characters in length.
- The parameter does not consist of alphanumeric characters.

IMSID
- More than one parameter was specified.
- The parameter specified contained more than 4 characters.
- The parameter, as specified, was not alphanumeric.

MAXCLAS
- More than one parameter was specified.
- The parameter was not specified as a decimal value from 1 through 255.

MAXIO
- More than two parameters were specified.
- The first parameter is no longer used. It is kept only for compatibility purposes.
- The second parameter was specified, but not as a decimal value from 7 through 255.

MAXREGN
- More than four parameters were specified.
- The first parameter was specified, but not as a decimal value from 1 through 999.
- The second value was specified, but not as a value from 1 KB through 99999 KB.
- The third parameter was specified, but not as an alphanumeric character.
- The fourth parameter was specified, but not as an alphanumeric character.

MSVID
- More than one parameter was specified.
- The parameter was specified as a decimal number from 1 through 255.
- The parameter was not specified for a MSVERIFY type of system definition.

SYSTEM
- More than four parameters were specified.
- The first parameter was specified, but not as a decimal value from 1 to 31.
- The first part of the second parameter was not specified as ALL, CTLBLKS, NUCLEUS, BATCH, ON-LINE, MSVERIFY or MODBLKS.
- The second part of the second parameter was not specified as DB/DC, DBCTL, DCCTL, or null.
• The fourth parameter can be specified only as LGEN or null.

**G003**  
**RELEASE AND MOD LEVEL NOT SPECIFIED OR INVALID; DEFAULT xxx ASSUMED.**

Explanation: This is a warning message. The specified third subparameter of the system keyword is not valid for the system specified or defaulted. The field xxx is the default release or modification level for the system specified. If VS/1 or VS/1V was specified as the first subparameter, the default is Release 7 Mod 0. If VS/2 was specified, the default is Release 3 Mod 8.

Problem determination: See the IMS system definition information for the valid keyword parameter for IMSCTRL.

**G004**  
**HOST SYSTEM MUST BE MVS FOR IRLM**

Explanation: The IRLM feature can be included only if the host system, specified on the IMSCTRL macro, is specified as VS/2.

**G005**  
**DBRCNM OPERAND IS INVALID. DEFAULT ASSUMED.**

Explanation: This is a warning message. One of the following occurred:

• More than one operand was specified.
• The operand exceeded 8 alphanumeric characters.
• The operand did not begin with an alphabetic character.

System action: The parameter is ignored and the default name is used.

**G006**  
**IRLM OPERAND IS INVALID. NULL ASSUMED.**

Explanation: This is a warning message. One of the following occurred:

• More than one operand was specified.
• The only operands allowed are YES and NO.
• The IRLM keyword is specified without the IRLMNM keyword also being specified.

System action: The parameter is ignored and the default is used.

**G007**  
**WARNING: PRDR PARM INCORRECT.**

Explanation: The PRDR parameter must consist of 1 through 8 alphanumeric or national characters; the first character must be alphabetic or national.

System action: Stage 1 does not complete successfully.

Severity: 4

**G008**  
**LGEN ASSEMBLE EXECUTION NOT FROM THE PREPROCESSOR.**

Explanation: One of the following occurred:

• A LGEN/MODBLKS or LGEN/MSVERIFY system definition assembly was attempted without using the preprocessor. The preprocessor must be invoked to build the assembly input and to call the assembler.

• High Level Assembler listing control instructions (such as PRINT OFF) are imbedded in the stage 1 source.

System action: The assembly fails.

Programmer response: Change the job step JCL to execute the preprocessor rather than the assembler or modify the stage 1 source by removing the assembler listing control instructions. Rerun the stage 1.

Severity: 4

**G009**  
**SCP LEVEL MUST BE AT LEAST SP 2.1.3 - HSB KEYWORD IGNORED.**

Explanation: The level of MVS/XA specified cannot support XRF processing.

**G010**  
**NAMECHK= SPECIFICATION INVALID**

Explanation: The name check parameter is invalid for one of the following reasons:

• The first positional parameter was incorrectly specified and should have been either YES or NO, where YES is the default.

• The second positional parameter was incorrectly specified and should have been either S1 or S2, where S1 is the default.

• The first positional parameter and the second parameter formed an invalid combination.

• NAMECHK was specified along with LGEN on the IMSCTRL SYSTEM keyword. NAMECHK is ignored. The preprocessor does duplicate name checking and the Sort/Split utility does resource sorting.

The following combinations are allowed:

NAMECHK=YES
NAMECHK=(YES,S1)
NAMECHK=(YES,S2)
NAMECHK=NO
NAMECHK=(NO,S1)
NAMECHK=(NO,S2)

System action: The default is used for the invalid parameter.

Programmer response: Change the NAMECHK= keyword specification.

Severity: 2
G011  WARNING: THE DBRC|MAXIO KEYWORD IS NO LONGER USED AND IS IGNORED.

Explanation: The DBRC|MAXIO keyword is for compatibility only. If specified, it is ignored. The DBRC value is specified in the DFSIDEF0 module that is built by IVP or can be assembled and bound from the sample provided in SDFSSMPL.

System action: None.
Severity: 2

G012  HSB KEYWORD INVALID FOR BATCH SYSTEM - IGNORED

Explanation: XRF capability cannot be requested when defining a batch system.

G013  NO XRF CAPABILITY DUE TO PREVIOUS ERROR(S)

Explanation: The HSB keyword on the IMSCTRL macro was ignored because of previous errors. See message G009 or G012, issued before this message, to determine why the keyword was ignored.

Related information: 
"G009" on page 298
"G012"

G014  HSB KEYWORD PARAMETER INVALID - DEFAULT 'NO' ASSUMED

Explanation: The only acceptable values for the HSB keyword on the IMSCTRL keyword are YES and NO. Neither was specified; NO is assumed.

G015  MORE THAN ONE IMSCTF STMT SPECIFIED.

Explanation: Only one IMSCTF statement can be specified for an IMS system definition.

G016  FOLLOWING OPERAND SPECIFICATIONS ARE INVALID: list

Explanation: The list of operands (list) can include one or more of the following: APNDG, CORE, CPLOG, DISKLOG DYLOG, LOG, RDS, or SVCNO. (This message might be issued by the IMSGEN macro also.)

The possible error conditions are listed by operand as follows:

APNDG
- Too many parameters were specified.
- Specified or defaulted parameters were not 2 characters each.
- Specified parameters were not in the range of WA through Z9.
- Specified parameters were not unique.

CORE
- More than four parameters were specified.
- One or more of the parameters specified was not a decimal value.
- One or more of the first three parameters was not in the range of 1 through 16000.
- The fourth parameter was not within the range of 0 through 252.
- Value 1 plus value 3 exceeded value 2.

CPLOG
- More than one parameter was specified.
- The parameter specified was not a decimal number within the range of 500 through 16777215.

DISKLOG
- More than one parameter was specified.
- The specified parameter was not YES or NO.

DYLOG
- More than three parameters were specified.
- The first parameter was not specified as 3350, 3340, 3330, 2314, or 2305.
- The second parameter was not a decimal number in the range of 516 through the track size of the device specified (or defaulted) in the first parameter.
- The third parameter was not in the range of 2 through 32767.

LOG
- More than two parameters were specified.
- A parameter other than SNGL, DUAL, or MONITOR was specified.
- An invalid combination of parameters was specified. For example, LOG=(SNGL,DUAL).

RDS
- More than three parameters were specified.
- The first parameter was not specified as 3350, 3340, 3330, 2314, or 2305.
- The second parameter was not a decimal number in the range of 1024 through the track size of the device specified (or defaulted) in the first parameter.
- The third parameter was not in the range of 2 through 32767.

SVCNO
- Too many parameters were specified.
- The second operand was not a decimal number between 128 through 255, or the third parameter was not a decimal number between 200 through 255.
- Any two specified or defaulted parameters are the same.
**G017** WARNING: TYPE 1 SCVNO IGNORED

**Explanation:** This is a warning message. You specified a type 1 SVC number in the SVCNO keyword of the IMSCTF macro. The type 1 SVCs are no longer used and are therefore ignored.

**G018** WARNING: OSAM CHANNEL END APPENDAGE IGNORED

or

OSAM OR CTC CHANNEL END APPENDAGE IS IGNORED.

**Explanation:** This is a warning message.

The first form of this message is issued when an OSAM channel end appendage suffix is specified in the APNDG keyword of the IMSCTF macro. The OSAM channel end appendage is no longer used by IMS. Therefore, this specification is ignored.

The second form of this message is issued because either an OSAM or MSC CTC channel end appendage suffix is specified in the APNDG keyword of the IMSCTF macro. OSAM and CTC channel end appendage suffixes are no longer used by IMS. Therefore, this specification is ignored.

**G019** MACLIB OPERAND IS OBSOLETE.

**Explanation:** System definition no longer creates a copy job step for the macros. SMP/E places the macros into the databases with the low order names of ADFSMAC and SDFSMAC.

**System action:** System definition continues.

**Programmer response:** No action is required. Remove the MACLIB operand from the IMSGEN macro to eliminate this message the next time system definition is run.

**Severity:** 2

**G034** SPAREA MACRO NO LONGER REQUIRED. ALL PARAMETERS IGNORED.

**Explanation:** The SPAREA macro is no longer required. All parameters are ignored.

**System action:** The system definition continues normally. The SPAREA macro is ignored.

**System programmer response:** Remove the SPAREA macro before performing the next system definition.

**Severity:** 2

**G035** FIXED OPERAND IS INVALID.

**Explanation:** The FIXED operand is no longer supported.

**System action:** System definition continues.

**System programmer response:** Remove the FIXED operand before performing the next system definition.

**Severity:** 2

**G040** MORE THAN ONE BUFPOOLS STMT SPECIFIED.

**Explanation:** Only one BUFPOOLS macro-instruction statement is allowed within an IMS system definition.

**G041** THE FOLLOWING OPERANDS ARE INVALID: list

**Explanation:** List can include one or more of the following: PSB, PSBW, DMB, DBASE, COMM, GENERAL, FORMAT, FRE, SASPSB

- For GENERAL operand specifications, either more than one parameter was specified in the operand, or the parameter was not specified as a decimal number in the range of 5000 through 999000.
- For PSB, PSBW, DMB, DBASE, AND COMM, operand specifications, either more than one parameter was specified in the operand, or the parameter was not specified as a decimal number less than or equal to 999000.
- For FORMAT operand specifications, either more than 2 parameters were specified in the operand, or the first parameter was not specified as a decimal number in the range of 2000 through 999000, or the second parameter was not specified as a decimal number in the range 0 through 998999, or the second parameter is greater than or equal to the first parameter.
- For FRE operand specifications, either more than one parameter was specified in the operand, or the parameter was not specified as a decimal number in the range of 10 through 65535.
- For SASPSB operand specifications only one operand was specified. Two are required.
BUFFERS follows:
The possible err

SHUTDOWN

Explanation: This message is issued by IMS system definition macro BUFPOLLS as a result of processing the SASPSB parameter. In a DL/I subordinate address space system, if the CSA PSB pool size is zero, no scheduling can occur. If the DL/I PSB pool size is 0, no program which references a full-function database can be scheduled. CSAPSB= and DLIPSB= on the control region JCL can be used to override the SASPSB specifications.

CSA and/or DLI PSB Pool Size is 0.

Explanation: This message is issued by IMS system definition macro BUFPOLLS as a result of processing the SASPSB parameter. In a DL/I subordinate address space system, the size of the DL/I PSB pool should normally be much larger than the size of the CSA PSB pool. CSAPSB= and DLIPSB= on the control region JCL can be used to override the SASPSB specifications.

CSA PSB Pool Size GT or EQ to DL/I PSB Pool Size

Explanation: This message is issued by IMS system definition macro BUFPOLLS as a result of processing the SASPSB parameter. In a DL/I subordinate address space system, the size of the DL/I PSB pool should normally be much larger than the size of the CSA PSB pool. CSAPSB= and DLIPSB= on the control region JCL can be used to override the SASPSB specifications.

MORE THAN ONE MSGQUEUE STMT SPECIFIED.

Explanation: You can only specify one MSGQUEUE statement for an IMS system definition.

User response: Correct the definition.

DSETS OPERAND IS OMITTED OR INVALID.

Explanation: One of the following occurred:
- The DSETS operand was not specified.
- The specified operand contained more than two than three parameters.
- An unsupported device was specified in one or more of the parameters.

FOLLOWING OPERAND SPECIFICATIONS ARE INVALID: list

Explanation: The list of operands (list) can include one or more of the following: BUFFERS, RECLNG, or SHUTDOWN.

The possible error conditions by operand are as follows:
BUFFERS
- More than two parameters were specified.
- The first parameter was not a decimal number from 3 through 9999.
- The second parameter was not a decimal number greater than 0 and equal to the second parameter specified (or defaulted) in the RECLNG= keyword through 32764, inclusive.

RECLNG
- More than two parameters were specified.
- The first parameter was not a decimal value from 392 through 32764, inclusive.
- The second parameter was not a decimal value from 672 through 32764.
- The first parameter was greater than the second parameter.

BUFFER SIZE EXCEEDS TRACK LENGTH; TRACK=length.

Explanation: The specified or default value of the second parameter of the BUFFERS keyword value was less than the track capacity of the device that contained the smallest track length specified in the DSETS keyword operand. The buffer size cannot exceed 32K bytes, or the track length, whichever is smaller.

ERROR IN MRQPSBN OPERAND. DEFAULT ASSUMED.

Explanation: One or more of the following occurred:
- More than one operand was specified for the MRQPSBN keyword on the MSGQUEUE macro statement.
- The specified operand was not alphanumeric.
- The specified operand exceeded 8 characters.

System action: This warning message is issued, and the default name MRQPSB is assigned.

RECLNG PARAMETER 1 OR 2 IS NOT EVENLY DIVISIBLE BY THE QBLKS LRECL VALUE OF 56.

Explanation: The RECLNG parameter specifies a value that is not evenly divisible by the IMS.QBLKS data set logical record length (LRECL). This results in unused space on the OLDS data set.

System action: If the BUFFERS parameter size3 value was not specified, the size3 calculation uses the values in RECLNG parameters size1 and size2. If BUFFERS size3 was specified, RECLNG size1 and size2 are not used for calculating size3. Stage 1 will complete normally.

Programmer response: No action is required. If size3 was not specified and you want to reduce the amount of unused space on the OLDS data set, respecy RECLNG size1 and size2 so they are an even multiple of the IMS.QBLKS data set LRECL value of 56.

Severity: 0
G056 • G090

G056  THE MAXIMUM OF 999 LTERMS WAS EXCEEDED FOR MASTER, SECONDARY MASTER, OR XRF LU6 TERMINAL STATEMENTS.

Explanation: You have more than 999 NAME statements (LTERMS) defined for the master, secondary master, or XRF LU6 terminal.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the stage 1 input and rerun the stage 1.

Severity: 4

G060  POOL STMT MUST OCCUR WITHIN A SWITCHED LINEGRP.

Explanation: The preceding LINEGRP statement does not define a SWITCHED line group.

G061  LINE/POOL SPECIFICATION LIMIT EXCEEDED.

Explanation: The number of LINE statements plus the number of POOL statements exceeded 999.

G070  SUBPOOL STMT MUST FOLLOW POOL/VTAMPOOL STMT; SUBPOOL SPECIFICATION IS IGNORED.

Explanation: One of the following occurred:

- Either a POOL or a VTAMPOOL statement did not precede this SUBPOOL statement. The POOL statement is required to define one or more switched BTAM LTERM SUBPOOLS, and a VTAMPOOL statement to define one or more VTAM LTERM SUBPOOLS for parallel LUTYPE6 sessions.
- A LINE statement occurred preceding this SUBPOOL statement and following any preceding POOL statement.
- For a VTAM LTERM SUBPOOL for LUTYPE6 parallel sessions, a TYPE, TERMINAL, or NAME statement occurred preceding this SUBPOOL statement and following a preceding VTAMPOOL statement.

G072  NAME OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred:

- The operand was omitted for a VTAM LTERM SUBPOOL for LUTYPE6 parallel sessions.
- The parameter exceeded 8 alphanumeric characters.
- The parameter did not begin with an alphabetic character.
- More than one parameter was specified.
- The operand was specified for a BTAM switched LTERM SUBPOOL.

G073  MSGDEL OPERAND IS INVALID

Explanation: One of the following occurred:

- The parameter was not specified as SYSINFO, or NONIOPCB.
- More than one parameter was specified.

G074  SPECIFIED SUBPOOL NAME IS A DUPLICATE

Explanation: You have specified the SUBPOOL NAME operand previously.

G080  USER ROUTINE TABLE FULL.

Explanation: This is a warning message. More than 200 user routines were defined to be included in the generated system.

System action: All user routines which exceed the limit are not included.

G085  COMMUNICATION TERMINAL TABLE (CTT) EXCEEDED.

Explanation: More than 255 unique communication devices were defined.

G090  MORE THAN ONE COMM STATEMENT SPECIFIED.

Explanation: Only one COMM macro-instruction statement is allowed within an IMS system definition.

APPLID

- The parameter did not begin with an alphanumeric character.
- The parameter contained more than 8 alphanumeric characters.
- More than one parameter was specified.

CIPHER

- More than two parameters were specified.
- A parameter was used which did not begin with an alphabetic character or was more than 8 characters long.
- OPTIONS=NOCIPH was coded but a conflicting CIPHER operand was used.

MFSEXIT

- More than two parameters were specified.
- A parameter was specified and it was not a decimal number.
- The first parameter was not equal to or greater than 0 and less than the default or specified value of the second parameter.
- The second parameter was not equal to or greater than the default or specified value of the first parameter.

OPTIONS
More than ten parameters were specified.
No valid parameter specifications were made.
Conflicting or duplicate parameter specifications were made.

PASSWD
- The parameter did not begin with an alphanumeric character.
- The parameter contained more than 8 alphanumeric characters.
- More than one parameter was specified.

RECANY
- More than two parameters were specified.
- The first parameter was specified, but not as a decimal number greater than 0 and less than or equal to 500.
- The second parameter was specified, but not as a decimal number greater than or equal to 50 and less than or equal to 4095.

SECCNT
- More than one parameter was specified.
- The parameter was specified, but not as a decimal number greater than or equal to 0 and less than or equal to 3.

G091 COMM STATEMENT MUST BE DEFINED BEFORE ANY VTAM TERMINAL OR VTAMPOOL DEFINITIONS.

Explanation: The COMM macro must be placed before any VTAM TERMINAL or VTAMPOOL definitions in the Stage 1 input sequence.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun Stage 1.

Severity: 2

G092 THE OPTIONS PARAMETERS MSTEXIT AND NOMSTEX ARE NO LONGER USED AND WILL BE IGNORED.

Explanation: The MSTEXIT and NOMSTEX parameters can no longer be coded in the OPTIONS keyword on the COMM macro. The following OPTIONS PARAMETERS are invalid:
- MSPEXIT and NOMSPEX
  The user exit DFSCMPR0 is not valid; use the DFSMSCE0 exit.
- MSLEXIT and NOMSLEX
  The user exit DFSCMLR0 is not valid; use the DFSMSCE0 exit.

System action: The parameters are ignored.

Programmer response: No action is required; however, you should remove the invalid parameters from the OPTIONS keyword of the COMM macro.

Severity: 2

G101 POSITIONAL PARAMETER(S) INVALID.

Explanation: The positional parameters of the DATABASE statement are valid only when specified as INDEX or RESIDENT, or both.

G102 DBD OPERAND IS OMITTED OR INVALID.

Explanation: One of the following occurred:
- The DBD keyword operand was not specified.
- A DBD keyword operand parameter did not begin with an alphabetic character.
- A DBD keyword operand parameter contained more than 8 alphanumeric characters.

G103 DBD OPERAND CONTAINS DUPLICATE SPECIFICATION.

Explanation: The DBD name was previously specified on a DATABASE statement.

G messages G101-G400

This topic contains the following messages:

- The value begins with the string 'DFS' or 'DBCSDM', or it contains a reserved word.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
G104  ACCESS OPERAND SPECIFIED INCORRECTLY

Explanation: One of the following occurred:
- More than one parameter was specified.
- The specified parameter was not one of the following: R0, R0, UP, EX

G105  DATABASE STATEMENT TOTAL SPECIFICATION EXCEEDED.

Explanation: The total number of DATABASE specifications was exceeded. The total DATABASE definition cannot exceed 32,700.

System action: The Stage 1 assembly fails.

Programmer response: Limit the number of DATABASE definitions to 32,700.

Severity: 4

G106  MORE THAN 1 SECURITY STATEMENT SPECIFIED

Explanation: A SECURITY macro statement has already been processed. It is invalid to have more than one.

G111  RACF NOT SUPPORTED FOR THE OPERATING SYSTEM SPECIFIED ON IMSCTRL.

Explanation: The RACF specification (TYPE=RACFTERM or RACFAGN) is valid only for VS/2 Release 3.7 or later (z/OS).

G112  THE FOLLOWING OPERANDS ARE INVALID: list

Explanation: The list can include one or more of the following: PASSWD, RCLASS, SECCNT, SECLVL, TERMNL, TRANCMD, or TYPE.

The possible error conditions by operand are as follows:

RECLASS
- More than one parameter was specified.
- The parameter was not specified as 1 to 7 alphanumeric characters.

SECCNT
- More than one parameter was specified.
- The parameter was not specified as 0, 1, 2, or 3.

SECLVL
- An invalid parameter was specified.
- Two mutually exclusive parameters were specified.
- More than two parameters were specified.
- TRANAUTH was specified with NOSIGN or SIGNON.

TRANCMD, PASSWD, or TERMNL
- More than one parameter was specified.
- The parameter was not specified as FORCE, YES, or NO.

TYPE
- An invalid parameter was specified.
- Two mutually exclusive parameters were specified.
- More than seven parameters were specified.
- TRANEXIT was specified with NORACTRM and NOSIGNEX.
- More than one of the following parameters was specified: RAS, NORAS, RASRACF, and RASEXIT.

G113  TYPE SECLVL PARAMETER COMBINATION IS INVALID

Explanation: One of the following problems has occurred:
- TYPE=(NORACTRM,NOTRANEX, NOSIGNEX) was specified or defaulted and the SECLVL operand specified either FORCTRAN, TRANAUTH, FORCSIGN, or SIGNON.
- TYPE=(NORACTRM,NOTRANEX) was specified or defaulted, and the SECLVL operand specified either FORCTRAN or TRANAUTH.
- TYPE=(TRANEXIT) was specified with no corresponding value for SECLVL. When TRANEXIT is specified, you must specify SECLVL, with a valid combination of TRANAUTH | FORCTRAN and SIGNON | FORCSIGN.

G114  TYPE=RACFTERM NOT SPECIFIED; RCLASS IGNORED.

Explanation: This is a warning message. It is not valid to specify a RACF subsystem ID unless TYPE=RACFTERM or RACFAGN is also specified; therefore, the specification is ignored.

G115  SECURITY MACRO IS NOT SUPPORTED. SPECIFY SECURITY OPTIONS USING IMS EXECUTION PARAMETERS.

Explanation: The SECURITY macro is no longer supported. All the parameters that were in the SECURITY macro must be specified in the DFSPBxxx or DFSDBCxxx IMS PROCLIB member.

System action: The SECURITY macro is ignored and IMS stage 1 processing continues. A return code of 2 is issued for the stage 1 job.

System programmer response: Make sure that the DFSPBxxx and DFSDBCxxx IMS PROCLIB member includes the correct security definitions. If so, the message can be ignored. If not, move the SECURITY
macro definitions into the DFSPBxxx or DFSDCxxx IMS PROCLIB member so that IMS uses the correct security definitions after the next cold start.

G140 NUMBER OF NAMED MACROS DEFINED EXCEEDS MAXIMUM

Explanation: The number of NAME macros or statements specified in stage 1 exceeds the maximum, which is an internal limit. The actual maximum in any system definition is dependent upon the number of remote LTERMS that are defined.

System action: The NOGO switch is set and the stage 1 does not complete normally.

Programmer response: Correct the specification and rerun stage 1.

G141 INTERNAL ERROR DETECTED IN PCHCOMU MACRO

Explanation: An internal error has been detected in the execution of the PCHCOMU macro during a stage 1 assembly.

System action: The NOGO switch is set and the stage 1 does not complete normally.

Programmer response: Attempt to run the stage 1 assembly. If the problem continues, contact the IBM support center for assistance.

G170 ETOFEAT=(,,ALL|ONLY) IS INVALID IF NO DC IS DEFINED.

Explanation: The ETOFEAT keyword was defined with subparameter three specified as ALL or ONLY. But the stage 1 input deck did not contain any data communication system definition macro statements. Therefore, the normal stage 1 output cannot be generated.

System action: The NOGO switch is set, and the stage 1 will not complete normally.

System programmer response: Redefine the keyword, or add data communication system definition macro statements to the stage 1 input deck. Run the stage 1 input job again.

Severity: 4

G201 POSITIONAL PARAMETER(S) INVALID.

Explanation: One of the following has occurred:
- More than one positional parameter was specified.
- A positional parameter other than DOPT or RESIDENT was specified.
- DOPT and SCHTYP=PARALLEL, which are mutually exclusive, were specified.

G202 PGMTYPE OPERAND IS INVALID.

Explanation: One of the following occurred:
- More than three parameters were specified.
- TP and BATCH were both specified.
- TP, BATCH, or OVL was specified twice.
- A parameter was not specified as TP, BATCH, or OVL.
- The class number was not specified as a value from 1 to 255 inclusive.
- The class number was greater than the specified or defaulted value of the MAXCLAS operand of the IMSCTRL statement.
G203  SCHDTYP OPERAND IS INVALID.

Explanation: One of the following occurred:
• More than one parameter was specified.
• The parameter was not specified as SERIAL or PARALLEL.

G205  PSB OPERAND IS OMITTED OR INVALID.

Explanation: One of the following occurred:
• More than one parameter was specified.
• The parameter was not specified as SERIAL or PARALLEL.

G206  PSB OPERAND IS A DUPLICATE.

Explanation: The specified PSB name was previously specified on an APPLCTN macro-instruction statement.

G207  SYSID OPERAND IS INVALID.

Explanation: One of the following occurred:
• The specified SYSID keyword operand did not contain two parameters.
• The specified parameter was not a decimal value from 1 through 2036.
• The same value was specified for both SYSID parameters.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G208  FPATH OPERAND IS INVALID.

Explanation: The FPATH= keyword operand is not one of the following valid specifications: FPATH=YES, FPATH=NO, FPATH=0, FPATH=size.

System action: Generation terminates.

System programmer response: Correct the FPATH= keyword specification on the APPLCTN or TRANSACT macro and rerun Stage 1 assembly.

Problem determination: 10

Severity: 4

Related information: Chapter 2, “IMS problem determination,” on page 13

G209  OVLY IS INVALID WHEN FPATH=YES. PGMTYPE OPERAND OVLY PARAMETER IS IGNORED.

Explanation: This is a warning message. The OVLY parameter of the PGMTYPE= keyword operand is incompatible with FPATH=YES.

System action: The APPLCTN macro ignores the OVLY specification after issuing the warning message.

Programmer response: Remove the OVLY parameter specification.

G210  CLASS IS INVALID WHEN FPATH=YES

Explanation: This is a warning message. Fast Path does not use class specification for program scheduling.

Programmer response: Remove the CLASS parameter on the PGMTYPE keyword operand.

G212  SYSID IS INVALID WHEN FPATH=YES

Explanation: The SYSID= keyword operand is incompatible with FPATH=YES.

Programmer response: Remove the SYSID= or the FPATH= keyword specification.

G213  FPATH=YES IS INVALID WITH PGMTYPE=BATCH

Explanation: Non-message-driven Fast Path regions are not supported.

System action: Stage 1 does not complete successfully.

Programmer response: The non-message-driven program must be changed to run as either a message-driven program or a BMP.

G214  GPSB IS INVALID

Explanation: The GPSB= parameter has been incorrectly specified.

Programmer response: Correct the GPSB= keyword specification and rerun the Stage 1 assembly.

G215  RESIDENT AND DOPT ARE INVALID WITH GPSB

Explanation: The GPSB= parameter has been specified with either the RESIDENT parameter or the DOPT parameter. The RESIDENT and DOPT parameters are mutually exclusive with the GPSB= parameter. The RESIDENT or DOPT parameter is ignored.
**G216**

**LANG=xxxxx IS ONLY VALID WITH GPSB OR DOPT**

or

**LANG=xxxxx IS ONLY VALID WITH GPSB**

**Explanation:** You specified the LANG= parameter, but the GPSB=, or DOPT for Java™, parameter was not specified.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification of the LANG= and GPSB= or DOPT parameters.

**Severity:** 4

---

**G217**

**LANG IS INVALID**

**Explanation:** The LANG= parameter has been incorrectly specified. The value specified must be ASSEM, COBOL, JAVA, PL/I, or PASCAL.

**Programmer response:** Correct the specification of the LANG= parameter and rerun the Stage 1 assembly.

**Severity:** 4

---

**G218**

**GPSB OPERAND IS INVALID**

**Explanation:** One of the following occurred:

- The GPSB= parameter does not begin with an alphabetic character, or it contained more than eight alphanumeric characters.
- The value begins with the string 'DFS' or 'DBCDM', or it contains a reserved word.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G219**

**PSB IS INVALID WITH GPSB**

**Explanation:** You specified both the PSB= and GPSB= keywords. These keywords are mutually exclusive.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Remove the PSB= or GPSB= keyword specification and rerun the Stage 1 assembly.

**Severity:** 4

---

**G220**

**LANG=JAVA INVALID WHEN FPATH=YES**

**Explanation:** FPATH=YES cannot be specified with LANG=JAVA.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Remove the FPATH=YES keyword specification or correct the LANG= keyword specification.

**Severity:** 4

---

**G221**

**TRANSTAT operand is invalid.**

**Explanation:** One of the following problems occurred:

- You specified more than one parameter.
- The operand was not Y(es) or N(o).

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the TRANSTAT= specification and run the stage 1 assembly again.

**Severity:** 4

---

**G300**

**TRANSACTION SPECIFICATION CANNOT PRECEDE APPLCTN.**

**Explanation:** The TRANSACTION statement must be used in conjunction with a preceding APPLCTN statement.

---

**G302**

**POSITIONAL PARAMETER(S) INVALID.**

**Explanation:** You specified more than one positional parameter, or the parameter specified was not WFI.

---

**G303**

**PRIORITY VALUES FOR TRANSACTION CODES USED BY BATCH PROGRAMS MUST BE NULL; SPECIFIED PRIORITY VALUES RESET TO ZERO.**

**Explanation:** This is a warning message.

---

**G304**

**INQUIRY AND INQ OPERANDS ARE MUTUALLY EXCLUSIVE; ONLY ONE MAY BE SPECIFIED.**

**Explanation:** The INQUIRY and INQ operands cannot both be specified on any one TRANSACT statement.

---

**G305**

**CONVERSATIONAL AND WFI TRANSACTIONS MUST BE MODE=SNGL; MODE RESET TO INDICATE SNGL.**

**Explanation:** This is a warning message.

---

**G306**

**THE FOLLOWING OPERANDS ARE INVALID: list**

**Explanation:** One of the following occurred:

- The value begins with the string DFS or DBCDM, or it contains a reserved word.
- The list can include one or more of the following: EDIT, INQ/INQUIRY, MODE, MSGTYPE, PARLIM, PROCLIM, PRTY, SCHD, SEGNO, SEGSIZE, SPA, or SYSID.

Possible error conditions by operand are as follows:

- EDIT
- More than two parameters were specified.
- The first parameter was specified but was not specified as UC or ULC.
- The second parameter was specified but was not specified as a 1- to 8-character alphanumeric name that begins with an alphabetic character.

INQ/INQUIRY
- More than two parameters were specified.
- A parameter specified was not specified as UC or ULC.
- The second parameter was specified but was not specified as a 1- to 8-character alphanumeric name that begins with an alphabetic character.

MODE
- More than one parameter was specified.
- A parameter other than SNGL or MULT was specified.

MSGTYPE
- More than three parameters were specified.
- A parameter specified was not specified as MULTSEG, SNGLSEG, NONRESPONSE, RESPONSE, or not specified as a decimal number from 1 to 255, and less than the specified or default value of the IMSCTRL statement MAXCLAS keyword operand.
- An invalid combination of parameters was specified.

PARLIM
- SCHDTYP=PARALLEL was not specified for the preceding APPLCTN macro instruction statement.
- The parameter was specified but was not specified as a decimal number from 1 to 32767.

PROCLIM
- More than two parameters were specified.
- One of the parameters was specified but was not specified as a decimal number from 1 to 65535.

PTY
- More than three parameters were specified.
- The first or the second parameter, or both, was specified but was not specified as a decimal number from 1 to 14.
- The third parameter was specified but was not specified as a decimal number from 1 to 65535.

SCHD
- More than one parameter was specified.
- The specified parameter was not a decimal number from 1 to 65535.

SPA
- More than two subparameters were specified.
- The first subparameter was not a decimal number from 16 to 32767.
- The second subparameter was not the characters STRUNC or RTRUNC.

SYSID
- The operand did not contain two parameters.
- The specified parameters were not a decimal value from 1 to 2036.
- The same value was specified for both SYSID parameters.
- The parameter cannot be specified for a Fast Path exclusive transaction.

System action: Stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G307 CODE OPERAND CONTAINS DUPLICATE ENTRY. SPECIFIED TRANSACTION CODE—code.
Explanation: A specified transaction code name was previously specified as a transaction code name.

G308 TRANSACTION CODE IS DEFINED AS AN LTERM. SPECIFIED TRANSACTION CODE—code.
Explanation: The specified transaction code name was also specified as a logical terminal name.

G309 CODE OPERAND IS OMITTED OR INVALID. SPECIFIED TRANSACTION CODE—code.
Explanation: One of the following occurred:
- The CODE operand was not specified.
- The parameter contained a null subparameter.
- The parameter was not specified as a 1- to 8-character alphanumeric name.

G310 TRANSACT MACRO INVALID FOR FAST PATH NONMESSAGE DRIVEN APPL PROGRAM.
Explanation: Fast Path non-message-driven application programs are not allowed to issue file calls to retrieve or insert terminal messages. TRANSACT macros following a Fast Path non-message-driven APPLCTN macro are therefore invalid.

Programmer response: Remove all TRANSACT macros following the APPLCTN macros with FPATH=YES and PGMTYPE=BATCH specified.
G311  SPA OPERAND(S) INVALID FOR FAST PATH APPLICATION PROGRAMS.

Explanation: Fast Path does not support conversational transactions.

Programmer response: Remove the SPA= keyword operand specification on all Fast Path transactions.

G313  IMS BMP APPLICATION INCOMPATIBLE WITH FAST PATH POTENTIAL TRANSACTION.

Explanation: Fast Path does not support Fast Path potential transactions on BMP application programs.

Programmer response: Remove the FPATH= keyword operand from the TRANSACT macro or convert the BMP application to a MPP.

G314  FAST PATH TRANSACTION MUST BE MODE=SNGL. MODE RESET TO SNGL.

Explanation: This is a warning message. Fast Path only supports transactions that are specified as MODE=SNGL.

Programmer response: Specify MODE=SNGL or remove the MODE keyword operand.

G315  FAST PATH TX MUST BE MSGTYPE=(SNGLSEG,RESPONSE). MSGTYPE RESET TO (SNGLSEG,RESPONSE).

Explanation: Fast Path only supports transactions that are specified as MSGTYPE=(SNGLSEG,RESPONSE).

Programmer response: Change the MSGTYPE keyword operand to specify MSGTYPE=(SNGLSEG,RESPONSE) or eliminate the specification.

G316  THE EXPRTIME OPERAND IS INVALID; DEFAULT OF WAS ZERO ASSUMED.

Explanation: You supplied an invalid value for the transaction expiration time. One of the following events occurred:
• More than one value was entered for the keyword.
• The value was outside the range of 0-65535.
• The value was not numeric.

System action: The default value of zero is set for the transaction, this message is issued, and a return code of 2 is set.

Programmer response: No action is required.

If you want the transaction expiration time to be set, correct the problem and rerun.

Severity: 2

G317  MAXRGN OPERAND INVALID, DEFAULT ASSUMED.

Explanation: One of the following occurred:
• More than one value was specified for the MAXRGN= keyword on the TRANSACT macro.
• If the value is not zero, then PARLIM= is not specified.
• The MAXRGN= keyword is not a value from 0 through 255.

System action: The default value of zero is used.

Programmer response: No action is required.

Severity: 2

G318  SERIAL OPERAND INVALID, DEFAULT ASSUMED.

Explanation: One of the following occurred:
• More than one value was specified for the SERIAL= keyword on the TRANSACT macro.
• The PARLIM= keyword has a value specified.
• The SERIAL= keyword is not set to YES, NO, or null.

System action: The default value of NO is used.

Programmer response: No action is required.

Severity: 2

G399  SESSION BACKUP PARAMETER INVALID

Explanation: The BACKUP keyword is invalid for one of the following reasons:
• The first value in the BACKUP keyword was less than 1 or greater than 7.
• The second value in the BACKUP keyword was not YES or NO.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G400  LINEGRP SPECIFICATION LIMIT EXCEEDED.

Explanation: The number of LINEGRP statements specified exceeded 255 minus the number of ddnames on each LINEGRP statement specifying unit type SPOOL, minus the number of SPOOL LINEGRP statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
### G messages G401-G500

This topic contains the following messages:

<table>
<thead>
<tr>
<th>Message</th>
<th>Explanation</th>
<th>System action</th>
<th>Programmer response</th>
<th>Severity</th>
</tr>
</thead>
</table>
| **G401** | DDNAME OPERAND IS OMITTED OR INVALID. | One of the following occurred:  
• The operand was not specified.  
• The operand contained more than one ddname for other than a SPOOL line group.  
• A ddname specified did not begin with a letter, and contain from 1 to 8 characters. | The stage 1 will not complete successfully. | Correct the specification and rerun stage 1. | 4 |
| **G402** | ENTERED DDNAME IS A DUPLICATE—ddname. | The name specified in the ddname operand of this LINEGRP statement is a duplicate of one specified on a previous LINEGRP statement. | The stage 1 will not complete successfully. | Correct the specification and rerun stage 1. | 4 |
| **G403** | ENTERED DDNAME IS RESERVED—ddname. | A ddname reserved for use by IMS was specified. See the IMS system definition information. | The stage 1 does not complete successfully. | Correct the specification and rerun stage 1. | 4 |
| **G404** | UNITYPE OPERAND IS OMITTED OR INVALID. | One of the following has occurred:  
• The first operand does not specify an IMS supported terminal device type.  
• The second operand is specified with a device for which it is not valid, or is an invalid value. (LOCAL, NOSTACTL, and CONTENTION are the only valid values,)  
• The third operand is an invalid value. (S/S and BSC are the only valid values.) | The stage 1 does not complete successfully. | Correct the specification and rerun stage 1. | 4 |
| **G405** | FEAT AND UNITYPE OPERANDS NOT COMPATIBLE. | FEAT=SWITCHED is valid for 3275 only. FEAT=NOSWITCHED is invalid for 3275. | The stage 1 does not complete successfully. | Correct the specification and rerun stage 1. | 4 |
| **G406** | FOLLOWING OPERANDS ARE INVALID: list | The list can include one or more of the following: CODE, EDIT, FEAT, or MODE. | More than two parameters were specified.  
• A parameter was specified, and it begins with an alphabetic character.  
• A parameter was specified, and it is longer than 8 characters. | More than one parameter was specified on a terminal.  
The code keyword was specified for a terminal other than 3270 remote, or 3275.  
The first or second parameter is not a transmission code supported by IMS. | 4 |

---

**CODE**

- More than one parameter was specified on a terminal.
- The code keyword was specified for a terminal other than 3270 remote, or 3275.
- The first or second parameter is not a transmission code supported by IMS.

**EDIT**

- More than two parameters were specified.
- A parameter was specified, and it does not begin with an alphabetic character.
- A parameter was specified, and it is longer than 8 characters.

**FEAT**

- More than two parameters were specified.
- The first parameter was not specified as SWITCHED or NOSWITCHED.
- The second parameter was not specified as POLL or AUTOPOLL.
- The first parameter was specified as SWITCHED and the second parameter was not omitted.
- The first parameter was omitted, but the second parameter was specified.

**MODE**

- More than two parameters were specified.
- A parameter was not specified as A or B.
System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G408 BTAM TERMINAL SPECIFICATIONS MUST PRECEDE VTAM TERMINAL SPECIFICATIONS.

Explanation: This is a warning message. IMS system definition constructs the communication control blocks as though all VTAM terminals were defined last.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 2

G409 BTAM TERMINAL SPECIFICATIONS MUST PRECEDE MULT SYSTEM SPECIFICATIONS.

Explanation: BTAM terminal definition statements must precede the multiple system definition statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G410 MORE THAN 20 DDNAMES SPECIFIED FOR ONE LINEGRP.

Explanation: The number of ddnames for one LINEGRP macro exceeded the maximum of 20 ddnames.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G411 MACRO STATEMENT ASSOCIATED WITH AN UNSUPPORTED BTAM TERMINAL

Explanation: BTAM terminals are not supported in IMS Version 10 and later. One of the following conditions is true:

- An IMS macro statement specifies an unsupported BTAM terminal.
- An IMS macro statement is associated with an unsupported BTAM terminal.

System action: IMS ignores the IMS macro statements that are associated with unsupported BTAM terminals; system definition continues.

Programmer response: No action is required.

Severity: 2

G430 MSPLINK STATEMENT SPECIFICATION EXCEEDED.

Explanation: The number of MSPLINK statements cannot exceed 999 for a regular SYSGEN or 676 for a LGEN.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G431 PLINK NAME SPECIFICATION OMITTED OR INVALID.

Explanation: One of the following occurred:

- The required name on the MSPLINK statement was not specified.
- The name specified was not a 1- to 8- character name beginning with an alphanumeric character.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G432 PLINK NAME SPECIFIED BY PREVIOUS MSPLINK MACRO.

Explanation: The physical link name specified is a duplicate of one specified on a previous MSPLINK statement.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G433 DDNAME SPECIFICATION IS INVALID FOR TYPE=MTM|VTAM.

Explanation: A ddname must not be specified when the multiple systems link type is main storage-to-main storage or MSC/VTAM.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
**G434** DDNAME SPECIFICATION OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- The ddname required for TYPE=CTC was not specified.
- The ddname specified was not a 1- to 8-character name beginning with an alphanumeric character.
- More than one ddname was specified.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G435** ENTERED DDNAME IS RESERVED—ddname...

**Explanation:** A ddname reserved for use by IMS was specified.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G436** ENTERED DDNAME IS DUPLICATE—ddname...

**Explanation:** The name specified in the ddname operand is a duplicate of one specified on a previous LINEGRP or MSPLINK statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G437** ADDR SPECIFICATION IS INVALID FOR TYPE=MTM|VT.

**Explanation:** The ADDR operand is invalid when the multiple systems link type is main storage-to-main storage or MSC/VTAM.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G438** ADDR SPECIFICATION OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- The ADDR operand required for TYPE=CTC was not specified.
- The ADDR specified was not a single operand specified as 3 or 4 hexadecimal digits.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G439** SESSION BACKUP PARAMETER INVALID

**Explanation:** The BACKUP keyword on the MSPLINK macro did not have the value NO or a value from 1 through 7.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G440** TYPE SPECIFICATION OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- The required operand was not specified.
- The TYPE= keyword was not one of these values: VTAM, MTM, or CTC.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G441** BUFSIZE SPECIFICATION OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- The required operand was not specified.
- The BUFSIZE operand on the MSPLINK macro must be a number within the range, 1024 to 65,536 for CTC, MTM, and VTAM links.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4
G445
NAME OPERAND VALID ONLY FOR TYPE=VTAM

Explanation: The NAME operand is not valid unless the multiple systems link type is MSC/VTAM.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G446
NAME OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred:
- The NAME required when multiple systems link type is MSC/VTAM was not specified.
- The NAME specified was not a 1- to 8-character name beginning with an alphabetic character.
- The value begins with the string 'DFS' or 'DBCDM', or it contains a reserved word.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G447
ENTERED NAME IS DUPLICATE NAME-name

Explanation: The node name specified in the NAME operand (name) is a duplicate of a previously specified node name.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G448
SESSION OPERAND VALID ONLY FOR TYPE=VTAM

Explanation: You specified the SESSION operand, but it is invalid if the multiple systems link type is not MSC/VTAM.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G449
SESSION OPERAND INVALID

Explanation:
- You specified a SESSION operand that was not numeric, or was not between 1 and 999.

System action: Stage 1 does not complete successfully.

Severity: 4

G452
UNITYPE SPECIFICATION IS INVALID.

Explanation: One of the following occurred:
- The UNITYPE operand was not specified.
- More than two parameters were specified.
- The first parameter was specified but was not 3270, 3601, SLTYPE1, SLTYPE2, SLTYPEP, or LUTYPE6.
- The second parameter was specified, but was not LOCAL.
- The second parameter was specified LOCAL, but the first parameter was not 3270.

Error messages, generated by additional macro instruction statements associated with this type of specification, might be invalid. Processing of these macro instructions might be incorrect.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G453
EDIT OPERAND IS INVALID

Explanation: One of the following occurred:
- More than two parameters were specified.
- One or both of the parameters were specified, but not as a 1- to 8-character, alphanumeric name, beginning with an alphabetic character.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G454
FOLLOWING DEFAULT TERMINAL SPECIFICATIONS ARE INVALID: list

Explanation: See the TERMINAL macro error messages that are related to the listed operands.

To find the correct specification of the operands in error, see the TERMINAL macro description in the IMS system definition information.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
G455  FOLLOWING SPECIFICATIONS ARE IGNORED: list

Explanation: This is a warning message. The listed operands were ignored because the UNITYPE specified does not warrant the specification of the operands.

System action: The stage 1 does complete successfully.

Programmer response: No action is required.

Severity: 2

G456  WARNING: SIZE OPERAND FOR DISPLAY EXCEEDS 255 AND MAY BE INCONSISTENT WITH VTAM REQUIREMENTS.

Explanation: The line or column operands of the SIZE= keyword exceeds 255.

System action: The stage 1 does complete successfully.

Programmer response: No action is required.

Severity: 2

G457  FPACK/NFPACK OPERAND IGNORED

Explanation: One of the following occurred:
• FPACK/NFPACK was specified for a terminal type other than 3601 or SLUTYPEP.
• For a 3601 or SLUTYPEP terminal, FPACK/NFPACK parameters are ignored when the terminal is not eligible for Fast Path (FPBUF=0).

System action: The stage 1 does complete successfully.

Programmer response: No action is required.

Severity: 2

G458  SESSION BACKUP PARAMETER INVALID

Explanation: The BACKUP keyword is invalid for one of the following reasons:
• The first value in the BACKUP keyword was less than 1 or greater than 7.

G500  LINE SPECIFICATION CANNOT OCCUR BEFORE LINEGRP.

Explanation: The input sequence of IMS system definition statements requires that the LINEGRP statement must precede the LINE statements. Each LINE statement must be used in conjunction with a preceding LINEGRP statement.

G501  LINE SPECIFICATION LIMIT EXCEEDED.

Explanation: The number of LINE statements plus the number of POOL statements cannot exceed 999.

G502  LINE SPECIFICATION EXCEEDED FOR LINE GROUP

Explanation: The line specification was exceeded for the line group. You can specify only one LINE for the

G503  REFERENCED CONFIG STMT NOT PREVIOUSLY DEFINED.

Explanation: The CONFIG keyword operand parameter references the label of a CONFIG statement that was not defined preceding this LINE statement.

G504  REFERENCED IDLIST STMT NOT
PREVIOUSLY DEFINED.

**Explanation:** The IDS keyword operand parameter references the label of an IDLIST statement that was not defined preceding this LINE statement.

---

**G505** REFERENCED LINE HAS NO TERMINAL.

**Explanation:** The LINE statement, associated with the IDLIST statement referenced in the IDS keyword operand parameter, has no TERMINAL statement associated with it.

---

**G506** ADDR OPERAND IS OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- The operand was not specified, when required.
- The operand was specified for a 3270 local or a 2260 local line group.
- The specified value did not contain three hexadecimal digits through FFF.
- More than one parameter was specified.

---

**G507** ADDR VALUE HAS BEEN PREVIOUSLY SPECIFIED.

**Explanation:** All line addresses specified in the system definition must be unique values.

---

**G508** BUFSIZE OPERAND IS OMITTED OR INVALID.

**Explanation:** A problem was encountered with the BUFSIZE keyword. One of the following was detected:
- This keyword parameter was specified for other than a 3270 local, 7770-3, DISK, TAPE, or SPOOL line.
- This keyword parameter was not specified for a DISK, TAPE, or SPOOL line.
- More than two parameters were specified for a 7770 or more than one parameter was specified for a line with other than these devices.
- For a 3270 local line, a value other than a decimal number from 300 through 32 000 was specified.
- For a 7770 line, the first parameter was not specified as a decimal number from 1 through 240, or the second parameter was not specified as a decimal number from 1 through 250.
- For a DISK, TAPE, or SPOOL line, the parameters were not specified as decimal numbers from 16 through 32 767.

---

**G509** FOLLOWING OPERANDS ARE INVALID: list

**Explanation:** The list can include one or more of the following: CONFIG, FEAT, IDS, MODEL, RESP, or VERIFY.

The possible errors by operand are as follows:
- This keyword operand was specified for a line that is not a 3275 line.
- The parameter specified was longer than 8 characters.
- The IDLIST statement referenced was not previously defined.

---

**G520** 3275 LINEGRP STMT MUST PRECEDE CONFIG STMT.

**Explanation:** The CONFIG statement can only be specified within 3275 switched line groups.

---

**Chapter 11. G messages (system definition) 315**
G522 • G561

G522  ANTICIPATED 3275 TERMINAL SPECIFICATION WILL EXCEED MAXIMUM ALLOWABLE TERMINALS; CONFIG STATEMENT SPECIFICATION IS IGNORED.
Explanation: This is a warning message: 5000 terminals have already been defined, the CONFIG statement is ignored.

G523  REQUIRED CONFIG STATEMENT LABEL OMITTED.
Explanation: Each CONFIG statement must be labeled.

G524  FOLLOWING KEYWORD SPECIFICATIONS ARE INVALID: list
Explanation: list can include one or more of the following: FEAT, MODEL, OPTIONS, PTRSIZE.
The possible error conditions by operand are as follows:

FEAT
- More than three parameters were specified.
- No valid parameter specifications were made.
- Conflicting parameter specifications were made.

MODEL
This operand was not specified as 1 or 2.

OPTIONS
- More than two parameters were specified.
- No valid parameter specifications were made.
- Conflicting parameter specifications were made.

PTRSIZE
This operand was not specified as 120, 126, or 132.

G540  3275 LINE STMT MUST PRECEDE IDLIST STMT.
Explanation: The IDLIST statement can only be specified within 3275 switched line groups and must be preceded by a LINE statement.

G541  IDLIST STATEMENT SPECIFICATION LIMIT EXCEEDED.
Explanation: More than 1000 IDLIST statements were specified.

G542  LINE IDLIST STMT SPECIFICATION LIMIT EXCEEDED.
Explanation: Only one IDLIST statement can be specified for each line.

G543  SPECIFIED IDLIST STMT LABEL IS INVALID.
Explanation: The specified label exceeds 8 characters.

G544  NO IDLIST STATEMENT POSITIONAL PARAMETERS SPECIFIED. IDLIST STATEMENT IS IGNORED.
Explanation: Positional parameters are required, but none were found.

G545  MAXIMUM ALLOWABLE ID ENTRIES EXCEEDED.
Explanation: The combined total of positional parameters specified on all IDLIST statements cannot exceed 5000.

G546  POSITIONAL PARAMETER IS INVALID; POSITIONAL PARAMETER NUMBER number
Explanation: Either the first sublist entry in the referenced positional parameter was not 6 alphanumeric characters, or the second sublist entry exceeded 8 alphanumeric characters.

G547  REFERENCED CONFIG STATEMENT NOT FOUND. POSITIONAL PARAMETER NUMBER number
Explanation: The second sublist entry in the referenced positional parameter refers to the label of a CONFIG statement which has not been previously defined.

G560  MULT SYST SPECIFICATIONS MUST PRECEDE VTAM TERMINAL SPECIFICATIONS.
Explanation: Multiple system definition statements must precede the VTAM definition statements.

G561  MSLINK STATEMENT SPECIFICATION EXCEEDED.
Explanation: The number of MSLINK statements cannot exceed 999 for a regular SYSGEN or 676 for a LGEN.
System action: The stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G562  PARTNER ID OMITTED OR INVALID.
Explanation: One of the following occurred:
• The required operand was not specified.
• The PARTNER ID specified was not a 2-character alphabetic field.

G563  PARTNER ID PREVIOUSLY SPECIFIED.
Explanation: The PARTNER ID specified is a duplicate of one specified on a previous MSLINK statement. The PARTNER ID name must be unique.

G564  MSPLINK NAME INVALID OR NOT PREVIOUSLY DEFINED IN MSPLINK MACRO.

Or (for large system definition - LGEN)

MSPLINK NAME, name, INVALID OR NOT PREVIOUSLY DEFINED IN MSPLINK MACRO. THE ERROR IS IN MSPLINK MACRO NUMBER number.

Explanation: The first message is issued for a standard system definition and the second message is issued for a large system definition (LGEN).

One of the following occurred:
• The MSPLINK name specified did not begin with a letter and contain from 1 to 8 alphanumeric characters.
• The MSPLINK name specified was not defined by a previous MSPLINK statement.
• The value begins with the string 'DFS' or 'DBC', or it contains a reserved word.

The MSPLINK name and the defined order number of the MSLINK statement are provided for the LGEN message.

System action: Stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun Stage 1.
Severity: 4

G565  MSPLINK NAME SPECIFIED BY PREVIOUS MSPLINK MACRO.

Or (for large system definition - LGEN)

MSPLINK OF, name, HAS BEEN SPECIFIED BY A PREVIOUS MSPLINK MACRO. THE ERROR IS IN MSPLINK MACRO NUMBER number.

Explanation: This message might be issued by the MSPLINK or the MSLINK macro. One of the following occurred:
• An operand other than SYNCSESS, FORCSESS, ASR, or NOASR was specified on the OPTIONS parameter.
• ASR was specified, but TYPE=VTAM was not specified on the MSPLINK macro.
• Both ASR and NOASR or SYNCSESS and FORCSESS were specified (for example, OPTIONS=(ASR,NOASR)).

System action: Stage 1 does not complete successfully.

G566  OPTIONS PARAMETER INVALID

Explanation: This message might be issued by the MSPLINK or the MSLINK macro. One of the following occurred:
• An operand other than SYNCSESS, FORCSESS, ASR, or NOASR was specified on the OPTIONS parameter.
• ASR was specified, but TYPE=VTAM was not specified on the MSPLINK macro.
• Both ASR and NOASR or SYNCSESS and FORCSESS were specified (for example, OPTIONS=(ASR,NOASR)).

System action: Stage 1 does not complete successfully.

G567  OPTIONS OPERAND PRESENT, BUT MSPLINK IS OMITTED OR NOT MSC/VTAM.

or (for large system definition - LGEN)

OPTIONS OPERAND PRESENT, BUT MSPLINK IS OMITTED OR NOT MSC/VTAM IN MSPLINK MACRO NUMBER number.

Explanation: The first message is issued for a standard system definition and the second message is issued for a large system definition (LGEN).

The OPTIONS operand was specified on the MSLINK macro, but the MSPLINK operand was omitted, or the MSPLINK specified was not type MSC/VTAM. The defined order of the MSLINK statement is provided for the LGEN message.

System action: The indicated value (ASR, NOASR, SYNCSESS or FORCSESS) are set in the CTB.
Severity: 2

G568  MODE TABLE SPECIFICATION INVALID.

or (for large system definition - LGEN)
MODE TABLE SPECIFICATION IS INVALID FOR MSLINK NUMBER number.

Explanation: The first message is for a standard system definition and the second message is for a large system definition (LGEN).

The message might be issued by the MSLINK or MSPLINK macros or by the DCLIST internal macro. The MODETBL specification did not begin with a letter or contain 1 to 8 alphanumeric characters. This parameter is valid only if TYPE=VTAM was specified on the MSPLINK macro.

The defined order of the MSLINK statement is provided for the LGEN message.

System action: The parameter is ignored.

Severity: 2

MSLINK BACKUP PARAMETER INVALID

Explanation: The value specified for the BACKUP keyword on the MSLINK macro was less than 1 or greater than 7.

MSLINK LINKNAME INVALID

Explanation: One of the following has occurred:
- The linkname is not blank and is not a 1 to 8 character name.
- The value begins with the string DFS or DBCDM, or it contains a reserved word.

System action: Stage 1 does not complete.

Programmer response: Correct the specification and rerun the stage 1.

Severity: 4

MSPLINK, MSLINK AND MSNAME MUST HAVE AT LEAST ONE OF EACH MACRO TYPE SPECIFIED.

Explanation: When one of the MSC macros listed in the message text is coded, at least one of each of type must be coded in the system definition.

System action: Stage one does not complete successfully.

Programmer response: Code at least one each of the MSPLINK, MSLINK, and MSNAME macros in the system definition.

Severity: 4

MSNAME STATEMENT SPECIFICATION EXCEEDED.

Explanation: The number of MSNAME statements cannot exceed 255.

MSNAME LINKNAME OMITTED OR INVALID.

Explanation: One of the following occurred:
- The required operand was not specified.
- The link name specified on the MSNAME statement did not begin with a letter and contain from 1 to 8 alphanumeric characters.

 SYSID SPECIFICATION OMITTED OR INVALID.

Explanation: One of the following occurred:
- The required operand was not specified.
- The operand was not specified as two numeric parameters, both being between the range of 1 and 255.
- The value of the first parameter is identical to the second.

SYSID SPECIFIED PREVIOUSLY AS A REMOTE OR LOCAL SYSID.

Explanation: A parameter specified for the SYSID is a duplicate of one specified as a remote or local SYSID on a previous MSNAME statement.

MSLINK STATEMENT MUST PRECEDE MSNAME STATEMENT.

Explanation: The input sequence of IMS system definition statements requires that the MSLINK statement precede the MSNAME statements. Each MSNAME statement must be used in conjunction with the preceding MSLINK statement.

MSNAME IS A DUPLICATE LINKNAME.

Explanation: The link name was also specified as the link name in an earlier MSNAME statement.

MSNAME IS DEFINED AS AN LTERM.

Explanation: The specified link name was also specified as a logical terminal name.

MSNAME IS DEFINED AS A TRANSACT CODE.

Explanation: The specified link name was also specified as a transaction code.

CTLUNIT SPECIFICATION CANNOT OCCUR BEFORE LINE. CTLUNIT STATEMENT IGNORED.

Explanation: The input sequence of IMS system definition statements requires that the LINE statement must precede the CTLUNIT statement. The CTLUNIT
statement must be used in conjunction with a preceding LINE statement. System definition has ignored the CTLUNIT statement. The statement has not been added into the maximum count for CTLUNIT statements.

G messages G601-G800

This topic contains the following messages:

**G601**  CTLUNIT SPECIFICATION LIMIT EXCEEDED.

Explanation: More than 1000 CTLUNIT statements have been specified.

**G602**  CTLUNIT STMT IS INVALID FOR THIS LINEGRP.

Explanation: The CTLUNIT statement is valid for the 2260, 2980, and 3270 remote line groups only.

**G603**  ADDR OPERAND IS OMITTED OR INVALID.

Explanation: One of the following occurred:
- The operand was omitted.
- The operand was not a valid, 2-digit hexadecimal address.
- More than one parameter was specified.
- The operand was specified for a 2260 local line group.
- The operand was not the hexadecimal representation of an alphabetic character A through Z for a 2972 control unit.

**G604**  WLA OPERAND IS INVALID.

Explanation: One of the following occurred:
- The operand was specified for a 2980 or 3270 remote BTAM line group.
- The operand was specified for a 2260 local line group and the second parameter was not omitted.
- More than two parameters were specified.
- The first parameter was specified but was not YES or NO.
- The second parameter was specified but was not 1053.

**G605**  MODEL OPERAND IS INVALID.

Explanation: One of the following occurred. The MODEL operand was specified:
- For a 2980 line group.
- As other than 1 or 2 for a 3270 remote BTAM line group.
- As other than 1, 2, or 3 for a 2260 line group.
- With more than one parameter.

**G606**  BUFSIZE OPERAND IS INVALID.

Explanation: One of the following has occurred:
- More than one operand was specified.
- The operand was specified for a line group which was not a 2980 line group.
- The value specified was not 48 or 96.
- This operand was specified as 96, but FEAT=BUFEXP was not specified on the preceding LINE macro.

**G650**  STATION SPECIFICATION CANNOT PRECEDE LINE.

Explanation: The input sequence of IMS system definition statements requires that the LINE statement must precede the STATION statement. The STATION statement must be used in conjunction with a preceding LINE statement.

**G651**  STATION STMT IS INVALID FOR THIS LINEGRP.

Explanation: The STATION statement is valid for System/3 and System/7 line groups only.

**G653**  ADDR OPERAND IS OMITTED OR INVALID.

Explanation: One of the following occurred:
- The operand was omitted for a noncontention station.
- The operand was not specified as 2 valid hexadecimal digits.
- More than one parameter was specified.

**G654**  ALIGN OPERAND IS INVALID.

Explanation: The operand was specified as other than 0, 2, 4, or 8, or with more than one parameter.

**G655**  TRANSLM OPERAND IS INVALID.

Explanation: The operand was specified as other than a decimal number from 0 to 15, or with more than one parameter.

**G656**  TYPE OPERAND IS INVALID.

Explanation: One of the following occurred:
- The first operand was not specified as ASK or NOASK.
- The second operand was not specified as POSTPONE or NOPOSTPONE.
- More than two operands were specified.

**G657**  FEAT OPERAND IS INVALID.
**G659 • G707**

**Explanation:** One of the following occurred. The FEAT operand was specified:
- As other than PTTC/EBCD, PSEUDOBIN, or MIXED.
- With more than one parameter.

**G659**  
**CONTRATION LINES MAY NOT BE MULTI-STATION.**

**Explanation:** This is the second or subsequent STATION statement encountered for this System/3 or System/7 contention line. Only one STATION statement can be specified for a contention line.

**G700**  
**TERMINAL SPECIFICATION CANNOT PRECEDE LINE.**

**Explanation:** The input sequence of IMS system definition statements requires that the LINE statement precede the TERMINAL statement. The TERMINAL statement must be used in conjunction with a preceding TYPE or LINE statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G701**  
**3275 TERMINAL DEFINITION MUST PRECEDE CTLUNIT.**

**Explanation:** Within a 3270 remote BTAM line group, a CTLUNIT statement for this line cannot precede any 3275 TERMINAL statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G702**  
**TERMINAL SPECIFICATION CANNOT PRECEDE CTLUNIT.**

**Explanation:** Within a 3270 remote BTAM line group, a CTLUNIT statement for each line must be specified preceding any 3270 remote BTAM TERMINAL statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G703**  
**TERMINAL SPECIFICATION CANNOT PRECEDE STATION.**

**Explanation:** System/3 and System/7 TERMINAL statements must be used in conjunction with a preceding STATION statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G705**  
**ADDR OPERAND IS OMITTED OR INVALID.**

**Explanation:** A problem was encountered with the ADDR operand. The problem can be one of the following:
- You specified the ADDR operand for a VTAM terminal.
- You omitted the ADDR operand for a terminal that requires it be specified.
- The operand was specified incorrectly for the terminal being defined.
- More than one parameter was specified.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G706**  
**NAME OPERAND IS OMITTED OR INVALID.**

**Explanation:** One of the following occurred. The operand:
- Was specified for a non-VTAM terminal.
- Was not specified for a VTAM terminal.
- Exceeded 8 alphanumeric characters.
- Did not begin with an alphabetic character.
- Contained more than one parameter.
- The value begins with the string DFS or DBCDM, or it contains a reserved word.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G707**  
**SPECIFIED VTAM NODE NAME IS A DUPLICATE.**

**Explanation:** The VTAM node name specified was previously specified as a VTAM node name on a TERMINAL or MSPLINK macro.
**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G708**

**Explanation:** This is a warning message. You specified EDIT=YES on this TERMINAL statement to request an output edit routine for this terminal, but the respective edit routine name was not specified using the TYPE or LINEGRP statement associated with this TERMINAL statement.

**System action:** The OUTPUT EDIT specification is ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G709**

**Explanation:** This is a warning message. You specified EDIT=YES in this TERMINAL statement to request an input edit routine for this terminal, but the respective edit routine name was not specified using the TYPE or LINEGRP statement associated with this TERMINAL statement.

**System action:** The INPUT EDIT specification is ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G710**

**Explanation:** This operand is required for READER terminals.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G711**

**Explanation:** The NAME statement referenced does not precede this TERMINAL statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G712**

**Explanation:** This is a warning message. An attempt was made to select other than the first logical terminal name defined under the referenced TERMINAL statement.

**System action:** The LTERM value is changed.

**Programmer response:** No action is required.

**Severity:** 2

---

**G713**

**Explanation:** Due to the specifications on the LINE statement (VERIFY=YES) for this 3275 switched terminal, an IDLIST statement must be specified prior to this TERMINAL statement.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G715**

**Explanation:** The specified 3270 BTAM ADDR keyword operand value was equal to a previously specified non-3270 BTAM line address or to a previously specified 3270 BTAM terminal ADDR keyword operand value.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G716**

**Explanation:** One of the following occurred:

- More than one 2741 or LOCAL READER/SYSOUT terminal was specified for a line.
- FEAT=NONSUCHTED and UNITYPE=(2740,NOSTACTL) were specified on the LINEGRP statement. However, more than one TERMINAL statement was provided for the line. Only one 2740, non-station control terminal per line is allowable.
A local 3270 line was specified with 3284/3286 printers on the same line with 3277 terminals.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**SESSION BACKUP PARAMETER INVALID**

**Explanation:** One of the following BACKUP keyword restrictions on the TERMINAL macro was violated:

• The first BACKUP value must be set to NO or to a value from 1 through 7.
• If two BACKUP values were specified, the second BACKUP value must be set to YES or NO.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**SWITCHED TERMINALS CANNOT BE MULTI-DROPPED.**

**Explanation:** This TERMINAL statement defines a second or subsequent terminal on a switched line.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**LUTYPE6 LINK ALREADY DEFINED FOR XRF**

**Explanation:** An Intersystem Communication (ISC) link for communication between the active system and the alternate system was already defined by a previous NAME keyword that contained two operands (node names).

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**THE FOLLOWING OPERANDS ARE INVALID: list**

**Explanation:** The list can include one or more of the following: BUFSIZE, COMPT(N), EDIT, ERROPT, FEAT, FPBUF, HEADCTL, LTERM, MDISEG, MODEL, MODETBL, MSGDEL, OPTIONS, OUTBUF, PAGDEL, PTRSIZE, PTSEG, REPLACE, SEGSIZE, SESSION, SIZE, TYPE, UNIT, or VERCHK.

One of the following errors, listed by operand, was detected:

**BUFSIZE**

• This keyword operand was specified for other than a 3270 terminals with a 3284/3286, and 3275 terminals with a PTR1 component.
• It is invalid for 3270 and 3275 terminals if the PTRSIZE keyword operand was specified.
• More than one parameter was specified, or the specified parameter was not 120, 126, or 132 for a 3270/3275.

**COMPT(N)**

• This keyword operand was specified for other than 3270 remote, 3601, SLUTYPE1, SLUTYPEP, and LUTYPE6 terminal types.
• The parameters specified were not unique.
• FEAT=INPUT was specified, but the COMPT= keyword operand was not specified.
• Only certain combinations of parameters and terminal types are valid.

See the TERMINAL macro description in the IMS system definition information for a description of valid combinations.

**EDIT**

• More than two parameters were specified.
• One of the specified parameters was not YES or NO.

**ERROPT**

• The operand was specified for other than a terminal containing a magnetic data inscriber (MDI) component.
• The operand was not IGNORE, ACCEPT, or REJECT.

**FEAT**

• The operand was specified for a terminal type that does not allow such specification.
• The operand was specified incorrectly for the terminal type.

**FPBUF**

• More than one parameter was specified.
• A nonzero operand was specified for a terminal type that does not allow such specification.
• The specified operand was not zero or a decimal number within the range 12-32767 (32757 if output edit is specified for this terminal).
• A nonzero operand was specified for a terminal that also specified, or defaulted to, one of the following options: NORESP, BID, NPGDEL, or (PAGDEL=NO).
• The value specified must not be greater than the logical record length of the long
message queue data set specified in the RECLING= parameter of the MSGQUEUE macro.

**HEADCTL**
- The operand was not specified as a decimal number from 0 through 28 and a multiple of 4.
- More than one parameter was specified.

**LTERM**
- More than one parameter was specified.
- The operand was specified for a switched terminal.
- The LTERM specified is associated with the master terminal or secondary master terminal.
- A VTAM terminal cannot specify the LTERM operand. Shared LTERM is not supported for VTAM.

**MDISEG**
- The operand was specified for other than a terminal containing a magnetic data inscriber (MDI) component.
- The operand was not a decimal number less than 10,000.

**MODEL**
- The operand was specified for other than a 3270 terminal.
- More than one parameter was specified.
- The parameter was specified, but was not 1 or 2.

**MODETBL**
- More than one parameter was specified.
- The parameter did not begin with an alphabetic character.
- More than 255 unique mode table entry names were specified.

**MSGDEL**
- The specified logical terminal has been defined as the IMS master terminal.
- The operand was not specified NONE, SYSINFO, or NONIOPCB.
- More than one parameter was specified.

**OPTIONS**
- More options than allowed were specified for the defined terminal type.
- One or more of the specified parameters were invalid.

**OUTBUF**
- The operand was specified for a terminal type that does not allow specification.
- More than one parameter was specified.
- The parameter was specified, but was not a decimal number within the range of acceptable values for that terminal type.

**PAGDEL**
- The operand was not specified YES or NO.
- More than one parameter was specified.

**PTRSIZE**
- This keyword operand was specified for other than 3270 terminals with a 3284/3286 and with 3275 terminals with a PTR1 component.
- More than one parameter was specified, or the specified parameter was not 120, 126, or 132.

**PTSEG**
- The operand was specified for other than a terminal containing a paper tape (PT) or a paper tape reader (PTRDR) component.
- The operand was not a decimal number less than 10,000.

**REPLACE**
- The operand was specified for other than a terminal containing a magnetic data inscriber (MDI) component.
- The operand was not 2 hexadecimal digits.

**SEGSIZE**
- More than one parameter was specified.
- The operand was specified for a terminal type that does not allow such specification.
- The specified parameter was not a decimal number within the range of acceptable values for that terminal type.

**SESSION**
- The operand was specified for a terminal type other than LUTYPE6.
- The specified parameter was not a decimal number in the range 1-255.

**SIZE**
- There are not exactly two parameters.
- The first value is not a number in the range 1-16384.
- The second value is not a number in the range 2-16384.
- The product of the two values is not a number in the range 80-16384.
- The operand was specified for a terminal type other than 3270 or SLUTYPE2.
- The operand was specified for a terminal that also specified UNIT=3284 or 3286.

**TYPE**
- The parameter was not in the format '3270-Ann' where 'nn' is a 1-digit number from 1 to 9, inclusive, or a 2-digit number from 01 to 15, inclusive.
- The operand was specified for a terminal type other than 3270 or SLUTYPE2.
- The operand was specified for a terminal that also specified UNIT=3284 or 3286.

**UNIT**
- The operand was specified for a terminal within a line group that does not allow specification.
- The operand was specified incorrectly.

For a 3270 local line group, the UNIT keyword operand specification is in direct conflict with the LINE macro BUFSIZE keyword operand specifications.
For a description of valid operands, see the description of the TERMINAL macro in the IMS system definition information.

**VERCHK**
- The operand was specified for other than a 2770 terminal containing a magnetic data inscriber (MDI) component.
- The operand was not NOCHK or VOKCHK.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G722**

**THE FOLLOWING OPERANDS ARE IGNORED:** list

**Explanation:** This is a warning message. list can include one or more of the following: MSGDEL, MODETBL, NORELRQ, OPTIONS, PAGDEL, or RELRQ.

One of the following errors, listed by operand, was detected:

**MSGDEL**
For VTAM terminals, specification of NONE is ignored, and the SYSINFO default is used.

**MODETBL**
The operand was specified for a terminal type that does not allow such specification.

**NORELRQ**
- For non-VTAM terminals, NORELRQ is ignored and RELRQ is used.
- For valid terminals, if NORELRQ and RELRQ are both specified, NORELRQ is ignored and RELRQ is used.

**OPTIONS**
- For 2770 and 3601 terminals without correct COMPT operand specification, NPGDEL and PAGDEL are ignored.
- For 3600 and SLUTEYPEP terminals, FPACK or NFPACK are ignored if FPFBUF=0.
- For 3270 and SLUTEYPE2 terminals, TRSOSI or NOTRSOSI is ignored.

**PAGDEL**
For 2770 and 3601 terminals without correct components, PAGDEL was ignored.

**RELQ**
- For VTAM 3270 local terminals and VTAM 3275/3277 remote terminals, RELQ is not a valid option and is ignored.
- For SLUTEYPE2 terminals, RELQ is not a valid option and is ignored.
- For NTO terminals, RELQ is not a valid option and is ignored.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G723**

**COMBINATION OF FORCED RESPONSE AND NO AUTOMATIC PAGE DELETION IS NOT RECOMMENDED, AND MAY CAUSE OTHER THAN DESIRED RESULTS DURING EXECUTION.**

**Explanation:** This is a warning message. The combination of OPTIONS=FORCRESP and OPTIONS=NPGDEL or PAGDEL=NO could cause a terminal to become locked during execution.

**System action:** No action is taken.

**Programmer response:** No action is required.

**Severity:** 2

**G724**

**WARNING: SIZE OPERAND FOR DISPLAY EXCEEDS 255 AND MAY BE INCONSISTENT WITH VTAM REQUIREMENTS**

**Explanation:** This is a warning message. One of the SIZE parameters specified a number larger than 255 lines or columns for a SLUTEYPE2 terminal. This might cause a conflict with VTAM BIND parameters.

**System action:** No action is taken.

**Programmer response:** No action is required.

**Severity:** 2

**G725**

**TYPE/SIZE PARAMETER COMBINATION IS INVALID**

**Explanation:** One of the following occurred:
- No valid screen size has been declared for this symbolic name.
- No symbolic name is specified for this screen size.
- The screen size declared for the specified symbolic name is not the same as that previously declared for the same symbolic name.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

**G728**

**SECOND NODE NAME FOR MASTER ALREADY DEFINED OR INVALID**

**Explanation:** The second operand (node name) for the master terminal was invalid or was already defined in a NAME keyword on a previous TERMINAL macro.

**System action:** The stage 1 does not complete successfully.
**G729**  
**NAMES DO NOT MATCH APPLID NAMES IN COMM MACRO**

**Explanation:** To define an Intersystem Communication (ISC) link for communication between the active system and the alternate system, both operands (node names) in the NAME keyword on the TERMINAL macro must match the operands in the APPLID keyword on the COMM macro.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G730**  
**ASR OPTION IS NOT VALID FOR THIS DEVICE TYPE**

**Explanation:** This is a warning message and might be issued by the TYPE or the TERMINAL macro. ASR was specified on the OPTIONS parameter, but the ASR specification is valid for SNA VTAM devices only.

**System action:** The ASR specification is ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G731**  
**NUMBER OF VTAM TERMINALS DEFINED EXCEEDS MAXIMUM**

**Explanation:** The number of VTAM terminals defined exceeded the maximum. Reduce the number of terminals you defined.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G732**  
**DPM-xxx NOT VALID FOR LU6 XRF LINK, DEFAULT ASSUMED.**

**Explanation:** The TERMINAL macro issues this message because the DPM=xxx subparameter is not allowed for the XRF/ISC link.

**System action:** The default value of VLVB is used.

**Programmer response:** No action is required.

**Severity:** 2
### G802  COMPT OPERAND IS INVALID.

**Explanation:** One of the following occurred:
- The operand was specified for a terminal type that does not allow such specification.
- The operand was specified incorrectly for the terminal type defined. See the IMS system definition information for a description of valid specifications for each terminal.

### G803  OUTPUT TERMINAL NOT DEFINED OR INVALID

**Explanation:** One of the following occurred:
- The OUTPUT keyword operand specified was not specified as the label field of a TERMINAL statement preceding the previous TERMINAL statement.
- A VTAM LTERM cannot be defined as a split LTERM. For VTAM, the input and output terminal must be the same physical terminal.

### G804  EDIT OPERAND IS INVALID.

**Explanation:** One of the following occurred:
- The operand contained more than 2 parameters.
- The first parameter was specified, but was not YES or NO.
- The second parameter was specified, but was not UC or ULC.

### G805  LTERM PARAMETER number IS OMITTED OR INVALID.

**Explanation:** One of the following occurred:
- No positional parameters were specified.
- A positional parameter was specified with more than 2 subparameters.
- A first subparameter was specified, which is not a 1- to 8-character name.
- A second subparameter was specified which is not MASTER or SECONDARY.

### G806  SPECIFIED LTERM IS A DUPLICATE—name.

**Explanation:** The logical terminal name (name in the message text) was previously specified.

### G807  SPECIFIED LTERM PREVIOUSLY DEFINED AS A TRANSACTION CODE—name.

**Explanation:** The names of transaction codes and logical terminal collectively must be unique. You have the name name defined more than once.

### G808  MULTIPLE MASTER SPECIFICATIONS ARE INVALID.

**Explanation:** A NAME statement LTERM positional parameter specified as a sublist and containing a specified second parameter of MASTER was previously specified.

### G809  MULTIPLE SECONDARY SPECIFICATIONS ARE INVALID.

**Explanation:** A NAME statement LTERM positional parameter, with the subparameter SECONDARY, was previously specified.

### G810  OUTPUT OPERAND IS INVALID FOR MASTER OR SECONDARY MASTER TERMINAL.

**Explanation:** The OUTPUT operand was specified when defining the MASTER or SECONDARY MASTER terminal with the LTERM positional parameter.

### G811  ICOMPT/COMPT OPERAND SPECIFICATION IS INVALID FOR MASTER SPECIFICATION.

**Explanation:** The COMPT and ICOMPT operands do not refer to a console component of a terminal in defining the MASTER terminal.

### G812  MASTER OR SECONDARY MASTER TERMINAL CANNOT BE ON A SWITCHED LINE.

**Explanation:** This NAME statement defined a MASTER or SECONDARY MASTER terminal. However, the LINEGRP statement specified FEAT=SWITCHED. This is an invalid combination. The IMS master or secondary master terminal cannot be on a switched line.

### G813  MASTER TERMINAL MUST BE A 1050, 2740, 3275, 3277, SLU Type 2, or 3767/3770/SLU Type 1 Console.

**Explanation:** Only a 1050, 2740, 3275, 3277, a terminal defined as SLU, Type 2, a 3767, or the console component of a 3770 or a terminal defined as SLU, Type 1 is acceptable as the MASTER terminal. The 2740 terminal must contain the station control feature.

### G814  SECONDARY MASTER TERMINAL MUST BE A 1050, 2740, 3284, 3286, 3767, 3770, SLU Type 1, SPOOL, OR PRINTER.

**Explanation:** Only a 1050, 2740, 328x, 3767, the
console component of a 3770, or the console or 3784 component of a terminal defined as SLU, Type 1, or a terminal on a line group defined as SPOOL or PRINTER is acceptable as the SECONDARY MASTER terminal.

System action: The Stage 1 assembly fails.

Programmer response: Specify the secondary master as one of the acceptable terminal types.

Severity: 4

G815 PRIMARY MASTER–SECONDARY MASTER COMBINATION SPECIFICATION INVALID.

Explanation: You specified a 1050 terminal type. However, the master and secondary master terminals are not associated with the same physical terminal.

G816 NAME STMT INVALID FOR PRECEDING TERMINAL STMT.

Explanation: One of the following occurred:
• NAME statements cannot follow TERMINAL statements containing LTERM keyword operand specifications or TERMINAL statements in switched line groups.
• The NAME macro statement followed a TERMINAL statement containing a SESSION keyword operand specifying a value greater than one. If parallel sessions are defined, the associated logical terminal names must be specified within a SUBPOOL.
• Multiple LTERM names are invalid when defining the XRF fixed LUTYPE6 surveillance link.

System action: The Stage 1 assembly fails.

Programmer response: Remove the NAME macro statements that caused the error.

Severity: 4

G817 ICOMPT OPERAND IS INVALID.

Explanation: One of the following occurred:
• The operand was specified for a terminal type that does not allow such specification.
• The operand was specified incorrectly for the terminal type defined.
• The operand referred to an output-only component of the terminal.

G818 MSGDEL=NONIOPCB INVALID FOR MASTER OR SECONDARY MASTER TERMINAL.

Explanation: You cannot specify MASTER or SECONDARY if:
• MSGDEL=NONIOPCB was specified on the preceding TERMINAL statement.

• MSGDEL=NONIOPCB was implied from the preceding TYPE statement.
• UNITYPE=3790 was specified for this terminal.

G819 ICOMPT OPERAND SPECIFICATION IS INVALID FOR SECONDARY SPECIFICATION.

Explanation: The ICOMPT operand does not refer to the first component of a terminal to define the SECONDARY MASTER terminal.

G820 SPECIFIED LTERM PREVIOUSLY DEFINED AS AN MS LINKNAME—name.

Explanation: The specified logical terminal name was used previously to define a multiple systems link name.

G821 RESERVED NAME WAS USED FOR LTERM.

Explanation: The value begins with the string DFS or DBCDM or contains a reserved word.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

IMSGEN

G822 THE NUMBER OF LTERMS DEFINED EXCEEDS THE MAXIMUM

Explanation: The number of LTERMS defined in a stage 1 system definition:
• Exceeds the number that can be contained in one DFSCLCxxy module for a standard system definition, or
• Exceeds the number that can be contained in 16 DFSCLCxxy modules for a Large System Generation (LGEN) where x is the module number and y is the system definition suffix.

System action: Stage 1 does not complete successfully.

Programmer response: If the failure is in a standard system definition, then use LGEN. If the failure is in LGEN, then the ETO feature will need to be used.

Severity: 4
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G899   ONLY 2 SUBPARAMETERS ARE ALLOWED FOR ONEJOB= KEYWORD

Explanation: The ONEJOB= keyword must not have more than 2 subparameters and must have the value of YES or NO.
System action: The Stage 1 assembly does not complete successfully.
Programmer response: Probable syntax error. Correct the ONEJOB= parameter on the IMSGEN macro, and rerun the Stage 1 assembly.
Severity: 4

G900   ONEJOB KEYWORD PARAMETER 1 OR 2 IS INVALID

Explanation: The ONEJOB= subparameters must have the value of YES or NO specified in parentheses.
System action: The Stage 1 assembly does not complete successfully.
Programmer response: Probable syntax error. Correct the ONEJOB= parameter on the IMSGEN macro and rerun the Stage 1 assembly.
Severity: 4

G messages G901-G1000

This topic contains the following messages:

G901   JOBCTL= AND/OR SCL= PARM 1 WILL BE IGNORED WITH ONEJOB= PARM SPECIFIED

Explanation: The JOBCTL= and the SCL= subparameter 1 are mutually exclusive with ONEJOB=. When the ONEJOB=YES keyword is specified, it will cause the SCL= and the JOBCTL= subparameter 1 to be ignored.
System action: Stage 1 does complete normally.
Programmer response: No action is required.
Severity: 2

G902   TERM OPERAND IS INVALID; DEFAULT OF 'NO' ASSUMED.

Explanation: The parameter you specify for the TERM operand must be YES, NO, or a null value.
System action: The default value of NO is used.
Programmer response: No action is required.
Severity: 2

G903   MSGQUEUE STATEMENT NOT SPECIFIED.

Explanation: The MSGQUEUE statement is required for a DB/DC environment.
System action: The stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G904   SPECIFIED SIZE FOR GENERAL POOL IS TOO SMALL. SIZE IS ADJUSTED TO MINIMUM VALUE.

Explanation: This is a warning message. The pool size specified in the GENERAL operand on the BUFPOOLS statement must be large enough to accommodate all main storage scratchpad areas plus 10% of one disk scratchpad area.
System action: The system uses the minimum value.
Programmer response: No action is required.
Severity: 2

G905   NO APPLCTN SPECIFICATIONS.

Explanation: You did not specify an APPLCTN statement within this IMS system definition.
System action: The stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G906   NO TRANSACTIONS SPECIFIED FOR THIS APPLCTN.

Explanation: This is a warning message. One of the following occurred:
• An APPLCTN statement was found with no TRANSACT statements following it.
• No TRANSACT statements were supplied in the input to the IMS system definition.
System action: The stage 1 completes successfully.
Programmer response: No action is required.
Severity: 2
**G908** NO DATA BASE SPECIFICATIONS.

**Explanation:** This is a warning message. No DATABASE statements were provided in the input to the IMS system definition.

**System action:** The stage 1 completes successfully.

**Programmer response:** No action is required.

**Severity:** 2

---

**G909** NO COMMUNICATION SPECIFICATIONS.

**Explanation:** You did not define either VTAM terminals or multiple system communication links within this IMS system definition.

**System action:** The stage 1 processing does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G910** NO LINES SPECIFIED FOR THIS LINEGRP.

**Explanation:** No LINE statements were specified within this LINEGRP definition.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G911** NO TERMINALS SPECIFIED FOR THIS LINE.

**Explanation:** No TERMINAL statements were provided for the LINE being defined. This error message might be generated erroneously, if a previous error message describing a communication configuration error is received.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G912** NO CTLUNITS SPECIFIED FOR THIS LINE.

**Explanation:** No CTLUNIT statements were provided for the line being defined. This error message might be generated erroneously, if a previous error message describing a communication configuration error was received.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G913** NO TERMINALS SPECIFIED FOR THIS CTLUNIT.

**Explanation:** No TERMINAL statements were provided for the CTLUNIT being defined.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G914** NO NAMES SPECIFIED FOR THIS TERMINAL.

**Explanation:** No NAME statements were provided for the TERMINAL being defined, therefore, no logical terminal name was specified for this physical terminal.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G916** THE FESEXIT KEYWORD COMM MACRO IS MISSING OR INVALID

**Explanation:** FESEXIT=YES is expected, but FESEXIT=NO has been coded in the COMM macro.

**System action:** Stage 1 completes with return code 4.

**Programmer response:** To activate Front End Switch, specify both OPTION=FES in the TERMINAL macro and FESEXIT=YES in the COMM macro. To deactivate FES, either eliminate OPTION= and FESEXIT= statements completely or specify OPTION=NOFES and FESEXIT=NO. OPTION=NOFES and FESEXIT=NO are the defaults.

**Severity:** 2

---

**G917** NO MASTER TERMINAL SPECIFICATION.

**Explanation:** None of the NAME statements defined the MASTER specification in a logical terminal parameter. You must define an IMS master terminal for this system.

**System action:** The stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G918 PROCLIB OPERAND IS INVALID; DEFAULTS ASSUMED.
Explanation: This is a warning message. One of the following occurred:
• The operand contained more than two parameters.
• The first parameter was specified but was not YES or NO.
• The second parameter was specified but was not a decimal number.
System action: The default value of PROCLIB=(YES,7) is used.
Programmer response: No action is required.
Severity: 2

G919 MACLIB OPERAND IS OBSOLETE.
Explanation: System definition no longer creates a copy job step for the macros. SMP/E places the macros into the databases with the low order names of ADFSMAC and SDFS MAC.
System action: System definition continues.
Programmer response: No action is required. Remove the MACLIB operand from the IMSGEN macro call to eliminate this message the next time system definition runs.
Severity: 2

G920 PAGE OPERAND IS INVALID; DEFAULT ASSUMED.
Explanation: This is a warning message. You must specify the PAGE operand as YES or NO.
System action: The default value of PAGE=NO is used.
Programmer response: No action is required.
Severity: 2

G921 PAGE SPECIFICATION WILL BE INEFFECTIVE.
Explanation: This is a warning message.
System action: The stage 1 does complete successfully.
Programmer response: See the IMSGEN macro PAGE keyword specification in the IMS system definition information.
Severity: 2

G922 SUFFIX OPERAND IS INVALID; DEFAULT ASSUMED.
Explanation: This is a warning message. The SUFFIX keyword operand was not specified as 1 alphanumeric character.
System action: The default value of 0 is used.
Programmer response: Change the SUFFIX operand if 0 is not the suffix to be used.
Severity: 2

G923 THE FOLLOWING OPERANDS ARE INVALID: list
Explanation: The list can include one or more of the following: OBJDSET, USERLIB, SYMSC, MODGEN, UMAC1, UMAC2 or UMAC3.
The specified operand contains more than 44 alphanumeric characters or does not begin with a letter.
System action: The stage 1 does not complete successfully.
Programmer response: Correct the specification and rerun stage 1.
Severity: 4

G925 ASMPRT OPERAND IS INVALID; DEFAULT ASSUMED.
Explanation: This is a warning message. You must specify the ASMPRT operand as ON or OFF.
System action: The default value OFF is used.
Programmer response: No action is required.
Severity: 2

G926 {JCL AND/OR SCL | JOBCTL AND/OR PRTY} KEYWORD SPECIFICATIONS INVALID. {JCL AND/OR SCL | JOBCTL AND/OR PRTY} DEFAULTS ASSUMED.
Explanation: This is a warning message that indicates that the following specifications are invalid:
• The JCL, the SCL, or both
• The JOBCTL keyword, the PRTY keyword, or both
System action: Default values are assumed.
Programmer response: No action is required.
Severity: 2

G928 NO TERMINALS SPECIFIED FOR THIS STATION.
Explanation: No TERMINAL statements were provided for the STATION being defined.
System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G929 THE FOLLOWING REMOTE 3270 TERMINAL CONFIGURATION IS INVALID IN RESPECT TO THE COPY FEATURE SPECIFIED FOR TERMINAL ADDRESS.

Explanation: Within this remote 3270 line group, the TERMINAL statement for the indicated 3277 terminal specified the desire for the COPY feature, and either no candidate printer was found, or the model numbers of the 3277 terminal and one of the candidate printers are not compatible.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G930 ASM OPERAND IS INVALID; DEFAULT OF 'HLASM,SYSLIN' ASSUMED.

Explanation: One of the following occurred:
• The first subparameter was not High Level Assembler. This is the only valid value for the first subparameter.
• More than two subparameters were specified.
• The second subparameter did not begin with an alphanumeric character.
• The second subparameter was longer than eight characters.

System action: The default values of 'HLASM,SYSLIN' are used.

Programmer response: No action is required.

Severity: 2

G931 LKSIZE OPERAND IS INVALID; DEFAULT ASSUMED.

Explanation: This is a warning message. One of the following occurred:
• More than two parameters were specified.
• The first parameter specification exceeded the maximum specification of 16384000 or 16000K.
• The second parameter specification exceeded the maximum specification of 65520 or 63K.

System action: The Binder SIZE option defaults are used.

Programmer response: No action is required.

Severity: 4

G932 LKRGN OPERAND IS INVALID; DEFAULT ASSUMED.

Explanation: This is a warning message. Either more than one parameter was specified or the length of the parameter exceeds 6 characters.

System action: The default value of 4M is used.

Programmer response: No action is required.

Severity: 2

G933 MFSTEST OPERAND IS INVALID.

Explanation: One of the following occurred:
• More than two parameters were specified.
• The first parameter was specified but was not YES or NO.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G935 SYSMSG OPERAND IS INVALID; DEFAULT ASSUMED.

Explanation: This is a warning message. The operand specified was not TIMESTAMP or NOTIMESTAMP.

System action: The default value of NOTIMESTAMP is used.

Programmer response: No action is required.

Severity: 2

G936 NODE OPERAND IS INVALID—operand.

Explanation: The specified operand contains more than 8 alphanumeric characters and does not begin with a letter, @, $, or #.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G937 IMSPLEX OPERAND IS INVALID. operand

Explanation: The operand specified by operand contains more than 35 characters (including embedded periods); a qualifier that begins with a character other than alphabetic, @, $, or #; or otherwise breaks the rules.
of z/OS data set naming conventions.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun Stage 1.

**Severity:** 4

---

**G939** SECCNT OPERAND IS INVALID; DEFAULT ASSUMED.

**Explanation:** This is a warning message. The operand specified was not a decimal number in the range 0-3.

**System action:** The default value of 0 is used.

**Programmer response:** No action is required.

**Severity:** 2

---

**G940** PSWDSEC OPERAND IS INVALID; DEFAULT ASSUMED.

**Explanation:** This is a warning message. The operand specified was not YES, NO, or FORCE.

**System action:** The default value of NO is used.

**Programmer response:** No action is required.

**Severity:** 2

---

**G941** TERMSEC OPERAND IS INVALID; DEFAULT ASSUMED.

**Explanation:** This is a warning message. The operand specified was not YES, NO, or FORCE.

**System action:** The default value of NO is used.

**Programmer response:** No action is required.

**Severity:** 2

---

**G942** SECONDARY MASTER SPECIFICATION OMITTED OR INVALID.

**Explanation:** If a 3277 primary master terminal specification is made, a valid secondary master specification is required.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G943** RECANY BUFFERS DEFINED BUT NO VTAM TERMINALS. RECANY BUFFER SPECIFICATION IGNORED.

**Explanation:** This is a warning message. The COMM statement includes a specification of VTAM RECEIVE ANY buffers, but no VTAM terminals are defined in the system definition input.

**System action:** The VTAM buffer specification is ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G944** NO VTAM TERMINAL SPECIFICATION.

**Explanation:** A TYPE statement specification was found for which no TERMINAL statement was specified.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G945** VTAM RECEIVE ANY BUFFERS SPECIFICATION OMITTED OR INVALID.

**Explanation:** One of the following occurred:

- The number of VTAM RECEIVE ANY buffers in the COMM macro was 0.
- The size of the VTAM RECEIVE ANY buffers in the COMM macro was 0.
- The RECANY keyword operand in the COMM macro was not specified although VTAM terminals were defined. This operand is required with VTAM terminals.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G946** COMM STATEMENT NOT SPECIFIED.

**Explanation:** No COMM statement was supplied in the input to the IMS system definition, although one or more VTAM terminals were defined.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4
3270 VTAM TERMINAL CONFIGURATION IS INVALID IN RESPECT TO THE COPY FEATURE SPECIFIED FOR THIS TERMINAL.

3270 VTAM TERMINAL CONFIGURATION IS INVALID IN RESPECT TO THE COPY FEATURE SPECIFIED FOR TERMINAL(S) IN PREVIOUS LGEN ASSEMBLY CYCLES.

Explanation: For the first form of this message, the TERMINAL statement for the indicated 3277 terminal specified the COPY feature, and either no candidate printer was found or the model numbers of the 3277 terminal and the candidate printer were not compatible.

For the second form of this message, the TERMINAL statement for the indicated 3277 terminal in the previous LGEN cycle specified the COPY feature and no candidate printer was found in the previous LGEN cycle. The candidate printer definition is probably split between LGEN cycles or is missing.

System action: Stage 1 does not complete successfully.

Programmer response: For the first form of this message, correct the specification and rerun stage 1.

For the second form of this message, adjust the STAGE1 input definition sequence so that the 3277 terminal and the candidate printer are in the same LGEN cycle. Contact IBM Software Support if necessary.

Severity: 4

G948 SPECIAL MASTER TERMINAL FORMATTING REQUEST IS IGNORED; REQUIRED CAPABILITY NOT SPECIFIED.

Explanation: This is a warning message. 3270 special master terminal formatting was requested, and either no VTAM or other IMS supported terminals were defined or no primary master terminal was defined.

System action: The request is ignored.

Programmer response: No action is required.

Severity: 2

G949 JOBCTL AND/OR PRTY SPECIFICATIONS ARE MUTUALLY EXCLUSIVE WITH JCL AND/OR SCL SPECIFICATIONS. JCL/SCL DEFAULTS OR SPECIFICATIONS ASSUMED.

Explanation: This is a warning message. The JCL or the SCL, or both, keywords are mutually exclusive with the JOBCTL or the PRTY, or both, keywords. More than one set cannot be specified.

System action: JOBCTL/PRTY specifications are be ignored; JCL/SCL specifications or defaults are assumed.

Programmer response: No action is required.

Severity: 4

G950 REMOTE SYSID DEFINED BUT NO MSNAME RESOURCES DEFINED

Explanation: A remote system ID was specified in the SYSID= keyword operand of an APPLCTN or TRANSACT statement, but no MSNAME statements were specified.

System action: The stage 1 does not complete.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G951 THIS REMOTE SYSID WAS NOT SPECIFIED AS A REMOTE SYSID IN ANY MSNAME STMT.

Explanation: A remote system ID, specified in the SYSID= keyword operand of an APPLCTN statement, was not specified as a remote system ID in any MSNAME statement in the input to this IMS system definition.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G952 LOGICAL LINKS DEFINED BUT NO PHYSICAL LINKS.

Explanation: No MSPLINK statements were specified in this IMS system definition, although one or more MSLINK statements were specified to define logical links.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G953 PHYSICAL LINKS DEFINED BUT NO LOGICAL LINKS.

Explanation: No MSLINK statements were specified in this IMS system definition, although one or more
MSPLINK statements were specified to define physical links.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G954**

**NO MSNAMES SPECIFIED WITH THIS LOGICAL LINK.**

**Explanation:** This is a warning message. An MSLINK statement was specified with no associated MSNAME statements. Failure to provide at least one MSNAME SYSID statement results in abend U0833.

This error message might be generated erroneously if a previous error message describing a communication configuration error is received.

**System action:** The stage 1 does complete successfully.

**Programmer response:** No action is required.

**Severity:** 2

---

**G955**

**NO REMOTE LTERMS SPECIFIED FOR THIS LOGICAL LINK.**

**Explanation:** This is a warning message. An MSNAME statement was specified with no associated NAME statements. This error message might be generated erroneously if a previous error message describing a communication configuration error is received.

**System action:** The stage 1 does complete successfully.

**Programmer response:** No action is required.

**Severity:** 2

---

**G956**

**MSVERIFY DEFINITION TYPE IS INVALID; NO VALID MS STATEMENT SPECIFICATIONS.**

**Explanation:** MSVERIFY was specified in the IMSCTRL statement as the type of IMS generation, but no valid multiple system definition statements were contained in the input to this system definition.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

---

**G957**

**IMSCTRL MSVID SPECIFICATION IGNORED; NO VALID MS STATEMENT SPECIFICATIONS.**

**Explanation:** This is a warning message. The MSVID keyword operand was specified in the IMSCTRL statement, but no valid multiple system definition statements were contained in the input to this system definition.

**System action:** The operand was ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G959**

**FAST PATH MESSAGE-DRIVEN APPLCTN(S) DEFINED BUT NO TERMINAL ELIGIBLE TO ENTER FP TRANS.**

**Explanation:** This is a warning message. No terminals are defined with Fast Path buffers. Therefore, no terminals are able to send messages to a message-driven application program.

**System action:** The operand was ignored.

**Programmer response:** No action is required.

**Severity:** 2

---

**G961**

**FAST PATH POTENTIAL TRANSACT(S) REQUIRE AT LEAST ONE FAST PATH MESSAGE DRIVEN APPLCTN.**

**Explanation:** This is a warning message. All Fast Path potential transactions require at least one Fast Path application program defined to handle any input from terminals.

**System action:** The operand is ignored.

**Programmer response:** Add at least one Fast Path application program to the definition, or remove all Fast Path potential TRANSACT macro specifications.

**Severity:** 2

---

**G963**

**NO RTCODE(S) SPECIFIED FOR THIS APPLCTN.**

**Explanation:** This is a warning message. No RTCODE macros were coded following the identified APPLCTN statement.

**System action:** The operand was ignored.

**Programmer response:** Code at least one TRANSACT macro to process the Fast Path application.

**Severity:** 2
G964  THIS LOCAL SYSID WAS SPECIFIED AS A REMOTE SYSID IN AN MSNAME STATEMENT.

Explanation: The SYSID specified as a local SYSID in this APPLCTN statement was specified as a remote SYSID in an MSNAME statement. You cannot specify both.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G965  NO FAST PATH APPLCTN SPECIFICATIONS.

Explanation: This is an informational message. You defined resources related to a Fast Path terminal, but no Fast Path application programs were specified.

System action: This is an informational message.

Programmer response: No action is required.

Severity: 4

G966  NO VALID VTAM SUBPOOL DEFINED FOR LUTYPE6 NODE WITH MULTIPLE SESSIONS

Explanation: No valid VTAM LTERM SUBPOOL definition was contained in the IMS system definition, although an LUTYPE6 TERMINAL statement specified subpool LTERM allocation.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G968  MSGDELSPECIFICATIONS WILL NOT ALLOW ANY DEFINED SUBPOOL TO BE ALLOCATED TO A SESSION FOR THIS NODE

or (for large system definition - LGEN)

A TERMINAL STATEMENT SPECIFIED MSGDELS=value, BUT NO VTAM SUBPOOL HAS A MATCHING SPECIFICATION.

Explanation: The first message is issued for a standard system definition and the second message is issued for a large system definition (LGEN).

One of the following occurred:

- The TERMINAL statement specified MSGDELS=NONIOPCB, but no VTAM SUBPOOL statement was recognized with MSGDELS=NONIOPCB.
- The TERMINAL statement specified MSGDELS=NOTERM, but no VTAM SUBPOOL statement was recognized with MSGDELS=NONIOPCB.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun Stage 1.

Severity: 4

G969  SECONDARY MASTER HARDCOPY LOGGING SPECIFIED BUT NO SECONDARY MASTER DEFINED.

Explanation: Although the COMM macro COPYLOG keyword specification indicated hardcopy logging on the secondary master terminal, no valid specification was found in the system definition stage 1 input.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G970  VTAM APPLID FROM COMM MACRO STATEMENT IS ALSO DEFINED AS AN LTERM NAME

Explanation: The COMM macro statement specified the APPLID as a name which is also used on a NAME macro statement as a logical terminal name.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G971  IMSGEN MACRO GENERAL COMMUNICATIONS OPTIONS IGNORED; COMM MACRO SPECIFICATIONS USED

Explanation: The IMSGEN macro statement specified one or more of the general communications options, and the COMM macro statement was present in the Stage 1 input stream. The COMM macro specifications and defaults for these options will be used; those from the IMSGEN macro statement will be ignored.

System action: The operand was ignored.

Programmer response: No action is required.

Severity: 2
SECURITY OPTIONS SPECIFIED ON MORE THAN ONE MACRO; THOSE FROM THE [COMM|SECURITY] STATEMENT WILL BE USED.

Explanation: Specifications that relate to the security count (SECCNT), which can be made on the IMSGEN, COMM, or SECURITY macro statement, were present on two or more of these macro statements. The specifications and defaults from the macro specified in the MNOTE are used; those from the other macro statements are ignored.

System action: The operand was ignored.

Programmer response: No action is required.

Severity: 2

SURVEY OPERAND IS INVALID; DEFAULT ASSUMED.

Explanation: This is a warning message. The operand was not specified as YES or NO. More than one parameter was specified.

System action: The default value of SURVEY=NO is used.

Programmer response: No action is required.

Severity: 2

THE FOLLOWING ARE DUPLICATE TRANSACTION CODES:

Explanation: The transaction code name was specified on multiple TRANSACT macro statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

THE FOLLOWING ARE DUPLICATE MSNAME LINKNAMES:

Explanation: The link name was specified on multiple MSNAME macro statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

THE FOLLOWING ARE DUPLICATE VTAM NODE NAMES:

Explanation: The VTAM node name was specified on multiple TERMINAL macro statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

THE FOLLOWING ARE DUPLICATE LTERM NAMES:

Explanation: The logical terminal name was specified on multiple NAME macro statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

THE FOLLOWING ARE DUPLICATE ROUTING CODES:

Explanation: The routing code was specified on multiple RTOCODE macro statements.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
The following are duplicate SUBPOOL names:

**Explanation:** The SUBPOOL name was specified on multiple SUBPOOL macro statements.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

The following are duplicate PARTNER IDs:

**Explanation:** The PARTNER ID was specified on multiple MSLINK macro statements.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

The following are duplicate physical link names:

**Explanation:** The physical link name was specified on multiple MSPLINK macro statements.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

The following are duplicate remote system VTAM node names:

**Explanation:** The remote system VTAM node name was specified on multiple MSPLINK macro statements.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

Cross-check failed for the following resource names:

**Explanation:** One of the following occurred:

- The transaction code was also specified as an LTERM.
- The MSNAME link name was also specified as a transaction code.

**System action:** The stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4

The following are duplicate BTAM xxxxxxx addresses:

**Explanation:** The field xxxxxxx can be one of the following: LINE, CTLUNIT, STATION, TERMINAL. The list is the duplicate addresses that were detected.

Possible errors by operand are as follows:

**LINE**  The address specified on the ADDR operand of the LINE macro is a duplicate of one specified on a previous LINE or MSPLINK statement.

**CTLUNIT**  The address specified on the ADDR operand of a CTLUNIT macro has been previously specified for a control unit on this line.

**STATION**  The address specified on the ADDR operand of a STATION macro is a duplicate of one specified on a previous STATION statement on this line.

**TERMINAL**  Independent of terminal type, all input terminal addresses for a line must be unique.

**System action:** The stage one assembly does not complete normally.

**Programmer response:** Correct the duplicate specification and rerun.

**Severity:** 4

**G987**  MFSDFMT KEYWORD PARAMETER IS INVALID

**Explanation:** The MFSDFMT keyword does not contain YES or NO, or has more than one parameter.

**System action:** Stage 1 does not complete successfully.

**Programmer response:** Correct the specification and rerun stage 1.

**Severity:** 4
G988 NO TRANSACT MACROS CODED. AT LEAST ONE TRANSACT MACRO MUST BE INCLUDED WHEN AN APPLCTN MACRO IS INCLUDED.

Explanation: An APPLCTN macro was defined in Stage 1 without a corresponding TRANSACT macro.

System action: The Stage 1 assembly does not complete normally.

Programmer response: Add at least one TRANSACT macro to the definition.

Severity: 4

G989 DATABASE SPECIFICATIONS ARE REQUIRED FOR DBCTL, NONE SPECIFIED.

Explanation: No DATABASE statements were provided in the input to the IMS system definition for a DBCTL generation.

System action: Stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

G992 THE FESEXIT KEYWORD COMM MACRO IS MISSING OR INVALID

Explanation: FESEXIT=YES is expected, but FESEXIT=NO was specified in the COMM macro.

System action: Stage 1 does not complete successfully.

Programmer response: To activate Front End Switch (FES), specify both OPTION=FES in the TERMINAL macro and FESEXIT=YES in the COMM macro. To deactivate FES, either eliminate OPTION= and FESEXIT= statements completely, or specify OPTION=NOFES and FESEXIT=NO. (OPTION=NOFES and FESEXIT=NO are the default.)

Severity: 4

G999 GENERATION TERMINATED; NOGO SET.

Explanation: One or more errors have occurred. Stage 1 is terminated; no Stage 2 JCL or control statements are produced.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4
G messages G1001-G9999

This topic contains the following messages:

**G1002  RTCODE MUST FOLLOW FAST PATH MSG-DRIVEN APPLCTN SPEC.**

**Explanation:** The RTCODE specification is only valid for Fast Path message-driven application programs. RTCODE specifications are used to route transactions to the correct application program. Non-message-driven programs cannot retrieve input messages and process them.

**System action:** Parameter validation continues as though the previous APPLCTN statement defined a Fast Path application program.

**Programmer response:** Remove the RTCODE statement or move it to follow the correct APPLCTN statement.

**G1003  CODE OPERAND CONTAINS DUPLICATE ENTRY. SPECIFIED RTCODE—code**

**Explanation:** A specified routing code name was previously specified as a routing code name.

**System action:** The duplicate routing code is ignored.

**Programmer response:** Eliminate the duplicate routing code by removing it or changing its name.

**G1004  CODE OPERAND IS OMITTED OR INVALID.**

**Explanation:** One of the following occurred:
- The CODE operand was not specified.
- The parameter contained a null subparameter.
- The parameter or subparameter was not specified as a 1-8 character alphanumeric name.
- The value begins with the string ‘DFS’ or ‘DBCDM’, or it contains a reserved word.

**System action:** Any routing code names following the invalid one, when specified as a subparameter, are not validity checked. They are skipped. Stage 1 does not complete successfully.

**Programmer response:** Specify the CODE parameter or correct its specification and rerun stage 1.

**Severity:** 4

**G1005  INQ/INQUIRY OPERAND IS INVALID.**

**Explanation:** One of the following occurred:
- More than one parameter was specified.
- The parameter specified was not YES or NO.
- Both INQ and INQUIRY parameters were specified.

**Programmer response:** Correct the specification to either INQ=YES or INQ=NO.

**G1010  OTHREAD OPERAND IS INVALID.**

**Explanation:** One of the following events invalidated:
- More than one parameter was specified.
- The parameter was not numeric.
- The first parameter was specified, but not as a decimal value from 1 to 31.
- A call was made to the FPCTRL macro. This macro is no longer supported.

**System action:** Validation continues with the BFALLOC and INREXIT parameters.

**Programmer response:** Correct the specification and rerun Stage 1. Any valid number can be specified at system definition time. This parameter can be specified at system initialization time.

**G1011  BFALLOC OPERAND IS INVALID.**

**Explanation:** One of the following occurred:
- More than three subparameters were specified.
- The parameters that were specified were not numeric.
- Subparameters 1 and 2 were not in the range of through 999.
- Subparameter 3 is not 512, 1024, 2048, or 4096.

**System action:** The subparameter checking is done from left to right. The first error causes the error message to be issued, and the subparameters to the right of the error are not validated. Validation continues with the INREXIT parameter.

**Programmer response:** Correct the specification and rerun Stage 1. This parameter can be removed and specified at system initialization time.

**G1012  INREXIT OPERAND IS INVALID.**

**Explanation:** One of the following occurred:
- Only one parameter is valid, and more than one was specified.
- The specified parameter did not start with an alphabetic character, or it was longer than 8 characters.

**Programmer response:** Correct the specification and rerun Stage 1.

**G1016  FAST PATH NOT SUPPORTED ON VS/1.**

**Explanation:** Fast Path can only be specified if the IMSTRL macro indicates that the host system is z/OS.

**System action:** Stage 1 does not complete normally.

**Module:** IMSCTRL
Severity: 4

G1200   HSB KEYWORD INVALID FOR DBCTL

Explanation: The HSB keyword cannot be specified for a DBCTL class system definition. The HSB keyword is ignored.

System action: The stage 1 does complete successfully.

Programmer response: No action is required.

Severity: 2

G1201   WARNING: CMDCHAR INCORRECT.

Explanation: One of the following occurred:

• More than one parameter was specified.
• Operand is not one character.

System action: The stage 1 does not complete successfully.

Severity: 4

G1205   RSR FEATURE 'feature' NOT AVAILABLE

Explanation: Either the Remote Site Recovery feature RLT or DLT is not available. The RLT feature must be available if the DLT feature is specified.

System action: Stage 1 does not complete normally.

System programmer response: Ensure the needed RSR feature is available and rerun the stage 1 assembly.

Severity: 2

G1206   THE MCS SUBPARAMETER IS OUTSIDE THE RANGE OF ACCEPTABLE VALUES. DEFAULT OF (2,7) ASSUMED.

Explanation: This is a warning message. One or more of the following occurred:

• More than 16 values were specified for the MSC routing code. Extra values are ignored.
• An MCS routing code value was outside the acceptable range of 1 through 16.

System action: The subparameter is ignored or the default value is used.

Operator response: No action is required.

Programmer response: No action is required.

Severity: 2

G1207   THE DESC SUBPARAMETER IS OUTSIDE THE RANGE OF ACCEPTABLE VALUES. DEFAULT OF (7) IS ASSUMED.

Explanation: This is a warning message. One or more of the following occurred:

• More than 16 values were specified for the DESC code. Extra values are ignored.
• A DESC code value was outside the range of 1 through 16.

System action: The subparameter is ignored or the default value is used.

Operator response: No action is required.

Programmer response: No action is required.

Severity: 2

G1208   TYPE/CLASS OF ALL,DCCTL SPECIFIED; TYPE/CLASS OF ON-LINE,DCCTL USED.

Explanation: This is an informational message indicating the second subparameter of the SYSTEM keyword in the IMSCTRL macro was changed.

Severity: 2

G1209   ETOFEAT= sub parameters 1 and/or 2 have been specified. These sub parameters are no longer valid and are ignored.

Explanation: This is an informational message to indicate that subparameters 1, 2, or both, of the ETOFEAT= keyword in the IMSCTRL macro are invalid.

System action: The subparameters are ignored.

Programmer response: No action is required.

Severity: 2

G1210   ETO DESCRIPTORS REQUESTED, BUT INVALID SYSGEN CLASS OR TYPE.

Explanation: ETOFEAT=(,,ALL) or ETOFEAT=(,,ONLY) specified. Descriptors were requested, but invalid system definition class or type was specified.

System action: The request to produce ETO descriptors is ignored.

Programmer response: No action is required unless a system with the ETO feature is to be built.

Severity: 2

G1211   ETO DESCRIPTORS ARE NOT BUILT IN A LGEN SYSGEN.

Explanation: Extended Terminal Option (ETO) descriptors are not built in a large system definition (LGEN).
A severity 2 warning message is issued when ETO descriptors are requested along with the system definition, that is, ETOFEAT=(,,ALL).

A severity 4 error message is issued when only ETO descriptors are requested in a LGEN system definition, that is, ETOFEAT=(,,ONLY).

System action: For the warning message, processing continues. For the error message, the stage 1 will not complete successfully.

Programmer response: Change the ETOFEAT keywor word of the IMSCTRL macro to not request the building of the ETO descriptors.

Severity: 2 or 4

The following OPERANDS ARE INVALID: list

Explanation: The list can include one or more of the following: FEAT, SIZE, or TYPE. Each operand indicates that one of the following errors occurred:

FEAT
- An operand was specified more than once.
- Mutually exclusive operands were specified.
- IGNORE was specified with other operands.

SIZE
- There are not exactly two parameters.
- The first value is not a number in the range 1-16384.
- The second value is not a number in the range 2-16384.
- The product of the two values is not a number in the range 80-16384.

TYPE
- The parameter was not in the format '3270-Ann' where 'nn' is a 1-digit number from 1 to 9, inclusive, or a 2-digit number from 01 to 15, inclusive.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

The following OPERANDS ARE INVALID:

Explanation: One of the following occurred:
- No valid screen size is declared for this symbolic name.
- No symbolic name is specified for this screen size.
- The screen size declared is not the same as that previously declared for the same symbolic name.

System action: The stage 1 does not complete successfully.

Programmer response: Correct the specification and rerun stage 1.

Severity: 4

The xxxxxxxxx MACRO IS INVALID FOR A DBCTL GEN

Explanation: The Database Control Subsystem (DBCTL) does not support macro xxxxxxxxx specified in the DBCTL Stage 1 system definition.

System action: Processing continues.

Programmer response: Delete the identified macro from the DBCTL Stage 1 system definition.

Severity: 2

INVALID PARAMETER - xxxxxxxxx - SPECIFIED IN xxxxxxxxx MACRO.

Explanation: One or more parameters in the statement being processed contains a syntax error.

System action: The invalid parameters are ignored and the defaults are used.

Programmer response: Remove or correct the invalid
parameters and rerun Stage 1 of IMS system definition.

Severity: 4

G9002 xxxxxxx OPERAND IS IGNORED FOR DBCTL GEN

Explanation: Operand xxxxxxx is not supported for DBALL/DBCTL. This message is issued for each invalid operand within a macro.

System action: Operand is ignored.

Programmer response: Operand can be removed from the DBCTL Stage 1 system definition.

Severity: 2
Chapter 12. HWS messages (IMS Connect)

IMS Connect messages begin with the prefix HWS.

Some messages include an E=ec value. The ec value represents the TCP/IP error code. Refer to your TCP/IP Messages and Codes documentation for more information on the ec value.

Some messages include an M=mc value. The mc value represents the IMS Connect module suffix that issued the message. For example, in M=CPAR, the issuing module is HWSCPAR0.

HWS messages HWSA0300E-HWSI1816W

This topic contains the following messages:

**HWSA0300E** A FAILURE OCCURRED QUEUING WORK FOR ADAPTER *adptname*; R=rc, M=mc

**Explanation:** An IMS Connect internal error has occurred while trying to queue work for adapter support.

In the message text:
- *adptname* Identifies the adapter.
- *rc* Is the return code, which can be one of the following:
  - X'80' Post failed for target server's ECB.
  - X'84' Invalid AWE server index passed.
- *mc* Identifies the module that issued the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** This error is an internal problem that has occurred. If the problem persists, search the problem reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the following SYSLOG, and memory dump if available.

**Module:** HWSSDRCV, HWSSDXMT

**HWSA0305E** ADAPTER *adptname* DID NOT RETURN type BUFFER; M=mc

**Explanation:** The adapter did not return a valid buffer address, or it returned no buffer address.

In the message text:
- *adptname* Identifies the adapter that was called.
- *type* Identifies the type of buffer error, which can be one of the following:
  - MESSAGE - no buffer returned
  - VALID - the buffer returned was not valid
- *rc* Is the return code, which can be:
  - X'04' Invalid type storage requested
  - X'08' Storage not available to satisfy request
- *mc* Identifies the module issuing the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** This error can occur when the storage being freed has been modified by the adapter incorrectly or as a result of an internal error. If the problem persists, search the problem reporting...
databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the following SYSLOG, and memory dump if available.

**Module:** HWSSDRCV, HWSSDXMT

**HWSA0315E INVALID EXIT FUNCTION WAS REQUESTED; FUNC=ft, msgid1,msgid2, M=mc**

**Explanation:** The IMS Connect user message exit was unable to process the requested FUNC=ft.

In the message text:
- **ft** Identifies the function passed to the user message exit; values can be:
  - READ - Process input message
  - XMIT - Process output message
  - RXML - Return ADAPTER/TAG name
- **msgid1** Identifies the EBCDIC MSGID (*HWSOA1*) in the message prefix
- **msgid2** Identifies the ASCII MSGID (*HWSOA1*) in the message prefix
- **mc** Identifies the module issuing the message

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** This error can occur when the User Message Exit is called with an invalid function request. The problem could be that the client application identified the incorrect User Message Exit and that exit was called with a function of RXML or XXML and the User Message Exit does not support the adapter function. Verify that you are calling the correct User Message Exit and that the exit supports the function call being made.

**Module:** HWSSDRCV

**HWSA0320E USER MESSAGE EXIT RETURNED AN INVALID RETURN CODE; R=rc, M=mc**

**Explanation:** The User Message Exit returned an unknown or invalid return code.

In the message text:
- **rc** Identifies the return code returned by the User Message Exit
- **mc** Identifies the module issuing the message

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the User Message Exit, or correct the User Message Exit to return the correct return code.

**Module:** HWSSDRCV

**HWSA0325E ADAPTER adptname RETURNED AN INVALID RETURN CODE; R=rc, M=mc**

**Explanation:** The adapter returned an invalid return code.

In the message text:
- **adptname** Identifies the adapter that was called.
- **rc** Identifies the invalid return code returned by the adapter.
- **mc** Identifies the module issuing the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to return a valid return code.

**Module:** HWSSDRCV, HWSSDXMT

**HWSA0330E NO ADAPTER NAME RETURNED FROM USER MESSAGE EXIT; M=mc**

**Explanation:** The User Message Exit did not return an adapter name.

In the message text:
- **mc** Identifies the module issuing the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the User Message Exit, or correct the User Message Exit to return the adapter name.

**Module:** HWSSDRCV

**HWSA0335E ADAPTER adptname MIGHT BE IN A LOOP, REQUESTING OUTPUT BUFFER; M=mc**

**Explanation:** The adapter has made a second request for a new buffer.

In the message text:
- **adptname** Identifies the adapter that was called.
- **mc** Identifies the module issuing the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to not loop on requesting output buffer.

**Module:** HWSSDRCV, HWSSDXMT
**HWSA0340E**  
**MESSAGE WAS NOT PROCESSED BY ADAPTER**  
**adptname**; **R=rc, M=mc**

**Explanation:** Control was returned to IMS Connect without the adapter processing the message.

In the message text:
- **type** - Identifies the message type, which can be:
  - INPUT - for input messages
  - OUTPUT - for output messages
- **adptname** - Identifies the adapter that was called.
- **rc** - The return code returned by the named adapter.
- **mc** - Identifies the module that issued the message.

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to process the message.

**Related tasks:**
- Configuring XML conversion support for IMS Connect clients (System Definition)

**HWSA0345E**  
**ADAPTER adptname ENCONTRED AN INVALID DATA LENGTH; LEN=len, M=mc**

**Explanation:** The adapter returned an invalid data length of 8 characters or less. The data must be 9 to 32,767 characters.

In the message text:
- **adptname** - The adapter that was called
- **len** - The data length returned by the adapter
- **mc** - Identifies the module issuing the message

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to return a valid length of data.

**Module:** HWSSDRCV, HWSSDXMT

**Related reference:**
- XML adapter return and reason codes (Messages and Codes)
- Error messages for IBM Rational Developer for System z Enterprise Service Tools

**HWSA0350E**  
**ADAPTER adptname RETURNED AN INVALID FUNCTION REQUESTED FOR ADAPTER**  
**adptname**; **FUNC=ft, M=mc**

**Explanation:** The IMS Connect adapter was unable to process the requested **FUNC=ft**.

In the message text:
- **adptname** - Identifies the adapter that was called

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to process the message correctly based on the return code value returned.

**Module:** HWSSDRCV

**Related reference:**
- XML adapter return and reason codes (Messages and Codes)
- Error messages for IBM Rational Developer for System z Enterprise Service Tools

**HWSA0355E**  
**ADAPTER adptname FAILED TO INITIALIZE; ADAPTER SUPPORT IS DISABLED; RC=rc, M=mc**

**Explanation:** The adapter failed its initialization processing. Adapter support is disabled.

In the message text:
- **adptname** - The adapter that was called
- **rc** - The return code returned by the adapter
- **mc** - Identifies the module issuing the message

**System action:** IMS Connect continues to run fully, except without adapter support. The client socket connection is disconnected.

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to process the message correctly based on the return code value returned.

**Module:** HWSSDOPN

**Related reference:**
- XML adapter return and reason codes (Messages and Codes)
- Error messages for IBM Rational Developer for System z Enterprise Service Tools

**HWSA0365E**  
**INVALID FUNCTION WAS REQUESTED FOR ADAPTER adptname; FUNC=ft, M=mc**

**Explanation:** The IMS Connect adapter was unable to process the requested **FUNC=ft**.

In the message text:
- **adptname** - Identifies the adapter that was called

**System programmer response:** Verify that you are using the correct copy of the adapter, or correct the adapter to process the message correctly based on the return code value returned.

**Module:** HWSSDRCV

**Related reference:**
- XML adapter return and reason codes (Messages and Codes)
- Error messages for IBM Rational Developer for System z Enterprise Service Tools
**HWSA0370E • HWSB0005W**

ft Identifies the function passed to the adapter

mc Identifies the module issuing the message

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** This error can occur when you call the adapter with an invalid function request. The problem could be that the client application identified the incorrect adapter and that adapter was called with a function that was not supported. Verify that you are calling the correct adapter and that the adapter supports the function call being made.

**Module:** HWSSDRCV

---

**HWSA0370E** THE TRANSCODE WAS NOT PROVIDED TO IMS CONNECT EITHER FROM THE XML CONVERTER OR FROM THE IRM_TRNCOD FIELD; M=mc

**Explanation:** IMS Connect tried to convert from XML to application data format. However, the transaction code was not found in either the data or in the IRM_TRNCOD field of the IMS request message (IRM) for IMS Connect to place in the converted application data.

In the message text:

mc The module issuing the message

**System action:** IMS Connect continues to run. The client socket connection is disconnected.

**System programmer response:** If you are using the converter to set the transaction code, verify that the XML message sent to IMS Connect contains the transaction code. If you are providing the transaction code in the IRM_TRNCOD field, then verify the transaction code is set in the IRM_TRNCOD field of the IRM.

**Module:** HWSSDRCV

---

**HWSA0375I** XML CONVERTER cvtname WAS SUCCESSFULLY REFRESHED,M=xxxx

**Explanation:** An IMS Connect XML converter was successfully refreshed when one of the following commands was issued:

- WTOR command REFRESH CONVERTER
- z/OS Modify command UPDATE CONVERTER
- Type-2 command UPDATE IMSCON TYPE(CONVERTER)

In the message text:

cvtname The name of the XML converter that was refreshed. If a wildcard (*) is included, cvtname is the mask for all of the converters that were refreshed. If only a wildcard is shown, all converters were refreshed successfully.

xxxx The 4-character name of the module that issued this message.

**System action:** The system continues normal processing.

**User response:** No action is required.

**Module:** HWSXMLA0

---

**HWSA0380E** ADAPTER adptname WAS UNABLE TO LOAD cvtname; R=rc, S=sc, M=mc

**Explanation:** An adapter encountered a problem while running. Control was returned to IMS Connect without the adapter processing the message.

In the message text:

adptname The name of the adapter that was called.

cvtname The name of the XML converter that was called.

rc The return code from the adapter.

sc The service code from the adapter.

mc The name of the module that issued the message.

**System action:** IMS Connect continues to run. The current message in progress is not processed.

**System programmer response:** Ensure that the correct converter and its associated program are linked to the correct data set.

**Module:** HWSXMLA0

---

**HWSB0005W** A FAILURE OCCURRED OBTAINING STORAGE; R=rc, B=type, M=mc

**Explanation:** IMS Connect was unable to obtain the specified storage area.

In the message text:

rc The return code returned by the adapter

type Identifies the buffer type:

- 'HWSHLES' LES block
- 'ONEKBUF' 1K buffer
- 'DDABUF' dynamic data area for conversion services

mc Identifies the module issuing the message

**System action:** IMS Connect continues to run fully. The client socket connection is disconnected.

**System programmer response:** This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide JCL, SYSLOG, and memory dump if available.

**Module:** HWSXMLA0
HWSB0010W A FAILURE OCCURRED RELEASING STORAGE; R=rc, B=type, M=mc

Explanation: IMS Connect was unable to release the specified storage area.

In the message text:
rc The return code returned by named adapter.

type Identifies the buffer type, as follows:
  * 'OUTBUF' - output buffer

mc Identifies the module issuing the message.

System action: IMS Connect continues to run fully. The client socket connection is disconnected.

System programmer response: This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide JCL, SYSLOG, and memory dump if available.

Module: HWSXMLA0

HWSB0105E <XMLAdapterOutput>
  <XMLAdapterError> HWSB0105E
  Inbound Error: Failed to obtain storage for storing the converted message.
  BPEGETM RC=rc. </XMLAdapterError>
</XMLAdapterOutput>

Explanation: IMS Connect was unable to obtain a storage area. This error is returned to the client by the XML adapter.

In the message text:
rc Identifies the return code from the BPEGETM service

System action: IMS Connect continues to run fully. The client socket connection is disconnected.

System programmer response: No action is required. This is an internal error.

Module: HWSXMLA0

Related reference:
- XML adapter return and reason codes (Messages and Codes)

HWSB0110E <XMLAdapterOutput>
  <XMLAdapterError> HWSB0110E
  Inbound Error: LE failed to invoke the XML Converter. LE CEEPIPI (call_sub) function RC=rc. </XMLAdapterError>
</XMLAdapterOutput>

Explanation: The Language Environment CEEPIPI module returned an error when calling the XML converter. This error is returned to the client by the XML adapter.

In the message text:
rc The return code returned by the BPEGETM service

HWSB0115E <XMLAdapterOutput>
  <XMLAdapterError> HWSB0115E
  Inbound Error: The converted inbound message is greater than the supported size of 32767 bytes. The message that caused this failure is n bytes.
  </XMLAdapterError>
</XMLAdapterOutput>

Explanation: The data that is being passed in is longer than is valid. This error is returned to the client by the XML adapter.

In the message text:
n The length of the message in bytes causing the failure

System action: IMS Connect continues to run fully. The client socket connection is disconnected.

System programmer response: Check that the input data structure of the XML converter that you are using is not greater than 32,767 bytes.

Module: HWSXMLA0

Related reference:
- XML adapter return and reason codes (Messages and Codes)

HWSB0205E <XMLAdapterOutput>
  <XMLAdapterError> HWSB0205E
  Outbound Error: Failed to obtain storage for storing converted message.
  BPEGETM RC=rc. </XMLAdapterError>
</XMLAdapterOutput>

Explanation: IMS Connect was unable to obtain a storage area. This error is returned to the client by the XML adapter.

In the message text:
rc The return code returned by the BPEGETM service
System action: IMS Connect continues to run fully. The client socket connection is disconnected.

System programmer response: No action is required. This is an internal error.

Module: HWSXMLA0

Related reference:

- XML adapter return and reason codes (Messages and Codes)

HWSB0210E <XMLAdapterOutput>

<XMLAdapterError> HWSB0210E Outbound Error: LE failed to invoke the XML Converter. LE CEEPIPI (call_sub) function RC=rc. </XMLAdapterError>

</XMLAdapterOutput>

Explanation: The Language Environment CEEPIPI module returned an error when calling the XML converter. This error is returned to the client by the XML adapter.

In the message text:

rc The return code from the LE CEEPIPI module that called the XML converter

System action: IMS Connect continues to run fully. The client socket connection is disconnected.

System programmer response: This error is internal.

Module: HWSXMLA0

HWSC0001 m HWSC0000I *IMS CONNECT READY* hid

Explanation: A z/OS outstanding reply message used for entering IMS Connect commands.

hid identifies the HWS (the ID parameter of the HW$ statement in the HWSCFGxx configuration files).

HWSC0001I message_text

Explanation:

This message can consist of multiple lines, where the message_text on each line consists of the command response of any of the IMS Connect WTOR VIEW commands, such as VIEWDS, VIEWHWS, or VIEWPORT, or the equivalent IMS Connect z/OS commands, such as QUERY DATASTORE, QUERY MEMBER, or QUERY PORT.

For the description of message_text values, see the output fields section of the commands that were run.

System action: The messages are issued, and IMS Connect continues to run.

Related reference:

- IMS Connect WTOR commands (Commands)
- IMS Connect z/OS commands (Commands)

HWSC0010I HELLO, WELCOME TO IMS CONNECT!

Explanation: Indicates that IMS Connect is ready.

HWSC0020I IMS CONNECT IN TERMINATION

Explanation: Indicates that IMS Connect has shut down.

HWSC0030I *PING RESPONSE* *CSMOKY*

Explanation: This message is the response to a ping request of IMS Connect. It indicates that the ping was successful.

User response: No action is required.

HWSC0031I PASSWORD CHANGE SUCCESSFUL *CSMOKY*

Explanation: The request to change password was successful.

User response: No action is required.

HWSC0032E INVALID ERROR CODE x *CSMOKY*

Explanation: IMS Connect detected an invalid error code in the decimal returned. x in the message text is the code that it detected.

User response: This is an internal error. If the problem persists, contact IBM Software Support and report the code.

Module: HWSSMPL1

HWSC0033E PASSWORD CHANGE FUNCTION IS NOT SUPPORTED *CSMOKY*

Explanation: IMS Connect as set up on your system does not support changing the password. Possible causes of the problem include a missing address for the HWSPWCH0 module or RACF=N was specified.

User response: Make sure that IMS Connect is properly set up for using the change password support.

Module: HWSSMPL1
HWSC0034W  RACF IS NOT ACTIVE *CSMOKY*
Explanation:  IMS Connect detected that RACF is not currently active.
User response:  Make sure that RACF is active and rerun the password change.

HWSC0035E  THE OLD PASSWORD IS NOT AUTHORIZED *CSMOKY*
Explanation:  You tried to change your password, but RACF detected that the old password that you specified is not authorized.
System action:  The password remains unchanged.
User response:  Check that you are using the correct old password, and rerun the password change.

HWSC0036E  THE PASSWORD HAS EXPIRED *CSMOKY*
Explanation:  You tried to change your password, but RACF detected that the old password that you specified has expired.
System action:  The password remains unchanged.
User response:  Correct the RACF password problem and rerun the password change.

HWSC0037E  THE NEW PASSWORD IS INVALID *CSMOKY*
Explanation:  You tried to change your password, but RACF detected that the new password that you specified is not valid.
System action:  The password remains unchanged.
User response:  Rerun the password change with a valid new password.

HWSC0038E  PASSWORD CHANGE ERROR *CSMOKY*
Explanation:  When you tried to change your password, the RACROUTE call returned a return code other than zero.
System action:  The password remains unchanged.
User response:  See the information about preceding RACF errors to determine the problem, and rerun the password change.
Related reference:

HWSC0039E  INVALID OLD PASSWORD LENGTH *CSMOKY*
Explanation:  You tried to change your password, but length of the old password that you specified was not valid.
System action:  The password remains unchanged.
User response:  Check that you are using the correct old password, and rerun the password change.
Module:  HWSPWCH0

HWSC0040E  INVALID NEW PASSWORD 1 LENGTH *CSMOKY*
Explanation:  You tried to change your password, but length of the new password that you specified was not valid.
System action:  The password remains unchanged.
User response:  Rerun the password change with a valid new password.
Module:  HWSPWCH0

HWSC0041E  INVALID NEW PASSWORD 2 LENGTH *CSMOKY*
Explanation:  You tried to change your password, but length of the confirmation password for the new password was not valid.
System action:  The password remains unchanged.
User response:  Rerun the password change with the same new password and confirmation password.
Module:  HWSPWCH0

HWSC0042E  OLD PASSWORD CONTAINED NON-ALPHANUMERIC OR LOWERCASE CHARACTER *CSMOKY*
Explanation:  You tried to change your password, but the old password that you entered contained characters other than letters and numbers or contained lowercase letters.
System action:  The password remains unchanged.
User response:  Rerun the password change with the valid old password.
Module:  HWSPWCH0

HWSC0043E  NEW PASSWORD 1 CONTAINED NON-ALPHANUMERIC OR LOWERCASE CHARACTER *CSMOKY*
Explanation:  You tried to change your password, but the new password that you entered contained
characters other than letters and numbers or contained lowercase letters.

**System action:** The password remains unchanged.

**User response:** Rerun the password change with a valid new password.

**Module:** HWSPWCH0

---

HWSC0044E NEW PASSWORD 2 CONTAINED NON-ALPHANUMERIC OR LOWERCASE CHARACTER *CSMOKY*

**Explanation:** You tried to change your password, but the confirmation password contained characters other than letters and numbers or contained lowercase letters.

**System action:** The password remains unchanged.

**User response:** Rerun the password change with a valid new password and matching confirmation password.

**Module:** HWSPWCH0

---

HWSC0045E NEW PASSWORDS DO NOT MATCH *CSMOKY*

**Explanation:** You tried to change your password, but the new password and the confirmation password were not the same.

**System action:** The password remains unchanged.

**User response:** Rerun the password change with a valid new password and matching confirmation password.

**Module:** HWSPWCH0

---

HWSC0046E INVALID REQUEST SYNTAX *CSMOKY*

**Explanation:** IMS Connect detected a syntax problem in your password change request.

**System action:** The password remains unchanged.

**User response:** Correct the HWSPWCH command and rerun the password change.

**Module:** HWSPWCH0

---

**HWSC0100W UNABLE TO ALLOCATE STORAGE FOR COMMAND; R=rc, S=ssc, M=mc**

**Explanation:** Storage for the command buffer cannot be allocated.

In the message text:
- `rc` identifies the return code.
- `ssc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for service and return codes.

### Table 3. Service and return code explanation for HWSC0100W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETC01L</td>
<td>BPECBGET, the system service used to acquire the C01K.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CG get routine. This is an internal system error.</td>
</tr>
<tr>
<td>GETFWEB</td>
<td>BPECBGET, the system service used to acquire the FWEB.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the command is notified. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** CMDC - HWSCMOP0

---

HWSC0101E FUNCTION WORK ELEMENT PROCESSING FAILURE, FUNC=func; R=rc, S=ssc, M=mc

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
• **func** identifies the function requested.
• **rc** identifies the return code.
• **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• **mc** identifies the module issuing the message.

See the following table for the service and return code explanation.

**Table 4. Service and return code explanation for HWSC0101E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** CMDC - HWSCMDC0, CMOP - HWSCMOP0

---

**HWSC0110W  COMMAND VERB BLOCK PROCESS FAILURE; R=rc, S=sc, M=mc**

**Explanation:** Storage for the command verb block (CVB) cannot be allocated. The CVB contains the command verb and its parameters and is the structure used by all command processors to process a command in IMS Connect. Without this block, a command cannot be processed.

In the message text:
• **rc** identifies the return code.
• **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• **mc** identifies the module issuing the message.

See the following table for service and return codes.

**Table 5. Service and return code explanations for HWSC0110W**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCVBB</td>
<td>BPECBGET, the system service used to acquire the CVB.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** CMDC - HWSCMDC0

---

**HWSC0112W  COMMAND PARSER FAILED, COMMAND=hws cmd; R=rc, S=sc, M=mc**

**Explanation:** An error occurred during an attempt to parse the command from the command buffer.

In the message text:
• **hws cmd** identifies the command.
• **rc** identifies the return code.
• **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• **mc** identifies the module issuing the message.

The following table describes the service and return codes for HWSC0112W.

**Table 6. Service and return code explanation for HWSC0112W**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NODATA</td>
<td>No data exists in the command buffer.</td>
<td>40</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>
### Table 6. Service and return code explanation for HWSC012W (continued)

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVCMD</td>
<td>The command verb cmd is not a valid HWS command.</td>
<td>41</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NOPARM</td>
<td>The command requires parameters, but none were specified.</td>
<td>42</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NO2PARM</td>
<td>The second parameter is missing for this command.</td>
<td>43</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>PARM1ERR</td>
<td>The first parameter is incorrect.</td>
<td>44</td>
<td>Correct the syntax.</td>
</tr>
<tr>
<td>PARM2ERR</td>
<td>The second parameter is incorrect.</td>
<td>45</td>
<td>Correct the syntax.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the command buffer is freed and IMS Connect continues to run.

**System programmer response:** Ensure that the correct command is entered. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** CPAR - HWSCPAR0

**HWSC0114W** **COMMAND=hwscmd; R=rc, S=sc, M=mc**

**Explanation:** During an attempt to propagate the command to the next level of command processing, an error is detected. The command is being forwarded to the component that can process it; however, a resource that this command is targeting might not be available.

In the message text:
- `hwscmd` identifies the command.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes:

### Table 7. Service and return code explanation for HWSC0114W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVCMD</td>
<td>The command is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDDCT</td>
<td>The data store communication table cannot be found. This table contains the information that is retrieved from the configuration member HWSCFGxx for each data store defined.</td>
<td>8</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDDST</td>
<td>The data store table cannot be found. This table maintains the activity of a data store.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNSVT</td>
<td>The server table cannot be found. This table maintains the activity of a connected client.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NACTO/C</td>
<td>The open/close thread is not active. The command can only be processed by the open/close controller and the controller is no longer active. IMS Connect could be shutting down.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>BPEGETM</td>
<td>System service used to acquire the response buffer.</td>
<td>4</td>
<td>An incorrect or unsupported subpool is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8</td>
<td>A zero length is requested.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
</tr>
</tbody>
</table>
Table 7. Service and return code explanation for HWSC0114W (continued)

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NFNDCOMP</td>
<td>The component that handles the requested function cannot be found. An HWS component issues an interface call for the service of another component, and the component being requested for service cannot be located.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDFUNC</td>
<td>The requested function cannot be found. An HWS component issues an interface call for the service of another component, and the service being requested cannot be located.</td>
<td>8</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDIMSA</td>
<td>The IMS alias was not found. Check that the IMS alias and the ODBM name you specified are correct.</td>
<td>8</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDINTF</td>
<td>The interface needed to call an IMS Connect component is not available.</td>
<td>4</td>
<td>This is a command processing error. The internal IMS Connect interface is not initialized.</td>
</tr>
<tr>
<td>PORTNACT</td>
<td>A STOPPORT command was issued for an inactive or already stopped PORT.</td>
<td>4</td>
<td>PORT not active.</td>
</tr>
<tr>
<td>PORTINIT</td>
<td>The command is rejected since PORT initialization is still in progress.</td>
<td>4</td>
<td>Enter the command again once the ports are initialized.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the command buffer is freed and the IMS Connect continues to run.

**System programmer response:** Ensure that the correct command is entered. If the service code is NFNDCOMP or NFNDFUNC, this problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** CVBC - HWSCVBC0, DUPD - HWSDUPD0, DUP1 - HWSDUPD1

**HWSC0120W UNABLE TO SEND COMMAND RESPONSE TO HWSHOST; R=rc, S=sc, M=mc**

**Explanation:** An error occurs during an attempt to send the command response back to the system console.

In the message text:
- \( rc \) identifies the return code.
- \( sc \) identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- \( mc \) identifies the module issuing the message.

See the following table for an explanation of service and return codes.
Table 8. Service and return code explanation for HWSC0120W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVLTAG</td>
<td>The command response tag is incorrect. Command response tags represent the types of response that are being sent.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDCOMP</td>
<td>The component that handles the requested function cannot be found. An HWS component issues a call to the call interface for another component's service and the requested component cannot be located.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDFUNC</td>
<td>The requested function cannot be found. An HWS component issues a call to the call interface for another component's service and the requested service cannot be located.</td>
<td>8</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and the command response buffers are freed. IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** CRSP - HWSCRSP0

**HWSC0130I** CLOSEHWS ALREADY IN PROGRESS; M=mc

**Explanation:** IMS Connect is in the process of closing. This message is issued when a CLOSEHWS command is entered more than once.

In the message text:
- mc identifies the module issuing the message.

**System action:** If IMS Connect does not terminate after the CLOSEHWS command is entered, use the VIEWHWS command to determine the status and queues for the data stores and clients. Ensure that no clients are active. If any clients are active, IMS Connect does not terminate. You can issue the IMS Connect command CLOSEHWS FORCE to force IMS Connect to terminate.

**Module:** CHWS - HWSCHWS0

**HWSD0200E** FUNCTION WORK ELEMENT PROCESSING FAILURE, FUNC=func; R=rc, S=sc, M=mc

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
- func identifies the function requested.
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of service and return codes.

Table 9. Service and return code explanation for HWSD0200E

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** DOCC- HWSDOC0, DSCH - HWSDSCH0, DCVC - HWSDCVC0
• *did* identifies the data store.
• *hwscmd* identifies the IMS Connect command in progress.
• *mc* identifies the module issuing the message.

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** The IMS Connect command in progress is terminating the data store; therefore, any new function for that data store cannot be processed.

**Module:** DSCM - HWSDSCM0

---

**HWSD0204W** **COMMAND=hwscmd FAILED FOR DS=did, COMMAND=prev_hwscmd ALREADY IN PROGRESS; M=mc**

**Explanation:** The IMS Connect command entered for the data store, *hwscmd*, cannot be processed because a command for that data store, *prev_hwscmd*, is already in progress.

In the message text:
• *hwscmd* identifies the IMS Connect command that was blocked from being run by *prev_hwscmd*.
• *did* identifies the data store affected by *hwscmd* and *prev_hwscmd*.
• *prev_hwscmd* identifies the IMS Connect command that is blocking *hwscmd* from running.
• *mc* identifies the module issuing the message.

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** The IMS Connect command in progress is terminating the data store; therefore, any new commands cannot be processed. If the IMS Connect command ( hwscmd ) was CLOSEHWS, the IMS Connect terminates after the processing of *prev_hwscmd* completes.

**Module:** DSCM - HWSDSCM0

---

**HWSD0212E** **UNABLE TO START SCHEDULER CONTROLLER; R=rc, S=ssc, M=mc**

**Explanation:** Storage cannot be allocated for the scheduler controller structure, or the scheduler controller thread cannot be scheduled. A scheduler controller is started for each data store that is defined to IMS Connect. The scheduler controller is the controller that schedules the threads associated with a data store.

In the message text:
• *rc* identifies the return code.

• *ssc* identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• *mc* identifies the module issuing the message.

See the following table for an explanation of service and return codes:

**Table 10. Service and return code explanation for HWSD0212E**

<table>
<thead>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** DOCC - HWSDOCC0, DOCM - HWSDOCM0

---

**HWSD0222W UNABLE TO START TRANSMIT/RECEIVE THREADS FOR DS=did; R=rc, S=sc, M=mc**

**Explanation:** Storage cannot be allocated for the transmit or receive thread structure, or either the transmit thread or the receive thread cannot be scheduled. A transmit thread and receive thread are allocated for each data store that is defined for message transmission and reception.

In the message text:
- *did* identifies the data store.
- *rc* identifies the return code.
- *sc* identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- *mc* identifies the module issuing the message.

See the following table for an explanation of service and return codes:

**System action:** This message is issued and IMS Connect continues to run with data stores that can be started.

**System programmer response:** On the subsequent close and startup of IMS Connect, ensure that the region size in the JCL statement is large enough to
accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** DSC1 - HWSDSC10, DSCM - HWSDSCM0

**HWSD0227W**  
**CLOSE FAILED FOR DS=did; R=rc, S=sc, M=mc**

**Explanation:** An attempt to close the named data store is unsuccessful during IMS Connect shutdown.

In the message text:
- *did* identifies the data store.
- *rc* identifies the return code.
- *sc* identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- *mc* identifies the module issuing the message.

See the following table for an explanation of service and return codes.

<td></td>
<td>8</td>
<td>Storage is unavailable to satisfy the request.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Ensure that the correct name is provided in the OPENS or OPENIP command. If you are issuing the OPENIP command, determine if SCI has been initialized. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Support Center. Provide the JCL, SYSLOG, and dump if available.

**Module:** DOC3 - HWSDOC30

**HWSD0230I**  
**type=il ALREADY ACTIVE; R=rc, S=ss, M=mm**

**Explanation:** An OPENS or OPENIP command is issued for a data store or IMSplex that is already active.

In the message text:
- *type* identifies the data store (DS) or IMSplex (IP).
- *id* identifies the data store or IMSplex name.
- *rc* identifies the return code.
- *sc* identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- *mc* identifies the module issuing the message.

See the following table for an explanation of service and return codes:

<td>ACTVDISC</td>
<td>The IMSplex is active, however, it is currently disconnected.</td>
<td>0</td>
<td>The IMSplex is disconnected and remains disconnected until the SCI is started. When the SCI is started, IMS Connect automatically reconnects to the SCI.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Ensure that the correct name is provided in the OPENS or OPENIP command. If you are issuing the OPENIP command, determine if SCI has been initialized. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

A status of ACTIVE means that the data store defined in the configuration file is known to IMS Connect and is either ready to connect, or already connected. A status of CONNECTED or DISCONNECTED, in the output of a VIEWHWS command for the data store, indicates the connection state. A status of NOT ACTIVE means that the status in IMS Connect was changed using the STOPDS command; an OPENS command changes this status. For example:

- **ACTIVE**, as shown in this message, means that the data store control block structure is intact.
- **DISCONNECTED**, as shown in the VIEWHWS output, means that the data store is disconnected from the XCF group. When the data store rejoins the XCF
In the message text:

- **clientid** identifies the TCP/IP client.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

See the following table for an explanation of return and service codes:

<td>4</td>
<td>This is an internal processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. The message whose processing caused the error is discarded.

**System programmer response:** This error can occur when the data store is no longer active or the communication linkage to IMS Connect is broken.

**Module:**
- DOCM - HWSDOCM0
System action: This message is issued and IMS Connect continues to run. The response message is discarded.

System programmer response: This error can occur when the client is no longer active and is not connected to IMS Connect. The client might have logged off, or the connection might have timed out. If the message was placed on the asynchronous hold queue, you can retrieve it by issuing a RESUME TPIPE call.

If the service code is NFNDCOMP or NFNDFUNC, an internal error has probably occurred. Search the problem-reporting databases to find a correction for the problem. If the problem persists, record the return and service codes, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

Module: DREC - HWSDREC0

HWSD0254W • HWSD0270I

</table>

HWSD0255W • RECEIVED A MESSAGE WITH NO USER DATA PREFIX FROM DS=did; TM=member; CLIENT=cn; M=drec

Explanation: IMS Connect received a message that does not include a user data prefix.

In the message text:
- did identifies the data store that sent the message.
- tname identifies the instance of IMS Connect that detected the error.
- cn identifies the client name to which the message was sent.
- mc identifies the module issuing the message.

System action: IMS Connect returns a NACK and the data store reroutes the output to TPIPE HWS$DLQ.

System programmer response: Review the log records of the data store to determine why a user data prefix was not included with the message. TPIPE HWS$DLQ serves as a dead letter queue for invalid messages.

Module: DREC — HWSDREC0

HWSD0260I DS=did tname THREAD TERMINATED; M=mc

Explanation: The data store transmit thread or receive thread has terminated.

In the message text:
- did identifies the data store.
- tname identifies the thread type.
- mc identifies the module issuing the message.

System action: This message is issued when a data store thread has terminated.

Module: DREC - HWSDREC0, DXMT -HWSDXMT0

HWSD0270I OTMA OPEN FAILED; R=rc, M=mc

Explanation: Communication with a data store failed during IMS Connect startup or in response to an IMS Connect OPENDS command and resulted in the failure of the OTMA open function.

In the message text:
- rc identifies the return code.
- mc identifies the module issuing the message.

System action: This message is issued when communication to OTMA fails due to a
communications failure with a data store. See message HWSO1105W or message HWSO1110W for additional information related to this failure.

**System programmer response:** This error can occur when the group and members of IMS OTMA are not correctly defined. Use the IMS Connect VIEWDS or VIEWHWS commands to view the status of the data stores in the system and determine which data stores were not able to be opened. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** DOC1 - HWSDOC10

**Related information:**
- "HWSO1105W" on page 402
- "HWSO1110W" on page 402

---

**HWSD0280I** DATASTORE COMMUNICATION FUNCTION CLOSED; M=mc

**Explanation:** The communication facility for data stores has become inactive.

In the message text:
- *mc* identifies the module issuing the message.

**System action:** This message is issued when all communications with the data stores have terminated and during IMS Connect shutdown.

**Module:** DOC3 - HWSDOC30

---

**HWSD0282I** COMMUNICATION WITH DS=did CLOSED; M=mc

**Explanation:** Communication for the named data store has terminated.

In the message text:
- *did* identifies the data store.
- *mc* identifies the module issuing the message.

**System action:**

HWSDSCL0 - A STOPDS command has successfully completed.

HWSDREC0 - The connection to the named data store has terminated.

This message is issued when a STOPDS command has successfully completed.

**Module:** DSC1 - HWSDSCL0, DREC - HWSDREC0

---

**HWSD0284I** COMMUNICATION WITH DS=did STOPPED; M=mc

**Explanation:** Communication for the named data store has stopped.

In the message text:
- *did* identifies the data store.
- *mc* identifies the module issuing the message.

**System action:** This message is issued when a STOPDS command has successfully completed.

**Module:** DSC1 - HWSDSC10
HWSE3130W • HWSE3155W

HWSE3130W  THE MSC DRIVER FAILED TO OBTAIN STORAGE; R=rc, S=sc, B=bn, M=mc

Explanation: The IMS Connect MSC communications driver was unable to get storage for internal buffers, possibly because not enough storage is available to complete the process.

In the message text:
rc    Return code of the service.
sc    Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. The following codes are BPE storage service codes:
     • BPECBGET
     • BPEGETM
bn    Buffer name.
mc    Module issuing the message.

Possible cause: Not enough storage is available to complete the process.

System action: This message is issued and IMS Connect continues to run normally. If the failure to obtain storage results in a communications error, additional error messages are issued.

System programmer response: If the error is related to a BPE service, look up the return code for the BPE service listed in the message. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: IXMT – HWSIDXMT; IXOT - HWSIDXOT

Related reference:
BPE codes (Messages and Codes)

HWSE3135W  THE MSC DRIVER FAILED TO RELEASE STORAGE; R=rc, S=sc, B=bn, A=sa, M=mc

Explanation: The IMS Connect MSC communications driver was unable to release storage for internal buffers.

In the message text:
rc    The return code of the service.
sc    The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
bn    The buffer name.
a     The buffer address.
mc    The module issuing the message.

System action: This message is issued and IMS Connect continues to run normally.

System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: IXRC - HWSIDXRC

HWSE3155W  MSC IS NOT AVAILABLE: MEMBER=mbrname; STATE=s, M=mc

Explanation: IMS Connect attempted to send an MSC message to the IMS system identified by MEMBER in the message text, but the attempt failed because the IMS system is unavailable. In the message text, the value of STATE identifies the reason the IMS system is unavailable.

In the message text:

mbrname   The name of the MSC-enabled IMS system in the IMSplex.
s     The status of the IMS system. The possible values for s include:
     • DISC   Communications between IMS Connect and MSC have been stopped in IMS Connect by a command.
     • TERM   The IMS system identified in the message text by mbrname is down.
mc    The module issuing the message.

System action: IMS Connect issues a negative response (NAK) to the sender. This message is issued and IMS Connect continues to run.

System programmer response: If the state is DISC, MSC communications must be restarted in IMS Connect. You can restart MSC communications by issuing any one of the following IMS Connect commands:
     • The IMS type-2 command UPDATE IMSCON TYPE(MSC)
     • The WTOR command STARTMSC
     • The z/OS MODIFY command UPDATE MSC

If the state is TERM, the IMS system identified in the message text must be restarted.

Module: IXMT – HWSIDXMT

Related reference:
UPDATE IMSCON TYPE(MSC) command (Commands)
STARTMSC command (Commands)
IMS Connect UPDATE MSC command (Commands)
**HWSF3300I** COMMUNICATIONS ON MSC PHYSICAL LINK lclplkid STARTED; M=mc

**Explanation:** Multiple Systems Coupling (MSC) communications has been established with IMS for the stated MSC physical link. This message is issued during IMS Connect startup or at the successful completion of the following IMS Connect commands:

- The IMS type-2 command UPDATE IMSCON TYPE(MSC) START(COMM)
- The WTOR command STARTMSC
- The z/OS MODIFY command UPDATE MSC START(COMM)

In the message text:

- **lclplkid** The MSC physical link ID, as defined to IMS Connect on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member.
- **mc** The module issuing the message.

**System action:** MSC communications has been established with IMS for the stated MSC physical link. IMS Connect continues to run normally.

**System programmer response:** No action is required.

**Module:** ISC1 – HWSISC10

---

**HWSF3305I** COMMUNICATIONS ON MSC PHYSICAL LINK lclplkid STOPPED; M=mc

**Explanation:** Communications with IMS on the Multiple Systems Coupling (MSC) physical link that is identified in the message has been stopped.

In the message text:

- **lclplkid** The ID of the MSC physical link, as defined to IMS Connect on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member.
- **mc** The module issuing the message.

**Possible cause:** A CLOSEHWS or similar command might have shut down IMS Connect, or one of the following commands might have stopped MSC communications on the MSC physical link:

- The IMS type-2 command UPDATE IMSCON TYPE(MSC) STOP(COMM)
- The WTOR command STOPMSC
- The z/OS MODIFY command UPDATE MSC STOP(COMM)

**System action:** MSC communications has stopped with IMS for the stated MSC physical link.

**System programmer response:** No action is required.

To resume MSC communication with IMS for the MSC physical link, you can issue any one of the following IMS Connect commands:

- The IMS type-2 command UPDATE IMSCON TYPE(MSC) START(COMM)
- The WTOR command STARTMSC
- The z/OS MODIFY command UPDATE MSC START(COMM)

**Module:** DSCM - HWSDSCM0

---

**HWSF3310I** LOGICAL LINK msclink TERMINATED; MSC=lclplkid, M=mc

**Explanation:** An IMS Connect command has stopped the Multiple Systems Coupling (MSC) logical link on the MSC physical link. All communications on the logical link are stopped and the control blocks and storage used by the logical link are released.

The following IMS Connect commands can stop an MSC logical link:

- The IMS type-2 command UPDATE IMSCON TYPE(LINK)
- The WTOR command STOPLINK
- The z/OS MODIFY command DELETE LINK
- The IMS type-2 command UPDATE IMSCON TYPE(LINK)

In the message text:

- **msclink** Identifies the MSC logical link that was stopped.
- **lclplkid** Identifies both the MSC physical link that the logical link was assigned to and the MSC statement in the IMS Connect configuration member that defines the MSC physical link to IMS Connect.
- **mc** Identifies the module that issued the message.

**System action:** IMS Connect releases the logical link control blocks and storage and continues to run normally.

**User response:** No action is required.

**Module:** ISC2 – HWSISC20

---

**HWSF3315E** COMMUNICATIONS WITH MSC FAILED TO OPEN BECAUSE IMS CONNECT IS NOT CONNECTED TO AN IMSPLEX; M=mc

**Explanation:** IMS Connect attempted to establish Multiple Systems Coupling (MSC) communications with IMS, but could not because IMS Connect is not a registered member of an IMSPlex. This failure is most likely to occur during IMS Connect startup, but can occur at any time if the IMS Connect system to which the IMSplex is connected is not operational.
also occur after a STARTMSC command has been issued.

In the message text:

- **mc**: The module that issued the message.

**Possible cause:** An IMSplex statement is not correctly specified in the IMS Connect configuration PROCLIB member, or an instance of the CSL Structured Call Interface (SCI) is not available.

**System action:** This message is issued and IMS Connect continues to run, but cannot route MSC messages to IMS systems.

**System programmer response:** If MSC communications failed to start because an instance of SCI is not available, start an instance of SCI in the IMSplex that is specified on the IMSPLEX statement in the IMS Connect configuration PROCLIB member.

If MSC communication failed to start when an instance of SCI was running, check that the IMSplex name specified on the IMSPLEX= substatement of the MSC statement in the IMS Connect configuration PROCLIB member matches the name of the IMSplex in which SCI is running. You can use the IMS type-2 command QUERY IMSPLEX to determine the names of the SCI instances available to IMS Connect.

If the IMSplex names do not match, correct the IMSplex name in the IMS Connect configuration member and restart IMS Connect.

| Module: IXOT – HWSIDXOT, IOC1 – HWSIOC10 |

- [QUERY IMSPLEX command (Commands)](HWSF3330W)
System action: This message is issued and IMS Connect continues to run. IMS Connect issues a negative response to the sending IMS.

System programmer response: Check the availability of the remote IMS Connect. If the remote IMS Connect is available, check the parameter specifications in the RMTIMSCON statement.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: IREC – HWSIREC0

Related reference:

HWSF3345W UNABLE TO NOTIFY MSC=1clplkid SCHEDULER OF COMMUNICATION ERROR: R=-rc, S=-sc, M=-mc

Explanation: An error occurred while IMS Connect was sending an MSC message from a remote IMS system to the local IMS system. IMS Connect tried to notify the remote IMS Connect of the error, but could not because another error occurred.

In the message text:
- \textit{clientid}: The client ID of the remote IMS Connect that sent the MSC message that could not be delivered.
- \textit{rc}: The return code of the service.
- \textit{sc}: The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. The following codes are storage services:
  - \textit{mc}: The module issuing the message.

System action: This message is issued and IMS Connect continues to run.
System action: This message is issued and IMS Connect continues to run.

System programmer response: If the problem is service code GETFWEB, ensure that the region size for IMS Connect is large enough.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: IXMT – HWSIXMT0

HWSF3355E SHUT DOWN WAS REQUESTED FOR MSC LOGICAL LINK OF partnerid BUT THE LINK CANNOT BE FOUND; M=mc

Explanation: IMS Connect received from IMS an MSC shutdown directive message for the logical link identified by partnerid, but IMS Connect could not find an MSC logical link with that partner ID.

In the message text:

partnerid
The partner ID of the MSC logical link as received by IMS Connect in the shutdown directive from the IMS system.

mc
The module issuing the message.

Possible cause: A STOPLINK or similar IMS Connect command might have deleted the link at approximately the same time as the link was shut down in IMS.

System action: This message is issued and IMS Connect continues to run.

System programmer response: No action is required.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: IREC – HWSIREC0

HWSF3360I THE threadtype THREAD TERMINATED FOR MSC PHYSICAL LINK lclplkid; M=mc

Explanation: An MSC physical link transmit thread or receive thread has terminated.

In the message text:

lclplkid
The ID of the MSC physical link through which IMS Connect could not deliver the message to the local IMS system. The lclplkid value is specified on the LCLPLKID parameter of the MSC statement.

threadtype
The type of thread that terminated.

RECEIVE
A receive thread

mc
The module issuing the message.

Possible cause: IMS Connect was unable to send an MSC message to IMS on the MSC physical link that is identified in the message text by the lclplkid value.

System action: This message is issued and IMS Connect continues to run; however, IMS Connect cannot process MSC messages on the named MSC physical link.

System programmer response: If the thread terminated because of a communications error, look for other IMS Connect error messages to determine the cause of the error.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: IREC – HWSIREC0, IXMT – HWSIXMT0

HWSF3365E UNABLE TO SEND MESSAGE TO MSC ON lclplkid; C=clientid; P=portid, PARTNER=partnerid, R=rc, S=ss, M=mc

Explanation: IMS Connect was unable to send an MSC message to IMS on the MSC physical link that is identified in the message text by the lclplkid value.

In the message text:

lclplkid
The ID of the MSC physical link through which IMS Connect could not deliver the message to the local IMS system. The lclplkid value is specified on the LCLPLKID parameter of the MSC statement.

clientid
The client ID that identifies the receive socket on which the failed message was received. This ID is generated by the remote IMS Connect instance.

portid
The receiving port ID.

partnerid
The partner ID of the MSC logical link.

rc
The return code of the service.

ss
The service code. Service codes can contain either codes that more specifically identify the error, or codes that are returned by called services that failed the request.

mc
The module that issued the message.

Table 19. Service and return code explanation for HWSF3365E

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPEGETM</td>
<td>The get storage service failed.</td>
<td>BPEGETM</td>
<td>A storage error occurred while the service was trying to send an MSC message to IMS.</td>
</tr>
</tbody>
</table>
Table 19. Service and return code explanation for HWSF3365E (continued)

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>HWSFSTOR</td>
<td>The release storage service failed.</td>
<td>Return code that is issued by HWSFSTOR service. The HWSFSTOR service might be a BPE release storage service or an MVS release storage service.</td>
<td>A storage error occurred while the service was trying to send an MSC message to IMS.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

If the failed message was an MSC transaction or response message from a remote IMS Connect instance, IMS Connect tries to return an error message to the remote IMS Connect instance.

If the failed message was an error message from a remote IMS Connect instance, IMS Connect discards the message.

**System programmer response:** If a get storage error occurred, ensure that the region size specified in the JCL statement is large enough to accommodate the IMS Connect region.

If the error is related to a BPE service, look up the return code for the BPE service that is listed in the message.

If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

If a release storage error occurred, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** IXMT – HWSIXMT0

**Related reference:**

[SLSMSG: send message request (System Programming APIs)]

---

HWSF3370E IMS CONNECT WAS UNABLE TO NOTIFY IMS THAT MSC PHYSICAL LINK lclplkid STOPPED; R=rc, S=sc, M=mc

**Explanation:** In the message text:

- `lclplkid` The MSC physical link ID, as defined to IMS Connect on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member.
- `rc` The CSLCMSG return code that was passed to IMS Connect from MSC.
- `sc` The service code. The service code MSCMSC indicates an MSC-level directive.
- `mc` The module issuing the message.

**Possible cause:** The likeliest cause is that SCI is unavailable.

**System action:** This message is issued and IMS Connect continues to run normally.

If SCI is unavailable, MSC cannot send messages to IMS Connect. If this message was triggered by a different error and IMS Connect receives additional messages for the link, IMS Connect attempts to issue another error message to IMS.

**System programmer response:** No action is required.

**Module:** IXMT – HWSIXMT0

**Related reference:**

[BPE codes (Messages and Codes)]

---

HWSF3375E IMS CONNECT WAS UNABLE TO NOTIFY IMS THAT MSC LOGICAL LINK logicallink STOPPED; R=rc, S=sc, M=mc

**Explanation:** IMS Connect failed to send a notification to IMS indicating that the multiple systems coupling (MSC) logical link `logicallink` has been stopped.

In the message text:

- `logicallink` The MSC logical link name.
- `rc` The CSLCMSG return code that was passed to IMS Connect from MSC.
- `sc` The service code. The service code MSCLINK indicates an MSC link-level directive.
- `mc` The module issuing the message.

**Possible cause:** The likeliest cause is that SCI is unavailable.

**System action:** This message is issued and IMS Connect continues to run normally.

If SCI is unavailable, MSC cannot send messages to IMS Connect. If this message was triggered by a different error and IMS Connect receives additional messages for the link, IMS Connect attempts to issue another error message to IMS.

**System programmer response:** No action is required.

**Module:** IXMT – HWSIXMT0

Chapter 12. HWS messages (IMS Connect) 367
HWSF3400E • HWSG4010I

HWSF3400E FUNCTION WORK ELEMENT PROCESSING FAILED, FUNC=fun; R=rc, S=sr, M=mc

Explanation: The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:

fun  The function requested.
rc  The return code of the service.
sr  The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc  The module issuing the message.

Table 20. Service and return code explanation for HWSF3400E

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

System action: This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

System programmer response: This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Support Center. Provide the JCL, SYSLOG, and dump if available.

Module: ISCH – HWSISCH0

HWSF3405W PROCESS OF STOPPING MSC LOGICAL OR PHYSICAL LINK FAILED BECAUSE MSC=isclplkid IS IN DISCONNECT STATE; M=mc

Explanation: IMS Connect failed to stop the MSC logical or physical link because the MSC physical link is already disconnected.

In the message text:
isclplkid  The MSC physical link ID, as defined to IMS Connect on the LCLPLKID parameter of the MSC statement in the IMS Connect configuration member.
mc  The module issuing the message.

Possible cause: SCI or IMS is unavailable or an IMS Connect command such as STOPPIP has been issued to stop communications with the IMSplex.

System action: The message is issued and the process of stopping MSC logical or physical link is ignored.

System programmer response: No action is required.

Module: ISCH – HWSISCH0

HWSG4001I COMMUNICATIONS ON ISC LINK isclnkid STARTED; M=mc

Explanation: The Intersystem Communication (ISC) link has been started with IMS for the ISC link. This message is issued during IMS Connect startup or at the successful completion of the IMS type-2 command UPDATE IMSCON TYPE(ISC) START(COMM).

In the message text:
isclnkid  The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
mc  The module issuing the message.

System action: ISC communications has been established with IMS for the stated ISC link. IMS Connect continues to run normally.

System programmer response: No action is required.

Module: JSC1 - HWSJSC10

HWSG40051I COMMUNICATIONS ON ISC LINK isclnkid STOPPED; M=mc

Explanation: The Intersystem Communication (ISC) link with IMS has been stopped.

In the message text:
isclnkid  The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
mc  The module issuing the message.

Possible cause: A CLOSEHWS or similar command might have shut down IMS Connect, or the IMS type-2 command UPDATE IMSCON TYPE(ISC) STOP(COMM) might have stopped communications on the ISC link.

System action: ISC communications has stopped with IMS for the stated ISC link.

System programmer response: No action is required.

Module: DSCM – HWSDSCM0

HWSG4010I ISCUSER sessn_id TERMINATED; ISC=isclnkid, M=mc

Explanation: An IMS Connect command has stopped the ISC parallel session (ISCUSER) on the ISC link. All communications on the parallel session are stopped and the control blocks and storage used by the parallel session are released.

A parallel session can be stopped by the IMS type-2 command UPDATE IMSCON TYPE(ISCUSER) STOP(COMM).
In the message text:

- **ischnkid** The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
- **mc** The module that issued the message.
- **sessn_id** The ISCUSER ID of the ISC parallel session that was terminated.

**System action:** IMS Connect releases the control blocks and storage that were used by the parallel session and continues to run normally.

**User response:** No action is required.

**Module:** JSC20 – HWSJSC20

**Related reference:** UPDATE IMSCON commands (Commands)

---

**HWSG4015E COMMUNICATIONS ON ISC LINK**

**ischnkid FAILED TO OPEN; IMS CONNECT IS NOT CONNECTED TO AN IMSPLEX; M=mc**

**Explanation:** IMS Connect attempted to establish Intersystem Communication (ISC) with IMS, but could not because IMS Connect is not a registered member of an IMSplex. This failure is most likely to occur during IMS Connect startup, but can also occur after a type-2 UPDATE IMSCON TYPE(ISC) START(COMM) command has been issued.

In the message text:

- **ischnkid** The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
- **mc** The module that issued the message.

**Possible cause:** An IMSplex statement is not correctly specified in the IMS Connect configuration PROCLIB member, or an instance of the CSL Structured Call Interface (SCI) is not available.

**System action:** This message is issued and IMS Connect continues to run, but cannot route ISC messages to IMS systems.

**System programmer response:** If ISC communications failed to start because an instance of SCI is not available, start an instance of SCI in the IMSplex that is specified on the IMSPLEX statement in the IMS Connect configuration PROCLIB member.

If ISC communication failed to start when an instance of SCI was running, check that the IMSplex name specified on the IMSPLEX= substatement of the ISC statement in the IMS Connect configuration PROCLIB member matches the name of the IMSplex in which SCI is running. You can use the IMS type-2 command QUERY IMSPLEX to determine the names of the SCI instances available to IMS Connect.

If the IMSplex names do not match, correct the IMSplex name in the IMS Connect configuration member and restart IMS Connect.

**Module:** JXOT – HWSJDXOT, JOC1 – HWSJOC10

---

**HWSG4020W**

**FWE FUNCTION=func FAILED FOR ISC=ischnkid, COMMAND=hwscmd IN PROGRESS; M=mc**

**Explanation:** The function **func** cannot be processed because the command identified by **hwscmd** is already being processed.

In the message text:

- **func** Identifies the function requested.
- **ischnkid** Identifies the ISC configuration statement that defines the ISC link to IMS Connect.
- **hwscmd** Identifies the IMS Connect command in progress.
- **mc** Identifies the module issuing the message.

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** The IMS Connect command in progress is terminating the data store. Therefore, any new function for that data store cannot be processed.

**Module:** DSCM – HWSDSCM0

---

**HWSG4025W**

**COMMAND=hwscmd FAILED FOR ISC=ischnkid, COMMAND=prev_hwscmd ALREADY IN PROGRESS; M=mc**

**Explanation:** The IMS Connect command entered for the ISC link, **ischnkid**, cannot be processed because a command for that ISC link, **prev_hwscmd**, is already in progress.

In the message text:

- **hwscmd** The IMS Connect command that was blocked from being run by **prev_hwscmd**
- **ischnkid** The ID of the ISC configuration statement that defines the ISC link that is affected by **hwscmd** and **prev_hwscmd**
- **prev_hwscmd** The IMS Connect command that is blocking **hwscmd** from running
- **mc** The module issuing the message

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** The IMS Connect command in progress is terminating the ISC link; therefore, any new commands cannot be processed. If the IMS Connect command (**hwscmd**) was CLOSEHWS, the IMS Connect terminates after the processing of **prev_hwscmd** completes.
**HWSG4030W** THE ISC COMMUNICATIONS
COMPONENT FAILED TO OBTAIN STORAGE; \(R = rc\), \(S = sc\), \(B = bn\), \(M = mc\)

**Explanation:** IMS Connect ISC communications component was unable to get storage for internal buffers, possibly because not enough storage is available to complete the process.

In the message text:
- **rc** Return code issued by the service identified by \(sc\) in the message text.
- **sc** Service code. This is the name of the service, which is usually a BPE service. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **bn** Buffer name.
- **mc** Module issuing the message.

**Possible cause:** Not enough storage is available to complete the process.

**System action:** This message is issued, IMS is notified, and IMS Connect continues to run. The requested message in progress is discarded.

**System programmer response:** Ensure that the region size for IMS Connect is large enough.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** JREC – HWSJREC0, JSC2 - HWSJSC20

**HWSG4040W** SEND FAILED FROM ISC=ischlkid TO NODE=nodename ON RMTCICS=rmtcicsid; \(R = rc\), \(S = sc\), \(M = mc\)

See the following table for an explanation of service and return codes:

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETFWEB</td>
<td>BPECBGET service was unable to create an FWEB control block.</td>
<td>(rc)</td>
<td>(rc) indicates the return code from the BPECBGET service. Check storage available.</td>
</tr>
<tr>
<td>GETSSTB</td>
<td>BPECBGET service was unable to create an SSTB control block.</td>
<td>4</td>
<td>Check storage available.</td>
</tr>
<tr>
<td>INVLFUNC</td>
<td>An internal FWE request contained an invalid function code.</td>
<td>8</td>
<td>This is an internal processing error.</td>
</tr>
<tr>
<td>NFNDRCIC</td>
<td>The ISC datastore processing the message from IMS defined an invalid RMTCICS destination. The RMTCICS could not be found.</td>
<td>4</td>
<td>Verify the RMTCICS= specified in the ISC statement in the IMS Connect configuration.</td>
</tr>
</tbody>
</table>

**Explanation:** IMS Connect was unable to send a message to the remote CICS subsystem that is defined to IMS Connect by the RMTCICS statement \(rmtcicsid\).

IMS Connect received the message for delivery from the local IMS system on the ISC link that is defined to IMS Connect by the ISC statement \(ischlkid\).

In the message text:
- **ischlkid** The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
- **nodename** The name of the destination ISC node, as defined on both the NODE parameter of the ISC configuration statement and the APPLID= parameter on the DFHSIT macro definition of the target CICS subsystem.

In the local IMS system, for statically defined terminals, this value is also defined on the NAME parameter of the TERMINAL system definition macro and the ISCTCPIP parameter in the DFSDCxxx PROCLIB member.

- **rmtcicsid** The ID of the RMTCICS statement that defines to IMS Connect attributes of the connection to the remote CICS subsystem.
- **rc** The return code of the service.
- **sc** The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. See the following table for an explanation of the possible return codes.
- **bn** Buffer name.
- **mc** Module issuing the message.

**Possible cause:** This error can occur if the remote CICS subsystem is no longer available or if parameters are incorrectly specified in the IMS Connect configuration member in the IMS.PROCLIB data set.
### Table 21. Service and return code explanation for HWSV4840W (continued)

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>

<td>The send client that was to be used to send the ISC message to CICS is in the process of being stopped.</td>
<td>4</td>
<td>The ISC parallel session is terminated. The session must be reestablished from IMS (/OPNDST command) or from CICS.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect issues a negative response to the sending IMS system and terminates the session. This message is issued and IMS Connect continues to run.

**System programmer response:** Check the availability of the remote CICS subsystem. If the remote CICS subsystem is available, check the parameter specifications in the RMTCICS statement. If the error is related to a BPE service, look up the return code for the BPE service listed in the message. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** JREC – HWSJREC0

**Related reference:**
- [HWSCFGxx member of the IMS PROCLIB data set](#)
- [System Definition](#)
- [BPE codes (Messages and Codes)](#)

**HWSG4045W**

**Explanation:** An error occurred that prevented IMS Connect from sending a notification to the scheduler controller for the Intersystem Communication (ISC) link identified in the message. The service code, identified by sc in the message text, describes the error.

IMS Connect was attempting to notify the scheduler controller of a prior error that occurred while IMS Connect was receiving an ISC message from the local IMS system.

In the message text:
- **iscnkid** The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
- **rc** The return code of the service.
- **sc** The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. The following codes are storage services:
  - **mc** The module issuing the message.

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** If the problem is service code GETFWEB, ensure that the region size for IMS Connect is large enough.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

- BPE codes (Messages and Codes)

---

**HWG4060I** THE threadtype THREAD TERMINATED
FOR ISC LINK isclnkid; M=mc

**Explanation:** An ISC link transmit thread or receive thread has terminated.

In the message text:
- **isclnkid**: The ID of the ISC configuration statement that defines the ISC link associated with the thread. The ID of the link is specified on the ID parameter of the ISC parameter of the ISC statement in the IMS Connect configuration member in the IMS.PROCLIB data set.
- **threadtype**: The type of thread that terminated.
  - **RECEIVE**: A receive thread
  - **TRANSMIT**: A transmit thread
- **mc**: The module issuing the message.

**Possible cause:** IMS Connect is shutting down or an IMS type-2 command UPDATE IMSCON TYPE(ISC) STOP(COMM) was issued. If another type of communications error occurred, other error messages are issued.

**System action:** This message is issued and IMS Connect continues to run; however, IMS Connect cannot process ISC messages on the named ISC link.

**System programmer response:** If the thread terminated because of a communications error, look for other IMS Connect error messages to determine the cause of the error.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** JREC – HWS|JRECO, JXMT – HWS|JXMT0

---

**HWG4065E** UNABLE TO SEND MESSAGE TO ISC
ON isclnkid; C=clientid; P=portid,
ISCUSER=sssn_id, R=rc, S=sc, M=mc

**Explanation:** IMS Connect was unable to send an ISC message to IMS on the ISC link that is identified in the message text by the isclnkid value.

In the message text:
- **isclnkid**: The ID of the ISC link through which IMS Connect could not deliver the message to the local IMS system. The isclnkid value is specified on the ID parameter of the ISC statement.
- **clientid**: The client ID that identifies the receive socket on which the failed message was received.

This ID is generated by IMS Connect.
- **rc**: The return code of the service.
- **sc**: The service code. Service codes can contain either codes that more specifically identify the error, or codes that are returned by called services that failed the request.
- **portid**: The receiving port ID.
- **sssn_id**: The ISCUSER ID of the ISC parallel session.
- **mc**: The module that issued the message.

**Table 23. Service and return code explanation for HWG4065E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NISC</td>
<td>ISC is disconnected</td>
<td>4</td>
<td>The message could not be sent to IMS because the ISC link was stopped, the IMSplex was stopped, or SCI or the IMS system is unavailable. The message is discarded, and the parallel session is terminated.</td>
</tr>
<tr>
<td>NOISCUSR</td>
<td>No ISCUSER exists.</td>
<td>4</td>
<td>The ISC parallel session was terminated before this message could be sent to IMS. The message is discarded.</td>
</tr>
<tr>
<td>SCIF</td>
<td>CSLSCMSG failed.</td>
<td>A reason code that is issued by the CSLSCMSG service.</td>
<td>IMS Connect attempted to send the message to IMS, but the CSLSCMSG service returned an error. The reason code from the service is displayed as the return code in the message.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

IMS Connect discards the message. If the ISC parallel session is still active, then the session is terminated.

**System programmer response:** If the error is related to an unavailable ISCUSER or ISC, determine the status of the ISCUSER or ISC and, if appropriate, start them.

If the error is related to a CSL service, look up the reason code for the CSL service that is listed in the message.

**Module:** JXMT – HWS|JXMT0

Related reference:

- QUERY IMSCON TYPE(ISC) command (Commands)
- QUERY IMSCON TYPE(ISCUSER) command (Commands)
**HWSG4080W**  SEND FAILED FROM ISC=ischenkid TO 
NODE=nodename ON 
CICSPORT=port_id; R=rc, S=sc, M=mc

**Explanation:** IMS Connect was unable to send a message to a CICS subsystem on the locally defined CICSPORT port_id. The CICSPORT is used to receive transaction messages and data replies from CICS. The message that IMS Connect was unable to send was probably an ACK or a NAK response to a prior message that was sent by CICS. IMS Connect attempted to send the message on the ISC link isclnkid.

In the message text:
ischenkid  The ID of the ISC configuration statement that defines the ISC link to IMS Connect.
mc  The module that issued the message.
nodename  The name of the destination ISC node, as defined on both the NODE parameter of the ISC configuration statement and the APPLID= parameter on the DFHSIT macro definition of the target CICS subsystem.
port_id  The port number, as defined on the CICSPORT parameter in both the ISC and TCPIP configuration statements.
rc  The return code of the service.
sc  The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

**Possible cause:** This error can occur if the remote CICS subsystem is no longer available or if parameters are incorrectly specified in the IMS Connect configuration member in the IMS.PROCLIB data set.

**System action:** This message is issued and IMS Connect continues to run. IMS Connect issues a negative response to the sending IMS.

**System programmer response:** Check the availability of the remote CICS subsystem. If the remote CICS subsystem is available, check the parameter specifications in the RMTCICS statement.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** JREC – HWSJREC0

**Related reference:**

- ISC statement (System Definition)
- TCPIP statement (System Definition)

---

**HWSG4100E**  FUNCTION WORK ELEMENT 
PROCESSING FAILED, FUNC=fn; R=rc, S=sc, M=mc

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
fn  The function requested.
rc  The return code of the service.
sc  The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc  The module issuing the message.

**Table 24. Service and return code explanation for HWSG4100E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Support Center. Provide the JCL, SYSLOG, and dump if available.

**Module:** JSCH – HWSJSCH0

---

**HWSG4105W**  PROCESS OF STOPPING ISC LINK 
OR ISCUSER FAILED, ISC=ischenkid IS IN DISCONNECT STATE; M=mc

**Explanation:** IMS Connect failed to stop the ISC link or parallel session because the ISC link is already disconnected.

In the message text:
ischenkid  The ISC link ID, as defined to IMS Connect on the ID parameter of the ISC statement in the IMS Connect configuration member.
mc  The module issuing the message.

**Possible cause:** SCI or IMS is unavailable, or an IMS Connect command such as STOPIP has been issued to stop communications with the IMSplex.

**System action:** The message is issued and the process of stopping MSC logical or physical link is ignored.

**System programmer response:** No action is required.
HWSG4230W • HWSG4255W

Module: JSCH – HWSJSC0

HWSG4230W  THE ISC DRIVER FAILED TO
        OBTAIN STORAGE; R=r, S=ss, B=bn,
        M=mc

Explanation: The IMS Connect ISC communications
driver was unable to get storage for internal buffers,
possibly because not enough storage is available to
complete the process.

In the message text:
- rc Return code of the service.
- sc Service code. Service codes can contain either
codes that more specifically identify the error,
or codes returned by called services that failed
the request. The following codes are BPE
storage service codes:
  - BPECBGET
  - BPEGETM
- bn Buffer name.
- mc Module issuing the message.

Possible cause: Not enough storage is available to
complete the process.

System action: This message is issued and IMS
Connect continues to run normally.

System programmer response: This problem is
probably an internal error. Search the
problem-reporting databases to find a correction for the
problem. If none exists, contact IBM Software Support.
Provide the JCL, SYSLOG, and dump if available.

Module: JXOT - HWSJOTXOT

HWSG4235W  THE ISC DRIVER FAILED TO
        RELEASE STORAGE; R=r, S=ss, B=bn,
        A=at, M=mc

Explanation: The IMS Connect ISC communications
driver was unable to release storage for internal
buffers.

In the message text:
- rc The return code of the service.
- sc The service code. Service codes can contain
  either codes that more specifically identify the
  error, or codes returned by called services that
  failed the request.

bn The buffer name.

System action: This message is issued and IMS
Connect continues to run normally.

System programmer response: This problem is
probably an internal error. Search the
problem-reporting databases to find a correction for the
problem. If none exists, contact IBM Software Support.
Provide the JCL, SYSLOG, and dump if available.

Module: JXCN - HWSJDXCN, JXRC – HWSJ DXGI

HWSG4255W  ISC IS NOT AVAILABLE:
        MEMBER=mbrname; STATE=s, M=mc

Explanation: IMS Connect attempted to send an ISC
message to the IMS system identified by MEMBER in
the message text, but the attempt failed because the
IMS system is unavailable. In the message text, the
value of STATE identifies the reason the IMS system is
unavailable.

In the message text:
- mbrname The name of the ISC-enabled IMS system in
  the IMSplex.
- s The status of the IMS system. The possible
  values for s include:
  - DISC Communications between IMS
    Connect and ISC have been stopped
    in IMS Connect by a command.
  - TERM The IMS system identified in the
    message text by mbrname is down.
- mc The module issuing the message.

System action: IMS Connect issues a negative
response (NAK) to the sender. This message is issued
and IMS Connect continues to run.

System programmer response: If the state is DISC,
ISC communications must be restarted in IMS Connect.
You can restart ISC communications by issuing the IMS
type-2 command UPDATE IMSCON TYPE(ISC).

If the state is TERM, the IMS system identified in the
message text must be restarted.

Module: JXMT – HWSJDXMT, JXR – HWSJ DXRC

Related reference:
- [UPDATE IMSCON TYPE(ISC) command](Commands)

HWS messages HWSI0001-HWSK3500

This topic contains the following messages:
HWSI1601W F A I L E D  T O  R E L E A S E  S T O R A G E ;  R = r c ,   B = b n ,  A = a ,  M = m c

Explanation: The IMS Connect IMSplex driver is unable to release storage for internal buffers.

In the message text:
rc Identifies the return code.
bn Identifies the buffer name.
a Identifies the buffer address.
mc Identifies the module that issued this message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: OXMT HWSOMXMT

HWSI1605W  G E T M A I N  F O R  O T O K E N  A N D  R E G I S T R A T I O N  C O N T R O L  B U F F E R  F A I L E D ;  R = r c ,  S = s c ,  M = m c

Explanation: Storage for the OTOKEN buffer could not be allocated.
• rc identifies the return code.
• sc identifies the service code. Service codes contain codes that more specifically identify the error, or codes returned by called services that failed the request.
• mc identifies the module issuing the message.

The following table describes the return codes for the HWSI1605W message. The service code is GETOTOKEN, and BPEGETM is the system service that is used to acquire the OTOKEN.

Table 25. Return codes for HWSI1605W

<table>
<thead>
<tr>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>An incorrect or unsupported subpool is specified.</td>
</tr>
<tr>
<td>8</td>
<td>A zero length is requested.</td>
</tr>
<tr>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run.

System programmer response: This error is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support.

Provide JCL, SYSLOG, and a dump if one is available.

Module: OXMT HWSOMXMT

HWSI1615W  S C I  F U N C = f u n c t i o n ,  E R R O R  F O R  I M S P L E X  E N V I R O N M E N T ;  D S = i p i d ,   R = r c ,  S = s c ,  M = m c

Explanation: The function of an SCI call terminated in error for the named IMSplex.
• ipid identifies the IMSplex.
• rc identifies the return code.
• sc identifies the SCI service code. Service code contains codes that identify specific errors or codes returned by called services that failed the request.
• mc identifies the module issuing the message.

System action: This message is issued when a transmit or receive to or from IMSplex occurs. The connection will be lost.

Module: OXMT HWSOMXMT, OMXRC HWSOMXRC

HWSI1618W  S C I  I S  N O T  E X E C U T I N G ,  F O R  I M S P L E X = n a m e ,  D S = i p i d ,   R = r c ,  S = s c ,  M = m c

Explanation: The IMS command request sent to the IMS OM was rejected.
• ipid identifies the IMSplex
• rc identifies the return code
• sc identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
• mc identifies the module issuing the message.

See the following table for an explanation of the service and return codes.

Table 26. Service and return code explanation for HWSI1618W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCI reason</td>
<td>X'01nnnnnn'</td>
<td>SCI return code.</td>
</tr>
<tr>
<td>OM reason</td>
<td>X'02nnnnnn'</td>
<td>OM return code.</td>
</tr>
</tbody>
</table>

For more information about SCI and OM return and reason codes, see the CSL codes information.

System action: This message is issued and IMS Connect continues to run.

System programmer response: An SCI request has been rejected. The SCI has been terminated by means other than an IMS Connect STOPIP command. If the return code is X'01nnnnnn', SCI needs to be restarted. If the return code is X'02nnnnnn', OM needs to be restarted.

Module: OXMT HWSOMXMT

Related reference:
HWSI1619W OM IS NOT ACTIVE FOR IMSPLEX=ipid, R=rc, S=sc, M=mc

Explanation: The SCI interface has rejected the request. Operation Manager (OM) is not active.
- ipid identifies the IMSplex
- rc identifies the return code
- sc identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

The following table provides an explanation of service and return codes:

<table>
<thead>
<tr>
<th>Service code</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>SCI reason code</td>
<td>X'01nnnnnn'</td>
<td>SCI return code</td>
</tr>
<tr>
<td>OM reason code</td>
<td>X'02nnnnnn'</td>
<td>OM return code</td>
</tr>
</tbody>
</table>

See the CSL codes information for more information about SCI and OM return and reason codes.

System action: This message is issued and IMS Connect continues to run.

System programmer response: An SCI request has been rejected. OM has rejected the command. The command structure is invalid. Correct the command structure and retry the command.

Module: OMXM HWSOMXMT

Related reference:

HWSI1650I COMMAND REGISTRATION SUCCESSFUL FOR IMSPLEX=imsplex; M=mc

Explanation: IMS Connect has successfully registered its command set to the Operations Manager (OM) component of an IMSplex. IMS Connect is now ready to process commands that are routed by the Operations Manager to IMS Connect. Commands are registered to the Operations Manager in the following situations:
- During IMS Connect initialization when communication between IMS Connect and an IMSplex is started
- During processing of a STARTIP or equivalent command when communication between IMS Connect and an IMSplex is started
- When an Operations Managers component joins an IMSplex after IMS Connect has started communication with the IMSplex

In the message text:
- imsplex Identifies the name of the IMSplex where command processing is now available.
- mc Identifies the module issuing the message.

System action: IMS Connect can now process commands that are entered through the Operations Manager. IMS Connect continues to run normally.

User response: No action is required.

You can now issue supported IMS Connect commands through the Operations Manager.

Module: OREG HWSOREG0
Explanation: IMS Connect has attempted to register its command set to the Operations Manager (OM) component of an IMSplex, but the registration request failed for this command and keyword combination.

In the message text:

- **Identifies the command that was registered with OM.**
- **Identifies the keyword that was registered with OM.**
- **Identifies the completion code for the command and keyword registration. The cccccccc values are defined in the CSLORR macro.**

- **Identifies the name of the OM where command registration failed.**
- **Identifies the module issuing the message.**

System action: IMS Connect continues to attempt to register the rest of its commands to OM. IMS Connect continues to run normally. The IMSplex is still available for uses other than for command processing, such as IMS Control Center processing, and might still be available for command processing for other command and keyword combinations.

User response: The registration failure can be a temporary internal error or a communications error. Complete any of the following actions, which cause IMS Connect to try command registration again:

- Stop communication with the IMSplex by using the STOPIP or an equivalent command, and then restart communication with the IMSplex by using the STARTIP or an equivalent command.
- Cancel and restart OM.
- Cancel and restart SCI.

If the problem persists, gather the necessary diagnostic data and call IBM Software Support for assistance.

Module: OREG HWSOREG0

---

HWSI1665E macroname REQUEST FAILED FOR IMSPLEX=insplex; R=rrrrrrrrr S=ssssssssss; M=mc

Explanation: IMS Connect received an unexpected return code, reason code, or both from a Common Service Layer (CSL) service request.

In the message text:

- **Identifies the name of the failing service macro.**
- **Identifies the name of the IMSplex where the request was issued.**
- **Identifies the return code from the service.**
- **Identifies the reason code from the service.**
- **Identifies the module issuing the message.**

System action: If this error occurs during IMS Connect initialization, the system might end.
abnormally. Otherwise, the current process is rejected and online processing continues.

**User response:** Determine the return and reason code that is causing the process to fail. If this condition is temporary, retry the process. If necessary, restart the communication with the IMSplex.
- Stop communication with the IMSplex by using the STOPIP or an equivalent command, and then restart communication with the IMSplex by using the STARTIP or an equivalent command.
- Cancel and restart OM.
- Cancel and restart SCI.

**Module:** OREG HWSOREG0

**Related concepts:**

**HWSI1705W GETMAIN FOR CTOKEN AND REGISTRATION CONTROL BUFFER FAILED; R=rc, S=ss, M=mc**

**Explanation:** The storage buffer could not be allocated.
- `rc` identifies the return code.
- `ss` identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Brief explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCTKN</td>
<td>BPEGETM, the system service used to acquire the CTOKEN failed.</td>
<td>4</td>
<td>An incorrect or unsupported subpool is specified or there is no storage available.</td>
</tr>
</tbody>
</table>

**System action:** This message issued and IMS Connect continues to run.

**System programmer response:** This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide JCL, SYSLOG, and dump, if available.

**Module:** OMXO HWSOMXOT

**HWSI1720W REGISTRATION TO SCI FAILED FOR IMSPLEX=ipid; R=rc, S=ss, M=mc**

**Explanation:** An IMS Connect attempt to register with the Structure Call Interface (SCI) has failed. This problem might be because the SCI address space has not been started. As soon as SCI is started, the IMS Connect command OPENIP for the named IMSplex (ID=name that was specified in the configuration file) can be issued.
- `ipid` identifies the IMSplex.
- `rc` identifies the return code.
- `ss` identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of the service and return code:

<table>
<thead>
<tr>
<th>IMSplex name</th>
<th>Return code</th>
<th>Reason code</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID name specified in the IMS Connect configuration file</td>
<td>See the information about CSL codes and CSL SCI requests for more information about SCI and OM return and reason codes.</td>
<td></td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** See the information about CSL codes and CSL SCI requests to determine the SCI reason for the registration failure.

**Module:** OMXO HWSOMXOT

**Related concepts:**

**HWSI1815W • HWSJ2500E**

**HWSJ2500E FUNCTION WORK ELEMENT PROCESSING FAILED; FUNC=fn, R=rc, S=sc, M=mc.**

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between and within the components. This structure contains the function and parameters that a service requires for processing.

In the message text:
- **fn** identifies the function requested.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

See the following table for an explanation of service and return codes:

Table 32. Service and return code explanation for HWSJ2500E

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requester of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run. The request message in progress is discarded.

**System programmer response:** This problem is probably an internal error. Search the problem-reporting database to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** MCVC - HWSMCVC0
HWSJ2510W • HWSJ2520E

HWSJ2510W  IMS CONNECT WAS UNABLE TO NOTIFY ORIGIN=portid clientid OF MESSAGE FAILURE; R=rc, S=sc, M=mc.

Explanation: IMS Connect is unable to notify the named TCP/IP client about an error that has occurred while processing a request message that IMS Connect has received.

In the message text:
- `clientid` identifies the TCP/IP client.
- `mc` identifies the module issuing the message.
- `portid` identifies the TCP/IP port.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

See the following table for an explanation of service and return codes:

<table>

</table>

System action: This message is issued and IMS Connect continues to run. The request message in progress is discarded.

System programmer response: This error can occur when not enough storage is available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module:  MCVC – HWSMCVC0; MREC – HWSMREC0; MRE4 – HWSMRE40

HWSJ2520E  IMS CONNECT HAS FAILED TO RECEIVE OR SEND A MESSAGE FROM CLIENT=portid clientid TO ODBM=odbm; R=rc, S=sc, CP=cp, M=mc

Explanation: IMS Connect is either unable to receive a message from the named TCP/IP client or to send a message to the Open Database Manager (ODBM).

In the message text:
- `portid` The TCP/IP port.
- `clientid` The TCP/IP client.
- `odbm` The targeted ODBM.
- `rc` The return code.
- `sc` The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `cp` The DDM code point of the command originally submitted by the client.
- `mc` The module issuing the message.

<tr>
<td>RRSNFAIL</td>
<td>The RRS environment in IMS Connect has not been set up or IMS Connect did not complete the restart with RRS.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>SHUTDOWN</td>
<td>A CLOSEHWS command has been issued. IMS Connect termination is in process.</td>
<td>8</td>
<td>Termination in process.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run. The request message in progress is discarded.

System programmer response: The response can vary depending on the service code.

- For service codes DSCLOSE, NFNDDST, NOTACTV, SHUTDOWN, and STP/CLSE, the ODBM is no longer active or connected to IMS Connect. Investigate why the ODBM was terminated, or if a STOP/DS command was issued.

- For service codes DUPECLNT, a second client connects to IMS Connect with the same Client ID currently identified to IMS Connect. The client might have disconnected and reconnected with the same Client ID. However, IMS Connect is not aware of the disconnection because the client is in a CONN state waiting for a response from IMS.

- For service code FREEFAIL, GETAWE, GETFWEB, and GETMFAIL, there is not enough storage available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

- For service code RRSNFAIL, investigate why the RRS is not enabled in IMS Connect.

- For service code TRANSMIT, this problem is probably an internal error. Search the problem-reporting database to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

Module: MRE4 – HWSMRE40

HWSJ2530W A CONNECTION FOR A CLIENT ACCESSING IMS DB TIMED OUT;
PORT=portid, CLIENT=clientid, ODBM=odbm, CP=cp, M=mc

Explanation: A connection between IMS Connect and a client timed out before the CSL Open Database Manager (ODBM) returned a reply from an IMS database to IMS Connect.

In the message text:
portid   The DRDA port that the client was using.
clientid  The client ID of the client that was using the
terminated socket.
odbm  The instance of ODBM from which IMS
Connect was expecting a reply.
cp  The codepoint of the DDM command
originally submitted by the client.
mc  The module issuing the message.

**System action:** The TCP/IP socket is terminated and
IMS Connect continues to run. If IMS Connect receives the
reply from IMS after the socket is terminated, IMS
Connect discards the reply message.

**System programmer response:** Determine if ODBM,
SCI, and IMS are active. If they are all active, restore
the connection between the client and IMS Connect and
resend the request. If any one of ODBM, SCI, and IMS
are not active, restart the inactive system, reconnect the
client, and resend the request.

**Programmer response:** Initiate a new connection and
resubmit the database request.

**Module:** MCVC – HWSMCVC0

---

**HWSJ2540E** UNABLE TO SEND A DATABASE DEALLOCATION REQUEST TO
ODBM=odbm; C=clientid, R=rc, S=sc, P=portid, M=mc

**Explanation:** IMS Connect was unable to send an
internal database deallocation request to the Open
Database Manager (ODBM). The service code identifies
the cause of failure.

In the message text:
odbm  The target ODBM
clientid  The client ID
rc  The return code
sc  The service code
portid  The port ID
mc  The module issuing the message

See the following table for an explanation of service
and return codes:

**Table 35. Service and return code explanation for
HWSJ2540W**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DSCLOSE</td>
<td>All ODBMs are becoming inactive. This situation can result from a CLOSEHWS command that is shutting down IMS Connect.</td>
<td>12</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS
Connect continues to run. The TCP/IP socket is terminated.

**System programmer response:** If this problem is a
storage error, ensure that the region size for IMS
Connect is large enough. If the error recurs, search the
problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support.
Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** MREC – HWSMREC0

---

**HWSJ2700W** UNABLE TO NOTIFY ODBM=odbm OF MESSAGE FAILURE; R=rc, S=sc, M=mc

**Explanation:** IMS Connect is unable to notify the
Open Database Manager (ODBM) about an error that has occurred while processing a reply message.

In the message text:
odbm  The targeted ODBM.
rc  The return code.
sc  The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc  The module issuing the message.

See the following table for an explanation of service
and return codes:

**Table 35. Service and return code explanation for
HWSJ2540W (continued)**

<td>BPECBGET, the system service used to acquire storage to build the error message.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This problem is an internal system error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. The request message in progress is discarded.

**System programmer response:** This problem is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** MXMT - HWSMXMT0

---

**HWSJ2700W THE ROUTING EXIT FAILED TO INITIALIZE; R=rc, S=rsn, M=mc**

**Explanation:** The routing exit IMS Connect DB Routing user exit (HWSROUT0) failed to initialize. The reason code identifies the cause of failure.

In the message text:
- `rc` Return code
- `rsn` Reason code
- `mc` Module that issued the message

The return and reason codes are defined in your IMS Connect DB routing user exit.

**System action:** IMS Connect continues to function. The IMS Connect DB routing user exit is disabled.

**System programmer response:** Investigate the return code and reason codes, and check with the owner of the exit.

**Module:** SDOP – HWSSDOPN

---

**HWSK2800E THE WAITING ECB FAILED; F=fn, C=pc, M=mc**

**Explanation:** The IMS Connect TCP/IP driver is informed of an unsuccessful post code.

In the message text:
- `fn` Identifies the function performed.
- `mc` The module issuing the message.
- `pc` Identifies the post code set by IMS Connect.

**System action:** IMS Connect continues to run.

**System programmer response:** This error is probably an internal error. Check the post code for the possible cause.

Search the problem reporting database to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** MRCV – HWSMDRCV

---

**HWSK2810E TCP/IP ASYNCHRONOUS FUNCTION CALL FAILED; F=fn, R=rc, E=ec, M=mc**

**Explanation:** TCP/IP rejected the request for asynchronous function processing.

In the message text:
- `ec` Identifies the TCP/IP error code.
- `fn` Identifies the TCP/IP socket function call.
- `mc` The module issuing the message.
- `rc` Identifies the TCP/IP return code.

**System action:** IMS Connect continues to run.

**System programmer response:** For the possible cause of the specified TCP/IP return and error codes, see the z/OS UNIX System Services Messages and Codes (SA22-7807).

**Module:** MRCV – HWSMDRCV

**Related reference:**

- z/OS: z/OS UNIX System Services return codes
- z/OS: Macro application programming interface

**Related information:**

- "HWSK2810E"

---

**HWSK2815E TCP/IP INTERNAL ERROR; F=fn, R=rc, E=ec, M=mc**

**Explanation:** TCP/IP is unable to perform the specified socket function.

In the message text:
- `ec` Identifies the TCP/IP error code.
- `fn` Identifies the TCP/IP socket function call.
- `mc` The module issuing the message.
- `rc` Identifies the TCP/IP return code.

**System action:** IMS Connect continues to run.

**System programmer response:** For the possible cause of the specified TCP/IP return and error codes, see the z/OS UNIX System Services Messages and Codes (SA22-7807).

**Module:** MRCV – HWSMDRCV

---

**HWSK2820W FAILED TO OBTAIN STORAGE; R=rc, B=bn, M=mc**

**Explanation:** The IMS Connect ODBM socket driver for the CSL Open Database Manager (ODBM) is unable to get storage for internal buffers. This error can occur when not enough storage is available to complete the process.

In the message text:
- `rc` The return code returned by z/OS for an z/OS GETMAIN failure.
The buffer name
mc The module issuing the message.

**System action:** IMS Connect continues to run.

**System programmer response:** If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** MRCV – HWSMDRCV

---

**HWSK2825E** A DDM COMMAND IS INCOMPLETE; \( C=cl, P=portid, M=mc \)

**Explanation:** An IMS Connect client closed a TCP/IP socket connection before any of the data for an incoming message was received. This error can occur when either of the following TCP/IP values is specified:

- SO_LINGER=Y, VALUE=0
- SO_LINGER=NO

In the message text:

- **cl** Client ID. If \( cl \) contains blanks, the client ID is not available.
- **portid** DRDA port on which the DDM command was received.
- **mc** Module that issued the message

**System action:** The request message is discarded and IMS Connect continues to run.

**System programmer response:** If this error occurred because the TCP/IP values were SO_LINGER=Y, VALUE=0 or SO_LINGER=NO, change the TCP/IP values to SO_LINGER=Y, VALUE=10. The VALUE parameter can be any value other than 0. Otherwise, determine why the client application terminated the socket.

**Module:** MRCV – HWSMDRCV

---

**HWSK2830E** INVALID LENGTH SPECIFIED IN THE DDM COMMAND HEADER; \( L=ll, C=cl, P=portid, M=mc \)

**Explanation:** The length field in the header (DSSHDR) of a distributed data management (DDM) command that was received by IMS Connect contains an invalid value. Messages can be from 10 bytes to 32,767 bytes, inclusive, in length. The value that is specified in the length field must equal the exact length of data that is sent.

In the message text:

- **ll** Length currently specified in the message prefix.
- **cl** Client ID of the DDM source server.
- **portid** DRDA port on which the DDM command was received.
- **mc** Module that issued the message.

**System action:** The message is discarded and IMS Connect continues to run.

**Programmer response:** Modify the DDM source server to specify \( 0 \) if the value for SRVCLSNM is not the text string DFS. DFS is the only server class name that is supported by IMS.

**Module:** MRCV – HWSMDRCV

---

**HWSK2840E** INVALID DDM SERVER CLASS NAME IS SPECIFIED; \( C=cl, P=portid, M=mc \)

**Explanation:** You specified an invalid distributed data management (DDM) target server class name. Either the required SRVCLSNM code point is not specified in the EXCSAT DDM command, or the value of SRVCLSNM is not the text string DFS. DFS is the only server class name that is supported by IMS.

In the message text:

- **cl** Client ID of the DDM source server.
- **portid** DRDA port on which the DDM command was received.
- **mc** Module that issued the message.

**System action:** The message is discarded and IMS Connect continues to run.

**Programmer response:** Modify the DDM source server to specify 0F5 as the value for SRVCLSNM in the EXCSAT command.

**Module:** MRCV – HWSMDRCV
HWSK2845E A DDM COMMAND IS ISSUED OUT OF ORDER; C=cl, CP=cp, P=portid, M=mc

**Explanation:** A distributed data management (DDM) source server submitted a DDM command or other code point in a sequence that is not supported by the IMS target server. For example, an OPNQRY command cannot be submitted before an ACCRDB command is submitted.

In the message text:
- **cl**: Client ID of the DDM source server
- **cp**: Code point that identifies the command that was submitted out of order
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

**System action:** IMS Connect discards the message and continues to run.

**Programmer response:** Modify the variable at the DDM source server to include the required data.

**Module:** MRCV – HWSMDRCV

---

HWSK2850E THE REQUIRED DDM COMMAND INSTANCE VARIABLE IS MISSING; C=cl, CP=cp, P=portid, M=mc

**Explanation:** A required variable is missing from a distributed data management (DDM) command. For example, if the SECMEC variable is omitted from the ACCSEC command.

In the message text:
- **cl**: Client ID of the DDM source server
- **cp**: Code point of the variable that is missing from the DDM command
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

**System action:** IMS Connect discards the message and continues to run.

**Programmer response:** Modify the DDM source server to include the required parameter in the DDM command.

**Module:** MRCV – HWSMDRCV

---

HWSK2855E A DDM COMMAND INSTANCE VARIABLE CONTAINS INVALID DATA; C=cl, CP=cp, P=portid, M=mc

**Explanation:** A distributed data management (DDM) command variable contains non-alphanumeric data. For example, the variable USRID on the DDM SECCHK command must contain only alphanumeric characters.

In the message text:
- **cl**: Client ID of the DDM source server
- **cp**: Code point of the variable that contains invalid data
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

**System action:** This message is issued and IMS Connect continues to run. The request message is discarded.

**Module:** MRCV – HWSMDRCV

---

HWSK2860E A DDM COMMAND INSTANCE VARIABLE DOES NOT CONTAIN REQUIRED DATA; C=cl, CP=cp, P=portid, M=mc

**Explanation:** A distributed data management (DDM) command parameter does not contain required data or the data portion of the parameter is missing.

In the message text:
- **cl**: Client ID of the DDM source server
- **cp**: Code point of the DDM command parameter that is missing the required data
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

**System action:** IMS Connect discards the message and continues to run.

**Programmer response:** Modify the variable at the DDM source server to include the required data.

**Module:** MRCV – HWSMDRCV

---

HWSK2865E SECURITY VIOLATION; R=rc, C=cl, U=uid, RACFRC=rrc, RACFRS=rsn, M=mc

**Explanation:** RACF verification failed for the user ID and password from a client. The user ID and password were contained in the SECCHK DDM command.

In the message text:
- **rc**: SAF return code.
- **cl**: Client ID. This field contains blanks if the client ID is not available.
- **uid**: The user ID.
- **rrc**: RACF return code.
- **rsn**: RACF reason code
- **mc**: Module that issued the message

Return codes (decimal): See the RACROUTE REQUEST=VERIFY macro return and reason codes for R=rc, RACFRC=rrc, and RACFRS=rsn values.

**System action:** This message is issued and IMS Connect continues to run. The request message is discarded.
System programmer response: No action is required.

Module: MRCV – HWSMDRCV

Related reference:

- [z/OS: RACF RACROUTE REQUEST=VERIFY return codes and reason codes](#)

HWSK2870E DUPLICATE ACCESS DATABASE COMMAND ACCRDB IS DETECTED; C=cl, P=portid, M=mc

Explanation: IMS Connect has determined that a distributed data management (DDM) ACCRDB command was submitted before the database connection established by a previous ACCRDB command was closed by a DEALLOCDB command. Currently, access to only one database at a time is allowed on each socket connection.

In the message text:

- **cl**: Identifies the client ID. If cl contains blanks, the client ID is not available.
- **portid**: Identifies the DRDA port on which the DDM command was received.
- **mc**: The module issuing the message.

System action: The request message is discarded and IMS Connect continues to run.

System programmer response: No action is required.

Programmer response: If the ACCRDB command was issued by an application program that is using an IMS DB API, such as the JCA-compliant IMS database resource adapter (DRA), the type-4 JDBC driver for IMS, or the Java API for DL/I, this problem is an internal error. Contact IBM Software Support.

(DRDA programmer) If the ACCRDB command was issued by a user-written Distributed Relational Database Architecture” (DRDA) DDM source server, modify the DDM source server either to issue a DEALLOCDB command to deallocate the current PSB before attempting to establish another connection to the database or to wait until the current database connection terminates before issuing the ACCRDB command.

Module: MRCV – HWSMDRCV

HWSK2880E DUPLICATE ACCESS DATABASE COMMAND ACCRDB IS DETECTED; C=cl, P=portid, M=mc

Explanation: IMS Connect has determined that a distributed data management (DDM) ACCRDB command was submitted before the database connection established by a previous ACCRDB command was closed by a DEALLOCDB command. Currently, access to only one database at a time is allowed on each socket connection.

In the message text:

- **cl**: Identifies the client ID. If cl contains blanks, the client ID is not available.
- **portid**: Identifies the DRDA port on which the DDM command was received.
- **mc**: The module issuing the message.

System action: The request message is discarded and IMS Connect continues to run.

System programmer response: No action is required.

Programmer response: If the ACCRDB command was issued by an application program that is using an IMS DB API, such as the JCA-compliant IMS database resource adapter (DRA), the type-4 JDBC driver for IMS, or the Java API for DL/I, this problem is an internal error. Contact IBM Software Support.

(DRDA programmer) If the ACCRDB command was issued by a user-written Distributed Relational Database Architecture” (DRDA) DDM source server, modify the DDM source server either to issue a DEALLOCDB command to deallocate the current PSB before attempting to establish another connection to the database or to wait until the current database connection terminates before issuing the ACCRDB command.

Module: MRCV – HWSMDRCV

HWSK2885E THE DDM COMMAND ACCRDB WAS NOT ISSUED BEFORE ATTEMPTING TO ACCESS A DATABASE; C=cl, CP=cp, P=portid, M=mc

Explanation: An IMS Connect client submitted a message that IMS Connect cannot deliver to Open Database Manager (ODBM) for processing for one of the following reasons:

- The specified IMS alias is not associated with any instance of ODBM that is known to IMS Connect.
- The specified IMS alias is inactive on all ODBM instances that are known to IMS Connect.

In the message text:

- **cl**: Client ID of the DDM source server
- **alias**: IMS alias name that is specified on the DDM message received by IMS Connect
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

System action: IMS Connect discards the message and continues to run.

Operator response: Determine the status of the IMS alias in question and its associated ODBM instance by issuing any of the following IMS Connect commands:

- VIEWHWS
- VIEWDS ALL
- QUERY MEMBER
- QUERY DATASTORE NAME(*)

Programmer response: Confirm that the IMS alias name is specified correctly by the DDM source server.

Module: MRCV – HWSMDRCV

Related information:

- [HWSR0698W message](#) on page 415

HWSR0698W RRS REQUEST FAILED; C=cl, CP=cp, P=portid, M=mc

Explanation: IMS Connect issued a request to z/OS Resource Recovery Services (RRS) and the request failed. This message is accompanied by message HWSR0698W message, which contains the RRS return code.

In the message text:

- **cl**: Identifies the client ID. If cl contains blanks, the client ID is not available.
- **cp**: The codepoint of the DDM command for which IMS Connect issues the RRS request.
- **portid**: The module issuing the message.
- **mc**: Identifies the DRDA port on which the DDM command was received.

System action: The request message is discarded and IMS Connect continues to run.

System programmer response: Review the contents of the HWSR0698W message issued with this message. If the RRS reason code contained in HWSR0698W is RRSNAVIL, check the status of RRS. This problem is likely an internal error.

Module: MRCV – HWSMDRCV

Related information:

- [HWSR0698W message](#) on page 415

HWSR0698W RRS REQUEST FAILED; C=cl, CP=cp, P=portid, M=mc

Explanation: IMS Connect issued a request to z/OS Resource Recovery Services (RRS) and the request failed. This message is accompanied by message HWSR0698W message, which contains the RRS return code.

In the message text:

- **cl**: Identifies the client ID. If cl contains blanks, the client ID is not available.
- **cp**: The codepoint of the DDM command for which IMS Connect issues the RRS request.
- **portid**: The module issuing the message.
- **mc**: Identifies the DRDA port on which the DDM command was received.

System action: The request message is discarded and IMS Connect continues to run.

System programmer response: Review the contents of the HWSR0698W message issued with this message. If the RRS reason code contained in HWSR0698W is RRSNAVIL, check the status of RRS. This problem is likely an internal error.

Module: MRCV – HWSMDRCV

Related information:

- [HWSR0698W message](#) on page 415
**HWSK2900E • HWSK3000W**

**Explanation:** An attempt to access a database was not preceded by the ACCRDB command. The ACCRDB command must be issued to allocate a database before that database can be accessed. For example, before the OPNQRY command can be issued, the ACCRDB command must be issued.

In the message text:
- **cl**: Client ID of the DDM source server
- **cp**: Code point of the parameter that is missing from the DDM command
- **portid**: DRDA port on which the DDM command was received
- **mc**: Module that issued the message

**System action:** IMS Connect discards the message and continues to run.

**Programmer response:** Modify the DDM source server to submit the DDM commands in the order that is required by the IMS target server.

**Module:** MRCV – HWSMDRCV

---

**HWSK2900E AN INVALID IMS ALIAS IS SPECIFIED; C=clientid, P=portid, s=sc, M=mc**

**Explanation:** The client application issued a database allocation request, but it either did not provide a required IMS ALIAS or provided one whose length was not equal to 4.

In the message text:
- **clientid**: Client ID
- **portid**: Port ID
- **sc**: Reason code
- **mc**: Module that issued the message

See the following table for an explanation of service and return codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Short explanation</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOALIAS</td>
<td>No alias is specified.</td>
<td>This problem is a processing error.</td>
</tr>
<tr>
<td>INVLDLNA</td>
<td>The specified alias is not a 4 character name.</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Modify the application to ensure that the application program specified a valid 4 character IMS ALIAS name.

**Module:** MRCV – HWSMDRCV

---

**HWSK2910W FAILED TO RELEASE STORAGE; R=rc, B=bn, A=a, M=mc**

**Explanation:** The IMS Connect Open Database Manager (ODBM) socket driver was unable to release storage for internal buffers.

In the message text:
- **rc**: Return code
- **bn**: Buffer name
- **a**: Address of the buffer
- **mc**: Module that issued the message

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and a dump if available.

**Module:** MDRC - HWSMDRCV

---

**HWSK2915E THERE IS NO ODBM AVAILABLE FOR DATABASE ACCESS; P=portid, M=mc**

**Explanation:** The IMS Connect Open Database Manager (ODBM) socket component sent a negative reply MGRDEPRM to the exchange attributes EXCSAT request for one of the following reasons:
- There is no ODBM available.
- All ODBMs do not have associated aliases.
- No ODBM has suitable release level of handshaking.

In the message text:
- **portid**: The TCP/IP port
- **mc**: Module that issued the message

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Bring up ODBM with associated aliases and proper release level of handshaking.

**Module:** MRCV - HWSMDRCV

---

**HWSK3000W FAILED TO RELEASE STORAGE; R=rc, B=bn, A=a, M=mc**

**Explanation:** The IMS Connect Open Database Manager (ODBM) socket driver was unable to release storage for internal buffers.

In the message text:
- **rc**: Return code for an z/OS GETMAIN failure
- **bn**: Buffer name
- **a**: Address of the buffer
- **mc**: Module that issued the message

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** This problem is
probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

HWSK3005I  TCP/IP SOCKET FUNCTION CALL FAILED; fn=fn, rc=rc, ec=ec, cl=cl, portid=portid, M=mc

Explanation: IMS Connect TCP/IP was unable to perform the specified socket function, identified by fn in the message. This message is issued during the shutdown of IMS Connect. HWSK3005E is issued during normal execution of IMS Connect.

In the message text:
fn TCP/IP socket function call
rc TCP/IP return code
ec TCP/IP error code
cl Client ID
portid TCP/IP port
mc Module that issued the message

System action: This message is issued and IMS Connect continues to shut down.

System programmer response: For the possible cause of the specified return code and error code, see either the z/OS UNIX System Services Message and Codes (SA22-7807) or, for the TCP/IP Macro API, the z/OS Communications Server IP Sockets Application Programming Interface Guide and Reference (SC31-8788).

Module: MRCV – HWSMDXMT

HWSK3005E  TCP/IP ASYNCHRONOUS FUNCTION CALL FAILED; fn=fn, rc=rc, ec=ec, cl=cl, portid=portid, M=mc

Explanation: TCP/IP rejected the request for asynchronous function processing.

In the message text:
fn TCP/IP socket function call
rc TCP/IP return code
ec TCP/IP error code
cl Client ID
portid TCP/IP port
mc Module that issued the message

System action: This message is issued and IMS Connect continues to run.

System programmer response: For the possible cause of the specified return and error codes, see the related release of z/OS UNIX System Services Messages and Codes (SA22-7807).

Module: MRCV – HWSMDXMT

HWS messages HWSL0001-HWSQ3000

This topic contains the following messages:

HWSL0101I  HWS CLEANUP SUCCESSFUL
Explanation: IMS Connect Local Option resource cleanup was successfully completed during termination.
HWSL0103I  •  HWSL0106W

System action: The message is issued and IMS Connect terminates.
Module: HWSRSM00

HWSL0103I CLEANUP SUCCESSFUL:
Client=cccccccc
Explanation: The IMS Connect resource manager successfully cleaned the interface storage in the client address space identified in cccccccc. This message is issued in the client address space.

In the message text:

cccccccc
The client address space name. This name is typically the job name of the web server where the client servlet is running.

Important: The client address space name is different from the Client ID used in the input or output of IMS Connect commands such as STOPCLNT and VIEWHWS.

System action: The message is issued and IMS Connect terminates.
Module: HWSRSM20

HWSL0103I CLEANUP FAILED: CLIENT= cccccccc,
RSN=rrr
Explanation: The IMS Connect resource manager encountered a problem while cleaning up the interface storage associated with the client in the client address space. The reason code identifies the problem. The message is issued in the client address space.

In the message text:

cccccccc
The client address space name. This name is typically the job name of the web server (for example, IMWEBSRV) where the client servlet is running.

Important: The client address space is different from the Client ID that is used in the input or output of IMS Connect commands such as STOPCLNT and VIEWHWS.

rrr
Is one of the following reason codes:
• 104: A CGCT block was damaged.
• 108: The CCIB block was damaged.
• 10C: An error occurred when the CCIB storage was released.
• 110: A CRET block was damaged.
• 114: An error occurred when the storage for a CRET block was released.
• 118: HWSRSM20 abended for an unknown reason.
• 11C: An unknown error occurred.

System action: The message is issued, and IMS Connect terminates.

System programmer response: This error message indicates that CSA storage might not be available. Contact the IBM Software Support.
Module: HWSRSM20

HWSL0105I INTF CLEANUP SUCCESSFUL:
Client=cccccccc
Explanation: Before terminating, IMS Connect successfully posted or resumed all outstanding HWS requests from the Local Option client.

In the message text:

cccccccc
The client address space name. This name is typically the job name of the web server where the client servlet is running.

Important: The client address space name is different from the Client ID used in the input or output of IMS Connect commands such as STOPCLNT and VIEWHWS.

System action: The message is issued and IMS Connect terminates.
Module: HWSRSM10

HWSL0106W INTF CLEANUP FAILED: CLIENT= cccccccc,
RSN=rrr
Explanation: When the IMS Connect address space terminated, the IMS Connect resource manager that was monitoring IMS Connect for the client failed during cleanup. The reason code identifies the problem that was encountered.

In the message text:

cccccccc
The client address space name. This name is typically the job name of the web server (for example, IMWEBSRV) where the client servlet is running.

rrr
Is one of the following reason codes:
• 104: The resource manager could not obtain common storage for a CXSH block to notify the client that IMS Connect terminated.
• 108: The resource manager could not schedule an SRB to the client address space to notify the client that IMS Connect terminated.
• 10C: The resource manager could not schedule an SRB to the client address space to clean up the IMS connect interface blocks.
• 110: The resource manager (HWSRSM10) terminated abnormally.

System action: The message is issued, and IMS Connect terminates.

System programmer response: If the client address space terminates before the IMS Connect resource manager completes processing, you might receive message HWS0106W with either reason code 108 or
10C. If you do, other IMS Connect resource managers have cleaned up IMS Connect interface storage, and no action is required. If you do not, then contact the IBM Software Support. If you receive reason code 110, print the records in SYSLGREC for information on the abend. Provide the JCL, SYSLOG, and dump if available.

**Module:** HWSRSM10

---

**HWSL0111W HWS INTERFACE ABEND abend_code**

**PSW=psw R15=r15 MODULE module_addr STATUS**

**Explanation:** An abend occurred in the interface between the client and IMS Connect during the processing of an IMS Connect request.

In the message text:

- **abend_code** identifies the abend that occurred (Sxxx for system abends and Uxxxx for user abends).
- **psw** identifies the PSW contents at the time of the abend.
- **r15** identifies the contents of Register 15 at the time of the abend. For some abends, this value is the abend subcode.
- **module_addr** identifies the name of the IMS Connect interface module that detected the abend. This value is not necessarily the module that abended, but the module whose recovery routine (ESTAE or FRR) was driven because of the abend. Possible modules are:
  - **HWSRQS00** provides this additional value:
    - **IN POST** The abend occurred when the client was being posted to wake it after a request had completed.
  - **HWSSRB00** provides this additional value:
    - **IN ENQUEUE** The abend occurred when the request was queued to the IMS Connect address space.
  - **HWSRQS00** provides this additional value:
    - **SYSTEM** The message is issued to the client application, and IMS Connect continues to run.
  - **SYSTEM** The message is issued to the client application, and IMS Connect continues to run.

**System action:** The message is issued to the client application, and IMS Connect continues to run.

**System programmer response:** Save a copy of the dump product, and save or print a copy of the LOGREC records related to this abend. If the client is an IBM product, contact the IBM Software Support. If the client is not an IBM product, contact the supplier of the client.

**Module:** HWSREG20, HWSRQS00, HWSSRB0

---

**HWSL0281I CONNECT REJECTED FOR**

**CLIENT=client, USERID=userid; INSUFFICIENT AUTHORITY TO HWS ICON_NAME; RACROUTE AUTH R15=r15, RC=rc, RSN=rsn**

**Explanation:** A client attempted to connect to IMS Connect using the local option but the client was not authorized to access IMS Connect. IMS Connect issues a RACROUTE REQUEST=AUTH call to determine if the connecting client has the appropriate authority to access IMS Connect using the local option. IMS Connect uses the job user ID of the client to perform the authorization.

- **client** refers to the client ID that is attempting to connect.
- **userid** is the user ID associated with the address space of the client. If this field contains “NONE,” the client is running with no user ID specified.
- **icon_name** refers to the IMS Connect to which the client is trying to connect.
- **r15** refers to the value in register 15 from the RACROUTE call.
- **rc** refers to the RACF return code from the RACROUTE call.
- **rsn** refers to the RACF reason code from the RACROUTE call.

**System action:** The connection request is rejected and address space. This abend occurs when bad data is passed from the client.

**AFTER COPY**

The abend occurred after the data is copied and queued to the IMS Connect address space.

**STATUS UNKNW**

The FRR could not determine the status of the request when the abend occurred.

**HWSRQS00** provides this additional value:

**IN COPY**

The abend occurred after the data is copied to the IMS Connect address space.
the client is not allowed to access the requested IMS Connect.

**System programmer response:** If the indicated user should be allowed to access the requested IMS Connect, authorize the user to IMS Connect with at least RACF UPDATE authority. If the indicated user should not be allowed to access the requested IMS Connect, you should determine why the user is trying to connect to it and take appropriate action to protect against unauthorized or malicious access.

---

**HWSM0500E FUNCTION WORK ELEMENT PROCESSING FAILURE, FUNC=func, R=rc, S=sc, M=mc**

**Explanation:** The function work element (FWE) can not be processed. The FWE requests work between and within the components. This structure contains the function and parameters that a service requires for processing.

- **func** identifies the function requested.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

See the following table for an explanation of the service and return code.

**Table 38. Service and return code explanation for HWSM0500E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requester of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting database to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** OOCC HWSS0OC0, OSCH HWSSOSCH0, DCVC HWSDCVC0

---

**HWSM0504W COMMAND=hwscmd FAILED FOR IMSPLEX=ipid, COMMAND=prev_hwscmd ALREADY IN PROGRESS; M=mc**

**Explanation:** The IMS Connect command entered for the IMSplex, hwscmd, cannot be processed because a command for that IMSplex, prev_hwscmd, is already in progress.

- **hwscmd** identifies the IMS Connect command that was blocked by prev_hwscmd from being run.
- **ipid** identifies the IMSplex.
- **prev_hwscmd** identifies the IMS Connect command that is blocking hwscmd from running.
- **mc** identifies the module issuing the message.

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** The IMS Connect command in progress is terminating the IMSplex; therefore, any new commands cannot be processed. If the IMS Connect command (hwscmd) was CLOSEHWS, the IMS Connect terminates after processing of prev_hwscmd completes.

**Module:** DSCM HWSDSCM0

---

**HWSM0510W STOPIP COMMAND FAILED DUE TO IMSPLEX IN DISCONNECT STATE; M=mc**

**Explanation:** The STOPIP command was issued; however, the IMSplex connection is in a DISCONNECT state. Therefore, the STOPIP command cannot be processed. When the SCI address is restarted, IMS Connect will automatically reconnect to SCI. When the connection has been reestablished, the STOPIP command can be issued.

**System action:** This message is issued and the STOPIP command is ignored.

**System programmer response:** The DISCONNECT state has the same effect as a STOPPED state. If the SCI address space is restarted, the connection will be reestablished. When the connection is reestablished, the
STOPIP command can be issued.

**Module:** OSCH HWSOSCH0

**HWSM0522W UNABLE TO START**
TRANSmit/RECEIVE THREADS FOR IMSPLEX=ipid, R=rc, S=sc, M=mc

**Explanation:** Storage cannot be allocated for the transmit or receive thread structure, or the transmit thread or receive thread cannot be scheduled. A transmit thread and receive thread is allocated for each IMSplex that is defined for message transmission and reception.
- ipid identifies the IMSplex.
- rc identifies the return code.
- sc identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed request.
- mc identifies the module issuing the message.

See the following table for an explanation of service and return codes.

**Table 39. Service and return code explanation for HWSM0522W**

<table>
<thead>
<tr>
<th>Service Code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>

<tr>
<td>24</td>
<td>Unable to get stack storage for the thread</td>
<td></td>
<td></td>
</tr>
<tr>
<td>28</td>
<td>The initial post of the thread failed.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, IMS Connect continues to run without this IMSplex.

**System programmer response:** On the subsequent close and startup of IMS Connect, ensure that the region size of the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** DSC1 HWSDSC10, DSCM HWSDSCM0

---

HWSM0527W CLOSE FAILED FOR IMSPLEX=ipid; R=rc, S=sc, M=mc

**Explanation:** An attempt to close the named IMSplex is unsuccessful during IMS Connect shutdown.
- *ipid* identifies the IMSplex.
- *rc* identifies the return code.
- *sc* identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- *mc* identifies the module issuing the message.

See the following table for an explanation of service and return codes.

Table 40. Service and return code explanation for HWSM0527W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETFWEB</td>
<td>BPECBGET, the system service used to acquire an FWE to notify all IMSplex to close.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CBGET routine. This is an internal error.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8</td>
<td>Storage is unavailable to satisfy the request.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, IMS Connect continues to run.

**System programmer response:** Storage cannot be allocated to notify the IMSplex to close. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** DOC3 HWSDOC30

---

HWSM0538E UNABLE TO PROCESS COMMAND FROM OM=om_name, IMSPLEX=ipid, R=rc, S=sc, M=mc

**Explanation:** IMS Connect received a command from the Operations Manager (OM). However, IMS Connect was unable to process the command because an internal IMS Connect error occurred.

In the message text:
- *om_name* Identifies the name of the OM that initiated the command.
- *ipid* Identifies the name of the IMSplex that received the command.
- *rc* Identifies the return code.
**Module**: OREG HWSOREC0

**HWSM0540E  UNABLE TO PROCESS READY NOTIFICATION FROM OM=om_name, IMSPLEX=ipid, R=rc, S=sc, M=mc**

**Explanation**: IMS Connect received a ready notification from Structured Call Interface (SCI). This state indicates that an Operations Manager (OM) system is ready to accept command registration requests from IMS Connect. However, IMS Connect is unable to process the command because of an internal IMS Connect error.

In the message text:
- **om_name** identifies the name of the OM that initiated the ready notification.
- **ipid** identifies the name of the IMSplex that received the ready notification.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes identify the specific errors or codes that are returned by the called services that failed the request.
- **mc** identifies the module issuing the message.

**System action**: IMS Connect continues to run. The ready notification is discarded, and no command registration is performed by IMS Connect. IMS Connect type-2 command processing is not available from the identified OM.

**User response**: Determine the return and service code that is causing the process to fail. If this condition is temporary, retry the process. Otherwise, complete any of the following actions, which cause IMS Connect to retry command registration:
- Stop communication with the IMSplex by using the STOPIP or an equivalent command, and then restart communication with the IMSplex by using the STARTIP or an equivalent command.
- Cancel and restart OM.
- Cancel and restart SCI.

**HWSM0550W  UNABLE TO NOTIFY MSG ORIGIN=clientid OF IMSPLEX COMMUNICATION ERROR; R=rc, S=sc, M=mc**

**Explanation**: IMS Connect is unable to notify the TCP/IP client who originated the command message which is either being processed or queued for processing, that a communication error with IMS Operations Manager (OM) has occurred.
- **clientid** identifies the TCP/IP client.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

See the following table for an explanation of the service and return code.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMERR</td>
<td>Communication error with the IMSplex</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action**: This message is issued and IMS Connect continues to run. The message whose processing caused the error is discarded.

**System programmer response**: This error occurs when the IMSplex is no longer active or the communication linkage to IMS Connect is broken.

**Module**: OXMT HWSOXMT0, DSC3 HWSDSC30, DSCE HWSDSCE0

**HWSM0552W  UNABLE TO SEND RESPONSE RECEIVED FROM IMSPLEX=ipid TO CLIENT=clientid R=rc, S=sc, M=mc**

**Explanation**: IMS Connect is unable to send the response received from the IMSplex to the required TCP/IP client.
- **ipid** identifies the IMSplex.
- **clientid** identifies the TCP/IP client.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

See the following table for an explanation of service and return codes.
### Table 42. Service and return code explanation for HWSM0552W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVLDTOK</td>
<td>Invalid server token has been detected.</td>
<td>4</td>
<td>Use the correct server token for the exchange of the command and command response.</td>
</tr>
<tr>
<td>NFNDCOMP</td>
<td>The component that handles the requested function cannot be found. An IMS Connect component issues an interface call for another component’s service and the requested component cannot be located</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDFUNC</td>
<td>The requested function cannot be found. An IMS Connect component issues an interface call for another component’s service and the requested component cannot be located.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDSVT</td>
<td>The server table cannot be found. This table maintains the activity of a connected IMS Connect client.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. The response message is discarded.

**System programmer response:** This error occurs when the client is no longer active and is not connected to IMS Connect. If the service code is NFNDCOMP or NFNDFUNC, this is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** OREC HWSOREC0

---

### HWSM0554W UNABLE TO NOTIFY IMSPLEX=ipid SCHEDULER OF COMMUNICATION ERROR; R=rc, S=sc, M=mc

**Explanation:** IMS Connect is unable to notify the scheduler controller for the named IMSplex that a communication error has occurred. When this condition occurs, IMS Connect views the named IMSplex as active. However, messages queued for the IMSplex are not sent.

- `ipid` identifies the IMSplex.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes contain codes that identify specific errors or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of the service and return code.

### Table 43. Service and return code explanation for HWSM0554W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>COMMERR</td>
<td>Communication error with the IMSplex.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Issue the STOPIP command to terminate the IMSplex. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** OREC HWSOREC0, OXMT HWSOXMT

---

### HWSM0560I IMSPLEX=ipid THREAD TERMINATED; M=mc

**Explanation:** The IMSplex transmit thread or receive thread has terminated.

- `ipid` identifies the IMSplex
- `mc` identifies the module issuing the message

**System action:** This message is issued when the IMSplex thread has terminated.
Module: OREC HWSOREC0, OXMT HWSOXMT0

HWSM0570W  IMS PLEX OPEN FAILED; R=rc, M=mc

Explanation: Communication with the IMSplex failed during IMS Connect startup or in response to an IMS Connect OPENIP command and resulted in the failure of the IMSplex open function.

- rc identifies the return code.
- mc identifies the module issuing the message.

System action: This message is issued when communication to IMSplex fails due to a communications failure with the IMSplex. See message HWSI1605W for additional information related to this failure.

System programmer response: This error can occur when IMSplex is not correctly defined. Use VIEWIP or VIEWHWS commands to view the status of the IMSplex. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

Module: OOC1 HWSOOC10

Related information:
HWSI1605W on page 375

HWSM0580I  IMS PLEX COMMUNICATION FUNCTION CLOSED; M=mc

Explanation: The communication facility for IMSplex has become inactive.

- mc identifies the module issuing the message.

System action: This message is issued when all communications with the IMSplex have terminated and during IMS Connect shutdown.

Module: DOC3 HWSDOC30

HWSM0582I  COMMUNICATION WITH IMSPLEX=ipid CLOSED; M=mc

Explanation: Communication for the named IMSplex has terminated.

- mc identifies the module issuing the message.

System action: This message is issued when the CLOSEIP command has successfully completed.

Module: DSCL HWSDSCL0

HWSM0584  COMMUNICATION WITH IMSPLEX=ipid STOPPED; M=mc

Explanation: Communication for the named IMSplex has stopped.

- ipid identifies the IMSplex
- mc identifies the module issuing the message.

System action: This message is issued when a STOPIP command has successfully completed.

System programmer response: No action is required.

Module: DSCM HWSDSCM0

HWSM0590I  CONNECTED TO IMSPLEX=ipid; M=mc

Explanation: Communication has been established with the named IMSplex.

System action: This message is issued when a connection has been established with the IMSplex. This might occur during IMS Connect startup or at the successful completion of an OPENIP command.

Module: OSC10 HWSOSC10

HWSN1900I  IMS CONNECT IS CONNECTED TO ODBM=odbmname; M=mc

Explanation: Communication has been established with the Open Database Manager (ODBM) identified in the message text. This message is issued during IMS Connect startup or at the successful completion of a command that starts a connection to ODBM.

In the message text:
- odbmname ODBM with which communication was established
- mc Module that issued the message

User response: No action is required.

Module: HWSOSCI10

HWSN1910E  COMMUNICATIONS WITH ODBM FAILED TO OPEN BECAUSE AN IMSPLEX WAS NOT SPECIFIED; M=mc

Explanation: IMS Connect was unable to open communication to ODBM because it is not connected to an IMSplex. This message is issued when IMS Connect is unable to query the IMSplex for a list of ODBMs because IMS Connect is not connected to an IMSplex or an SCI is not available. This failure can occur during IMS Connect startup.

In the message text:
- mc Module that issued the message

System action: IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

System programmer response: Specify an IMSplex name in the IMS Connect configuration PROCLIB member and restart IMS Connect. You can specify the IMSplex name on either the global IMSPLEX parameter in the IMSPLEX statement or the IMSPLEX parameter that is specific to ODBM in the ODACCESS statement.
Module: NOC1 – HWSNOC10

HWSN1915E COMMUNICATIONS WITH ODBM FAILED TO OPEN BECAUSE IMS CONNECT IS NOT CONNECTED TO AN IMSPLEX; M=mc

Explanation: IMS Connect cannot open communication to ODBM because IMS Connect is not connected to an IMSplex or an instance of SCI is not available. This failure can occur during IMS Connect startup.

In the message text:
mc Module that issued the message

System action: IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

System programmer response: If communication between IMS Connect and ODBM did not start because an instance of SCI is not available, start an instance of SCI in the IMSplex that is specified in the IMS Connect configuration PROCLIB member.

After SCI is started, if IMS Connect is configured to connect to ODBM automatically (ODBMAUTOCONN=Y in the IMS Connect configuration PROCLIB member), IMS Connect connects to all ODBM instances that are running in the IMSplex. If IMS Connect is not configured to connect to ODBM automatically, issue the IMS Connect STARTOD command to connect to ODBM.

If communication between IMS Connect and ODBM fails to start when SCI is running, check that the IMSplex name specified on the IMSPLEX= parameter in the IMS Connect configuration PROCLIB member matches the name of the IMSplex in which SCI is running. If the IMSplex names do not match, correct the IMSplex name and restart IMS Connect.

Module: NOC1 – HWSNOC10

HWSN1920E COMMUNICATIONS WITH ODBM FAILED TO OPEN BECAUSE CSLSCQRY FAILED WITH RC=rc RSN=rsn; M=mc

Explanation: IMS Connect tried to query the IMSplex for instances of ODBM to which to connect. However, the CSLSCQRY query request failed with the specified return and reason codes.

In the message text:
rc Return code returned by CSLSCQRY
rsn Reason code returned by CSLSCQRY
mc Module that issued the message

System action: IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

System programmer response: Determine the problem by checking the SCI CSLSCQRY return and reason codes. After you resolve the problem, issue the IMS Connect command STARTOD to connect to specific instances of ODBM.

Module: NOC1 – HWSNOC10

HWSN1925E COMMUNICATIONS WITH ODBM FAILED TO OPEN BECAUSE NO ODBMS ARE AVAILABLE; M=mc

Explanation: IMS Connect cannot open communications with The Open Database Manager (ODBM) because no instances of ODBM are active in the IMSplex.

In the message text:
mc Module that issued the message

System action: IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

System programmer response: Start at least one instance of ODBM.

After ODBM is started, if IMS Connect is configured to connect to ODBM automatically (ODBMAUTOCONN=Y in the IMS Connect configuration PROCLIB member), IMS Connect connects to all ODBM instances running in the IMSplex. If IMS Connect is not configured to connect to ODBM automatically, restart communication with ODBM by issuing the appropriate IMS Connect command.

Module: NOC1 – HWSNOC10

HWSN1930E COMMUNICATIONS WITH ODBM FAILED TO OPEN BECAUSE IMS CONNECT FAILED TO GET STORAGE; RC=rc; M=m

Explanation: IMS Connect was unable to open communications with ODBM because there was an error getting the necessary storage.

In the message text:
rc Return code of the BFE service BPECTBGET
m Module that issued the message

System action: IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

System programmer response: Ensure that the region size that is specified in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and
the memory dump if available.

Module: NOC1 – HWSNOC10

HWSN1935W OPEN COMMUNICATIONS TO ODBM FAILED BECAUSE ODBM DRIVER OPEN FAILED; M=mc

Explanation: IMS Connect was unable to open communication to ODBM because the ODBM driver that opens communications failed.

In the message text:
mc Module that issued the message

System action: This message is issued and IMS Connect continues to run; however, no communication function is available to ODBMs.

System programmer response: If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: NOC1 – HWSNOC10

HWSN1940W UNABLE TO SEND RESPONSE FROM ODBM=odbmname TO CLIENT=clientid; R=rc, S=sc, M=mc

Explanation: IMS Connect received a message from the Open Database Manager (ODBM) identified in the message, but was not able to send the response to the named TCP/IP client. This situation can happen when the client that made the request is no longer active.

In the message text:

odbmname ODBM that sent the response.
clientid Client that made the request.
rc Return code.
sc Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc Module that issued the message.

Table 44. Service and return code explanation for HWSN1940W

<table>
<thead>
<tr>
<th>Service Code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETFWEB</td>
<td>IMS Connect was unable to obtain a required control block for processing. This condition might be temporary.</td>
<td>rc</td>
<td>This problem is a processing error. rc is the return code from BPECBGET.</td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run. The response message is discarded.

System programmer response: This error can occur when the client is no longer active and is not connected to IMS Connect. The client might have logged off, or the connection might have timed out.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, record the return and service codes, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: NREC – HWSNREC0

HWSN1950E UNABLE TO NOTIFY THE CLIENT clientid OF ODBM COMMUNICATION ERROR; R=rc, S=sc, M=mc, P=portid

Explanation: IMS Connect was unable to notify the TCP/IP client that originated a message that a communication error with ODBM has occurred.

In the message text:

clientid TCP/IP client
rc Return code
sc Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc Module that issued the message
portid Port ID. IMS Connect Port that is receiving the client message.

System action: This message is issued and IMS Connect continues to run. The message whose processing caused the error is discarded.

System programmer response: This error can occur when the ODBM is no longer active or the communication linkage between IMS Connect and ODBM is broken. If the error recurs, search the
problem-reporting databases to find a correction for the problem. If none exists, record the return, service, and message codes, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** NXMT – HWSNXMT0, DSCE - HWSDSCE0

HWSN1960I  ODBM=odbmname threadtype THREAD TERMINATED; M=mc

**Explanation:** An ODBM transmit thread or receive thread has terminated.

In the message text:

- **odbmname**
  Instance of ODBM that was handling the thread

- **threadtype**
  Type of thread that terminated
  - RECEIVE
    A receive thread
  - TRANSMIT
    A transmit thread

- **m**
  Module that issued the message

**System action:** IMS Connect continues to run, but cannot route database connection requests to IMS DB in DBCTL or DB/DC systems.

**System programmer response:** No action is required.

**Module:** NREC – HWSNREC0; NXMT – HWSNXMT0

HWSN1965I  IMS CONNECT WAS UNABLE TO SEND A MESSAGE TO ODBM=odbmname; C=clientid, P=portid, R=rc, S=ss, M=mc

**Explanation:** IMS Connect is unable to send a message to the Open Database Manager (ODBM). The service code identifies the service that caused this error.

In the message text:

- **odbmname**
  Name of the ODBM.

- **clientid**
  TCP/IP client ID.

- **portid**
  Port that received the message from the TCP/IP client.

- **rc**
  Return code.

- **ss**
  Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

- **mc**
  Module that issued the message.

See the following table for an explanation of service and return codes:

<table>
<thead>
<tr>
<th>Code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BPEGETM</td>
<td>The get storage service failed.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
<tr>
<td>HWSFSTOR</td>
<td>The release storage service failed.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** If a get storage error occurred, ensure that the region size specified in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and the memory dump if available.

If a release storage error occurred, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and the memory dump if available.

**Module:** NXMT – HWSNXMT0

HWSN1985I  COMMUNICATION WITH ODBM=odbmname CLOSED; M=mc

**Explanation:** Communication with the instance of ODBM terminated because either:

- A CLOSEHWS command was issued to terminate IMS Connect
- The ODBM instance identified by odbmname terminated

In the message text:

- **odbmname**
  Name of the ODBM instance with which communication has ended

- **mc**
  Module that issued the message

**System action:** If ODBM terminated, IMS Connect continues to run, but cannot route database connection requests to the ODBM instance that is identified in the message text.

If a CLOSEHWS command was issued, IMS Connect is no longer running.

**System programmer response:** To resume communication with ODBM after the ODBM instance terminated, start ODBM.

To resume communication with ODBM after a CLOSEHWS command was issued, start IMS Connect.
**HWSN2000E** STOP ODBM COMMAND FAILED DUE TO IMS CONNECT FAILED TO GET STORAGE; ODBM=odbm, R=rc, S=sc, M=mc

**Explanation:** An attempt to close the Open Database Manager (ODBM) identified in the message was unsuccessful. The system could not allocate storage to notify the ODBM to close.

In the message text:
- **odbm** Name of the target ODBM
- **rc** Return code
- **sc** Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request
- **mc** Module issuing the message

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** DSCM - HWSDSCM0

---

**HWSN2030W** FWE FUNCTION=func; FAILED FOR DS=odbm, COMMAND=hwscmd IN PROGRESS; M=mc

**Explanation:** The function func could not be processed because the command identified by hwscmd is already being processed.

In the message text:
- **func** Function name requested
- **odbm** Name of the target ODBM
- **hwscmd** IMS Connect command in progress
- **mc** Module issuing the message

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**Module:** NSCH – HWSNSCH00
System programmer response: The IMS Connect command that is in progress is terminating the ODBM; therefore, any new function for that ODBM cannot be processed.

Module: DSCM - HWSDSBCM0

HWSO110W FAILED TO OBTAIN FREE STORAGE; R=rc, B=bn, M=mc

Explanation: The IMS Connect OTMA driver is unable to get free storage for internal buffers.
- rc identifies the return code.
- bn identifies the buffer name.
- mc identifies the module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: This error can occur when not enough storage is available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

HWSO1101W FAILED TO RELEASE STORAGE;
R=rc, B=bn, M=mc

Explanation: The IMS Connect OTMA driver is unable to release storage for internal buffers.

In the message text:
- rc identifies the return code.
  - FST4 = invalid buffer
- bn identifies the buffer name.
- mc identifies the module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

HWSO1105W GETMAIN FOR OTOKEN + IXCQUERY CONTROL BUFFER FAILED; R=rc, S=sc, M=mc

Explanation: Storage for the OTOKEN buffer could not be allocated.

In the message text:
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETOTOKN</td>
<td>BPEGETM, the system service used to acquire the OTOKEN.</td>
<td>4</td>
<td>An incorrect or unsupported subpool is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8</td>
<td>A zero length is requested.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
</tr>
</tbody>
</table>

System programmer response: This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: DDXR - HWSDDXRG

HWSO1110W IXCQUERY FAILED FOR OTMA SYSPLEX ENVIRONMENT; R=rc, S=sc, M=mc

Explanation: An attempt to query OTMA sysplex environment information (REQINFO=SYSPLEX) is unsuccessful.

In the message text:
- rc identifies the return code.
- sc identifies the reason code.
- mc identifies the module issuing the message.

For information about the return and reason codes, see z/OS MVS Programming: Authorized Assembler Services Reference.

See the following table for an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Group name</th>
<th>Member name</th>
<th>Return code (decimal)</th>
<th>Reason code (decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td>See z/OS MVS Programming: Sysplex Services Reference.</td>
</tr>
</tbody>
</table>
System action: This message is issued and IMS Connect continues to run.

Module: DDXR - HWSDDXRG

HWSO115W  XCF FUNC=func, ERROR FOR OTMA SYSPLEX ENVIRONMENT; DS=did, R=rc, S=sc, M=mc

Explanation: A function on a XCF call terminated in error for the data store identified in the message.

In the message text:
• func identifies the function (Transmit or Receive).
• did identifies the data set
• rc identifies the XCF return code.
• sc identifies the XCF reason code.
• mc identifies the module issuing the message.

For information about the return and reason codes, see z/OS MVS Programming: Authorized Assembler Services Reference.

See the following table for an explanation of the service and return code:

<table>
<thead>
<tr>
<th>Group name</th>
<th>Member name</th>
<th>Return code (decimal)</th>
<th>Reason code (decimal)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>403</td>
<td>120</td>
</tr>
</tbody>
</table>

See z/OS MVS Programming: Sysplex Services Reference.

System action: This message is issued when a transmit or receive to or from IMS occurs. The connection to the named data store is terminated.

Module: DXMT - HWSDDXMT, DXRC - HWSDDXRC

HWSO1205W  GETMAIN FOR CTOKEN + IXCJOIN CONTROL BUFFER FAILED; R=rc, S=sc, M=mc

Explanation: Storage for the CTOKEN + IXCJOIN buffer could not be allocated.

In the message text:
• rc identifies the return code.
• sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• mc identifies the module issuing the message.

See the following table for an explanation of service and return codes:

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETCTOKN</td>
<td>BPEGETM, the system service used to acquire the CTOKEN.</td>
<td>4</td>
<td>An incorrect or unsupported subpool is specified.</td>
</tr>
</tbody>
</table>

Module: DXMT - HWSDDXMT, DXRC - HWSDDXRC

HWSO1120W  XCF FUNC=func TRANSMIT XCF ENVIRONMENT ERROR; DS=did, R=rc, S=sc, M=mc

Explanation: The function on a XCF call terminated in error for the named data store.

In the message text:
• func identifies the function (Transmit or Receive).
• did identifies the data store.
• rc identifies the XCF return code.
• sc identifies the XCF reason code.
• mc identifies the module issuing the message.

For information about the return and reason codes, see z/OS MVS Programming: Authorized Assembler Services Reference.
Table 52. Service and return code explanation for HWSO1205W (continued)

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>A zero length is requested.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run.

System programmer response: This is probably a storage error. Ensure that the region size for IMS Connect is large enough. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: DDXO - HWSDDXOT

HWSO1210W IXCQUERY FAILED FOR GROUP=group, MEMBER=member; R=rc, S=ss, M=mc

Explanation: An attempt to query OTMA group information (REQINFO=GROUP) was unsuccessful.

In the message text:

- group identifies the XCF group name.
- tmember identifies the IMS system's XCF target member name.
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Check the status of the target member and restart the target member.

Module: DDXO - HWSDDXOT

HWSO1220W IXCJOIN FAILED FOR GROUP=group, MEMBER=member; R=rc, S=ss, M=mc

Explanation: An attempt to join the XCF group was unsuccessful. In the message text:

- group identifies the XCF group name.
- member identifies the IMS Connect XCF member name.
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Check the status of the target member and restart the target member.

Module: DDXO - HWSDDXOT

HWSO1305W CBGET FOR C512 BLOCK FAILED; R=rc, S=sc, M=mc

Explanation: Storage for the client bid buffer cannot be allocated.

In the message text:
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of the return and service codes.

Table 56. Service and return code explanation for HWSO1305W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>

</thead>
<tbody>
<tr>
<td>GETC512</td>
<td>BPECBGET, the system service used to acquire C512.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run.

System programmer response: See z/OS MVS Programming: Sysplex Services Reference for the possible cause of the specified return and reason codes.

Module: DDXC - HWSDDXCN

Related reference: [z/OS: IXCJOIN return and reason codes](#)

HWSO1310W IXCMSGO FAILED FOR CLIENT BID GROUP=group, MEMBER=member; R=rc, S=sc, M=mc

Explanation: An attempt to send a client bid to IMS OTMA was unsuccessful.

In the message text:
- `group` The XCF group name.
- `member` The IMS Connect XCF member name.
- `rc` The return code.
- `sc` The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` The module issuing the message.

See the following table for an explanation of the return and reason code.

Table 57. Return and reason code explanation for HWSO1310W

System action: This message is issued and IMS Connect continues to run.

System programmer response: See z/OS MVS Programming: Sysplex Services Reference for the possible cause of the specified return and reason codes.

Module: DDXC - HWSDDXCN

Related reference: [z/OS: IXCJOIN return and reason codes](#)

HWSO1315W IXCLEAVE FAILED FOR GROUP=group, MEMBER=member; R=rc, S=sc, M=mc

Explanation: An attempt to leave the XCF group was unsuccessful.
In the message text:
- group: The XCF group name.
- member: The IMS Connect XCF member name.
- rc: The return code.
- sc: The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc: The module issuing the message.

See the following table for an explanation of the return and reason code:

**Table 58. Return and reason code explanation for HWSO1315W**

<table>
<thead>
<tr>
<th>Group name</th>
<th>Member name</th>

</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** See z/OS MVS Programming: Sysplex Services Reference for the possible cause of the specified return and reason codes.

**Module:** DDXC - HWSDDXCN

**Related reference:**
- [OTMA sense codes for NAK messages (Messages and Codes)](http://example.com)

HWSO1320W  CLIENT BID FAILED FOR GROUP=group, MEMBER=member, R=rc, RS=rs, S=sc, M=mc

**Explanation:** A client bid with IMS OTMA was unsuccessful.

In the message text:
- group: The XCF group name.
- member: The IMS Connect's XCF member name.
- rc: The return code.
- rs: The reason code.
- sc: The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc: The module issuing the message.

See the following table for the service and return codes and their explanations:

**Table 59. Service and return code explanation for HWSO1320W**

```
<table>
<thead>
<tr>
<th>Group name</th>
<th>Member name</th>

<tbody>
<tr>
<td>XCF group name</td>
<td>IMS Connect XCF member name</td>
<td>CBERROR</td>
<td>OTMA C/1 return codes</td>
<td>This is a client bid error.</td>
</tr>
</tbody>
</table>
```

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** See the OTMA C/1 return codes for the possible cause of the specified return code.

**Module:** DDXC - HWSDDXCN

**Related reference:**
- [OTMA sense codes for NAK messages (Messages and Codes)](http://example.com)

HWSO1325W  RACROUTE REQUEST=TOKENXTR FAILED FOR R=rc, S=sc, M=mc

**Explanation:** An attempt to extract a UTOKEN for IMS Connect address space identifier (ASID) is unsuccessful.

In the message text:
- rc identifies the SAF return code. See the RACROUTE macro reference for z/OS for more information.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** See the RACROUTE macro reference for z/OS for the possible cause of the specified return and reason codes.

**Module:** DDXC - HWSDDXCN

HWSPI1400W  IPV6 PROCESSING NOT ENABLED; FUNC=fn, R=rc, S=sc, M=mc

**Explanation:** IMS Connect is unable to get the Internet Protocol Version 6 (IPv6) socket.

In the message text:
- fn: The function code.
- rc: The return code.
- sc: The service code. Service codes contain either codes that specifically identify the error or...
System programmer response: Enable the TCP/IP stack for IPv6 processing by tailoring the BPXPRMxx member. See the IMS system definition information for more information.

---

HWSP1402W  SSL PROCESSING NOT ENABLED;
FUNC=fni, R=rc, S=ss, M=mc

Explanation: IMS Connect was unable to retrieve SSL support.

In the message text:
- fni The function code.
- rc The return code.
- ss The service code. Service codes contain either codes that specifically identify the error or codes returned by called services which failed to complete the request.
- mc The module issuing the message.

System action: This message is issued. The SSL socket is closed. IMS Connect continues to run fully. If the message occurred during the SSL environment initialization, the port might be closed.

System programmer response: Ensure that the requirements for z/OS are met.

Module: HWSDOPN0, HWSLEPS0, HWSSDOTD

---

HWSP1405W  FAILED TO OBTAIN FREE STORAGE;
R=rc, B=bn, M=mc

Explanation: IMS Connect OTMA was unable to get free storage for internal buffers.

In the message text:
- rc The return code returned by z/OS for a GETMAIN failure
- bn The buffer name
- mc The module issuing the message

System action: This message is issued and IMS Connect continues to run.

System programmer response: This error can occur when not enough storage is available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Related reference:
- [z/OS: GETMAIN return and reason codes](#)

---

HWSP1410W  FAILED TO RELEASE STORAGE;
R=rc, B=bn, M=mc

or

FAILED TO RELEASE STORAGE; R=rc, B=bn, A=a, M=mc

Explanation: The IMS Connect OTMA driver was unable to release storage for internal buffers.

In the message text:
- rc The return code returned by z/OS for an GETMAIN failure.
- bn The buffer name
- a The address of the buffer
- mc The module issuing the message

System action: This message is issued and IMS Connect continues to run.

System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Related reference:
- [z/OS: GETMAIN return and reason codes](#)

---

HWSP1415E  TCP/IP SOCKET FUNCTION CALL
FAILED; F=fni, R=rc, E=ec, M=mc, ID=cn, IPvni=ip

Explanation: The IMS Connect TCP/IP driver is unable to perform the specified socket function. This message is issued during normal execution of IMS Connect. HWSP1415I is issued during shutdown of IMS Connect.

In the message text:
- fni The TCP/IP socket function call.
- rc The TCP/IP return code. This can be either -1, indicating problem was encountered, or 0.
- ec The TCP/IP error code.
- mc The module issuing the message.
- cn The client name or port name.
- ip The TCP/IP address, when applicable.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Check the error code ec to determine the cause of the problem. See [z/OS: Return codes (errno)](#) for problems encountered from the TCP/IP API macro call, see [z/OS: Sockets return codes (ERRNOs)](#)

Related information:
- [“HWSP1415I” on page 408](#)
HWSP1415I  •  HWSP1435E

HWSP1415I  TCP/IP SOCKET FUNCTION CALL FAILED; F=fn, R=rc, E=ec, M=mc, ID=cn, IPV=ip

Explanation: The IMS Connect TCP/IP driver is unable to perform the specified socket function. HWSP1415E is issued during normal execution of IMS Connect. This message is issued during shutdown of IMS Connect.

For more information about this message, see HWSP1415E.

System action: This message is issued and IMS Connect continues to shut down.

Related information: HWSP1415E on page 407

HWSP1420E  PORT NUMBER CONTAINS NON-NUMERIC VALUE; P=portid, M=mc

Explanation: The IMS Connect TCP/IP driver was unable to convert the portid string to a numeric value.

In the message text:
portid The port ID in the PORT substatement of the TCPIP statement in the IMS Connect configuration member, HWSCFGxx.
mc The module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Check the PORT substatement of the TCPIP statement in the IMS Connect configuration member, HWSCFGxx, for the correct numeric characters. Correct the problem and restart IMS Connect.

HWSP1425E  WAIT ECB FAILED; F=fn, C=pc, M=mc

Explanation: The IMS Connect TCP/IP driver encountered a code in the event control block (ECB) that indicated the operation was not successful.

In the message text:
fn The function performed
pc The post code set by IMS Connect
mc The module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Check the post code for the possible cause. See the IMS Connect post code information.

Module: HWSSDOTD

Related reference: IMS Connect post codes (Messages and Codes)

HWSP1430E  TCP/IP INTERNAL ERROR; F=fn, R=rc, E=ec, M=mc

Explanation: TCP/IP was unable to perform the specified socket function.

In the message text:
fn The TCP/IP socket function call
rc The TCP/IP return code
ec The TCP/IP error code
mc The module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: For the possible cause of the specified return code and error code, see the information on z/OS UNIX System Services.

Related reference:
- z/OS: Return codes (errnos)
- z/OS: Macro application programming interface

HWSP1435E  SOCKET CLOSED; REQUEST MESSAGE INCOMPLETE; M=mc

Explanation: The TCP/IP socket closed before all the data has been received.

In the message text:
mc The module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: No action is required.

The connection has been terminated by the client code, and IMS Connect has received either no data or partial
data from the client. This error can occur if you specified a TCP/IP value of SO_LINGER=Y,VALUE=0 or SO_LINGER=NO. Instead, specify SO_LINGER=Y,VALUE=10. The VALUE parameter should be any value other than 0. See z/OS UNIX System Services Messages and Codes (SA22-7807) for more information about SO_LINGER= and VALUE=. The request message is discarded.

or

INVALID LENGTH SPECIFIED IN MESSAGE PREFIX; L=l, M=mc, ID=, IPv=address

Explanation: The length field in the message prefix contains an invalid value. A valid message length value is between 12 and 10,000,000 inclusive, and it must be equal to the exact data being sent.

In the message text:
- **l**: The length specified in the message prefix. This is the length of the entire message including the 12-byte message prefix.
- **mc**: The module issuing the message.
- **id**: The client ID.
- **address**: The client IP address. The address is in either Internet Protocol version 4 (IPv4) or IPv6 format.

System action: This message is issued and IMS Connect continues to run. The request message is discarded.

System programmer response: If the problem persists, check the messages for the client ID and client IP address to determine what the problem is. If necessary, contact IBM Software Support.

HWSP1445E  UNKNOWN EXIT IDENTIFIER SPECIFIED IN MESSAGE PREFIX;
MSGID=msgid1/msgid2, M=mc

or

UNKNOWN EXIT IDENTIFIER SPECIFIED IN MESSAGE PREFIX; MSGID=msgid1/msgid2, M=mc, IPv=address

Explanation: The MSGID identifier in the message prefix contains an unknown identifier. Exit identifiers are given to IMS Connect in the INIT subroutine of the user exit.

In the message text:
- **msgid1**: The EBCDIC MSGID in the message prefix.
- **msgid2**: The ASCII MSGID in the message prefix.
- **mc**: The module issuing the message.
- **address**: The client IP address. The address is in either Internet Protocol version 4 (IPv4) or IPv6 format.

If the msgid1 or msgid2 is partially readable, it might mean that the message was built incorrectly and the IRM_ID field contains only part of the ID. For example:

- If 4 extra bytes precede IRM_ID, you might receive one of the following messages:
  - HWSP1450E Unknown EXIT identifier specified in message prefix; MSGID=*)($%
  - HWSP1450E Unknown EXIT identifier specified in message prefix; MSGID=())($%
  - HWSP1450E Unknown EXIT identifier specified in message prefix; MSGID=*)($%

- If 4 bytes are missing in front of IRM_ID, you might receive one of the following messages:
  - HWSP1450E Unknown EXIT identifier specified in message prefix; MSGID=*)($%
  - HWSP1450E Unknown EXIT identifier specified in message prefix; MSGID=())($%

System action: This message is issued and IMS Connect continues to run. The request message is discarded.

System programmer response: If msgid1 and msgid2 are both unreadable, then one of the following problems might have occurred:

1. The message was built incorrectly. The IMS request message (IRM) ID of the message is incorrect or missing. Ensure that the message is built correctly.
2. The message was sent on a client-defined Secure Socket Layer (SSL) port; however, the port was not defined to IMS Connect as an SSL port.

HWSP1450E  MESSAGE CONTAINS INVALID LENGTH; SEG_NO=sn, APP_LL=al,
TOTAL MSG LEN=tl, C=clientid, M=mc

Explanation: The input OTMA message contains an incorrect application data length.

In the message text:
- **sn**: The OTMA segment number.
- **al**: The application data length in the OTMA segment.
- **tl**: The length of the total message specified.
- **el**: The length of the expected message.
- **clientid**: The client name. This field contains blanks if the client name is not available.
- **mc**: The module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: Make sure that the specified value is correct.

HWSP1455E  MESSAGE CONTAINS INVALID LENGTH; AREA_LL=ar, APP_LL=al,
M=mc

Explanation: The input OTMA message contains an incorrect application data length.

In the message text:
HWSP1460E  MISSING FIC IN OTMA PREFIX;  
\textbf{M} = \text{mc}

\textbf{Explanation:} The input OTMA message does not contain a first-in-chain (FIC) flag in the first segment.

In the message text:
\textbf{mc} The module issuing the message

\textbf{System action:} This message is issued and IMS Connect continues to run.

\textbf{System programmer response:} Make sure that the message contains an FIC flag.

---

HWSP1465E  MISSING LIC IN OTMA PREFIX;  
\textbf{SEG\_NO=}sn, \textbf{M=}mc

\textbf{Explanation:} The input OTMA message does not contain a last-in-chain (LIC) flag in the last segment.

In the message text:
\textbf{sn} The number of the segment
\textbf{mc} The module issuing the message

\textbf{System action:} This message is issued and IMS Connect continues to run.

\textbf{System programmer response:} Make sure that the message contains a LIC flag.

---

HWSP1470E  LOADING EXIT FAILED; \textbf{EXIT=}msgid, \textbf{R=}rc, \textbf{M=}mc

\textbf{Explanation:} IMS Connect failed to load the user exit.

In the message text:
\textbullet{} \textit{msgid} identifies the MSGID (exit name) in the message prefix.
\textbullet{} \textit{rc} identifies the return code returned by z/OS from a z/OS load failure.
\textbullet{} \textit{mc} identifies the module issuing the message.

\textbf{System action:} This message is issued for each user exit that fails to load. If at least one user exit loads correctly, IMS Connect continues to run. However, the exits that failed to load will not be available to IMS Connect.

If all user exits fail to load, IMS Connect continues to run but no TCP/IP communication is established (see HWSS0785W).

If any user exit returns a valid return code, IMS Connect continues to run but no TCP/IP communication is established.

\textbf{System programmer response:} If TCP/IP communication failed to establish because none of the exits returned a valid return code, run CLOSEHWS to terminate IMS Connect.

Examine the return code and resolve the problem and then restart IMS Connect to reload the exit or exits.

Related information:
"HWSS0785W" on page 428

HWSP1475E  EXIT EXECUTION FAILED;  
\textbf{EXIT=}msgidmsgid, \textbf{F=}fn, \textbf{R=}rc, \textbf{M=}mc

\textbf{Explanation:} A user exit returns an incorrect return code to IMS Connect when called by IMS Connect to perform an INIT or TERM function.

In the message text:
\textbullet{} \textit{msgid} identifies the MSGID (exit name) in the message prefix.
\textbullet{} \textit{fn} identifies the function failed.
\textbullet{} \textit{rc} identifies the return code returned by z/OS from a z/OS load failure.
\textbullet{} \textit{mc} identifies the module issuing the message.

\textbf{System action:} This message is issued for each user exit that returns an incorrect return code. If at least one exit returns a valid return code, IMS Connect continues to run. However, the exits that failed will not be available to IMS Connect.

If all exits return an invalid return code, IMS Connect continues to run but no TCP/IP connection is established (see HWSS0785W).

\textbf{System programmer response:} Pass the return code and function name to the exit owner to resolve the problem.

If TCP/IP communication is not established because none of the exits returned a valid return code, run CLOSEHWS to terminate IMS Connect.

Related information:
"HWSS0785W" on page 428

HWSP1480E  CONFLICT IDENTIFIERS RETURNED FROM EXIT; \textbf{EXIT1=}en1, \textbf{EXIT2=}en2, \textbf{M=}mc

\textbf{Explanation:} Multiple user exits that use the same exit name are defined in the \textbf{EXIT} substatement of the TCPIP statement in the HWSCFGxx configuration member.

In the message text:
\textbullet{} \textit{en1} identifies the first exit name.
\textbullet{} \textit{en2} identifies the second exit name.
\textbullet{} \textit{mc} identifies the module issuing the message.

\textbf{System action:} This message is issued and IMS Connect continues to run, but none of the TCP/IP communication facilities will work properly.

\textbf{System programmer response:} Have the owner of EXIT1 and EXIT2 resolve the naming problem, correct
the exit names in the EXIT substatement in HwSCFxx, and then shut down and restart IMS Connect.

**HWSP1485E**  **PASSING TO TCP/IP ASYNC FAILED;**

\[ F=fn, \ R=rc, \ E=ec, \ M=mc, \ ID=cn, \ IPv4=ip, IPv6[ip] \]

**Explanation:** TCP/IP rejects the request for asynchronous function processing.

In the message text:
- \( fn \) The TCP/IP socket function call
- \( rc \) The TCP/IP return code
- \( ec \) The TCP/IP error code
- \( mc \) The module issuing the message
- \( cn \) The client name or port name
- \( n \) The IP addressing standard (that is, IPv4, IPv6).
- \( ip \) The TCP/IP address, when applicable

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** For the possible cause of the specified return and error codes, see the related release of z/OS UNIX System Services Messages and Codes (SA22-7807).

**Related reference:**
- \[ z/OS: Return codes (errnos) \]
- \[ z/OS: Macro application programming interface \]

**HWSP1490E**  **INVALID OTMA SEQUENCE NUMBER;**

\[ Seg=gn, \ SEQ=qn, \ C=cn, \ M=mc \]

**Explanation:** A request message coming from a client or generated by a user exit contains an invalid sequence number in the OTMA prefix. The sequence number must match the segment number.

In the message text:
- \( gn \) identifies the segment number.
- \( qn \) identifies the sequence number.
- \( cn \) identifies the client name. It will contain blanks if the client name is not available.
- \( mc \) identifies the module issuing the message.

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** None. The request message is discarded.

**HWSP1495E**  **PROTOCOL VIOLATION;**

\[ R=rc, \ C=cn, \ DS=ds, \ M=mc \]

**Explanation:** IMS Connect received the input message while waiting for the response ACK/NAK.

In the message text:
- \( rc \) identifies the return code.
- \( cn \) identifies the client name. It will contain blanks if the client name is not available.
- \( ds \) identifies the data store name.
- \( mc \) identifies the module issuing the message.

**System action:** This message is issued and IMS Connect sends the NAK to IMS.

**System programmer response:** No action is required.

The request message is rejected.

**Module:** SDRC - HWSSDRCV

**HWSP1500E**  **SECURITY VIOLATION;**

\[ R=rc, \ C=cn, \ U=un, \ RACFRC=rrc, \ RACFS=rrs, \ M=mc \]

**Explanation:** RACF verification failed for the user ID and password from a client or user message exit routine. The user ID and password were contained in the user data section of the OTMA prefix of a request message.

In the message text:
- \( rc \) The System Authorization Facility (SAF) return code.
- \( cn \) The client name. This contains blanks if the client name is not available.
- \( un \) The user name. This contains blanks if the user name is not available.
- \( rrc \) The RACF return code.
- \( rrs \) The RACF reason code.
- \( mc \) The module issuing the message.

Return codes (decimal): See the RACROUTE REQUEST=VERIFY macro reference for z/OS for \( R=rc, \) RACFRC=rrc, and RACFS=rrs values.

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Check the user ID and password, the PassTicket and group name to ensure they are valid and have the proper authority. Check with your systems security administrator to perform the necessary changes.

**Module:** SDRC - HWSSDRCV, PCRC - HWSPCRCV

**Related reference:**
- \[ z/OS: RACF RACROUTE REQUEST=VERIFY return codes and reason codes \]

**HWSP1501I**  **RACF USERID CACHING \{ENABLED | DISABLED\};**

\[ M=xxxx \]

**Explanation:** IMS Connect successfully processed a command to enable or disable the RACF user ID cache.

In the message text:
- \( xxxx \) The 4-character name of the module that issued the message.

**System action:** Normal processing continues.

**User response:** No action is required.

**Module:** HWSCHWSO, HWSCUPD0, and HWSCUPR0
HWSP1503E  SECURITY VIOLATION, NO RACROUTE CALL; R=rc, C=clientid, U=userid, M=mc

Explanation:  IMS Connect rejected the security input data, the user ID or the password. RACF=Y had been specified; however, no user ID or password was passed to IMS Connect by the user-written exit.

In the message text:
- rc identifies the return code from IMS Connect.
  - 255 - No OTMA security header; IMS Connect security checking cannot be done.
  - 252 - Invalid security header length. The security header length is less than X'6A', security parms are missing.
  - 248 - No password (see note 1).
  - 244 - No user ID (see note 2).
  - 242 - Invalid character detected in user ID, groupname, or password field.
  - 240 - No password and no user ID (see note 3).
- clientid identifies the client ID.
- userid identifies the user ID.
- mc identifies the module issuing the error message.

Note:
1. There is no password in IMS request message (IRM), but there is a user ID in IRM. Or, there is no password or user ID in IRM; however, there is a default user ID in the IMS Connect configuration file.
2. There is no user ID in IRM and there is no default user ID in the IMS Connect configuration file.
3. There is no password or user ID in IRM and there is no default user ID in the IMS Connect configuration file.

System action: The request message is rejected. IMS Connect continues to run.

System programmer response: No action is required.

If the problem continues, correct the user exit to pass valid security data.

Module:  SDRC - HWSSDRCV, PCRC - HWSPCRCV

HWSP1504I  RACF USERID uidname WAS SUCCESSFULLY REFRESHED, M=xxxx

Explanation:  IMS Connect successfully refreshed the cached data for the specified RACF user ID with the RACROUTE REQUEST=VERIFY command.

In the message text:
uidname  The RACF user ID
xxxx  The four letter name of the module that issued the message

System action:  IMS Connect continues normal processing with the updated RACF user ID information.

User response:  No action is required.

Module:  HWSCUPR0

HWSP1505E  NEGATIVE SEGMENT LEN; SEG LEN=1111, R=rc, M=mc

Explanation:  One of the data segments contains an invalid segment length; the length is negative.

In the message text:
- 1111 identifies the length value in the message segment.
- rc identifies the XCF return code.
- mc identifies the module issuing the message.

System action:  The request message is rejected. This message is issued when a negative segment length is received from the client. The connection is closed.

System programmer response:  No action is required.

Module:  DRCV - HWSSDRCV

HWSP1506I  RACF USERID uidname NOT FOUND, M=xxxx

Explanation:  A RACF user ID was not refreshed because the requested RACF user ID uidname was not in the IMS Connect RACF user ID cache.

In the message text:
uidname  The RACF user ID name that was specified by the WTO command REFRESH RACFUID or a z/OS Modify command UPDATE RACFUID.
xxxx  The 4-character name of the module that issued the message.

System action:  Normal processing continues.

User response:  Check the spelling of the user ID and reissue the command.

Module:  HWSCUPR0

HWSP1507E  CONNECTION SECURITY ERROR; C=clientid, U=userid, A=applid, SAFRC=safr, RACFRC=racfr, RACFRSN=racfrsn, M=mc

Explanation:  The IMS Connect RACROUTE REQUEST call to RACF failed to authenticate or authorize the security credentials on a connection identified by the clientid.

In the message text:
clientid  Identifies the client ID of the connection.
userid  The user ID used for authentication and authorization.
applid  The application ID used for authentication and authorization.
safr  Identifies the SAF return code.
racfr  The RACF return code.
racfrsn  The RACF reason code.
mc  Identifies the module issuing the message.
System action: IMS Connect rejects the message and returns a NAK with OTMA sense code 002A/0005. OTMA reroutes the message to the dead letter queue, HWSSDLQ. IMS Connect closes the socket connection.

System programmer response: Check the RACF return codes and reason codes for the RACROUTE REQUEST=VERIFY call in the z/OS Security Server RACROUTE Macro Reference.

Check that the security credentials passed by the sender are correct. Check that the RACF security definitions for the system on which this instance of IMS Connect resides are correct.

Module: MSCX – HWSMSCX0, OTMX – HWSOTMX0

Related reference:
- z/OS: RACF RACROUTE REQUEST=VERIFY return codes and reason codes

Related information:
- 002A (Messages and Codes)

HWSP1510E AN ERROR OCCURRED PROCESSING THE OUTBOUND MESSAGE; THE MESSAGE WAS REROUTED TO THE DEAD LETTER QUEUE queueuname; M=mc

Explanation: IMS Connect encountered an error during outbound message processing. IMS Connect issues a negative acknowledgement (NAK) for the outbound message to OTMA and rerouted it to the dead letter queue.

In the message text:
- queueuname The queue to which the message was rerouted
- mc The module issuing the message

System action: The outbound message is rerouted to the dead letter queue. IMS Connect continues to run.

System programmer response: Prior to this message, IMS Connect issued another error message stating the error. IMS Connect rerouted the outbound message to the dead letter queue because it is not recoverable. Check the previous messages to resolve the problem.

Module: HWSSXMT0

HWSQ2200E IMS CONNECT RECEIVED THE ERROR RESPONSE FROM ODBM=odbmname; R=rc, S=rsn, M=mc

or

IMS CONNECT WAS UNABLE TO PROCESS THE ERROR RESPONSE FROM ODBM=odbmname; R=rc, S=rsn, M=mc

Explanation: IMS Connect received an error response from an Open Database Manager (ODBM) and was unable to process it.

In the message text:
- odbmname The name of the ODBM
- rc Return code
- rsn Reason code
- mc The module issuing the message

System action: IMS Connect continues to run.

System programmer response: Check the CSLDMI return and reason codes and take the appropriate action. If the problem persists, it is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support Center. Provide your JCL, SYSLOG, and memory dump if available.

Module: NXRC - HWSNDXRC

HWSQ2225E IMS CONNECT WAS UNABLE TO PROCESS THE CSLDMI ERROR RESPONSE FROM ODBM=odbmname; R=rc, S=rsn, M=mc

Explanation: IMS Connect received a CSLDMI error reply message from an Open Database Manager (ODBM) and was unable to process it.

In the message text:
- odbmname The name of the ODBM
- rc Return code from ODBM CSLDMI
- rsn Reason code from ODBM CSLDMI
- mc The module issuing the message

System action: IMS Connect continues to run.

System programmer response: Check the CSLDMI return and reason codes and take the appropriate action. If the problem persists, it is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support Center. Provide your JCL, SYSLOG, and memory dump if available.

Module: NXRC - HWSNDXRC

Related reference:
- CSLDMI: ODBM application program interface (System Programming APIs)

HWSQ2225E IMS CONNECT DID NOT RECEIVE THE DIRECTIVE PARMLIST FROM ODBM=odbmname, M=mc

Explanation: IMS Connect received a reply message from an Open Database Manager (ODBM) that did not contain the directive parameter list.

In the message text:
- odbmname The name of the ODBM
- mc The module issuing the message
System action: IMS Connect continues to run.

System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support Center. Provide your JCL, SYSLOG, and memory dump if available.

Module: NXRC-HWSNDXRC

HWSQ2230W FAILED TO OBTAIN STORAGE;
R=rc, S=ss, B=bn, M=mc

Explanation: The IMS Connect ODBM driver is unable to get free storage for internal buffers.

In the message text:
rc Return code of the service.
ss Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. The following codes are storage services:
- BPECBGET
- BPEGTM
bn Buffer name. The following codes are buffer names:
- CTOKEN—communications token block.
- FWE—function work element block.
- HASTBL—hash table block.
- IMSA—IMS alias block.
addr Address of the buffer
mc Module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: This error can occur when not enough storage is available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, record the return code, service code, buffer name, buffer address, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: NXMT – HWSNDXMT

HWSQ2240W REGISTRATION TO ODBM FAILED:
MEMBER=odbmname; R=rc, S=ss, M=mc

Explanation: The IMS Connect ODBM driver is unable to register to the named ODBM.

In the message text:
odbm Name of the ODBM.
rc Return code of the service.
ss Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc Module issuing the message.

System action: This message is issued and IMS Connect continues to run; however, no communication function is available to ODBMs.

System programmer response: If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, record the return code, service code, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: NXMT – HWSNDXMT

HWSQ2235W FAILED TO RELEASE STORAGE;
R=rc, S=ss, B=bn, A=addr, M=mc

Explanation: The IMS Connect ODBM driver is unable to release storage for internal buffers.

In the message text:
rc Return code of the service.
ss Service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request. The following codes are storage services:
- BPECBGET
- BPEGTM
- BPECBGET
- BPEGTM
- BPECBGET
- BPEGTM
codes that more specifically identify the error, or codes returned by called services that failed the request.

| mc  | Module issuing the message. |

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, record the return code, service code, and contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** NXCN – HWSNDXCN

---

**HWSQ2255W** THE ODBM IS NOT AVAILABLE:

**MEMBER=odbmname; STATE=s, M=mc**

**Explanation:** A request has been made to this ODBM odbmname, but it is not available due to the state s.

In the message text:

- **odbm** Name of the ODBM.
- **s** State of the ODBM. States include:
  - DISC
  - TERM
- **mc** Module issuing the message

**System action:** This message is issued and IMS Connect continues to run. IMS Connect issues a negative response to the client.

**System programmer response:** If the state is DISC issue the IMS Connect command STARTOD to start the connection to ODBM.

If the state is TERM restart the ODBM identified in the message.

**Module:** NXMT – HWSNDXMT

---

**HWS messages HWSR0001-HWSX2000**

This topic contains the following messages:

**HWSR0653I** PROTECTED CONVERSATION PROCESSING WITH RRS/MVS ENABLED M=mc

**Explanation:** An attempt to communicate and restart with RRS is successful.

**System action:** The message is issued and IMS Connect continues to run.

**Module:** RRSI - HWSRRSI0

**HWSR0698W** PROTECTED CONVERSATION PROCESSING NOT ENABLED FUNC=func; R=rc, S=sc, M=mc

**Explanation:** An attempt to communicate with z/OS Resource Recovery Services (RRS) is unsuccessful.

In the message text:

- **func** identifies the function requested.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

**System action:** The message is issued, and IMS Connect continues to run.

**System programmer response:** Ensure that RRS was brought up correctly. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** RRSI - HWSRRSI0

**Related reference:**

[–] z/OS: z/OS Callable Resource Recovery Services

**HWSR0800E** FUNCTION WORK ELEMENT PROCESSING FAILURE, FUNC=func; R=rc, S=sc, M=mc

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:

- **func** identifies the function requested.
- **rc** identifies the return code.
- **sc** identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **mc** identifies the module issuing the message.

See the following table for an explanation of the service and return code:

**Table 60. Service and return code explanation for HWSR0800E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.
System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and a memory dump, if available.

Module: HWSRCDCR0

HWSR0810E STORAGE ALLOCATE FAILED FOR RECORDER DCB; R=rc, S=ssc, M=mc

Explanation: Storage allocation failed for recorder data set DCB control block.

In the message text:
• rc identifies the return code.
• ssc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• mc identifies the module issuing the message.

See the following table for an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETDCB</td>
<td>BPEGETM, the system service used to acquire the CKTOKEN.</td>
<td>4</td>
<td>An incorrect or unsupported subpool is specified.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8</td>
<td>A zero length is requested.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
</tr>
</tbody>
</table>

System action: The system continues to operate, however, no logging of input or output messages will occur.

System programmer response: More storage is required for the execution of the IMS Connect address space.

Module: HWSRCDCR0

HWSR0820E DCB OPEN FAILED FOR RECORDER DATASET; R=rc, S=ssc, M=mc

Explanation: DCB open failed for the recorder data set DCB.

In the message text:
• rc identifies the return code returned from the OPEN request.
• ssc identifies the service code DCBOPEN.

• mc identifies the module issuing the message.

System action: The message is issued and the recorder data set is set to closed.

System programmer response: In the system programmer’s z/OS console, see the error message on the line that directly precedes this error message to determine the appropriate action.

Module: HWSRCDCR0

HWSR0880I RECORDER OPENED; M=mc

Explanation: A recorder function has been opened successfully.

In the message text:
• mc identifies the module issuing the message.

System action: The recorder data set is now open and logging of input and output message text has begun.

System programmer response: No action is required.

Module: HWSCHWS0

HWSR0890I RECORDER CLOSED; M=mc

Explanation: A recorder function has been closed successfully.

In the message text:
• mc identifies the module issuing the message.

System action: The recorder close request is ignored.

System programmer response: No action is required.

Module: HWSRCDCR0

HWSR0891I RECORDER ALREADY CLOSED; M=mc

Explanation: A recorder close command was issued; however, the recorder trace is already closed.

In the message text:
• mc identifies the module issuing the message.

System action: The recorder close request is ignored.

System programmer response: No action is required.

Module: HWSCHWS0
**HWSS0700E** FUNCTION WORK ELEMENT PROCESSING FAILURE; FUNC=fn, R=rc, S=sc, M=mc

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
- fn identifies the function requested.
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of the service and return code.

*Table 62. Service and return code explanation for HWSS0700E*

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible,

the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** SOCC - HWSSOCC0, SCVC - HWSSCVC0

**HWSS0712W** UNABLE TO START SCHEDULER CONTROLLER FOR PORT=portid; R=rc, S=sc, M=mc

**Explanation:** Storage cannot be allocated for the scheduler controller structure, or the scheduler controller thread cannot be scheduled. This controller processes the connection of TCP/IP or Local clients.

In the message text:
- portid identifies the TCP/IP or local port.
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of service and return codes.

</tr>
</thead>
</table>
| SHUT/STO     |                   | 4           | During a new session connection process, IMS Connect detected either of the two conditions:  
|              |                   |             | • IMS Connect is in the process of shutting down.  
|              |                   |             | • The port on which the connection is being made is stopped (before the IMS Connect STOPPORT command)  
|              |                   |             | The session connection request is ignored and IMS Connect continues (terminating in the case of shutdown). |

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Take one of the following actions:
- If the problem is due to an internal system error and the problem recurs after stopping and restarting IMS Connect, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Support Center. Provide the JCL, SYSLOG, and dump if available.
- If the problem is due to a storage shortage, either:
  - Allow IMS Connect to continue running with the currently connected TCP/IP clients.
  - Terminate and then restart IMS Connect, ensuring that the IMS Connect region size is large enough to accommodate an increase in TCP/IP client connections.

If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** SSC1 - HWSSSC10

---

HWSS0727W TERMINATE FAILED FOR TCP/IP
CLIENT=portid clientid; R=rc, S=ss, M=mc

**Explanation:** An attempt to terminate the named client is unsuccessful.

In the message text:
- portid identifies the port.
- clientid identifies the TCP/IP client.
- rc identifies the return code.
- ss identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of the service and return code.

Table 65. Service and return code explanation for HWSS0727W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>NFNDSVT</td>

<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** SCCL - HWSSSCCL0

---

HWSS0730W COMMAND=command FOR
PORT=portid REJECTED, CLIENT(S) IN PROGRESS; M=mc

**Explanation:** An attempt to terminate the port with a command cannot be processed because IMS Connect clients are currently scheduled for this port.
In the message text:
- `command` identifies the data store.
- `portid` identifies the port.
- `mc` identifies the module issuing the message.

**System action:** Reenter the command after all active clients for the port have become inactive. Use the VIEWPORT command to determine the activity on the port.

**Module:** SSTP - HWSSSTP0

**HWSS0742W**

**HWSS0742W MESSAGE FAILED,**

ORIGIN=`portid clientid` TO DESTID=`did`;

R=`rc`, S=`sc`, M=`mc`

**Explanation:** IMS Connect is unable to forward a message received from TCP/IP client `clientid`, which is communicating through port `portid` to the required data store destination.

In the message text:
- `portid` identifies the TCP/IP port.
- `clientid` identifies the TCP/IP client.
- `did` identifies the data store.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes that are returned by called services that failed the request.
- `mc` identifies the module that issued the message.

See the following table for an explanation of service and return codes:

<table>

<td>A CLOSEHWS command was issued. IMS Connect termination is in process.</td>
<td>8</td>
<td>Termination in process.</td>
</tr>
<tr>
<td>STP/CLSE</td>
<td>Data store / IMSplex in stop or close process.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. The message in progress is released.

**System programmer response:** The response can vary depending on the service code.

- For service codes DSCLOSE, NFNDDST, and SHUTDOWN, the data store is no longer active or connected to IMS Connect. Investigate why the data store was terminated, or if a STOPDS command was issued.

  For service codes DUPLNT and INVLDTOK, a second client connects to IMS Connect with the same Client ID currently identified to IMS Connect. The client might have disconnected and reconnected with the same Client ID; however, IMS Connect is not aware of the disconnect because the client is in a CONN state waiting for a response from IMS.

  For service code INVLDST, the client failed to send an ACK/NAK response when the sync level is defined as CONFIRM; or the client left the conversation early without issuing a DEALLOCATE request to IMS Connect.

  For service code INVLDCNV, the request message contained the conversational transaction information that might be in conflict with IMS Connect. It was not destined to a shareable persistent socket with Commit Mode 1, or it was routed to an IMS Connect that does not connect to the same data store which the conversation is having the affinity. The request message is discarded. IMS Connect leaves the socket connection and the conversation intact.

**Module:** SRE4 - HWSSRE40

**HWSS0743I**  DUPLICATE CLIENT ID TERMINATED, ORIGIN=portid
CID=clientid; R=rc, S=sc, M=mc

**Explanation:** By setting IRM_F3=IRM_F3_CANCLID (X’80’), the client requested to terminate a previous session that has the same client ID at the same port ID.

In the message text:
- *portid* identifies the TCP/IP port.
- *clientid* identifies the TCP/IP client.
- *rc* identifies the return code.
- *sc* identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- *mc* identifies the module issuing the message.

**System action:** IMS Connect issued a STOP CLIENT command internally regardless of the state of the previous instance of the session. The new session is activated.

**System programmer response:** No action is required.

**Module:** HWSSREC0

**HWSS0746W**  UNABLE TO NOTIFY ORIGIN=portid
clientid OF MESSAGE FAILURE; R=rc, S=sc, M=mc

**Explanation:** IMS Connect is unable to notify the named TCP/IP client about an error that has occurred.
while processing a request message or a response that IMS Connect has received.

In the message text:
- `portid` identifies the TCP/IP port.
- `clientid` identifies the TCP/IP client.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETFWEB</td>
<td>BPECBGET, the system service used to acquire an FWE for queuing of messages. The FWE is used as the queuing structure and the message is anchored off the FWE.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
<tr>
<td>GETC01K</td>
<td>BPECBGET, the system service used to acquire storage to build the error message.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
<tr>
<td>NFNDSVT</td>
<td>The TCP/IP client table cannot be found. This table maintains the activity of a connected TCP/IP client.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. The request or response message being processed is discarded.

**System programmer response:** This error can occur when not enough storage is available to complete the process. If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** SRE4 - HWSSRE40

---

**HWSS0748W**  FAILED TO OBTAIN FREE STORAGE ORIGIN=portid_clientid; R=rc, S=sc, M=mc

**Explanation:** IMS Connect was not able to obtain a buffer to send an ACK or NAK acknowledgement to the data store.

In the message text:
- `portid` identifies the TCP/IP port.
- `clientid` identifies the TCP/IP client.
- `rc` identifies the return code.
- `sc` identifies the service code.
- `mc` identifies the module issuing the message.

See the following table for the service and return codes and their explanation:

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETC01K</td>
<td>BPECBGET, the system service used to acquire storage to build the ACK/NAK message.</td>
<td>4</td>
<td>Storage is unavailable to satisfy the request.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect continues to run when this message is issued. The ACK/NAK acknowledgement is delivered to the data store in an emergency buffer obtained at the client connect time.

**System programmer response:** This problem is likely due to a temporary storage error. If the problem persists, check the region size of IMS Connect to determine if it is large enough.

**Module:** SCCL-HWSSCCL0

---

**HWSS0761I**  TCP/IP COMMUNICATION WITH CLIENT=portid clientid STOPPED; M=mc

**Explanation:** The communication for the named TCP/IP client stops.
In the message text:
• `portid` identifies the TCP/IP port.
• `clientid` identifies the TCP/IP client.
• `mc` identifies the module issuing the message.

**System action:** This message is issued when a STOPCLNT command has taken effect.

**Module:** SCCM - HWSSCCM0

**HWSS0762I** LOCAL COMMUNICATION WITH CLIENT=`cnname` STOPPED; M=`mc`

**Explanation:** Local communication for the named client is stopped.

In the message text:
• `cnname` identifies the client.
• `mc` identifies the module issuing the message.

**System action:** This message is issued when a STOPCLNT command takes effect for a client using a Local Option connection. IMS Connect continues to run.

**Module:** PCCM - HWSPCCM0

**HWSS0763W** LOCAL COMMUNICATIONS WITH CLIENT=`cnname` CONNECTION FAILURE; R=`rc` S=`sc` M=`mc`

**Explanation:** An IMS Connect client could not connect to IMS Connect. Refer to the service code (`sc`) for more information.

In the message text:
• `cnname` identifies the client.
• `rc` identifies the return code.
• `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error or are returned by called services that failed the request.
• `mc` identifies the module issuing the message.

**System action:** This message is issued, and IMS Connect continues to run. The response in progress is released.

**System programmer response:** This is probably a storage error. Check that the region size for IMS Connect is large enough to complete the process. If the error recurs, search the problem-reporting databases to find a correction to the problem. If a correction does not exist, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** PSCH - HWSPSCH0

**HWSS0770I** LISTENING ON PORT=`portid` TERMINATED; M=`mc`

**Explanation:** The communication for the named port has terminated.

In the message text:
• `portid` identifies the TCP/IP port.
• `mc` identifies the module issuing the message.

**System action:** This message is issued when listening has terminated on a port.

**Module:** SCCH - HWSSSCH0

**HWSS0771W** LISTENING ON PORT=`portid` FAILED; R=`rc`, S=`sc`, M=`mc`

**Explanation:** An attempt to start listening on the named port is unsuccessful.

In the message text:
• `portid` identifies the TCP/IP port.
• `rc` identifies the return code.
• `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
• `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes:

</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Ensure that the named ports are available to IMS Connect for communications. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump, if available.

**Module:** SSCH - HWSSSCH0

Chapter 12. HWS messages (IMS Connect) 425
Related information: "HWSP1415E" on page 407

HWSS0772W  THE CURRENT NUMBER OF SOCKETS n (p%) IS NEARING THE MAX SOCKETS LIMIT m; M=mc

Explanation: The current number of sockets used by IMS Connect is reaching the limit for the maximum specified by the MAXSOC= parameter of the IMS Connect configuration. This message is first issued when the number of sockets reaches the warning level specified in the WARNSOC= parameter. This message is issued again each time the number of sockets increases by the incremental value specified in the WARNINC= parameter.

In the message text:
- \( n \) The current number of sockets
- \( p\% \) The current number of sockets as a percentage of the maximum sockets limit
- \( m \) The maximum number of sockets limit
- \( mc \) The module issuing the message

System action: This message is issued and IMS Connect continues to run.

System programmer response: Reduce the socket usage accordingly.

HWSS0773I  THE CURRENT NUMBER OF SOCKETS n (p%) IS BELOW THE WARNING LEVEL w%; M=mc

Explanation: The current number of sockets is no longer reaching the maximum sockets limit. The number has decreased below the warning level specified in the WARNSOC= parameter of the IMS Connect configuration member and has decreased to the reset percentage. The reset percentage is either two times the WARNINC value below the WARNSOC value, or 5 percent below the WARNSOC value, whichever is lower.

In the message text:
- \( n \) The current number of sockets
- \( p\% \) The current number of sockets as a percentage of the maximum sockets limit
- \( w \) The warning level percentage
- \( mc \) The module issuing the message

System action: This message is issued and IMS Connect continues to run.

System programmer response: No action is required.

HWSS0775W  UNABLE TO START PORT=portid; R=rc, S=sc, M=mc

Explanation: An attempt to open the named port is unsuccessful.

In the message text:
- \( portid \) identifies the TCP/IP port.
- \( rc \) identifies the return code.
- \( sc \) identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- \( mc \) identifies the module issuing the message.

System action: This message is issued and IMS Connect continues to run.

System programmer response: See the following table for an explanation of the service and return code.

Table 70. Service and return code explanation for HWSS0775W

<tr>
<td>NFNDSCT</td>
<td>The port entry table (SCT) using the portid as the search value cannot be located. This table represents a port while connected with IMS Connect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

HWSS0776W  ALREADY ACTIVE PORT=portid; R=rc, S=sc, M=mc

Explanation: An attempt to open the named port is unsuccessful because the port is already open.

In the message text:
- \( portid \) identifies the TCP/IP port.
- \( rc \) identifies the return code.
- \( sc \) identifies the service code. Service codes can contain either codes that identify the error more specifically, or codes returned by called services that failed the request.
- \( mc \) identifies the module that issued the message.

System action: See the following table for an explanation of the service and return code.
<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACTIVE</td>
<td>The port identified by portid is already active.</td>
<td>4</td>
<td>The operator attempted to open the port, but the port is already opened. The port is available for processing. No action is required.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run normally. The port is available for processing.

**System programmer response:** The port is available for processing. No action is required.

**Module:** SOC1 - HWSSOC0

**HWSS0777W**

LISTENING ON PORT=portnumber FAILED. THE ONLY AVAILABLE SOCKETS ARE RESERVED;
MAXSOC=maxsoc, NUMSOC=numsoc

**Explanation:** IMS Connect cannot listen for incoming connections on the port identified in the message text because no sockets are available for incoming connection requests. The only available sockets are reserved for IMS Connect to IMS Connect communications. When a socket becomes available, IMS Connect will resume listening for incoming connection requests or continue processing an incoming connection request that has already been queued.

The number of sockets that IMS Connect reserves for IMS Connect to IMS Connect communications is specified in the RESVSOC parameter in the RMTIMSCON statements of the IMS Connect configuration member.

In the message text:
- **portnumber**
  - The port number.
- **maxsoc**
  - The maximum number of sockets, both reserved and unreserved, that this instance of IMS Connect can have open at the same time. This number is defined on the MAXSOC parameter of the TCPIP configuration statement in the IMS Connect configuration PROCLIB member.
- **numsoc**
  - The total number of sockets that this instance of IMS Connect currently has open.
- **mc**
  - The module issuing the message.

**System action:** Client connection requests to this IMS Connect are put on hold until a non-reserved socket is available. IMS Connect continues to run normally.

**User response:** No action is required; however, to reduce the likelihood that this message is issued in the future, you can adjust the values of either or both the RESVSOC parameters on the RMTIMSCON statements or the MAXSOC parameter on the TCPIP statement.

In the message text, if the numsoc value is close to the maxsoc value, you might increase the MAXSOC value in the TCPIP statement to make more sockets available to IMS Connect.

If the numsoc value is much lower than the maxsoc value, you might decrease the RESVSOC values in your RMTIMSCON statements to reserve fewer sockets for IMS Connect to IMS Connect communications.

**Module:** SSCH – HWSSSCH0

**HWSS0780I**

TCPIP COMMUNICATION ON
HOSTNAME=hostname OPENED;
M=mc

**Explanation:** The communication facility for TCP/IP is available.

In the message text:
- **hostname** identifies the TCP/IP hostname.
  - If hostname is the TCP/IP job name, IMS Connect has affinity to the single transport (TCP/IP stack) identified by the TCP/IP job name.
  - If hostname is blank, IMS Connect uses any active transport (TCP/IP stack) in the CINET environment.
  - If hostname is HWS$TCP, an invalid TCP/IP job name is specified in the HOSTNAME keyword of the TCP/IP configuration statement. IMS Connect uses any active transport (TCP/IP stack) in the CINET environment.
  - If hostname is HWS$TCP, the system is a multiple TCPIP stack environment (CINET) and an invalid TCPIP stack name is specified in the HOSTNAME= keyword of the TCPIP configuration statement. IMS Connect has connected to the default TCPIP stack.

In a single TCPIP stack environment (INET) hostname is be the value of the HOSTNAME parameter in the HWSCFG file but this may not be the name of the TCPIP stack to which IMS Connect is connected. In an INET environment IMS Connect connects to the single stack that is available regardless of what is in the HOSTNAME parameter.

- **mc** identifies the module issuing the message.

**System action:** This message is issued during IMS Connect startup and whenever communication is established with the TCP/IP communication facility.

**Module:** SOC1 - HWSSOC10
**HWSS0781I**  
TCP/IP COMMUNICATION FUNCTION FAILED; M=mc  

**Explanation:** The communication facility for TCP/IP has become inactive.  

In the message text:  
- mc identifies the module issuing the message.  

**System action:** This message is issued when IMS Connect communication with the TCP/IP communication facility is decoupled.  

**Module:**  SOC - HWSSOC10  

**HWSS0785W**  OPEN TCP/IP COMMUNICATION ON HOSTNAME=hostname FAILED; R=rc, S=mc, PORT=client_port, CLIENTID=clientid  

**Explanation:** An attempt to start communication with TCP/IP was unsuccessful.  

In the message text:  
- hostname identifies the TCP/IP hostname.  
- rc identifies the return code.  
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.  
- mc identifies the module issuing the message.  

**System action:** This message is issued and IMS Connect continues to run.  

**System programmer response:** Ensure that the TCP/IP hostname was specified correctly in the HWSCFGxx member or that the z/OS TCPIP communication facility is active. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Support Center. Provide the JCL, SYSLOG, and dump if available.  

**Module:**  SOC1-HWSSOC10  

**HWSS0790I**  LISTENING ON PORT=portid STARTED; M=mc  

**Explanation:** Communication has started for the named TCP/IP port.  

In the message text:  
- portid identifies the TCP/IP port.  
- mc identifies the module issuing the message.  

**System action:** This message is issued when listening has started on a TCP/IP port.  

**Module:**  SDOT — HWSSDSTD  

**HWSSL00E**  
"timestamp UNABLE TO action, RC=rc: error (IPv4|IPv6)=client_ip_address, PORT=client_port, CLIENTID=clientid  

**Explanation:** An error has occurred in SSL.  

In the message text:  
- timestamp identifies the time the error was detected. If you do not have the time zone specified in the Language Environment (LE) environment, the Coordinated Universal Time (UTC) is displayed along with the string UTC.  
- action identifies the name of the action that failed.  
- rc identifies the return code.  
- error identifies the error message specified by gsk_strerror().  
- IPv4|IPv6 identifies the Internet Protocol version, either IPv4 for 32 bit addresses or IPv6 for 128 bit addresses.  
- client_ip_address identifies the IP address of the client that failed.  
- client_port identifies the client port number.  
- clientid identifies the client that failed.  

This message can be two or three lines.  

**System action:** This message is issued. The SSL socket is closed. IMS Connect continues to run. If the message occurs during the SSL environment initialization (when the ports are set up to listen), the port might be closed.  

When this message is issued with a RC=503 and the action is INITIALIZE SOCKET or RETRY INITIALIZE SOCKET, this message is a warning. A 503 return code indicates that a READ on an SSL socket returned no data. During the SSL handshake process, IMS Connect keeps retrying the READ until it is satisfied or until the client closes the socket.  

**System programmer response:** If this problem is an initialization error, the SSL input file needs to be examined and fixed according to the error message received.  

**Module:**  HWSSSL00  

**HWSSL00I**  SSL DEBUG MESSAGE  

**Explanation:** The message corresponds to an SSL debugging message. The message is only enabled if the DEBUG_SSL variable is turned on. The message text pertains to the SSL encryption/transfer process or the SSL initialization process.  

**System action:** None  

**System programmer response:** No action is required.  

**Module:**  HWSSSL00
HWST3500I COMMUNICATIONS WITH REMOTE IMS CONNECT rmtimscon STARTED; M=mc

**Explanation:** Communication with a remote IMS Connect instance started on the connection identified by rmtimscon. This message is issued when a connection starts either during the startup of IMS Connect or after one of the following IMS Connect commands is issued:

- The IMS type-2 command UPDATE IMSCON TYPE(RMTIMSCON) NAME(rmtimscon_id) START(COMM)
- The WTOR command STARTRMT
- The z/OS MODIFY command UPDATE RMTIMSCON NAME(rmtimscon_id) START(COMM)

In the message text:

- **rmtimscon** The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- **mc** The module issuing the message.

**System action:** IMS Connect issues this message and continues to run normally.

**System programmer response:** No action is required.

To restart communications, issue any one of the following commands:

- The IMS type-2 command UPDATE IMSCON TYPE(RMTIMSCON) NAME(rmtimscon_id) START(COMM)
- The WTOR command STARTRMT
- The z/OS MODIFY command UPDATE RMTIMSCON NAME(rmtimscon_id) START(COMM)

**Module:** TSCH – HWSTSCH0

---

HWST3510E COMMUNICATIONS WITH REMOTE IMS CONNECT rmtimscon FAILED TO START; R=rc, S=sc, M=mc

**Explanation:** Communications with a remote IMS Connect instance failed to start on the connection identified by rmtimscon.

In the message text:

- **rmtimscon** The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- **rc** The return code of the service. Possible return codes and their meanings include:
  - 4 Get storage for CTOKEN error. HWST3730 is issued prior to HWST3510E.
  - 8 BPX1GAI for IPv4 error. HWST3700 is issued prior to HWST3510E.
  - 12 BPX1GAI for IPv6 error. HWST3700 is issued prior to HWST3510E.
  - 16 BPX1FAI error. HWST3700 is issued prior to HWST3510E.
- **sc** The service code.
- **mc** The module issuing the message.

**Possible cause:** The remote IMS Connect might be unavailable or the IP address or hostname specified in the RMTIMSCON configuration statement is incorrect.

**System action:** IMS Connect issues this message and continues to run normally.

**System programmer response:** Check that the remote IMS Connect instance is available and that it is listening on the correct port.

Check that the values specified on either the IPADDR or HOSTNAME parameter of the RMTIMSCON configuration statement are correct.

**Module:** TSCH – HWSTSCH0

---

HWST3505I COMMUNICATIONS WITH REMOTE IMS CONNECT rmtimscon STOPPED; M=mc

**Explanation:** Communication with a remote IMS Connect instance stopped on the connection identified by rmtimscon. This message is issued when communication is stopped either during the shutdown of IMS Connect or after one of the following IMS Connect commands is issued:

- The IMS type-2 command UPDATE IMSCON TYPE(RMTIMSCON) NAME(rmtimscon_id) STOP(COMM)
- The WTOR command STOPRMT
- The z/OS MODIFY command UPDATE RMTIMSCON NAME(rmtimscon_id) STOP(COMM)

In the message text:

- **rmtimscon** The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- **mc** The module issuing the message.

**System action:** IMS Connect continues to run normally.

**System programmer response:** No action is required.

To restart communications, issue any one of the following commands:

- The IMS type-2 command UPDATE IMSCON TYPE(RMTIMSCON) NAME(rmtimscon_id) START(COMM)
- The WTOR command STARTRMT
- The z/OS MODIFY command UPDATE RMTIMSCON NAME(rmtimscon_id) START(COMM)

**Module:** TSCH – HWSTSCH0

---
HWST3515E IMS CONNECT CANNOT START THE SCHEDULER CONTROLLER FOR
RMTIMSCON=rmtimscon; R=rc, S=sc, M=mc

Explanation: Storage could not be allocated for the scheduler controller structure, or the scheduler controller thread could not be scheduled or attached. This controller processes an IMS Connect to IMS Connect TCP/IP connection.

In the message text: rmtimscon The failed IMS Connect to IMS Connect

rc The return code of the service.
sc The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
mc The module issuing the message.

Table 72. Service and return code explanation for HWST3515E

<td></td>
</tr>
</tbody>
</table>

**System action:** IMS Connect continues to run; however, the RMTIMSCON connection cannot be used.

**System programmer response:** Check that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the region size is too small, increase the region size in the JCL and restart IMS Connect. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** TOC2 - HWSTOC20

**Related reference:** [RMTIMSCON statement (System Definition)](chapter)
HWST3520E PASSTICKET GENERATION FAILED FOR USER=user_id, APPL=appl_id;
RIC=rmtimscon, R=rc, M=mc

Explanation: IMS Connect encountered an error while trying to generate a PassTicket with the user ID and application name shown in the message text for connection security.

In the message text:
- user_id: The user ID specified in the USERID parameter of the RMTIMSCON statement.
- appl_id: The application name specified in the APPL parameter of the RMTIMSCON statement.
- rmtimscon: The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- rc: The return code of the service. If you are using RACF, this is the secured signon service. A return code of 8 means only that the PassTicket was not created.
- mc: The module issuing the message.

Possible cause: The APPL class might not have been defined or the application name might be incorrectly specified in either the RACF PTKTDATA class or in the IMS Connect RMTIMSCON statement.

System action: IMS Connect sends the message without a PassTicket to the remote IMS Connect instance. If RACF is enabled in the remote IMS Connect instance, the remote IMS Connect instance rejects the message and terminates the connection. If RACF is not enabled in the remote IMS Connect instance, the message is passed to the remote IMS system for processing. For OTMA problems, another error message is issued to the console stating where the original message was rerouted to.

System programmer response: Ensure that the PTKTDATA class is correctly defined in RACF. The application name defined in the PTKTDATA class must match the application name specified in the APPL parameter of the RMTIMSCON statement.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the HWSCFGxx configuration member, JCL, SYSLOG, and the memory dump if available.

Module: TDXM - HWSTDXMT

Related tasks:
- Securing IMS-to-IMS TCP/IP connections (Communications and Connections)
The module issuing the message.

**Possible cause:** Not enough storage is available to complete the process.

**System action:** IMS Connect continues to run. The requested message in progress is discarded.

**System programmer response:** Ensure that the region size for IMS Connect is large enough.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** TXMT - HWSTXMT0

---

**HWST3540E** UNABLE TO START TCP/IP SEND CLIENT TO REMOTE IMS CONNECT

*rmtimscon, R=rc, S=sc, M=mc*

**Explanation:** IMS Connect encountered an error while trying to start the conversation controller thread for the TCP/IP connection to the remote IMS Connect.

In the message text:

- **rmtimscon**
  - The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- **rc**
  - The return code of the service.
- **sc**
  - The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.
- **mc**
  - The module issuing the message.

The following table provides an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code (dec)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETSST</td>
<td>The BPECBGET get storage service failed.</td>
<td>A storage error occurred.</td>
<td></td>
</tr>
<tr>
<td>GETSTAT</td>
<td>The BPECBGET get storage service failed.</td>
<td>A storage error occurred.</td>
<td></td>
</tr>
<tr>
<td>NOTACTV</td>
<td>4</td>
<td>The RMTIMSCON is not active.</td>
<td></td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run. If a message that required this connection was being processed when this error occurred, another error message describes what happened to the message.

**System programmer response:** If this is a storage related error, consider increasing the storage allocation for IMS Connect.

If the delivery of a transaction message was interrupted, check for other HWS error messages, such as HWSF3340W, to determine what OTMA did with the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** TSC1 – HWSTSC10

**HWST3545E** CONNECTION REQUEST FOR comp MESSAGE FAILED BECAUSE RMTIMSCON rmtimscon IS FOR conntype; M=mc

**Explanation:** IMS Connect received a message from either multiple systems coupling (MSC) or OTMA that specified a RMTIMSCON connection to another IMS Connect instance that does not support messages from either OTMA or MSC. MSC messages cannot be sent on a RMTIMSCON connection that is defined to support OTMA and OTMA messages cannot be sent on a RMTIMSCON connection that is defined to support MSC.

In the message text:

- **comp**
  - The IMS communications component that sent the message.
- **rmtimscon**
  - The ID of the RMTIMSCON connection, as
defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.

\textit{conntype} 
The IMS communications component that the connection supports

\textit{mc} 
The module issuing the message.

**Possible cause:** The incorrect RMTIMSCON ID is specified in either the OTMA destination descriptor, the MSC MSPLINK macro, or the IMS Connect MSC configuration statement.

**System action:** This message is issued and IMS Connect continues to run. An error message is returned to the requestor. OTMA retains the message at the front of the queue.

**System programmer response:** For OTMA messages, correct the RMTIMSCON specified in the OTMA destination descriptor or in the IMS Connect configuration member.

For MSC messages, correct the RMTIMSCON specified in the MSPLINK macro or in the MSC configuration statement.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** TSCH – HWSTSHC0

**Related reference:**

**HWST3550W • HWST3560W**

**HWST3560W • AUTO RE-CONNECT TO RMTIMSCON rmtimscon FAILED; R=rc, S=sc, M=mc**

**Explanation:** IMS Connect had been continuously trying to connect to the remote IMS Connect. However, an error occurred that has prevented IMS Connect from continuing to try to connect to the remote IMS Connect.

In the message text:

- **rmtimscon** 
The ID of the connection to the remote IMS Connect instance, as defined on the ID parameter of the RMTIMSCON statement in the IMS Connect configuration PROCLIB member.
- **rc** 
The return code issued by the service identified by sc in the message text.
- **sc** 
The service code. This is the name of the service, which is usually a BPE service. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **mc** 
The module issuing the message.

The following table provides an explanation of service and return codes.

**Table 74. Service and return code explanation for HWST3560W**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>C512</td>
<td>A storage error.</td>
<td></td>
<td>Message HWST3530W is also issued.</td>
</tr>
<tr>
<td>CONNECT</td>
<td>A connect error.</td>
<td>4, 8, or 12</td>
<td>A return code of 4 indicates a get storage error. A return code of 8 indicates a create socket error. A return code of 12 indicates a connect error.</td>
</tr>
<tr>
<td>FWEB</td>
<td>A storage error.</td>
<td></td>
<td>Message HWST3530W is also issued.</td>
</tr>
</tbody>
</table>

**HWSTSC10** 
Varies
**System action:** This message is issued and IMS Connect continues to run. The thread that continuously tried to connect to the remote IMS Connect is terminated.

**System programmer response:** If the problem is a storage error, check the storage settings for IMS Connect. If the error is a create socket error, check if the maximum number of sockets has been reached.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

[BPE codes (Messages and Codes)]

---

**HWST3570E** OTMA Remote Message was rejected for TPIPE \texttt{tpipename} from DATASTORE \texttt{dsnname}; \texttt{Sense}=\texttt{sensecode}; \texttt{M}=\texttt{mc}

**Explanation:** An OTMA ALTPCB output message destined for a remote IMS system was rejected by IMS Connect and requeued to the front of the TPIPE queue identified in the message on the local IMS system identified in the message.

In the message text:

\texttt{newtpipe}

- The tpipe name that the message was requeued to.
- \texttt{dsnname} The data store IMS system that the message was sent from.
- \texttt{tpipename} The tpipe name that the message was sent from.
- \texttt{sensecode} The sense code returned to OTMA.
- \texttt{rsncode} The reason code returned to OTMA.
- \texttt{mc} The module issuing the message.

**Possible cause:** Look up the OTMA sense and reason codes that are returned with the NAK for the possible causes of this error.

**System action:** IMS Connect returns a NAK to OTMA with a sense code and reason code indicating the type of failure. OTMA requeues the message to the front of the TPIPE queue. IMS Connect continues to run normally.

**System programmer response:** Look up the OTMA sense code and reason code to determine the problem. After the problem is fixed, issue the IMS command \texttt{/STA TMEMBER TPIPE} to resume output from the specified TPIPE to IMS Connect.

**Module:** DREC – HWSDREC0, TDRC – HWSTDRCV

**Related reference:**

[OTMA sense codes for NAK messages (Messages and Codes)]

---

**HWST3600E** FUNCTION WORK ELEMENT PROCESSING FAILED; \texttt{FUNC}=\texttt{fn}, \texttt{R}=\texttt{rc}, \texttt{S}=\texttt{sc}, \texttt{M}=\texttt{mc}

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
Identifies the function requested.

rc The return code of the service. See the following table for an explanation.

sc The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.

mc The module issuing the message.

The following table provides an explanation of service and return codes.

<td>The function requested in the FWE is incorrect.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

**Table 75. Service and return code explanation for HWST3600E**

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** TSCH – HWSTSC0

**HWST3700E TCP/IP SOCKET FUNCTION CALL FAILED; F=fn, R=rc, E=ec, N=rsn, RIC=ri, M=mc**

**Explanation:** IMS Connect RMTIMSCON communications driver was unable to perform the specified socket function.

In the message text:

fn Identifies the TCP/IP socket function call. For a description of the possible functions and their associated z/OS UNIX System Services callable service, see the following table.

rc Identifies the TCP/IP return code.

ec Identifies the TCP/IP error code.

rsn Identifies the TCP/IP reason code.

ri Identifies the connection to the remote IMS Connect instance.

mc Identifies the module issuing the message.

**Table 76. Function names and associated UNIX System Services callable services for HWST3600E**

<table>
<thead>
<tr>
<th>Function name</th>
<th>UNIX System Services callable service</th>
</tr>

**HWST3730W THE RMTIMSCON DRIVER FAILED TO OBTAIN STORAGE; R=rc, S=sc, B=bn, M=mc**

**Explanation:** IMS Connect RMTIMSCON communications driver was unable to get storage for internal buffers. This error can occur when not enough storage is available to complete the process.

In the message text:
HWST3735W THE RMTIMSCON DRIVER FAILED TO RELEASE STORAGE; R=rc, S=sc, B=bn, A=a, M=mc

Explanation: IMS Connect RMTIMSCON communications driver was unable to release storage for internal buffers.

In the message text:
- rc: Identifies the return code of the service.
- sc: Identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- bn: Identifies the buffer name.
- a: Identifies the buffer address.
- mc: Identifies the module issuing the message.

Possible cause: Not enough storage is available to complete the process.

System action: This message is issued and IMS Connect continues to run normally.

System programmer response: This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: TDDS - HWSTDDSC, TDIT - HWSTDTTD

HWST3900E ASYNCHRONOUS WORK ELEMENT PROCESSING FAILURE, FUNC=func; R=rc, S=sc, M=mc

Explanation: The asynchr. work element (AWE) for the indicated function cannot be processed.

In the message text:
- func: The function requested.
- rc: The return code.
- sc: The service code. Service codes are used either to more specifically identify the error, or to encapsulate a code returned by the called service that failed to process the request.
- mc: The module that issued the message.

Table 77. Service and return code details for HWSU3900E

<th>Extended meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function requested in the AWE is incorrect.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

System action: This message is issued and the requestor of the function is notified if possible. Otherwise, the AWE is freed. IMS Connect continues to run in either case.

System programmer response: This message is caused by an internal error in IMS Connect. If the problem occurs multiple times, search the problem-reporting databases for a solution. If none exists, contact IBM Software Support. Collect the JCL, SYSLOG, and memory dump if it is available.

Module:
- UENF - HWSUENF0
- UGPA - HWSUGPA0
- UWLM - HWSUWL0

HWSV4400I COMMUNICATIONS SUPPORT FOR REMOTE CICS rmtcics STARTED; M=mc

Explanation: Support for communication with the remote CICS instance is successfully enabled in IMS Connect. This message is issued either during the startup of IMS Connect or after the IMS type-2 command UPDATE IMSCON TYPE(RMTCICS) NAME(rmtcics) START(COMM) is issued.

In the message text:
- rmtcics: The ID of the connection to the remote CICS.
instance, as defined on the ID parameter of the RMTCICS statement in the IMS Connect configuration PROCLIB member.

**rc** The return code of the service. Possible return codes and their meanings include:

4 Get storage for CTOKEN error. HWSV4630W is issued prior to HWSV4410E.

8 BPX1GAI error. HWSV4600E is issued prior to HWSV4410E.

12 BPX1GAI returned non-IPv6 and non-IPv4 address structure. HWSV4600E is issued prior to HWSV4410E.

16 BPX1FAI error. HWSV4600E is issued prior to HWSV4410E.

**sc** The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.

**mc** The module issuing the message.

**Possible cause:** The remote CICS subsystem might be unavailable or the IP address or hostname specified in the RMTCICS configuration statement is incorrect.

**System action:** IMS Connect issues this message and continues to run normally.

**System programmer response:** Check that the remote CICS subsystem is available and that it is listening on the correct port.

Check that the values specified on either the IPADDR or HOSTNAME parameter of the RMTCICS configuration statement are correct.

**Module:** QSCH – HWSQSC0

**Related reference:**

**HWSV4415E** IMS CONNECT CANNOT START THE SCHEDULER CONTROLLER FOR RMTCICS=rmtcics; R=rc, S=ss, M=mc

**Explanation:** Storage could not be allocated for the scheduler controller structure, or the scheduler controller thread could not be scheduled or attached. This controller processes an IMS Connect to CICS TCP/IP connection.

In the message text:

**rmtcics** The ID of the IMS Connect RMTCICS connection to CICS, as defined on the ID parameter of the RMTCICS configuration PROCLIB member.

**rc** The return code of the service. See the following table for an explanation.

**sc** The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

**mc** The module issuing the message.
### Table 78. Service and return code explanation for HWSV4415E

<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETTWUB</td>
<td>BPECBGET, the system service used to acquire the thread work unit (TWU) for the scheduler controller.</td>
<td>rc</td>
<td>Return code is from the BPECBGET service. This problem is an internal system error.</td>
</tr>
<tr>
<td>SCHEDTWU</td>
<td>BPETHDCR, the system service used to schedule the scheduler controller thread.</td>
<td>rc</td>
<td>Return code is from the BPETHDCR service. This problem is an internal system error.</td>
</tr>
<tr>
<td>BPEATTCH</td>
<td>BPEATTCH, the system service used to attach the scheduler controller thread.</td>
<td>rc</td>
<td>Return code is from the BPEATTCH service. This is an internal system error.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect continues to run; however, the RMTCICS connection cannot be used.

**System programmer response:** Check that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the region size is too small, increase the region size in the JCL and restart IMS Connect. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

**Module:** QOC2 - HWSQOC20

**Related reference:**
- [RMTCICS statement (System Definition)](link)
- [BPE service return codes (Messages and Codes)](link)

**HWSV4420E CICS IPIC ERROR RC=ipicrc**

- **HTTPR=** `httprc`  
- **MSGTYPE=** `msgtype`  
- **TEXT=** `description`  
- **RCICS=** `rmtcicsid`,  
- **C=** `clientid`,  
- **M=** `QREC`

**Explanation:** IMS Connect received an IP interconnectivity (IPIC) error message from CICS for an ISC TCP/IP session.

- If IMS is available, IMS Connect notifies IMS of the error.
- If IMS is not available, IMS Connect might notify CICS of the error, depending upon the type of error indicator that was received.

In the message text:
- **clientid** The client ID that identifies the TCP/IP socket connection on which the error message was received. The client ID is generated by IMS Connect.
- **description** Text that describes the error.
- **httprc** A 4-byte status code that is defined by the Hypertext Transfer Protocol – HTTP/1.1 standard. HTTP status codes can be customized by the TCP/IP server. Look up the TEXT value in the table [Table 79 on page 440](link).
- **ipicrc** A 2-byte CICS IPIC response and reason code. The first byte is the response code. The second byte is the reason code.

For an explanation of the reason codes and the possible actions to take, look up the text description that is issued with the reason code in the table [Table 79 on page 440](link).

The possible response codes are described in the following list.

#### CICS IPIC response codes

- **02** Indicates an exception event
- **03** Indicates a disaster event
- **04** Indicates that the message is not valid for CICS
- **05** Indicates a kernel error
- **06** Indicates that CICS purged the error

- **msgtype** A 2-byte code that indicates the CICS IPIC message type.
  - **0001** Capability exchange request
  - **0002** Capability exchange response
  - **0006** Syncpoint command
  - **0007** API conversation error
  - **0008** Security data
  - **000A** Unit of work ID
  - **0043** API request or response
  - **0046** Free request

- **QREC** The IMS Connect module HWSQREC0 that received the notification of the error.
**The ID of the IMS Connect RMTCICS configuration statement that defines the TCP/IP connection to the CICS subsystem.**

### Table 79. Error descriptions for TEXT field in HWSV4420E

<table>
<thead>
<tr>
<th>Service code</th>
<th>HTTP status code</th>
<th>IPIC reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLID</td>
<td>X'06'</td>
<td></td>
<td>In the capability exchange message received by CICS, the <code>server_applid</code> or its high-level qualifier does not match APPLID and high-level qualifier of the CICS subsystem. This is most likely caused by a value on the CICSAPPL keyword of an ISC statement that does not match the APPLID of the remote CICS subsystem. Correct the value of the CICSAPPL keyword on the ISC statement in the IMS Connect configuration member in the IMS.PROCLIB data set. CICS reason text: ISCE_INVALID_APPLID</td>
</tr>
<tr>
<td>AUTOINSTALL</td>
<td>X'01'</td>
<td></td>
<td>The CICS autoinstall function could not create the required IPCONN resource in the CICS subsystem. The autoinstall function can fail if the name of the new IPCONN resource is the same as the name of an existing IPCONN resource. Because the name of the IPCONN resource that is created by the autoinstall function is generated from the user name that is specified on an IMS session initiation request, such as the <code>/OPNDST NODE</code> command, try initiating the session with a different user name. CICS reason text: AUTOINSTALL_FAILED</td>
</tr>
<tr>
<td>CAPEXRACE</td>
<td>X'15'</td>
<td></td>
<td>Capability exchange race. The session between IMS and CICS was initiated by IMS and CICS at the same time resulting in race condition between the two capability exchange requests. Retry IMS <code>/OPNDST</code> command (6). Try initiating the session again from either IMS or CICS. CICS reason text: CAPEX_RACE</td>
</tr>
<tr>
<td>DFHxxxxx</td>
<td></td>
<td></td>
<td>API conversation error. DFHxxxxx is the CICS API error message that was returned to IMS Connect, where xxxx is a number, and DFH is the CICS message prefix. This is probably an internal error. Contact IBM Software Support.</td>
</tr>
<tr>
<td>HTTPRQST</td>
<td>X'400'</td>
<td></td>
<td>Defined by the HTTP protocol or the TCP/IP server, indicates that the request could not be understood by the server due to malformed syntax. The session initiation request is probably invalid and could not be understood by the receiving subsystem. Check that the ISC TCP/IP session initiation request is configured properly in the subsystem that is initiating the session. If the problem persists, contact IBM Software Support.</td>
</tr>
<tr>
<td>HTTPERR</td>
<td>X'0B'</td>
<td></td>
<td>A capability exchange response related to a callback connection contained an HTTP status code that indicates an error. CICS reason text: ISCER_HTTP_ERROR</td>
</tr>
<tr>
<td>Service code</td>
<td>HTTP status code</td>
<td>IPIC reason code</td>
<td>Meaning</td>
</tr>
<tr>
<td>--------------</td>
<td>------------------</td>
<td>-----------------</td>
<td>---------</td>
</tr>
<tr>
<td>IPCONNNO</td>
<td>X'13'</td>
<td></td>
<td>No IPCONN resource. An attempt to acquire or release a connection for a CICS TCPIPSERVICE resource was made, but the TCPIPSERVICE resource has no associated IPCONN resource. The error is probably caused by an incorrect TCPIPSERVICE or IPCONN resource definition in the CICS subsystem. Correct any errors in the resource definitions and try to initiate the session again. CICS reason text: NO_IPCONN</td>
</tr>
<tr>
<td>IPCONNNOTFND</td>
<td>X'04'</td>
<td></td>
<td>ICONN not found. An attempt to acquire or release a connection with a CICS subsystem was made, but the required IPCONN resource no longer exists or cannot be found. CICS reason text: IPCONN_NOT_FOUND</td>
</tr>
<tr>
<td>IPCONNONEWAY</td>
<td>X'14'</td>
<td></td>
<td>The ISC TCP/IP session requires a two-way connection, but the CICS IPCONN resource is defined to use a one-way connection. Correct the CICS IPCONN resource definition. CICS reason text: ISCER_ONE WAY IPCONN</td>
</tr>
<tr>
<td>IPCONNSTATE</td>
<td>X'02'</td>
<td></td>
<td>Invalid IPCONN state. An ISCO ACQUIRE_CONNECTION was issued, but failed because the CICS IPCONN resource is not in the correct state. The state of the IPCONN resource must be INSERVICE and RELEASED. Try to initiate the session again. If the problem persists, contact the CICS system administrator. CICS reason text: INVALID_IPCONN_STATE</td>
</tr>
<tr>
<td>OPENERR</td>
<td>X'0D'</td>
<td></td>
<td>Open session error. IMS attempted to initiate an ISC TCP/IP session with CICS through IMS Connect, but the capability exchange between the IMS and CICS subsystems failed. For example, this error is issued if the value specified on the PORT keyword of the IPCONN resource definition in the CICS DFHCSD dataset is not also defined to IMS Connect on the ID subparameter of the CICS.PORT.keyword in the TCPIP statement in the HWSCFGxx PROCLIB member. This probably a configuration or definition problem. Verify that all IMS, IMS Connect, and CICS PROCLIB members and resources are defined correctly. Correct any errors in the definition statements. CICS reason text: HWSV4420E</td>
</tr>

</tbody>
</table>

**System action:** If the session has already been established, IMS Connect forwards the message to IMS. Depending on the contents of the message, IMS might also issue an error message and terminate the session.

If the session has not already been established, IMS Connect discards the message.

**System programmer response:** Look up the value of TEXT= in the preceding table for the possible actions that you can take to resolve the problem.

**Module:** QREC - HWSQREC0

**Related reference:**

- RMTCICS statement (System Definition)
- ISC statement (System Definition)

HWSV4425I  THE SEND CLIENT sendclient WAS TERMINATED FOR REMOTE CICS rmtcics; ISCUSER isc_user; M=mc

**Explanation:** A command terminated the client send socket that is identified by sendclient. The client send socket was used for sending messages to a remote CICS subsystem on the connection that is identified by rmtcics.

In the message text:

sendclient

The name of the send client socket that was terminated. This name is generated by IMS Connect.

rmtcics

The ID of the connection as it is defined on both the ID parameter of the RMTCICS statement and the RMTCICS parameter of the ISC statement. The RMTCICS and ISC statements together define the connection in the IMS Connect configuration PROCLIB member.

isc_user

The user name that is associated with the session initiation request.

mc

The module that issued the message.

**Possible cause:** The send client socket can be terminated by any one of the following IMS type-2 commands:

- UPDATE IMSCON TYPE(RMTCICS) NAME(rmtcicsid) STOP(COMM)

**System action:** This message is issued and IMS Connect continues to run normally.

**System programmer response:** Use the isc_user value to correlate with any possible DFS3298E message.

**Module:** QCVC - HWSQCVC0

**Related reference:**

- UPDATE IMSCON TYPE(RMTCICS) command (Commands)
- UPDATE IMSCON TYPE(SENDCLNT) command (Commands)
- RMTCICS statement (System Definition)
- ISC statement (System Definition)

HWSV4435W  THE RMTCICS COMM. COMPONENT FAILED TO RELEASE STORAGE; R=rc, S=sc, B=bn, A=an, M=mc

**Explanation:** The IMS Connect RMTCICS communications component was unable to release storage for internal buffers.

In the message text:

rc

The return code of the service.

sc

The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

bn

The buffer name.

an

The buffer address.

mc

The module issuing the message.

**System action:** This message is issued and IMS Connect continues to run normally.

**System programmer response:** This problem is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** QCVC - HWSQCVC0, QOCC - HWSQOCC0, QSCH - HWSQSCH0

Chapter 12. HWS messages (IMS Connect) 445
HWSV4440E UNABLE TO START TCP/IP SEND CLIENT TO REMOTE CICS rmtcics, R=rc, S=sc, M=mc

Explanation: IMS Connect encountered an error while trying to start the conversation controller thread for the TCP/IP connection to a remote CICS subsystem.

In the message text:

rmtcics The ID of the RMTCICS statement that defines the CICS connection to IMS Connect.
rc The return code of the service.
sc The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.
mc The module issuing the message.

The following table provides an explanation of service and return codes.

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code (dec)</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETSS</td>
<td>The BPECBGET get storage service failed.</td>
<td>A storage error occurred.</td>
<td></td>
</tr>
<tr>
<td>GETSTAT</td>
<td>The BPECBGET get storage service failed.</td>
<td>A storage error occurred.</td>
<td></td>
</tr>
<tr>
<td>SHUT/STO</td>
<td>The RMTCICS is stopped or in shutdown process.</td>
<td>4</td>
<td></td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run. If a message that required this connection was being processed when this error occurred, another error message describes what happened to the message.

System programmer response: If this is a storage related error, consider increasing the storage allocation for IMS Connect.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump if available.

Module: QSC1 – HWSQSC10

- BPE service return codes

HWSV4480W UNABLE TO START COMMUNICATIONS WITH REMOTE CICS rmtcics, R=rc, S=sc, M=mc

Explanation: During processing of the IMS type-2 command UPDATE IMSCON TYPE(RMTCICS) NAME(rmtcics) START(COMM), IMS Connect failed to start communications with the remote CICS instance identified by rmtcics.

In the message text:

rmtcics The value specified on the NAME keyword of the of the UPDATE IMSCON TYPE(RMTCICS) NAME(rmtcics) START(COMM) command.
rc The return code that identifies the error condition.
sc The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.
mc The module that issued the message.

Possible cause: Either the rmtcics value that is specified on the NAME keyword of the UPDATE IMSCON TYPE(RMTCICS) command is incorrect or the value that is specified on the ID keyword of the RMTCICS configuration statement in the IMS Connect configuration PROCLIB member is incorrect.

System action: This message is issued and IMS Connect continues to run normally. However, ISC messages cannot be sent to the remote CICS instance on the rmtcics connection.

System programmer response: Verify that the value that is specified on the NAME keyword of the command is correct. If it is, verify that the ID keyword on the RMTCICS statement, as well as the RMTCICS keyword in the ISC statement, are correct.

Module: QOCC - HWSQOCC0

Related reference:

- UPDATE IMSCON TYPE(RMTCICS) command (Commands)
- RMTCICS statement (System Definition)
- ISC statement (System Definition)
the of the UPDATE IMSCON TYPE(RMTCICS)
NAME(rmtcics) START(COMM) command.

rc The return code that identifies the error condition.
4 The connection rmtcics is already started.

sc The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.

ACTIVE The connection rmtcics is already started.

mc The module that issued the message.

**System action:** This message is issued and IMS Connect continues to run normally. The connection that is identified by rmtcics in the message text is active and available for sending ISC messages to the remote CICS instance.

**System programmer response:** No action is required.

**Module:** QOCC - HWSQOCC0

---

**HWSV4500E**

**FUNCTION WORK ELEMENT PROCESSING FAILED;**

**FUNCTION NAME=fn, RETURN CODE=rc, SERVICE CODE=sc, MODULE=mc**

**Explanation:** The function work element (FWE) cannot be processed. The FWE requests work between components and within components. This structure contains the function and parameters that a service requires for processing.

In the message text:
- **fn** Identifies the function requested.
- **rc** The return code of the service. See the following table for an explanation.
- **sc** The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called service that failed the request.
- **mc** The module issuing the message.

The following table provides an explanation of service and return codes.

**Table 81. Service and return code explanation for HWSV4500E**

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INVFUNC</td>
<td>The function is requested in the FWE is incorrect.</td>
<td>4</td>
<td>This problem is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and, if possible, the requestor of the function is notified. Otherwise, the FWE is freed. In all cases, IMS Connect continues to run.

**System programmer response:** This is probably an internal error. Search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** QCVC - HWSQCV00, QOCC – HWSQOCC0, QSCH – HWSQSCH0

<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>FREIPADR</td>
<td>BPX1FAI</td>
</tr>
<tr>
<td>GETIPADR</td>
<td>BPX2GAI</td>
</tr>
</tbody>
</table>

**Explanation:** IMS Connect RMTCICS communications driver was unable to perform the specified socket function.

In the message text:
- **fn** Identifies the TCP/IP socket function call. For a description of the possible functions and their associated z/OS UNIX System Services callable service, see the following table.
- **rc** Identifies the TCP/IP return code.
- **ec** Identifies the TCP/IP error code.
- **rsn** Identifies the TCP/IP reason code.
- **rmtcics** Identifies the connection to the remote CICS subsystem, as defined on the ID parameter of the RMTCICS configuration statement.
- **mc** Identifies the module issuing the message.

**Table 82. Function names and associated UNIX System Services callable services for HWSV4600E**

**System action:** This message is issued and IMS Connect continues to run normally.

**System programmer response:** For the possible cause of the specified return code and error code, see z/OS Communications Server IP and SNA Codes.

**Module:** QDCO - HWSQDCON, QDOT - HWSQDOTD, QDRC - HWSQDRCV, QDXM - HWSQDXMT

HWSV4630W  THE RMTCICS DRIVER FAILED TO
OBTAIN STORAGE; R=rc, S=sc, B=bn,
M=mc

Explanation: IMS Connect RMTCICS communications
driver was unable to get storage for internal buffers.
This error can occur when not enough storage is
available to complete the process.

In the message text:
rc Identifies the BPE return code associated with
the service.
sc Identifies the service code. Service codes can
contain either codes that more specifically
identify the error, or codes returned by called
services that failed the request.
bn Identifies the buffer name.
mc Identifies the module issuing the message.

Possible cause: Not enough storage is available to
complete the process.

System action: This message is issued and IMS
Connect continues to run. The requested message in
progress is discarded.

System programmer response: Ensure that the region
size for IMS Connect is large enough. If the problem
persists, search the problem-reporting databases to find
a correction for the problem. If none exists, contact IBM
Software Support. Provide the JCL, SYSLOG, and the
memory dump if available.

<td>error.</td>
</tr>
</tbody>
</table>

System action: This message is issued and, if possible,
the requestor of the function is notified. Otherwise, the
FWE is freed. In all cases, IMS Connect continues to run.

System programmer response: This is probably an
internal error. Search the problem-reporting databases
to find a correction for the problem. If none exists,
contact IBM Software Support. Provide the JCL,
SYSLOG, and dump if available.

Module: GCVC - HWSGCVC0

HWSV4820E  CICS IPIC ERROR RC=ipirc
HTTPRC=httpsrc MSGTYPE=msgtype
TEXT=description; PORT=port, C=clientid,
M=QREC

Explanation: IMS Connect received an IP
interconnectivity (IPIC) error message from CICS for an
ISC TCP/IP session.

If IMS is available, IMS Connect notifies IMS of the
error.

If IMS is not available, IMS Connect might notify CICS
of the error, depending upon the type of error indicator
that was received.

In the message text:
clientid The client ID that identifies the TCP/IP socket
connection on which the error message was
received. The client ID is generated by IMS
Connect.
description Text that describes the error.
httpsrc A 4-byte status code that is defined by the
Hypertext Transfer Protocol (HTTP/1.1)
standard. HTTP status codes can be
customized by the TCP/IP server. Look up the
TEXT value in the table for the meaning of specific status codes and
possible actions to take.
2nn HTTP status codes in the 200 to 299
range indicate that the error was not
in the HTTP layer.
4nn HTTP status codes in the 400 to 499
range indicate that the error is related to the “client,” which for ISC TCP/IP
is usually the subsystem that initiated
the session.
5nn HTTP status codes in the 500 to 599
range indicate that the error is related.
to the “server,” which for ISC TCP/IP is usually the subsystem that received the session initiation request.

**ipicr** A 2-byte CICS IPIC response and reason code. The first byte is the response code. The second byte is the reason code.

For an explanation of the reason codes and the possible actions to take, look up the text description that is issued with the reason code in the table [Table 84](#).

The possible response codes are described in the following list.

### CICS IPIC response codes

- **02** Indicates an exception event
- **03** Indicates a disaster event
- **04** Indicates that the message is not valid for CICS
- **05** Indicates a kernal error
- **06** Indicates that CICS purged the error
- **07** Indicates an error in the API conversation
- **08** Indicates that the message is security data
- **09** Indicates that the message is a unit of work ID
- **0A** Indicates an API request or response
- **0C** Indicates an API request or response
- **0D** Indicates a free request
- **0E** Indicates a capability exchange request
- **0F** Indicates a capability exchange response
- **10** Indicates that the message is a syncpoint command
- **11** Indicates that the message is an API conversation error
- **12** Indicates that the message is a security data
- **13** Indicates that the message is a unit of work ID
- **14** Indicates that the message is an API request or response
- **15** Indicates an exception event for the session initiation request.
- **16** Indicates that the message is a syncpoint command.
- **17** Indicates that the message is an API conversation error.
- **18** Indicates that the message is a security data.
- **19** Indicates that the message is a unit of work ID.
- **1A** Indicates that the message is an API request or response.
- **1B** Indicates that the message is a free request.
- **1C** Indicates that the message is a capability exchange request.
- **1D** Indicates that the message is a capability exchange response.
- **1E** Indicates that the message is a syncpoint command.
- **1F** Indicates that the message is an API conversation error.
- **20** Indicates that the message is a security data.
- **21** Indicates that the message is a unit of work ID.
- **22** Indicates that the message is an API request or response.
- **23** Indicates that the message is a free request.
- **24** Indicates that the message is a capability exchange request.
- **25** Indicates that the message is a capability exchange response.
- **26** Indicates that the message is a syncpoint command.
- **27** Indicates that the message is an API conversation error.
- **28** Indicates that the message is a security data.
- **29** Indicates that the message is a unit of work ID.
- **2A** Indicates that the message is an API request or response.
- **2B** Indicates that the message is a free request.
- **2C** Indicates that the message is a capability exchange request.
- **2D** Indicates that the message is a capability exchange response.
- **2E** Indicates that the message is a syncpoint command.
- **2F** Indicates that the message is an API conversation error.
- **30** Indicates that the message is a security data.
- **31** Indicates that the message is a unit of work ID.
- **32** Indicates that the message is an API request or response.
- **33** Indicates that the message is a free request.
- **34** Indicates that the message is a capability exchange request.
- **35** Indicates that the message is a capability exchange response.
- **36** Indicates that the message is a syncpoint command.
- **37** Indicates that the message is an API conversation error.
- **38** Indicates that the message is a security data.
- **39** Indicates that the message is a unit of work ID.
- **3A** Indicates that the message is an API request or response.
- **3B** Indicates that the message is a free request.
- **3C** Indicates that the message is a capability exchange request.
- **3D** Indicates that the message is a capability exchange response.
- **3E** Indicates that the message is a syncpoint command.
- **3F** Indicates that the message is an API conversation error.

### Table 84. Error descriptions for TEXT field in HWSV4820E

<table>
<thead>
<tr>
<th>Service code</th>
<th>HTTP status code</th>
<th>IPIC reason code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>APPLID</td>
<td>X'06'</td>
<td></td>
<td>In the capability exchange message received by CICS, the server.applid or its high-level qualifier does not match APPLID and high-level qualifier of the CICS subsystem. This is most likely caused by a value on the CICSAPPL keyword of an ISC statement that does not match the APPLID of the remote CICS subsystem. Correct the value of the CICSAPPL keyword on the ISC statement in the IMS Connect configuration member in the IMS.PROCLIB data set. CICS reason text: ISCE_INVALID_APPLID</td>
</tr>
<tr>
<td>AUTOINSTALL</td>
<td>X'01'</td>
<td></td>
<td>The CICS autoinstall function could not create the required IPCONN resource in the CICS subsystem. The autoinstall function can fail if the name of the new IPCONN resource is the same as the name of an existing IPCONN resource. Because the name of the IPCONN resource that is created by the autoinstall function is generated from the user name that is specified on an IMS session initiation request, such as the /OPNDST NODE command, try initiating the session with a different user name. CICS reason text: AUTOINSTALL_FAILED</td>
</tr>
<tr>
<td>CAPEXRACE</td>
<td>X'15'</td>
<td></td>
<td>Capability exchange race. The session between IMS and CICS was initiated by IMS and CICS at the same time resulting in race condition between the two capability exchange requests. Retry IMS /OPNDST command (6). Try initiating the session again from either IMS or CICS. CICS reason text: CAPEX_RACE</td>
</tr>
<tr>
<td>DFHxxxxx</td>
<td></td>
<td></td>
<td>API conversation error. DFHxxxxx is the CICS API error message that was returned to IMS Connect, where xxxx is a number, and DFH is the CICS message prefix. This is probably an internal error. Contact IBM Software Support.</td>

</table>

**System action:** If the session has already been established, IMS Connect forwards the message to IMS. Depending on the contents of the message, IMS might also issue an error message and terminate the session. If the session has not already been established, IMS Connect discards the message.

**System programmer response:** Look up the value of TEXT= in the preceding table for the possible actions that you can take to resolve the problem.

**Module:** GREC - HWSGREC0

**Related tasks:**
- Setting up an ISC TCP/IP connection with CICS (Communications and Connections)

---

### HWSV4830W THE CICSPORT COMMUNICATIONS COMPONENT FAILED TO OBTAIN STORAGE; R=rc, S=sc, B=bn, M=mc

**Explanation:** IMS Connect CICSPORT communications component was unable to get storage for internal buffers, possibly because not enough storage is available to complete the process.

In the message text:
- **rc** Return code issued by the service identified by sc in the message text.
- **sc** Service code. This is the name of the service, which is usually a BPE service. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- **bn** Buffer name.
- **mc** Module issuing the message.

**Possible cause:** Not enough storage is available to complete the process.

**System action:** This message is issued, IMS is notified, and IMS Connect continues to run. The requested message in progress is discarded.

**System programmer response:** Ensure that the region size for IMS Connect is large enough.

If the error is related to a BPE service, look up the return code for the BPE service listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and memory dump, if available.

**Module:** GREC - HWSGREC0

---

### HWSV4840W HWSV4840W MESSAGE FAILED, ORIGIN=portid clientid TO DESTID=isc_id; CICSAPPL=cicsappl; R=rc, S=sc, M=mc

**Explanation:** IMS Connect is unable to forward a message received from the CICS subsystem cicsappl on the socket connection clientid on port portid to the destination ISC link isc_id.
In the message text:
- **cicsappl**: The APPLID of the CICS subsystem that sent the message.
- **clientid**: The TCP/IP client that was generated and assigned to the ISC link by IMS Connect.
- **isc_id**: The ID of the destination ISC link as specified on the ID keyword of the ISC statement. If the destination ISC link cannot be determined, **UNKNOWN** is displayed.
- **mc**: The module issuing the message.
- **portid**: The TCP/IP port (CICSPORT).
- **rc**: The return code.
- **sc**: The service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.

See the following table for an explanation of service and return codes:

### Table 85. Service and return code explanation for HWSV4840W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>DISCONN</td>
<td>The data store table (DST) block is found and active, but the target IMS is not reachable. The IMSPLEX might be stopped or the target IMS or SCI is not available.</td>
<td>4</td>
<td>This is a processing error. Make sure that the IMSPLEX is started, and that IMS and SCI are available.</td>
</tr>
<tr>
<td>DSCLOSE</td>
<td>All ISC links are becoming inactive. IMS Connect might be shutting down in response to a CLOSEHWS command.</td>
<td>12</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDDST</td>
<td>The DST block cannot be found. This table maintains the activity of an ISC connection to IMS.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NFNDFUNC</td>
<td>The requested function cannot be found. An IMS Connect component issues an interface call for another component's service and the requested service cannot be located.</td>
<td>8</td>
<td>This is a processing error.</td>
</tr>
<tr>
<td>NOTACTV</td>
<td>The DST block is not active or is stopped.</td>
<td>8</td>
<td>This is a processing error. Make sure that the ISC connection with IMS is started in IMS Connect.</td>
</tr>
<tr>
<td>SHUTDOWN</td>
<td>A CLOSEHWS command has been issued. IMS Connect termination is in process.</td>
<td>8</td>
<td>Termination in process.</td>
</tr>
<tr>
<td>STP/CLSE</td>
<td>The ISC link or IMSplex is in stop or close process.</td>
<td>4</td>
<td>This is a processing error.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect issues this message and continues to run. The message in progress is released. IMS Connect terminates the socket connection and deletes the client resource.

**System programmer response:** The response can vary depending on the service code.

For service codes DSCLOSE, NFNDDST, and SHUTDOWN, the data store is no longer active or connected to IMS Connect. Investigate why the data store was terminated, or if a command to stop the ISC connection was issued.

For service code DISCONN, the path to IMS is no longer available to IMS Connect. Investigate whether the IMSPLEX data store has been stopped, if SCI is unavailable, or if IMS is unavailable.

HWSV5000E TCP/IP SOCKET FUNCTION CALL
FAILED; F=fu, R=rc, E=ec, N=rsn, PORT=port, M=mc

Explanation: IMS Connect CICSPORT communications driver was unable to perform the specified socket function.

In the message text:

- fu: Identifies the TCP/IP socket function call. For a description of the possible functions and their associated z/OS UNIX System Services callable service, see the following table.
- rc: Identifies the TCP/IP return code.
- ec: Identifies the TCP/IP error code.
- port: Identifies the port that is associated with the socket.
- mc: Identifies the module issuing the message.

Table 86. Function names and associated UNIX System Services callable services for HWSV5000E

</tr>
<tr>
<td>SHUTDSOC</td>
<td>BPX1SHT</td>
</tr>
<tr>
<td>WRITE</td>
<td>BPX1AIO (AIO#WRITE)</td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues to run normally.

System programmer response: For the possible cause of the specified return code and error code, see z/OS Communications Server IP and SNA Codes.

Module: GDRC - HWSGDRCV
Related reference: z/OS: Sockets return codes (ERRNOs)

HWSV5030W THE CICSPORT DRIVER FAILED TO OBTAIN STORAGE; R=rc, S=ssc, B=bn, M=mc

Explanation: The IMS Connect CICSPORT communications driver was unable to get storage for internal buffers, possibly because not enough storage is available to complete the process.

In the message text:

- rc: Return code of the service.
- ssc: Service code. Service codes can contain either codes that more specifically identify the error, or codes that are returned by called services that failed the request. The following codes are BPE storage service codes:
  - BPECBGET
  - BPEGETM
- bn: Buffer name.
- mc: Module issuing the message.

Possible cause: Not enough storage is available to complete the process.

System action: This message is issued and IMS Connect continues to run. If the failure to obtain storage results in a communications error, other error messages are also issued.

System programmer response: If the error is related to a BPE service, look up the return code for the BPE service that is listed in the message.

If the problem persists, search the problem-reporting databases to find a correction for the problem. If none exists, record the return code, service code, buffer name, buffer address, and contact IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

Module: GDRC - HWSGDRCV

HWSX0901E UNABLE TO ALLOCATE ENVIRONMENT SYSTEM TABLE; R=rc, S=ssc, M=mc

Explanation: Storage cannot be allocated for the environment system table (EST). The EST anchors all of the common service routines, control tables, and control blocks used by the IMS Connect components.

In the message text:

- rc: Identifies the return code.
- ssc: Identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc: Identifies the module issuing the message.
See the following table for an explanation of service and return codes:

### Table 87. Service and return code explanation for HWSX0901E

<td>8</td>
<td>A zero length is requested.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>12</td>
<td>Unable to obtain the requested storage (z/OS GETMAIN failed).</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** XTRS - HWSXTRS0

---

**HWSX0902E UNABLE TO ALLOCATE INTERFACE STRUCTURE; R=rc, S=sc, M=mc**

**Explanation:** Storage cannot be allocated for the interface execution structure. This structure contains the linkage to the functions supported by each component within IMS Connect.

In the message text:
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes.

</tr>
<tr>
<td></td>
<td></td>
<td>8</td>
<td>Storage is unavailable to satisfy the request.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** ITBL - HWSITBL0

---

**HWSX0903E UNABLE TO ALLOCATE EXECUTION TABLE; R=rc, S=sc, M=mc**

**Explanation:** Storage cannot be allocated for the execution table (E_table). This structure contains the component-related data required for each component to run within the IMS Connect environment.

In the message text:
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes.

### Table 89. Service and return code explanation for HWSX0903E

<td>8</td>
<td>Storage is unavailable to satisfy the request.</td>
</tr>
</tbody>
</table>
**HWSX0904E • HWSX0905E**

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** XHD0 - HWSXHD00, XSH0 - HWSXSH00, XCM0 - HWSXCM00

**HWSX0904E UNABLE TO ALLOCATE COMPONENT INTERFACE; R=rc, S=sc, M=mc**

**Explanation:** A component cannot register its interface for the functions it supports. This message follows message HWSX0902E, and indicates that storage cannot be allocated for the component interface structure.

In the message text:
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes:

<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>REGINTFR</td>
<td>HWSINTFR is the IMS Connect service used to register the component’s interface.</td>
<td>4</td>
<td>An incorrect CBTE address is passed to the CB get routine. This is an internal system error.</td>
</tr>
</tbody>
</table>

**Table 90. Service and return code explanation for HWSX0904E**

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.

**Module:** XHD1 - HWSXHD10, XSH1 - HWSXSH10, XCM1 - HWSXCM10

**HWSX0905E UNABLE TO ALLOCATE MASTER SERVER; R=rc, S=smc, M=mc**

**Explanation:** Storage cannot be allocated for the master server control structure, or the master server thread cannot be scheduled. This server services all requests directed to the IMS Connect environment that are not directed to a specific component.

In the message text:
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.

See the following table for an explanation of service and return codes:

**Module:** XTRS - HWSXTRS0

HWSX0907E UNABLE TO START OPEN/CLOSE CONTROLLER; R=rc, S=ssc, M=mc

**Explanation:** Storage cannot be allocated for the open/close controller structure, or the open/close controller thread cannot be scheduled. This controller manages the linkage with the communication feature that IMS Connect uses to communicate with data stores and IMS Connect clients.

In the message text:
- rc identifies the return code.
- ssc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- MC identifies the module issuing the message.

See the following table for an explanation of service and return codes.

**HWSX0909E ERROR IN PROCESSING CONFIG MEMBER name; M=mc variable text**

**Explanation:** During the processing of the CONFIG member specifications, an error is detected, such as incorrect specification or allocation of storage for the execution control structure.

In the message text:
- `name` identifies the name of the CONFIG member.
- `rc` identifies the return code.
- `sc` identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- `mc` identifies the module issuing the message.
Table 1 describes the service and return codes for HWSX0909E and is organized by return codes. Table 2 describes the service codes from Table 1 that have variable return codes.

</tbody>
</table>

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the parameters in the CONFIG member are specified correctly. If it is a storage problem, ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact IBM Software Support. Provide the JCL, SYSLOG, and a memory dump if available.

**Module:** XCFG - HWSXCFG0

**Explanation:** Storage cannot be allocated for the command controller control structure, or the command controller thread cannot be scheduled. This server services all requests directed to the IMS Connect environment that are not directed to a specific component.

In the message text:
- rc identifies the return code.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

</tbody>
</table>

**System action:** This message is issued and IMS Connect terminates.

**System programmer response:** Ensure that the region size in the JCL statement is large enough to accommodate the IMS Connect region. If the error recurs, search the problem-reporting databases to find a correction for the problem. If none exists, contact the IBM Software Support. Provide the JCL, SYSLOG, and dump if available.
Module: XCM3 - HWSXCM30

HWSX0912E  HWS STARTED IN KEY - KEY 7 IS REQUIRED

Explanation: IMS Connect was executed in supervisor state but not in key 7.

In the message text:
- ky identifies the key.

This problem can occur when a problem exists in the program property table (PPT) member.

System action: IMS Connect terminates.

Operator response:
- Authorize to the APF the resident library (IMS.RESLIB) in which the IMS Connect modules reside. Update the SCHEDxx member in the PPT.

PPT PGMNAME(HWSHWS00) /*
| PROGRAM NAME = HWSHWS00 */
| CANCEL /*
| PROGRAM CAN BE CANCELED */
| KEY(7) /*
| PROTECT KEY ASSIGNED IS 7 */

Module: HWS - HWSHWS00

HWSX0912W  HWSUINIT RETURNS WARNING CODE; R=rc, S=sc, M=mc

Explanation: The user initialization exit HWSUINIT issued a warning return code. The meaning of that return code is defined by the user initialization exit itself. IMS Connect is not affected by this warning code and continues its initialization processing.

In the message text:
- rc identifies the return code that HWSUINIT sets.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of the service and return code.

Table 97. Service and return code explanation for HWSX0912W

<table>
<thead>
<tr>
<th>Service code</th>
<th>Short explanation</th>
<th>Return code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>INITFAIL</td>
<td>HWSUINIT returns with a warning code. The warning code is defined by the exit.</td>
<td>1-7</td>
<td>The meaning of the HWSUINIT-returned warning code is defined by the user initialization exit itself. IMS Connect is not affected by this warning, and continues its initialization processing.</td>
</tr>
</tbody>
</table>

System action: This message is issued and IMS Connect continues its initialization processing.

System programmer response: Because your installation defines the warning code, you must determine the corrective action to take, and whether to restart IMS Connect.

Module: XITF - HWSXITF0

HWSX0913E  HWSUINIT RETURN CODE >=8, IMS CONNECT SHUTDOWN; R=rc, S=sc, M=mc

Explanation: The user initialization exit HWSUINIT issued a return code of 8 or higher. IMS Connect terminates the initialization processing and shuts down the address space.

In the message text:
- rc identifies the return code that HWSUINIT sets.
- sc identifies the service code. Service codes can contain either codes that more specifically identify the error, or codes returned by called services that failed the request.
- mc identifies the module issuing the message.

See the following table for an explanation of the service and return code.
Table 98. Service and return code explanation for HWSX0913E

<tbody>
<tr>
<td>UINITLDF</td>
<td>HWSUINIT load failed</td>
<td>rc</td>
<td>HWSXITF0 failed to load HWSUINIT. HWSUINIT does not exist in the load library. IMS Connect initialization stops and IMS Connect terminates.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect terminates.

**System programmer response:** Because HWSUINIT is required, you must install the exit into your IMS load library (ADFSLOAD) before restarting IMS Connect.

**Module:** XITF - HWSXITF0

---

**HWX0920W**

**VALUE OF PARAMETER parm IN STATEMENT statement=id CHANGED TO newvalue FROM oldvalue BECAUSE reason; M=mc**

**Explanation:** During the processing of the IMS Connect configuration member, a parameter value was detected to be invalid or unsupported by the current IMS Connect configuration. IMS Connect changed the value of the parameter to the newvalue shown in the message text. The new parameter value remains in effect until the next restart of IMS Connect. The reason for the change is stated in the message.

In the message text:
- **parm** Identifies the parameter that was changed.
- **statement** Identifies the type of statement in which the parameter is specified.
- **id** Identifies the ID of the statement in which the parameter is specified.
- **newvalue** Identifies the runtime value of the parameter.
- **oldvalue** Identifies the value of the parameter as specified in the IMS Connect configuration member in the IMS.PROCLIB data set.
- **reason** Identifies the reason for the change.
- **mc** Identifies the module issuing the message.
Table 100. Reasons for resetting the value of a configuration parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Reason</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>AUTOCONN</td>
<td>THE RMTIMSCON IS USED BY MSC</td>
<td>MSC TCP/IP links do not support AUTOCONN=Y. If an MSC statement references a RMTIMSCON statement in which AUTOCONN=Y, or if the AUTOCONN parameter is omitted altogether, IMS Connect changes the specification during startup to AUTOCONN=N.</td>
</tr>
<tr>
<td>PERSISTENT=N WAS SPECIFIED</td>
<td></td>
<td>If AUTOCONN=Y and PERSISTENT=N are specified, IMS Connect changes the AUTOCONN value to N.</td>
</tr>
<tr>
<td>PERSISTENT</td>
<td>THE RMTIMSCON IS USED BY MSC</td>
<td>MSC TCP/IP links do not support PERSISTENT=N. If an MSC statement references a RMTIMSCON statement in which PERSISTENT=N, or if the PERSISTENT parameter is omitted altogether, IMS Connect changes the specification during startup to PERSISTENT=Y.</td>
</tr>
</tbody>
</table>

**System action:** IMS Connect changes the parameter value to the new value. This message is issued and IMS Connect continues to run normally.

**System programmer response:** No action is necessary; however, to prevent this message from being issued in the future, change the value of the parameter in the IMS Connect configuration PROCLIB member to the value supported by MSC TCP/IP links.

**Module:** XCFG - HWSXCFG0

**Related reference:**

[HWSCFGxx member of the IMS PROCLIB data set](System Definition)

HWSX0930I HWSTECL0 NOT INITIALIZED, R15=nn, R0=mm, M=xxx

**Explanation:** IMS Connect loads the module, HWSTECL0, and calls it for event recording initialization. HWSTECL0 returns with a return and reason code indicating initialization is unsuccessful.

In the message text:
- `nn` identifies the return code that HWSTECL0 set.
- `mm` identifies the reason code associated with any nonzero return codes passed.
- `xxx` identifies the module that issued the message.

For an explanation of the service and return codes, see the following table.
Table 101. Service and return code explanation for HWSX0930I

<table>
<thead>
<tr>
<th>Service code</th>
<th>Register number</th>
<th>Return code</th>

</tr>
<tr>
<td>8</td>
<td></td>
<td></td>
<td>Initialization was not successful. See reason code for additional information.</td>
</tr>
</tbody>
</table>

**System action:** This message is issued and IMS Connect continues to run.

**System programmer response:** Check with the provider for HWSTECL0 for possible causes of nonzero return code and corresponding reason codes.

**Module:** HWSINIT0

---

**HWSX0940A** **IMS CONNECT IS WAITING FOR**

**comp**: The component that IMS Connect is waiting for.

**mc**: The module issuing the message.

**System action:** IMS Connect continues attempting to communicate with the component address space.

If the component is SCI, then IMS Connect cannot route either database connection requests to IMS DB systems nor IMS command requests to the CSL Operations Manager (OM).

IMS Connect functions not related to the component continue to run.

**System programmer response:** Start the component that is identified in the message text.

**Module:** OMXO - HWSOMXOT
Chapter 13. MDA messages (dynamic allocation)

Dynamic allocation (IMSDALOC) messages have the prefix MDA.

Dynamic allocation messages are issued by the DFSMDA macro. You use the DFSMDA macro to create a parameter list in SDFSRESL for the databases that are to be dynamically allocated.

Because the parameter list creation involves the use of assembly language macro instructions, invalid keyword parameters can also result in error messages from the assembler program.

In addition to the system action for each message, the following system action is also taken unless explicitly excepted:

**System action (general):**

The remaining DFSMDA macro statements are checked for validity and the parameter list is not created if the system encounters an error.

MDA017  DBNAME REQUIRED
Explanation: You must specify the database name for TYPE=DATABASE
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA018  DBNAME CANNOT EXCEED 8 CHARACTERS
Explanation: Database names must be 8 characters or less.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA019  DDNAME REQUIRED FOR TYPE=DATASET
Explanation: You must specify the ddname for TYPE=DATASET.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA020  DSNAME REQUIRED FOR TYPE=DATASET
Explanation: The data set name (DSNAME) is required for TYPE=DATASET.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA021  DISP=OLD DEFAULTED
Explanation: This message is a warning.
System action: DISP= defaults to OLD.
Programmer response: No action is required.

MDA022  DISP=operand IS INVALID
Explanation: The operand identified by operand in the message text is not valid for the DISP keyword.
System action: The other statements are checked for validity
Programmer response: Correct the error and resubmit the job.

MDA023  INDEX PARAMETER IGNORED
Explanation: The index is no longer supported.
System action: The parameter is ignored.
Programmer response: No action is required.

MDA025  DDNAME CANNOT EXCEED 8 CHARACTERS
Explanation: The ddname must be 8 characters or less.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA026  DSNAME CANNOT EXCEED 44 CHARACTERS
Explanation: The DSNAME must be 44 characters or less.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA027  DDNAME DEFAULTED TO IMSMON
Explanation: For DC monitor, the DDNAME must be IMSMON. This is a warning message.
System action: The DDNAME defaults to IMSMON.

MDA028  DDNAME=operand INVALID FOR TYPE=DCMONITOR
Explanation: You specified an invalid DDNAME.
System action: The DDNAME defaults to IMSMON.
Programmer response: Check the DDNAME and ensure that it is valid.

MDA029  DBNAME MUST NOT START WITH CHARACTERS DFS
Explanation: A database name that begins with DFS was found.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.
MDA030  MAXIMUM NUMBER OF DATABASES EXCEEDED. LIMIT IS 250
Explanation: More than 250 database names were specified.
System action: The other parameters are checked for validity.
Programmer response: Divide the job in two or more jobs, and rerun these jobs.

MDA031  UNIT DEFAULTED TO TAPE
Explanation: This warning message indicated that the UNIT was not correct.
System action: UNIT defaults to tape.
Programmer response: No action is required.

MDA032  UNITNAME MUST NOT EXCEED 8 CHARACTERS
Explanation: A unit name with more than 8 characters was found. Unit names must be 8 characters or less.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA033  NO DATA SET SPECIFIED FOR PREVIOUS DATA SET
Explanation: The data set name for the database was missing.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA034  NO DATABASE SPECIFIED FOR THIS DATA SET
Explanation: The database for the data set was missing.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA035  UNITNAME IS IGNORED FOR DATABASE
Explanation: This is a warning message.
System action: The parameter is ignored.
Programmer response: No action is required.

MDA036  DBNAME IGNORED FOR FP DATABASE
Explanation: This is a warning message.
System action: The parameter is ignored.
Programmer response: No action is required.

MDA037  NO SPECIAL CHARACTERS ALLOWED
Explanation: Special characters were found where they are not allowed.
Programmer response: Correct the errors, and rerun the job.

MDA038  NO DATA SET SPECIFIED FOR PREVIOUS DB
Explanation: You did not specify a data set for the database.
System action: The other parameters are checked for validity.
Programmer response: Correct the errors, and rerun the job.

MDA039  NO DATA SET SPECIFIED FOR PREVIOUS DB.
Explanation: You did not specify a data set for the database.
System action: The other parameters are checked for validity.

MDA040  BUFNO DEFAULTED TO 5
Explanation: For the DFSMDA macro, BUFNO= describes the number of buffers wanted for the Monitor data set. If this value is not specified, the default is 5.
System action: The other parameters are checked for validity.

MDA041  BLKSIZE DEFAULTED TO 27992 FOR DCMONITOR
Explanation: For the DFSMDA macro, the block size was set to the default because it was not specified. Tape defaults to 32,768, and DASD defaults to 27,992.
System action: The other parameters are checked for validity.

MDA042  LABEL PARAMETER IGNORED FOR IMS MONITOR/XTRC
Explanation: The LABEL parameter is not needed and is ignored.
System action: The other parameters are checked for validity.

MDA043 TCBNUM PARAMETER REQUIRED FOR FUNC=func

Explanation: Some of the functions requested from DFSMDA require a TCBNUM parameter. In the message text, func identifies the function specified in the FUNC parameter.

MDA044 TFPAOCE PARAMETER REQUIRED FOR FUNC=func

Explanation: Some of the functions requested from DFSMDA require a TFPAOCE parameter. In the message text, func identifies the function specified in the FUNC parameter.

MDA045E YOU DID NOT SPECIFY A DATA SET FOR IMSACB(A or B)

Explanation: When creating a DFSMDA member for the IMSACBA or IMSACBB dynamic allocation member, there were no DATASET statements specified.

System action: The DFSMDA compile fails with an MNOTE 8.

User response: When creating DFSMDA members for the IMSACBA or IMSACBB DD statements, the TYPE=DATASET statements were omitted. You must have one TYPE=DATASET statement for each data set to be allocated.

MDA046E YOU CANNOT SPECIFY OTHER MEMBERS WITH THE IMSACBA OR IMSACBB MEMBER

Explanation: When processing DFSMDA statements for the IMSACBA or IMSACBB dynamic allocation member, DFSMDA statements for creating MDA members for other IMS data sets were found.

System action: The DFSMDA compile fails with an MNOTE 8.

User response: When creating DFSMDA members for the IMSACBA or IMSACBB data sets, remove any DFSMDA statement that creates MDA members for any other IMS data set.
Chapter 14. PSBGEN messages (PCB, PGEN, SEG, SFLD)

Program specification block generation (PSBGEN) messages begin with the prefixes PCB, PGEN, SEG, and SFLD.

Because PSB generation is composed of operating system assembler language macro instructions, the omission of or an invalid sequence in IMS PSB statements or invalid keyword parameters also result in error statements from the operating system assembler program.

In addition to the system action specified in this topic for each of these messages, the following action is also taken (except where explicitly noted otherwise): the remaining PSBGEN statements are checked for validity, and the PSB generation is terminated before macro expansion.

PCB messages for PSBGEN

This topic contains the following messages:

**PCB100**  PCB SPECIFICATION LIMIT EXCEEDED

- **Explanation:** You have exceeded the limit of 2500 PCB statements.
- **System action:** This PCB statement is used, and the prior PCB values are overlaid.
- **Programmer response:** Reduce the number of PCB statements to be less, and rerun PSBGEN.

**PCB110**  TYPE OPERAND IS OMITTED OR INVALID

- **Explanation:** The TYPE operand in a PCB macro was omitted or had a value other than "TP" or "DB".
- **System action:** No default is taken.
- **Programmer response:** Correct the TYPE operand, and rerun PSBGEN.

**PCB120**  LTERM, DBDNAME, OR NAME OPERAND IS INVALID

- **Explanation:** One of the values entered for the LTERM, DBDNAME, or NAME operand on a PCB macro statement exceeds 8 characters.
- **System action:** The name is used for checking validity of following operands.
- **Programmer response:** Correct the error, and rerun PSBGEN.

**PCB130**  NAME, LTERM, AND DBDNAME OPERANDS ARE MUTUALLY EXCLUSIVE, ONLY ONE MAY BE ENTERED

- **Explanation:** NAME, LTERM, and DBDNAME all have the same logical meaning for any one PCB statement.
- **System action:** In a TP PCB, LTERM is the default. In a DB PCB, the DBDNAME is used.
- **Programmer response:** Correct the error, and rerun PSBGEN.

**PCB140**  LTERM OR NAME OPERAND IS OMITTED

- **Explanation:** The destination name has been omitted for a PCB with TYPE=TP.
- **System action:** No default is given.
- **Programmer response:** Define an LTERM or NAME operand, and rerun PSBGEN.

**PCB150**  INVALID OPERANDS ARE SPECIFIED FOR A TP OR GSAM PCB

- **Explanation:** One or more of the following values were entered for a PCB with TYPE=TP: PROCOPT=, KEYLEN=, FB=, POS=, DBDNAME=.
- **System action:** Nothing else is processed on that PCB statement.
**PCB160** • **PCB170** • **PCB180** • **PCB190** • **PCB210** • **PCB220** • **PCB230** • **PCB234**

**Programmer response:** Correct the errors, and rerun PSBGEN.

---

**PCB160**  
**TP PCBs MUST BE SPECIFIED BEFORE DB OR GSAM PCBs**

**Explanation:** All PCB macros with TYPE=TP must precede PCB macros with TYPE=DB in the PSBGEN assembly.

**System action:** Nothing else is processed on that PCB statement.

**Programmer response:** Correct the errors, and rerun PSBGEN.

---

**PCB170**  
**DBDNAME OR NAME OPERAND IS OMITTED**

**Explanation:** The database name has not been specified for a PCB with TYPE=DB.

**System action:** The rest of the PCB parameters are scanned for validity.

**Programmer response:** Correct the error, and rerun PSBGEN.

---

**PCB180**  
**PROCOPT OPERAND IS INVALID**

**Explanation:** The value specified in the PROCOPT operand in a PCB macro TYPE=DB is invalid.

**System action:** No default is taken.

**Programmer response:** Correct the PROCOPT operand, and rerun PSBGEN.

---

**PCB190**  
**KEYLEN OPERAND IS OMITTED OR INVALID**

**Explanation:** The KEYLEN operand has been omitted, is not a numeric value, or is greater than 32,767.

**System action:** If the KEYLEN number exceeds 32,767, the invalid number is used for subsequent calculations.

**Programmer response:** Correct the KEYLEN operand, and rerun PSBGEN.

---

**PCB210**  
**POS OPERAND IS INVALID**

**Explanation:** The POS operand specified on a PCB TYPE=DB macro is invalid. Acceptable values are S, SINGLE, M, and MULTIPLE.

**System action:** The operand is ignored.

**Programmer response:** Correct the POS operand, and rerun PSBGEN.

---

**PCB220**  
**LTERM OPERAND IS INVALID FOR DB PCBs**

**Explanation:** The LTERM operand cannot be specified for a PCB with TYPE=DB.

**System action:** The operand is ignored.

**Programmer response:** Correct the error, and rerun PSBGEN.

---

**PCB230**  
**NAME OR DBDNAME OPERAND MUST BE ALPHA**

**Explanation:** The entered database name value must begin with an alphabetic character for DB PCBs.

**System action:** The operand is ignored if invalid.

**Programmer response:** Correct the error, and rerun PSBGEN.

---

**PCB234**  
**THE PSELOPT OPERAND MUST BE PSELOPT=MULT OR PSELOPT=SNGL**

**Explanation:** The user partition selection option specified in the PSELOPT operand is invalid.

The valid PSELOPT= values are:
- PSELOPT=MULT for multiple partitions
- PSELOPT=SNGL for a single partition

**System action:** The PSB generation attempt fails with an MNOTE of 8.

**Programmer response:**
- If user data partitioning is requested (as defined in the NAME operand on the LCHILD statement with two or more HISAM secondary index partition databases or two or more SHISAM secondary index partition databases):
  - Specify PSELOPT=MULT or PSELOPT=SNGL (on the PCB statement with the PROCSEQD operand or on the XDFLD statement for the primary DEDB DBD) to specify how partitions are to be processed in the logical partition database group. If the PSELOPT operand is specified on both the PCB statement with the PROCSEQD operand and the XDFLD statement of the primary DEDB DBD, the PSELOPT operand on the PCB statement overrides the PSELOPT operand on the XDFLD statement of the primary DEDB DBD.
- If user data partitioning is not requested (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database or one SHISAM secondary index database):
  - Delete the PSELOPT operand and PSELRTN operand on the XDFLD statement.
  - If the PSELOPT operand is specified on the PCB statement with the PROCSEQD operand, delete the PSELOPT operand on the PCB statement.
• Rerun the DBDGEN and PSBGEN utilities as necessary.

**Related reference:**
- XDFLD statements (System Utilities)
- Full-function or Fast Path database PCB statement (System Utilities)

**PCB235**  
**THE PSELOPT OPERAND IS VALID ONLY WHEN THE PROCSEQD OPERAND IS SPECIFIED**

**Explanation:** The user partition selection option is specified in the PSELOPT operand on the PCB statement without the PROCSEQD operand. The PSELOPT operand can only be specified on a PCB statement with the PROCSEQD operand.

**System action:** The PSB generation attempt fails with an MNOTE of 8.

**Programmer response:**
- If user data partitioning is requested (as defined in the NAME operand on the LCHILD statement with two or more HISAM secondary index partition databases, or two or more SHISAM secondary index partition databases):
  - Specify PSELOPT=MULT or PSELOPT=SNGL (on the PCB statement with the PROCSEQD operand or on the XDFLD statement for the primary DEDB DBD) to specify how the partitions are to be processed in the logical partition database group. If the PSELOPT operand is specified on both the PCB statement with the PROCSEQD operand and the XDFLD statement of the primary DEDB DBD, the PSELOPT operand on the PCB statement overrides the PSELOPT operand on the XDFLD statement of the primary DEDB DBD.
- If user data partitioning is not requested (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database or one SHISAM secondary index database):
  - Delete the PSELOPT and PSELRTN operands on the XDFLD statement.
  - If the PSELOPT operand is specified on the PCB statement with the PROCSEQD operand, delete the PSELOPT operand on the PCB statement.
- Rerun the DBDGEN and PSBGEN utilities as necessary.

**PCB236**  
**THE ACCESS OPERAND IS ONLY VALID WHEN THE PROCSEQD OPERAND IS ALSO SPECIFIED**

**Explanation:** The ACCESS and PROCSEQD operands on a PCB statement for a data entry database (DEDB) must both be specified. You can use the following specifications for the ACCESS operand:

- Use ACCESS=DB to access the primary DEDB database using a secondary index sequence. The PROCSEQD operand identifies the secondary index database or the first user partition database in a user partition group when user partitioning is in use. ACCESS=DB is the default.
- Use ACCESS=INDEX to access one or more user partition databases in a user partition group as a separate logical database.

**System action:** The PSB generation attempt fails with an MNOTE of 8.

**Programmer response:** If the PCB statement is not used to access a DEDB database from a Fast Path secondary index, remove the ACCESS operand and rerun the PSBGEN utility.

If the PCB statement is used to access a DEDB database from a Fast Path secondary index, add PROCSEQD operand on the PCB statement and rerun the PSBGEN utility.

**PCB237**  
**THE ACCESS OPERAND MUST BE ACCESS=DB OR ACCESS=INDEX**

**Explanation:** The ACCESS operand on a PCB statement contains an invalid value. The valid values are ACCESS=DB or ACCESS=INDEX. You can use the following specifications for the ACCESS operand:

- ACCESS=DB is used to access the primary data entry database (DEDB) using a secondary index sequence. ACCESS=DB is the default.
- Use ACCESS=INDEX to access one or more user partition databases in a user partition group as a separate logical database.

The ACCESS and PROCSEQD operands on a PCB statement for a DEDB database must both be specified. The PROCSEQD operand identifies the secondary index database or the first user partition database in a user partition group when user partitioning is in use.

**System action:** The PSB generation attempt fails with an MNOTE of 8.

**Programmer response:** Change the ACCESS operand to either ACCESS=DB or ACCESS=INDEX and rerun the PSBGEN utility.

**PCB240**  
**MODIFY OPERAND IS INVALID**

**Explanation:** The MODIFY operand was specified on a PCB macro and either the TYPE=TP operand was not specified or the NAME or LTERM operand was also specified.

**System action:** The MODIFY operand is ignored.

**Programmer response:** Correct the MODIFY operand, and rerun PSBGEN.

</tr>
</tbody>
</table>
PCB365  PCBNAME AND LABEL ARE CONFLICTING
Explanation: A PCBNAME and LABEL were used, but only one can be used to name a PCB.
System action: Processing terminates with RC=8.
Programmer response: Correct the PCBNAME/LABEL.
Problem determination: 2, 3, 8 and 19
Related information: Chapter 2, “IMS problem determination,” on page 13

PCB370  LIST= xxx IS INVALID -- YES/NO REQUIRED
Explanation: LIST=xxx was specified on the PCB and is invalid. Only YES or NO is recognized.
System action: Processing terminates with RC=8.
Programmer response: Correct the LIST= parameter on the PCB.
Problem determination: 2, 3, 8, and 19
Related information: Chapter 2, “IMS problem determination,” on page 13

PCB375  LIST=NO IS INVALID FOR PCB WITHOUT NAME
Explanation: You specified LIST=NO for the PCB, but a PCBNAME/LABEL was not used. LIST=NO requires a name for the PCB.
System action: Processing terminates with RC=8.
Programmer response: Correct the PCB definition.
Problem determination: 2, 3, 8, and 19
Related information: Chapter 2, “IMS problem determination,” on page 13

PCB400  INVALID SB PARAMETER xxxxxxxx
Explanation: The SB parameter value xxxxxxxx is invalid. The only valid SB parameter values are COND and NO.
System action: IMS terminates the PSBGEN.
User response: Correct the error by ensuring that the parameter value is either COND or NO; then rerun the PSBGEN.

PCB410  TOO MANY SB PARAMETERS
Explanation: There are more than 3 subparameters specified for the SB parameter.
System action: IMS terminates the PSBGEN.
User response: Correct the error by ensuring that no more than 3 subparameters are specified for the SB parameter; then rerun the PSBGEN.

PCB420  VIEW parameter is invalid
Explanation: The VIEW parameter is invalid. The correct value is MSDB.
System action: The PSBGEN terminates.
System programmer response: Correct the VIEW parameter and rerun the PSBGEN.

PCB440  DBVER OPERAND IS INVALID
Explanation: The value on the DBVER operand of the PCB statement was not valid.
Valid values for the DBVER operand on a PCB statement are 0 – 2147483647.
System action: The PSB generation attempt fails with an MNOTE of 8.
Programmer response: Correct the PCB statement and rerun the PSB generation utility.

PCB460  THE VALUE SPECIFIED ON THE EXTERNALNAME PARAMETER EXCEEDS 128 CHARACTERS.
Explanation: The value specified on the EXTERNALNAME parameter is more than 128 characters.
External names must be 128 characters or less.
System action: The DBD generation attempt fails with an MNOTE of 8.
Programmer response: Specify an external name on the EXTERNALNAME parameter that is less than 128 characters and rerun the DBD Generation utility.
Related reference:
Full-function or Fast Path database PCB statement (System Utilities)

PCB470  THE VALUE OF THE EXTERNALNAME PARAMETER CONTAINS INVALID CHARACTERS.
Explanation: The value specified on the EXTERNALNAME parameter contains invalid characters. An external name must be specified on the EXTERNALNAME parameter by using uppercase alphanumeric characters. The underscore character is also allowed.
System action: The DBD generation attempt fails with an MNOTE of 8.
Programmer response: Specify an external name on the EXTERNALNAME parameter that includes only uppercase alphanumeric characters and, optionally, the underscore character.
Related reference:
PCB602  THE VALUE OF EXTERNALNAME CANNOT BE A RESERVED SQL KEYWORD.

Explanation: The value specified on the EXTERNALNAME parameter is a reserved SQL keyword and cannot be used as an external name for a field.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify an external name for this field and rerun the PSB Generation utility.

Related reference:

PCB603  THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the PSB Generation utility.

Related reference:

PCB604  THE VALUE OF THE EXTERNALNAME PARAMETER xxxxxxxxxx IS NOT UNIQUE WITHIN THE PSB.

Explanation: The value specified on the EXTERNALNAME parameter is the same as the value specified on the EXTERNALNAME parameter in a PCB statement that was previously read by the PSB Generation utility.

In the message text: xxxxxxxxxx

The non-unique value of the EXTERNALNAME parameter.
## PGEN messages for PSBGEN

This topic contains the following messages:

<table>
<thead>
<tr>
<th>Message</th>
<th>Explanation</th>
<th>System action</th>
<th>Programmer response</th>
</tr>
</thead>
<tbody>
<tr>
<td>PGEN100</td>
<td>PSBNAME OPERAND IS OMITTED OR INVALID</td>
<td>Terminate PSBGEN after processing the other parameters.</td>
<td>Correct the errors, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN110</td>
<td>LANG OPERAND IS OMITTED OR INVALID</td>
<td>Terminate PSBGEN after processing the other parameters on this statement.</td>
<td>Correct the errors, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN120</td>
<td>PSBGEN TERMINATED; ERRORS IN PSB</td>
<td>No default is taken.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN130</td>
<td>PCBn HAS NO SENSITIVE SEGMENTS</td>
<td>No default is taken.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN140</td>
<td>INTERNAL PSBGEN ERROR, PSB NOT USABLE, SUBMIT APAR</td>
<td>The PSBGEN assembly is terminated.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN150</td>
<td>SSASIZE OPERAND IS INVALID</td>
<td>Terminate PSBGEN after processing the other parameters on this statement.</td>
<td>Correct the SSASIZE operand, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN160</td>
<td>IOASIZE OPERAND IS INVALID</td>
<td>Terminate PSBGEN after processing the other parameters on this statement.</td>
<td>Correct the IOASIZE operand, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN170</td>
<td>MAXQ OPERAND IS INVALID</td>
<td>No default is taken.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN180</td>
<td>CMPAT OPERAND IS INVALID</td>
<td>No default is taken.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN200</td>
<td>EITHER OLIC=YES OR OLIC=NO MUST BE SPECIFIED</td>
<td>The PSBGEN assembly is terminated.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
<tr>
<td>PGEN210</td>
<td>OLIC=YES IS INVALID IF ANY PCB SPECIFIES PROCOPT=L/LS</td>
<td>The PSBGEN assembly is terminated.</td>
<td>Correct the error, and rerun PSBGEN.</td>
</tr>
</tbody>
</table>
Explanation: A DL/I database PSB with a PROCOPT=L/LS has been specified. This is invalid in combination with OLIC=YES.

System action: The PSBGEN assembly is terminated.

Programmer response: Correct the error, and rerun PSBGEN.

OLIC=YES requires at least one data base PCB be specified

Explanation: OLIC=YES has been specified, but there were no DL/I database PCBs in this PSBGEN.

System action: The PSBGEN assembly is terminated.

Programmer response: Correct the error, and rerun the PSBGEN.

LOCKMAX must be numeric value between 0 and 255

Explanation: The PSBGEN detected a LOCKMAX specification that is either non-numeric or not between 0 and 255.

System action: The PSBGEN assembly terminates.

Programmer response: Correct the LOCKMAX specification and rerun the PSBGEN.

DBLEVEL is invalid.

Explanation: The value on the DBLEVEL operand of the PSBGEN statement was not valid.

The valid values for the DBLEVEL are:

• CURR
• BASE

System action: The PSB generation attempt fails with an MNOTE of 8.

Programmer response: Correct the PSB statement and rerun the PSB GENERATION utility.

Related reference:

PSBGEN statement (System Utilities)

The value specified on the REMARKS parameter exceeds 256 characters.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the PSB Generation utility.

Related reference:

PSBGEN statement (System Utilities)

The value of the REMARKS parameter contains invalid characters.

Explanation: The comments specified on the REMARKS parameter in the PSBGEN statement contain one or more invalid characters.

The value specified on the REMARKS keyword cannot contain the following characters:

• Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

CORRECT

REMARKS='These remarks apply to the XYZ application'

INCORRECT

REMARKS='These remarks apply to the 'XYZ' application'

• Double quotation marks.
• Less than (<) symbols.
• Greater than (>) symbols.
• Ampersands (&).

System action: PSBGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the comments that are specified on the REMARKS parameter in the PSBGEN statement and run the PSBGEN utility again.

Related reference:

PSBGEN statement (System Utilities)

Invalid positional operand—operand—specified on this statement

Explanation: One or more positional operands were specified, which are undefined in the syntax of the statement type being processed.

System action: The invalid positional operands are ignored.

Programmer response: Remove the positional operands, and rerun PSBGEN.
SEG messages for PSBGEN

This topic contains the following messages:

SEG100  SENSEG SPECIFICATION LIMIT EXCEEDED
Explanation: The limit of 3000 SENSEG statements has been reached.
System action: The first 999 SENSEG statements and the last are used. Each one after 999 is checked for validity and then overlaid by the next SENSEG statement.
Programmer response: Remove excess SENSEG statements, and rerun PSBGEN.

SEG110  PCB STMT MUST PRECEDE SENSEG STMT
Explanation: A PCB statement must precede a SENSEG statement.
System action: The previous PCB statement is used.
Programmer response: Correct the error, and rerun PSBGEN.

SEG120  NAME PARAMETER IS OMITTED Extra
Explanation: Either the NAME parameter has been omitted from the SENSEG statement or the value specified is not from 1 to 8 alphanumeric characters.
System action: If NAME is omitted, no name is used. If specified and exceeds 8 characters, the first 8 characters are used.
Programmer response: Correct the NAME parameter, and rerun PSBGEN.

SEG130  PARENT PARAMETER IS OMITTED OR INVALID
Explanation: Either the PARENT parameter has been omitted from the SENSEG statement or the value specified is not zero or 1 to 8 alphanumeric characters.
System action: No parent name is given in case of omission. The first 8 characters are used if the parameter exceeds 8 characters.
Programmer response: Correct the PARENT parameter, and rerun PSBGEN.

SEG140  SENSEG STMT IS INVALID FOR TP OR GSAM PCBs
Explanation: A PCB with TYPE=TP has been followed by a SENSEG statement without an intervening PCB with TYPE=DB.

SEG150  DUPLICATE SENSEG NAME IN PCB
Explanation: The name specified in the NAME operand on this SENSEG statement has previously been specified on another SENSEG statement for this PCB.
Programmer response: Correct the SENSEG name, and rerun PSBGEN.

SEG160  SENSEG PARENT NOT DEFINED
Explanation: The named parent value has not been previously defined as a sensitive segment.
System action: Validity checking on that SENSEG statement is terminated.
Programmer response: Correct the error, and rerun PSBGEN.

SEG170  POSITIONAL/KEYWORD OPERAND MIX IS INVALID
Explanation: Positional operands were specified on the same SENSEG statement with IMS keywords. One or the other must be used.
System action: This SENSEG statement is not processed.
Programmer response: Correct the SENSEG statement, and rerun PSBGEN.

SEG180  NAME OPERAND IS OMITTED OR INVALID
Explanation: Either the NAME operand has been omitted from the SENSEG statement or the specified name is not from 1 to 8 alphanumeric characters.
System action: If it is omitted, no name is used. The first 8 characters are used, if specified and the operand exceeds 8 characters.
Programmer response: Specify or correct the NAME operand, and rerun PSBGEN.

SEG190  PARENT OPERAND IS OMITTED OR INVALID
Explanation: Either the PARENT operand has been omitted from the SENSEG statement or the specified name is not from 1 to 8 alphanumeric characters.
System action: No parent name is given in case of omission. The first 8 characters are used if the parameter exceeds 8 characters.
Programmer response: Correct the PARENT operand, and rerun PSBGEN.
omission. The first 8 characters are used if the operand exceeds 8 characters.

**Programmer response:** Correct the PARENT operand, and rerun PSBGEN.

---

**SEG230**  
**PROCOPT OPERAND IS OMITTED OR INVALID**

**Explanation:** This message is issued if you
- Omitted the PROCOPT parameter from the SENSEG statement.
- Specified an invalid processing option on the PROCOPT parameter.

**System action:** The PSBGEN is terminated because of the specification error.

**Programmer response:** Correct the PROCOPT operand; then rerun PSBGEN.

---

**SEG250**  
**MAXIMUM NUMBER OF INDICES PER SENSEG IS 32**

**Explanation:** More than 32 secondary indexes were specified in the INDICES parameter for this SENSEG statement.

**System action:** Processing on this SENSEG statement is stopped.

**Programmer response:** Reduce the number of secondary indexes specified to less than or equal to 32, and rerun PSBGEN.

---

**SEG260**  
**INDICES OPERAND IS INVALID**

**Explanation:** One or more of the secondary index names specified in the INDICES operand exceeded 8 characters.

**System action:** Processing on this SENSEG is stopped.

**Programmer response:** Correct the INDICES operand, and rerun PSBGEN.

---

**SEG270**  
**SECONDARY INDEX NAME IS A DUPLICATE**

**Explanation:** One of the secondary index names specified for the INDICES operand on this SENSEG statement has been previously specified on another SENSEG statement for the PCB.

**Programmer response:** Correct the INDICES operand, and rerun PSBGEN.

---

**SEG280**  
**SECONDARY INDICES LIMIT PER PSB EXCEEDED**

**Explanation:** You have specified more than 1000 secondary indexes for this PSBGEN.

**System action:** Processing on this SENSEG is terminated.

**Programmer response:** Reduce the total number of secondary indexes to less than or equal to 1000, and rerun PSBGEN.

---

**SEG290**  
**INDICES OPERAND IS INVALID WITH PROCOPT=OPTION**

**Explanation:** A PCB with PROCOPT=LS or L has been followed by a SENSEG statement with an INDICES operand.

**System action:** Processing on this SENSEG is terminated.

**Programmer response:** Remove the INDICES operand, and rerun PSBGEN.

---

**SEG300**  
**SUBSET POINTER IS NOT SUPPORTED**

**Explanation:** The SSPTR operand is specified to the root segment.

**System action:** The PSBGEN is terminated because of the specification error.

**Programmer response:** Correct the SENSEG statement, and rerun PSBGEN.

---

**SEG310**  
**UPDATE NOT ALLOWED FOR SSPTR subset_pointer_number**

**Explanation:** The update sensitivity specified for subset pointer `subset_pointer_number` cannot be used because the processing option is not A, R, I, or D.

**System action:** The PSBGEN is terminated.

**Programmer response:** Take one of the following actions to correct the problem:
- Change the PCB or SENSEG PROCOPT to an update option.
- Change the sensitivity of the subset pointer to READ.

**Module:** DFSFLOAT

---

**SEG600**  
**THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.**

**Explanation:** The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

**Related reference:**
- SENSEG statement (System Utilities)
**SEG601**

THE VALUE OF THE REMARKS PARAMETER CONTAINS INVALID CHARACTERS.

**Explanation:** The comments specified on the REMARKS parameter in the SENSEG statement contain one or more invalid characters.

The value specified on the REMARKS keyword cannot contain the following characters:

- Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

**CORRECT**

REMARKS='These remarks apply to the XYZ application'

**INCORRECT**

REMARKS='These remarks apply to the 'XYZ' application'

Chapter 15. DBDGEN messages (AREA, DBD, DGEN, DMAN, EXT, FIN, FLD, LCHD, SEGM, SOUR, XDFLD)

Database description generation (DBDGEN) messages are displayed for DBD generation error conditions and have various prefixes.

The prefixes, in the approximate order in which they would occur during a DBDGEN, and the issuing module are as follows:

<table>
<thead>
<tr>
<th>Message prefix</th>
<th>Principal issuing macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>AREA</td>
<td>AREA</td>
</tr>
<tr>
<td>DBD</td>
<td>DBD</td>
</tr>
<tr>
<td>DGEN</td>
<td>DBDGEN</td>
</tr>
<tr>
<td>DMAN</td>
<td>DATASET, DMAN</td>
</tr>
<tr>
<td>EXT</td>
<td>LCHILD, DBDGEN</td>
</tr>
<tr>
<td>FIN</td>
<td>FIN</td>
</tr>
<tr>
<td>FLD</td>
<td>FIELD, FLD, FLDK, DFSMARSH, DFSMAP, DFSCASE</td>
</tr>
<tr>
<td>LCHD</td>
<td>LCHILD</td>
</tr>
<tr>
<td>SEGM</td>
<td>SEGM</td>
</tr>
<tr>
<td>SOUR</td>
<td>SEGM</td>
</tr>
<tr>
<td>XDFLD</td>
<td>XDFLD</td>
</tr>
</tbody>
</table>

Because DBD generation is composed of the operating system assembler language macro instructions, omission of or an invalid sequence in DBD control statements or invalid keyword parameters also result in error statements from the operating system assembler. In addition to the system action specified in this topic for each of these messages (except where explicitly noted otherwise), the remaining DBDGEN statements are checked for validity based on available information. The DBD generation is terminated prior to macro expansion.

AREA messages for DBD generation

This topic contains the following messages:

AREA100  AREA STMT IS INVALID FOR ACCESS=DEDB.

Explanation: The ACCESS= operand contains a value other than DEDB or the AREA statement was used incorrectly.

System action: The system ignores all operands specified on the AREA statement and continues to process the remaining statements.

Programmer response: Correct the ACCESS operand on the DBD statement or change the AREA statement to a DATASET statement. Rerun the DBDGEN.

AREA140  MODEL OPERAND SPECIFICATION IS INVALID

Explanation: The MODEL operand does not specify one of the following valid values:
- For DEVICE=2305, model=1 or 2 is allowed.
For DEVICE=3330, model=1 or 11 is allowed.

For DEVICE=2314, 2319, 3340 and 3350, no MODEL operand specification is allowed.

System action: Terminate the DBDGEN prior to expansion.

Programmer response: Correct the MODEL operand and rerun DBDGEN.

AREA644

THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference:

Related reference: AREA statement (System Utilities)

AREA645

THE VALUE OF THE REMARKS PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The comments specified on the REMARKS parameter in the AREA statement contain one or more invalid characters.

The value specified on the REMARKS keyword cannot contain the following characters:

- Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

  CORRECT
  REMARKS='These remarks apply to the XYZ application'

  INCORRECT
  REMARKS='These remarks apply to the XYZ application'

- Double quotation marks.
- Less than (<) symbols.
- Greater than (>) symbols.
- Ampersands (&).

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the comments that are specified on the REMARKS parameter in the AREA statement and run the DBDGEN utility again.

Related reference:

Related reference: AREA statement (System Utilities)

DBD messages for DBD generation

This topic contains the following messages:

DBD001

DBD CARD MUST OCCUR 1ST IN A DBDGEN

Explanation: The first entry to a DBDGEN must be a DBD statement. You must first know the DL/I organization of the database and its name before DBDGEN can function.

System action: The results obtained from the scan of the succeeding statements are unpredictable.

Programmer response: Provide a DBD statement as the first entry to DBDGEN, and rerun DBDGEN.

DBD100

MORE THAN ONE DBD CARD SPECIFIED

Explanation: Only one DBD statement is acceptable for each database.

System action: The parameters on the second DBD statement overlay the parameters on the first DBD statement. Results are unpredictable.

Programmer response: Remove excess DBD statements, and rerun DBDGEN.

DBD110

NAME OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred:

- The NAME operand was omitted.
- The NAME operand specifies a database name which is longer than 8 characters, which equals the reserved name of RDMVTAB, or whose first character is not alphabetic, #, @ or $, or whose remaining characters are not alphabetic, numeric, #, @ or $.
- The NAME operand specifies multiple database names, but the ACCESS is not INDEX, or the ACCESS=INDEX, but the maximum number of database names has been exceeded or there is a duplicate in the list.

System action: No default is assumed. The specified names are used for subsequent validity checking.

Programmer response: Correct the NAME operand and rerun DBDGEN.
**DBD113** PASSWD=value OPERAND IS INVALID

*Explanation:* An invalid password operand indicated by value in the message text was specified. The valid operand values are PASSWD=YES and PASSWD=NO.

*System action:* PASSWD=NO is assumed for subsequent validity checking.

*Programmer response:* Correct the PASSWD operand and rerun DBDGEN.

---

**DBD118** PASSWD OPERAND IS INVALID WITH ACCESS=access

*Explanation:* You specified PASSWD=YES with a DL/I access method other than HISAM, SHISAM, HDAM, HIDAM, INDEX, GSAM, PHDAM, PHIDAM, or PSINDEX. For a LOGICAL database, the password operand must be specified on the physical database descriptions, if password processing is wanted.

*System action:* PASSWD=NO is assumed for subsequent validity checking.

*Programmer response:* Correct the error and rerun DBDGEN.

---

**DBD119** PASSWD OPERAND MAY ONLY BE SPECIFIED IF VSAM IS THE SYSTEM ACCESS METHOD

*Explanation:* You specified PASSWD=YES, but VSAM was not specified as the system access method.

*System action:* PASSWD=NO is assumed for subsequent validity checking.

*Programmer response:* Correct the inconsistent operand information, and rerun DBDGEN.

---

**DBD120** ACCESS OPERAND IS OMITTED OR INVALID

*Explanation:* One of the following occurred:
* The ACCESS operand was omitted.
* The DL/I access method or the operating system access method is not one of the valid types or combinations listed.
* The ACCESS operand did not specify INDEX and contains more than two parameter values or did specify INDEX and contains more than four parameter values.
* The ACCESS operand specified the PROT or DOSCOMP option without VSAM, or the third parameter value was specified, but not PROT or NOPROT, or the fourth parameter value was specified, but was not DOSCOMP.

This error should be corrected before attempting to determine the validity of any following error messages, if any were generated.

*System action:* No default is assumed. This error must be corrected to obtain a meaningful scan of the succeeding parameters.

*Programmer response:* Correct the ACCESS operand and rerun DBDGEN.

---

**DBD130** RMNAME OPERAND IS OMITTED OR INVALID

*Explanation:* One of the following occurred:
* The RMNAME operand was specified for a DL/I access method other than HDAM, DEDB, or PHDAM.
* For HDAM or PHDAM, the RMNAME operand was omitted, or was specified, but the randomizing module name was omitted or it consists of more than 8 characters, or has invalid character content. Or, the RMNAME operand contains more than four parameters or one of the last three parameter values is not self-defining and is below the lower allowable limit, or above the upper allowable limit.
* For DEDB, the RMNAME randomizing module name was omitted and it consists of more than 8 characters, or has invalid character content. Or the RMNAME operand consists of more than just the single randomizing module name.

*System action:* A combination of default values and user information is used for subsequent validity checking.

*Programmer response:* Correct the RMNAME operand, and rerun DBDGEN.

---

**DBD131** RBN OPERAND MUST BE SPECIFIED

*Explanation:* The RBN operand must be specified when using randomizing module names DSHDC10 or DSHDC40.

*System action:* Errors in the DBD terminate the DBDGEN.

*Programmer response:* Correct the RBN operand, and rerun DBDGEN.

---

**DBD140** A SHARED SECONDARY INDEX REQUIRES VSAM AS THE SYSTEM ACCESS METHOD

*Explanation:* You specified multiple database names in the NAME operand with ACCESS=INDEX, but the system access method specified was not VSAM.

*System action:* The given information is used for subsequent validity checking.

*Programmer response:* Correct the inconsistent operand information, and rerun DBDGEN.
### DBD150 ISAM ACCESS METHOD IS NO LONGER SUPPORTED

**Explanation:** You specified `ACCESS=(xxx,ISAM)` in the DBDGEN. The ISAM access method is not supported under IMS.

**System action:** The system continues checking the validity of the remaining parameters in the DBDGEN.

**Programmer response:** Correct the `ACCESS=` operand and rerun DBDGEN.

### DBD160 PSNAME OPERAND IS INVALID.

**Explanation:** The PSNAME operand violates the rules for a name. The operand:
- Cannot be longer than 8 characters
- The first character must be alphabetic
- The remaining characters must be alphabetic, numeric, or #, @, $

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Correct the PSNAME specification and rerun the DBDGEN.

### DBD170 PSNAME OPERAND IS INVALID WITH ACCESS=

**Explanation:** The PSNAME operand is only valid for `ACCESS=PHDAM, PHIDAM, or PSINDEX`.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Remove the PSNAME operand or change the ACCESS parameter to one of the allowed organizations.

### DBD180 DBVER SPECIFIED ON UNSUPPORTED DB TYPE

**Explanation:** The DBVER operand is specified on a DBD statement for a database access type that does not support database versioning.

The DBVER can be specified on the DBD statements of only the following database access types:
- DEDB
- HDAM
- HIDAM
- PHDAM
- PHIDAM

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Correct the DBD statement and rerun the DBD Generation utility.

### DBD181 DBVER OPERAND IS INVALID

**Explanation:** The value on the DBVER operand in the DBD statement is not valid.

Valid values for DBVER are 1 - 2147483647.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Correct the DBD statement and rerun the DBD Generation utility.

### DBD200 FPINDEX OPERAND IS ONLY VALID FOR A INDEX DATABASE

**Explanation:** The DBDGEN utility encountered an FPINDEX operand on a DBD statement for a database that is not a secondary index database.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Correct the DBD statement and rerun the DBDGEN utility.

### DBD210 FPINDEX OPERAND VALUE IS INVALID

**Explanation:** The value on an FPINDEX operand on a DBD statement was not valid.

**System action:** The DBDGEN attempt fails with an MNOTE of 8.

**Programmer response:** Correct the DBD statement and rerun the DBDGEN utility.

### DBD300 PASSWD OPERAND IS INAPPLICABLE TO ACCESS={MSDB|DEDB}

**Explanation:** The PASSWD operand is invalid for a DBDGEN with `ACCESS=MSDB` or `ACCESS=DEDB` specified on the DBD statement.

**System action:** The system continues to process the parameter on the DBD statement and the remaining statements.

**Programmer response:** Remove the PASSWD parameter from the DBD statement and rerun the DBDGEN, or ignore the warning message.

### DBD600 THE VALUE SPECIFIED ON THE ENCODING PARAMETER EXCEEDS 25 CHARACTERS

**Explanation:** The value specified on the ENCODING parameter in the DBD statement exceeds the maximum length of 25 characters.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Correct the value on the
**DBD601**  
**THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS**

**Explanation:** The comments specified on the REMARKS keyword in the DBD statement exceed the maximum length of 256 characters.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Shorten the length of the REMARKS specification on the DBD statement and run the DBDGEN utility again.

---

**DBD602**  
**THE VALUE OF THE REMARKS PARAMETER CONTAINS INVALID CHARACTERS**

**Explanation:** The comments specified on the REMARKS parameter in the DBD statement contain one or more invalid characters.

The value specified on the REMARKS keyword cannot contain the following characters:

- Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

**CORRECT**

`REMARKS='These remarks apply to the XYZ application'`

**INCORRECT**

`REMARKS='These remarks apply to the 'XYZ' application'`

- Double quotation marks.
- Less than (<) symbols.
- Greater than (>) symbols.
- Ampersands (&).

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Remove the invalid characters from the comments that are specified on the REMARKS parameter in the DBD statement and run the DBDGEN utility again.

**Related reference:**

[DBD statements (System Utilities)]
DBD755  *EXIT NAME* xxxxxx IS INVALID

**Explanation:** You specified an EXIT= parameter in the DBD statement with the exit name positional parameter xxxxxx. However, you included invalid characters or used a length greater than 8 bytes.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the DBD statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

DBD760  xxxxxxxx EXIT OPTION SPECIFIED FOR EXIT yyyyyyyyy IS NOT A VALID OPTION. KEY, NOKEY, DATA, NODATA, PATH, NOPATH, FLD, NOFLD, INPOS, NOINPOS, SSPCMD, NOSSPCMD, BEFORE, NOBEFORE, DLET, NODLET, CASCADE, NOCASCADE ARE VALID OPTIONS

**Explanation:** The EXIT= parameter on the DBD statement contained the invalid option xxxxxxx for CASCADE.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the DBD statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:** Chapter 2, “IMS problem determination,” on page 13

---

DBD765  xxxxxxxx EXIT CASCADE OPTION SPECIFIED FOR EXIT yyyyyyyyy IS NOT A VALID OPTION. KEY, NOKEY, DATA, NODATA, PATH, NOPATH ARE VALID OPTIONS

**Explanation:** The EXIT= parameter on the DBD statement contained the invalid option xxxxxxx for CASCADE.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the DBD statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:** Chapter 2, “IMS problem determination,” on page 13

<tr>
<td>DGEN115</td>
<td>NUMBER OF SEGMENT STATEMENTS MUST EQUAL THE NUMBER OF INDEX DATABASE NAMES</td>
</tr>
</tbody>
</table>

---
**System action:** IMS terminates the DBDGEN.

**Programmer response:** The number of names and SEGM statements must be the same.

---

**DGEN117**  
**THE BLOCK SIZE VALUE EXCEEDS 32752 BYTES. IMAGE COPY WILL NOT BE AVAILABLE.**

**Explanation:** This is a warning message. The DBDGEN utility assigned 32767 bytes to the block size, since the value of 32752 was not large enough to hold the longest segment and some necessary overhead.

The Image Copy utility cannot be run with 32752 bytes specified because image copy processing module DFSUDMP0 adds fifteen bytes to the block size for double word alignment of its prefix. The maximum block size in a DBDGEN statement is 32767 bytes.

**User response:** To save a database using the Image Copy utility, specify either a smaller value for the BYTES operand in the SEGM statement or a smaller value for BLOCK/SIZE operands in the DATASET statement. Then, rerun DBDGEN.

---

**DGEN118**  
**THE USER SPECIFIED CI SIZE VALUE EXCEEDS 30720, WILL NOT HOLD THE MINIMUM SIZE BIT MAP, OR WILL NOT HOLD THE MAXIMUM SIZE SEGMENT IN THIS DATA SET GROUP**

**Explanation:** This is a warning message. For a (HDAM, VSAM) or a (HIDAM, VSAM) database, a CI size was specified on the DATASET statement which exceeds 30720, or which is too small to hold the minimum size bit map plus overhead, or the maximum size segment plus overhead in this data set group. For fixed length compressed segments, the maximum segment size is computed to include a 10-byte expansion which allows for noncompressible segment occurrences.

**System action:** The user specified value is used in subsequent processing.

**Programmer response:** No action is required.

---

**DGEN120**  
**SEGMENT name NOT IN DATABASE db_name**

**Explanation:** You defined the segment identified by name in the message text as existing in the database currently being defined. No SEGM statement was found to identify the named segment in its NAME operand.

**System action:** No default is given.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**DGEN130**  
**REFERENCED PAIRED SEGMENT DOES NOT SPECIFY 'PAIRED' IN ITS POINTER OR PTR OPERAND. PAIRED SEGMENT IS name.**

**Explanation:** Self-explanatory

**System action:** None

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**DGEN140**  
**DATASET—n name CONTAINS NO SEGMENTS**

**Explanation:** No SEGM statements were found following the DATASET statement specified in the message.

**System action:** This message is issued and processing continues.

---

**DGEN150**  
**LCHILD STATEMENT FOR ROOT SEGMENT name OMITTED OR INVALID**

**Explanation:** An LCHILD statement was not specified or was specified incorrectly for the root segment. A HIDAM database requires an LCHILD statement for the primary HIDAM index database. Each segment in an index database must have an LCHILD statement defined.

**System action:** No default is taken.

**Programmer response:** Provide an LCHILD statement for the root segments, and rerun DBDGEN.

---

**DGEN160**  
**ROOT SEGMENT name HAS NO SEQUENCE FIELD**

**Explanation:** There is no sequence field defined in any of the FIELD statements for the SEGM statement defining the root segment. Each segment in an index database must have a sequence field defined.

**System action:** No default is taken.

**Programmer response:** Provide a sequence field for the root segments, and rerun DBDGEN.

---

**DGEN165**  
**PREFIX LENGTH OF ALL SEGM STATEMENTS IN A SHARED SECONDARY INDEX MUST BE EQUAL**

**Explanation:** Multiple secondary indexes can be placed in a single shared index database, if the key offset positions in each indexing segment are the same. This implies that the prefix length of each segment must be the same.

**System action:** The specified operand information is used in subsequent validity checking.
Programmer response: Correct the errors, and rerun DBDGEN.

DGEN170 SEGMENT (name) LENGTH PLUS PREFIX EXCEEDS BLOCKSIZE MINUS FREE SPACE PERCENTAGE REQUESTED. SEGMENT WILL BE STORED AS ONLY SEGMENT IN A BLOCK.

Explanation: Informational only.

System action: The segment is stored as the only segment in the block. Free space is reduced by the amount the segment exceeds the amount requested.

DGEN185 LCHILD STATEMENT, name, REFERENCES A PAIRED SEGMENT, segname, WHICH IS NOT A CHILD OF THE LOGICAL PARENT

Explanation: The LCHILD statement indicated in the message above has a PAIR operand specifying a physically or virtually paired segment. But the physical parent of this paired segment is not the same segment that contains the LCHILD statement.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the errors, and rerun DBDGEN.

DGEN200 BLOCK SIZE EXCEEDS MAXIMUM BLOCK ON TRACK—size

Explanation: For HSAM or SHSAM databases, you specified a block size or blocking factor on the DATASET statement that caused the maximum allowable block size on a track to be exceeded. The maximum allowable block size is the track length or 32K bytes, whichever is smaller.

System action: The user-specified block size value can be reset.

Programmer response: Correct the error, and rerun DBDGEN.

DGEN210 ONE OR MORE SEGMENTS IN THE ABOVE DATA SET GROUP WILL NOT FIT IN THE MAXIMUM ALLOWABLE CI SIZE—30720

Explanation: This is a warning message generated for (HDAM,VSAM) or (HIDAM,VSAM) databases. One or more segments plus overhead bytes exceed the maximum Ci size of 30720.

DGEN220 SPECIFIED KSDS LOGICAL RECORD LENGTH RESET TO MULTIPLE OF 2...length

Explanation: This is a warning message generated for (HISAM,VSAM) or (INDEX,VSAM) databases. The user's specified logical record for KSDS was not specified as a multiple of 2.

DGEN229 THE MAXIMUM ROOT SEGMENT SIZE WILL NOT FIT IN THE USER SPECIFIED OR MAXIMUM KSDS PRIME LOGICAL RECORD LENGTH...lr

Explanation: This is a warning message. For a (HISAM, VSAM), SHISAM, or (INDEX, VSAM) database, the maximum size root segment plus overhead will not fit in the user-specified or maximum KSDS prime logical record length for this data set group. For a fixed length compressed root segment, the maximum root segment size additionally includes a 10-byte expansion which allows for noncompressible root segment occurrences.

System action: The user-specified or maximum KSDS prime logical record length is used in subsequent processing.

Programmer response: No action is required.

DGEN232 THE MAXIMUM SEGMENT LENGTH IN THIS DATA SET GROUP WILL NOT FIT IN THE USER SPECIFIED OR MAXIMUM ESDS OVERFLOW LRECL...lrecl

Explanation: For a (HISAM, VSAM) database, the user-specified or maximum ESDS overflow LRECL is not large enough to contain the largest segment plus overhead in this data set group. For fixed length compressed segments, the maximum segment size additionally includes a 10-byte expansion which allows for noncompressible segment occurrences.

System action: The ESDS overflow LRECL you specified or the maximum is used in subsequent processing.

Programmer response: This is a warning message.

DGEN240 SPECIFIED BLOCKING FACTOR CAUSES MAXIMUM ALLOWABLE CI SIZE (30720) TO BE EXCEEDED. BLOCKING FACTOR SPECIFIED—number RESET TO BLOCKING FACTOR—number

Explanation: This is a warning message.
DGEN245  SPECIFIED CI SIZE IS LESS THAN
CALCULATED OR SPECIFIED
LOGICAL RECORD LENGTH—xxxxx

Explanation: You specified a CI size minus VSAM
overhead that is less than the logical record length,
specified or calculated.

System action: The DBDLRECL macro resets the CI
size to an internally calculated value, and DBDGEN
continues.

Programmer response: Correct the error, and rerun
DBDGEN.

DGEN250  SPECIFIED ESDS LRECL—size
RESET TO MULTIPLE OF 2—size

Explanation: This is a warning message generated for
(HISAM,VSAM) or (INDEX,VSAM) databases. The
logical record that you specified for the ESDS data set
was not specified as a multiple of 2.

System action: The user-specified information is used
in subsequent validity checking.

Programmer response: Correct the error, and rerun
DBDGEN.

DGEN260  SPECIFIED ESDS BLOCKSIZE
INVALID. LRECL AND BLOCKSIZE
RESET TO PRIME VALUES.

Explanation: This is a warning message.

System action: The results obtained from the scan of
this statement, and of the succeeding statements, are
unpredictable.

Programmer response: Remove or rearrange the
incorrect statements, and rerun DBDGEN.

DGEN300  INVALID POSITIONAL
OPERAND—operand—SPECIFIED ON
THIS STATEMENT

Explanation: One or more positional operands you
specified in the statement type being processed were
invalid. operand identifies the operand that is invalid.

System action: The invalid positional operands are
ignored.

Programmer response: Remove the positional
operands, and rerun DBDGEN.

DGEN305  SHSAM SEGMENT SIZE MUST BE AN
EXACT DIVISOR OF BLOCK SIZE

Explanation: For an SHSAM database, the root
segment size must be an exact divisor of the
user-specified block size.

System action: The user-specified information is used
in subsequent processing.

Programmer response: Correct the error, and rerun
DBDGEN.

DGEN310  PRIOR DBDGEN STATEMENT
SHOULD NOT BE PRESENT

Explanation: You specified a DBDGEN statement
before a DATASET, AREA, SEGM, LCHILD, FIELD,
XDFLD, or DBDGEN statement. There must be only
one DBDGEN statement, and it must be at the end of
the input stream.

System action: The results obtained from the scan of
this statement, and of the succeeding statements, are
unpredictable.

Programmer response: Remove or rearrange the
incorrect statements, and rerun DBDGEN.

DGEN320  THERE IS A SECONDARY INDEX
LCHILD STATEMENT
(PTR=INDX/SYMB) WHICH IS NOT
PAIRED TO AN XDFLD STATEMENT.

Explanation: There are more secondary index LCHILD
statements than there are XDFLD statements.

System action: All specified operand information is
used in subsequent validity checking.

Programmer response: Correct the error, and rerun
DBDGEN.

DGEN330  THE /CK OPERAND IS INVALID ON
A FIELD STATEMENT FOR
LCHILD/XDFLD STATEMENTS FOR
ACCESS=DEDB

Explanation: The /CK operand is used in the NAME
operand on the FIELD statement for a DEDB database,
but there is no corresponding LCHILD or XDFLD statement defined under the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Remove the /CK operand in the NAME operand on the FIELD statement for the DEDB database and rerun the DBDGEN utility.

---

**DGEN331**  THE /CK OPERAND IS NOT USED ON AN XDFLD STATEMENT AS A SUBSEQ OR DDATA FIELD FOR ACCESS=DEDB

**Explanation:** The /CK operand can be used only on an XDFLD statement as a field in the SUBSEQ operand, or as a field in the DDATA operand for a DEDB database with LCHILD and XDFLD statements defined. However, the /CK operand was found on an XDFLD statement and it was not used as a field in the SUBSEQ or DDATA operand.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Remove the /CK operand on the XDFLD statement or change the /CK operand to be used as a field in the SUBSEQ operand or as a field in the DDATA operand on the XDFLD statement (or both) and rerun the DBDGEN utility.

---

**DGEN332**  THE FIELD STMT FOR A PARENT OF A TARGET SEGMENT DOES NOT HAVE A UNIQUE KEY DEFINED

**Explanation:** For a target segment that is not a root segment, the direct parent segments from the target segment to the root segment must have a unique key FIELD statement defined for each direct parent segment. A parent of the target segment does not have a FIELD statement that has a unique key defined.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Change the FIELD statement of the parent segment to make it a unique key FIELD statement and rerun the DBD Generation utility.

---

**DGEN440**  COMPRTN= IS INVALID FOR SEGMENT xxxxxxxx.

**Explanation:** You cannot specify the COMPRTN= when one of the following occurs:

- A DEDB database and the segment contains only a key field.
- A DEDB database and the key field is located at the end of the segment.

**Programmer response:** Correct the error, and rerun DBDGEN.
DMAN messages for DBD Generation

This topic contains the following messages:

**DMAN100** DATA SET SPECIFICATION LIMIT EXCEEDED

Explanation: You specified more DATASET statements than are permissible for the DL/I access method specified.

System action: The information specified on the current DATASET statement is used for subsequent validity checking. If the number of DATASET statements exceeds 10, the information from the 10th DATASET statement is overlaid by each succeeding DATASET statement greater than 10.

Programmer response: Reduce the number of DATASET statements to the correct limit, and rerun DBDGEN.

**DMAN110** DD1 OPERAND IS OMITTED OR INVALID

Explanation: The DD1 operand is omitted or it is longer than 8 characters, or has a first character which is not alphabetic, #, @ or $, or whose remaining characters are not alphabetic, numeric, #, @ or $.

System action: The specified value is used for validity checking of subsequent dependent parameters. In the case of omission, a null value is entered.

Programmer response: Correct the DD1 operand, and rerun DBDGEN.

**DMAN120** DD2 OPERAND IS OMITTED OR INVALID

Explanation: The DD2 operand has been omitted or it is longer than 8 characters, or has a first character which is not alphabetic, #, @ or $, or whose remaining characters are not alphabetic, numeric, #, @ or $.

System action: The specified value is used for validity checking of subsequent dependent parameters. In the case of omission, a null value is entered.

Programmer response: Correct the DD2 operand, and rerun DBDGEN.

**DMAN130** OVFLW AND DD2 OPERANDS ARE CONFLICTING

Explanation: The OVFLW and DD2 operands are mutually exclusive.

System action: The OVFLW operand is ignored.

Programmer response: Correct the OVFLW or DD2 operand, and rerun DBDGEN.

**DMAN140** OVFLW OPERAND IS OMITTED OR INVALID

Explanation: The OVFLW operand is omitted or it is longer than 8 characters, or has a first character which is not alphabetic, #, @ or $, or whose remaining characters are not alphabetic, numeric, #, @ or $.

System action: The specified value is used for validity checking of subsequent dependent parameters. In the case of omission, a null value is entered.

Programmer response: Correct the OVFLW operand, and rerun DBDGEN.

**DMAN150** DEVICE OPERAND xxx IS OMITTED OR INVALID. A 3330 MODEL 1 HAS BEEN ASSUMED.

Explanation: You specified an invalid operand for a 2305. Valid operands for DEVICE=2305 are MODEL=1 or MODEL=2.

System action: A 3330 model 1 is assumed and the DBDGEN continues.

Programmer response: Correct the DEVICE operand, and rerun DBDGEN.

**DMAN155** MODEL xx INVALID, MODEL 2 ASSUMED FOR SPACE CALCULATIONS

Explanation: You specified an invalid operand for a 2305. Valid operands for DEVICE=2305 are MODEL=1 or MODEL=2.

System action: The DATASET macro uses the default, MODEL=2 for the space calculation and DBDGEN continues.

**DMAN157** MODEL xx INVALID, MODEL 1 ASSUMED FOR SPACE CALCULATIONS

Explanation: DEVICE=3330 was specified and the MODEL operand was omitted or not equal to 1 or 11.

System action: MODEL=one is assumed and the DBDGEN continues.

Programmer response: Correct the MODEL operand, and rerun DBDGEN.

**DMAN160** DEVICE OPERAND IS INVALID FOR ACCESS=access

Explanation: DEVICE=3330 was specified and the MODEL operand was omitted or not equal to 1 or 11.

System action: MODEL=one is assumed and the DBDGEN continues.

Programmer response: Correct the MODEL operand, and rerun DBDGEN.
**DMAN170 • DMAN217**

**Explanation:** The value TAPE, 2400, or 3400 was entered in the DEVICE operand, but you did not specify HSAM or simple HSAM in the DBD ACCESS operand.

**System action:** Space calculations are done based on the specified device type and the given access method. Space calculations are not reliable in most cases.

**Programmer response:** Correct the DEVICE operand, and rerun DBDGEN.

---

**DMAN170 ENTERED DDNAME IS A DUPLICATE—name**

**Explanation:** The specified ddname is a duplicate of a name previously specified by the DD1, DD2, or OVLFW operand.

**System action:** The name is used for further validity checking.

**Programmer response:** Correct the ddname, and rerun DBDGEN.

---

**DMAN180 DATA SET NAME IS A DUPLICATE**

**Explanation:** The label on this DATASET statement is the same as the label on a previous DATASET statement, and both contain operands. Only the first DATASET statement with a common label can contain operands.

**System action:** A new data set group is created. Succeeding parameters are evaluated based on the new DATASET statement.

**Programmer response:** Examine your requirements, correct the erroneous information, and rerun DBDGEN.

---

**DMAN190 DATA SET NAME FIELD IS INVALID**

**Explanation:** The label field on the DATASET statement is invalid because it is longer than 8 characters, or has a first character which is not alphabetic, #, @ or $, or whose remaining characters are not alphabetic, numeric, #, @ or $.

**System action:** The specified value is used for validity checking of subsequent dependent parameters.

**Programmer response:** Correct the label field on the DATASET statement, and rerun DBDGEN.

---

**DMAN200 RECORD OPERAND IS INVALID**

**Explanation:** One of the following occurred:
- The RECORD operand contains more than two values, values which are not self-defining, values which are less than or equal to zero, or values which exceed 30713, where VSAM is the system access method.
- For GSAM: The second RECORD operand value exceeds the first, or RECFM=F/FB was specified, but the first RECORD operand value is not equal to the second RECORD operand value.

**System action:** The scan of the RECORD operand is terminated at the point the error is detected.

**Programmer response:** Correct the errors, and rerun the DBDGEN.

---

**DMAN210 BLOCK OPERAND IS INVALID**

**Explanation:** One of the following occurred:
- The BLOCK operand contains more than two values, values which are not self-defining, or values which are less than or equal to zero.
- For HDAM and HIDAM: More than one BLOCK operand value was specified, or the value exceeded 30709, where VSAM was the system access method.
- For GSAM: More than one BLOCK operand value was specified.

**System action:** The scan of the BLOCK operand is terminated at the point the error is detected.

**Programmer response:** Correct the BLOCK operand, and rerun DBDGEN.

---

**DMAN215 SIZE OPERAND IS INVALID**

**Explanation:** One of the following occurred:
- The SIZE operand contains more than two values, values which are not self-defining, or values which are less than or equal to zero.
- The BLOCK operand was also specified; the BLOCK and SIZE operands are mutually exclusive.
- For HSAM and SHSAM, the SIZE operand was specified (it is invalid for these databases).
- VSAM is the system access method, and the value of the SIZE operand exceeds 30720.
- For HDAM, HIDAM, and GSAM databases, more than one operand value was specified.
- If ACCESS=DEDB was specified on the DBD statement, the valid values for this operand are 512, 1024, 2048, and 4096. 4096 is invalid for a 2314 or a 2319.

**System action:** The scan of the SIZE operand is terminated at the point the error is detected.

**Programmer response:** Correct the SIZE operand, and rerun the DBDGEN.

---

**DMAN217 SIZE SPECIFICATION ROUNDED TO NEXT 512 OR 2K MULTIPLE**

**Explanation:** VSAM control interval sizes must always be a 512 multiple. If greater than 8K, they must be a 2048 multiple.

**System action:** The user specified value is reset to the proper VSAM multiple.

**Programmer response:** Correct the error.
**DMAN220**  
**POSITIONAL OPERAND ASSUMES LOGICAL DATA SET**

*Explanation:* The inclusion of a positional operand assumes a DBDGEN for a logical data set.

*System action:* This is a warning message; DBDGEN continues. No other data set parameters are scanned, since they are invalid for a logical DBDGEN.

**DMAN230**  
**KEYWORD SPECIFICATIONS ARE INVALID FOR A LOGICAL DATA SET DEFINITION**

*Explanation:* If the LOGICAL operand is specified on a DATASET statement, no other operands can be specified.

*System action:* The DBDGEN is processed as a logical DBDGEN. No other data set operands are scanned.

*Programmer response:* Remove the erroneous keyword parameters, and rerun DBDGEN.

**DMAN240**  
**DD2 AND OVFLW OPERANDS ARE INVALID FOR [HDAM | HIDAM]**

*Explanation:* Neither the DD2 nor the OVFLW operands can be specified for data sets that use HDAM or HIDAM as the access method.

*System action:* The values specified are ignored.

*Programmer response:* Remove the DD2 operand or the OVFLW operand, or both, and rerun DBDGEN.

**DMAN250**  
**DATA SET NOT PREVIOUSLY ESTABLISHED.**

*Explanation:* The label field of this DATASET statement does not refer back to any previous DATASET statement with the same label.

*System action:* The last data set group processed remains the current data set group used to validate subsequent statements.

*Programmer response:* Correct the DATASET label field, and rerun DBDGEN.

**DMAN260**  
**ENTERED DDNAME IS RESERVED—name**

*Explanation:* You specified one of the following names was specified: IEFRDER, IMSLOGR, QBLKS, SHMSG, LMSG, IMSACB, IMSDILIB, IMSSPA, IMSDBL, SYSUDUMP, STEPLIB. *name* in the message text identifies the reserved ddname.

*System action:* No default is used.

*Programmer response:* Correct the ddname, and rerun DBDGEN.

**DMAN270**  
**REVERSE REFERENCE TO A PREVIOUS DATA SET GROUP IS ONLY VALID FOR HD ORGANIZATIONS**

*Explanation:* The label field of this DATASET statement refers back to a previous DATASET statement with the same label. This usage of the label field is only valid for HDAM and HIDAM. In particular, for HISAM, segments must be placed in each data set group according to their hierarchic position in the data structure.

*System action:* DBDGEN establishes the referenced data set group as the current data set group or, if there were DATASET statement operands specified, assumes this is a new data set group with a duplicate name field.

*Programmer response:* Correct the error, and rerun DBDGEN.

**DMAN275**  
**ACCESS=LOGICAL MUST BE CODED IN THE DBD STATEMENT FOR A LOGICAL DATA SET**

*Explanation:* A DATASET statement was specified which indicates this is a LOGICAL database, but did not specify this on the DBD statement.

*System action:* DBDGEN assumes this is a LOGICAL database. If this is not the case, unpredictable results can occur.

*Programmer response:* Correct the error, and rerun DBDGEN.

**DMAN280**  
**SCAN OPERAND IS INVALID**

*Explanation:* The entered value is not a decimal integer value, is less than zero, exceeds 255, or has been specified with a database type other than HDAM or HIDAM.

*System action:* No default is used.

*Programmer response:* Correct the SCAN operand, and rerun DBDGEN.

**DMAN290**  
**FRSPC OPERAND IS INVALID**

*Explanation:* One of the following occurred:

- The operand has been specified with a database type other than HDAM or HIDAM.
- The operand contains more than 2 parameters.
- The first parameter was specified but was not zero or in the range from 2 to 100.
- The second parameter was not specified as a decimal number in the range from 0 to 99.

*System action:* No default is used.

*Programmer response:* Correct the FRSPC operand, and rerun DBDGEN.
DMAN300  INVALID KEYWORD PARAMETERS SPECIFIED FOR ACCESS=XXX

Explanation: One of the following occurred:
• For ACCESS=MSDB, an operand other than the REL operand was specified on the DATASET statement.
• For ACCESS not MSDB or DEDB, the REL, ROOT, or UOW keyword parameter was specified. These operands are exclusively MSDB/DEDB keyword parameters.

XXX in the message text identifies the access you specified.

System action: The invalid operands are ignored.

Programmer response: Remove the invalid operands or correct the DL/I Access Method, and rerun DBDGEN.

DMAN305  ACCESS=LOGICAL ONLY ALLOWS A LOGICAL DATA SET TO BE SPECIFIED

Explanation: You specified ACCESS=LOGICAL on the DBD statement, but a nonlogical DATASET statement was specified.

System action: No more operands on this DATASET statement are processed. This is a severe error which can cause unpredictable results.

Programmer response: Correct the error, and rerun DBDGEN.

DMAN320  REL OPERAND IS OMITTED OR INVALID.

Explanation: The REL operand is omitted or does not specify one of the following valid values: NO, TERM, FIXED, or DYNAMIC in the first value; and a 1-8 alphanumeric character in the second value for TERM, FIXED and DYNAMIC.

System action: The system continues to process the remaining statements.

Programmer response: Correct the REL operand, and rerun DBDGEN.

DMAN330  INVALID AREA STMT PLACEMENT FOR ACCESS=DEDB.

Explanation: An AREA statement for a DBDGEN with ACCESS=DEDB must be placed after the DBD statement and preceding a SEGM statement in an input string.

System action: The system continues to process the parameter on the AREA statement and the remaining statements.

Programmer response: Correct the misplaced AREA statement, and rerun the DBDGEN.

DMAN340  ROOT OPERAND IS OMITTED OR INVALID.

Explanation: The ROOT operand is omitted or one of the following occurred:
• The operand did not contain two parameters.
• The first parameter was specified, but was not in the range of 2 through 32767.
• The second parameter was specified but was not greater than zero or less than the first parameter.

System action: The system continues to process the parameter on the AREA statement and the remaining statements.

Programmer response: Correct the ROOT operand, and rerun the DBDGEN.

DMAN350  UOW OPERAND IS OMITTED OR INVALID.

Explanation: You omitted the UOW operand, or one of the following occurred:
• The operand did not contain two parameters.
• The first parameter was specified but was not in the range of 2 through 32767.
• The second parameter was specified but was not greater than zero or less than the first parameter.

System action: The system continues to process the parameter on the AREA statement and the remaining statements.

Programmer response: Correct the UOW operand, and rerun the DBDGEN.

DMAN355E  AREA EXCEEDS 4 GIGABYTES LIMIT.

Explanation: An AREA statement for a DBDGEN contained definitions that exceed the 4 gigabytes (4,294,967,296) limit of the area. The formula to calculate the size of the area is as follows:

\[
\text{Area} = \text{CI Size} \times \left(\left(\#\text{UOW}+1\right) \times \text{Root Addr Part} + 2\right)
\]

Each area has one extra reorganization unit of work (UOW) and 2 extra control intervals (CI).

This example shows an area definition that exceeds 4 gigabytes limit:

\[
\text{AREA} = (8192)\times (42)\times (12230,9746) = 4,308,107,264
\]

System action: DBDGEN terminates at the AREA statement with error.

Programmer response: Correct the AREA statement definitions, and rerun the DBDGEN.
DMAN360  DATASET STMT IS INVALID FOR ACCESS=access

Explanation: The DATASET statement is not supported for HALDBs.
System action: The DATASET statement is ignored.
Programmer response: Delete the DATASET statement and rerun DBDGEN.

DMAN400  OVERFLOW/OUTPUT RECORD SIZE CANNOT BE LESS THAN PRIME/INPUT RECORD SIZE.

Explanation: The second value in the RECORD operand must always be greater than or equal to the first value.
System action: The given values are ignored.
Programmer response: Correct the RECORD operand, and rerun DBDGEN.

DMAN420  RECORD/BLOCK SIZE EXCEEDS TRACK LENGTH

Explanation: One of the following occurred:
• For HSAM, SHSAM, HISAM, or INDEX databases, the logical record size exceeds the maximum allowable block on a track or 32K bytes, whichever is smaller.
• For HDAM or HIDAM, the block size with or without overhead exceeds the maximum allowable block on a track or 32K bytes, whichever is smaller.
System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the error, and rerun DBDGEN.

DMAN425  BLOCK SIZE EXCEEDS TRACK LENGTH

Explanation: For HISAM or INDEX databases, the block size specified cannot exceed the maximum allowable block on a track or 32K bytes, whichever is smaller.
System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the error, and rerun DBDGEN.

DMAN430  RECORD FORMAT IS OMITTED OR INVALID.

Explanation: The RECFM= operand contains invalid values, or has been specified inappropriately. The valid values for this operand are: F/FB/V/VB/U.
System action: DBDGEN is terminated because of the operand errors.

DMAN432  BLOCK AND SIZE OPERANDS ARE MUTUALLY EXCLUSIVE

Explanation: Both a BLOCK operand value and a SIZE operand value were specified. This is invalid.
System action: The scan of the DATASET operands is terminated at the point the error is detected.
Programmer response: Correct the errors, and rerun DBDGEN.

DMAN440  DEVICE AND MODEL OPERANDS ARE INAPPLICABLE TO GSAM.

Explanation: The DEVICE and MODEL operands are invalid for a DBDGEN with ACCESS=GSAM.
System action: DBDGEN is terminated because of the operand error.
Programmer response: Correct the error, and resubmit the job.

DMAN465  SPECIFICATION OF OVERFLOW/OUTPUT RECORD, BLOCK, OR SIZE OPERAND VALUE REQUIRES OVERFLOW/OUTPUT DDNAME BE GIVEN.

Explanation: You specified an overflow or output logical record size, or a block or CI size without a ddname for the overflow or output data set being provided. For VSAM primary index (INDEX,VSAM) databases, no overflow logical record length (reclen2) parameter should be defined on the RECORD= operand since all index segments are inserted into the index KEY SEQUENCED DATA SET.
System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the error, and rerun DBDGEN.

DMAN470  INPUT/OUTPUT BLOCKING FACTOR FOR HSAM MUST BE 1. RESET TO 1

Explanation: This is a warning message. The input blocking factor or the output blocking factor for HSAM was not specified as 1. HSAM always has unblocked format.
System action: If a logical record size was specified, it is reset based on the specified blocking factor.
Programmer response: No action is required.
DMAN475  [INPUT|OUTPUT] LOGICAL RECORD SIZE RESET TO LRECL TIMES BLOCKING FACTOR

Explanation: This is a warning message. The input blocking factor or the output blocking factor for HSAM was not specified as 1. HSAM always has unblocked format. The logical record size is reset based on the user specified blocking factor and a blocking factor of 1 is used in subsequent validity checking.

System action: The modified operand information is used in subsequent validity checking.

DMAN490  RECORD OPERAND IS IGNORED FOR HD

Explanation: This is a warning message. A RECORD operand value was specified. This is not valid for HDAM or HIDAM.

System action: The specified RECORD operand value is ignored.

Programmer response: No action is required.

DMAN510  SEARCHA IS INSIGNIFICANT WITHOUT FREE BLOCK FREQ FACTOR

Explanation: The free block frequency factor is missing on the FRSPC parameter of the DATASET macro. If you specify the SEARCHA parameter, you must also specify a free block frequency factor on the FRSPC parameter. These parameters work together.

System action: IMS ignores the SEARCHA parameter.

User response: If you did not intend to omit the free block frequency factor, provide a FRSPC value on the DATASET macro; then rerun DBDGEN.

DMAN520  INVALID SEARCH ALGORITHM ID. DEFAULT TO 0

Explanation: The value specified on the SEARCHA parameter of the DATASET macro is invalid.

System action: IMS assigns the SEARCHA parameter a default value of 0. The DBDGEN completes with a job step return code of 4 or more.

User response: If SEARCHA=0 is unacceptable, correct the SEARCHA specification; then rerun the DBDGEN.

DMAN530  INVALID RECORD LENGTH SPECIFIED FOR ACCESS=(GSAM, BSAM) AND FOR RECFM=(V OR VB).

Explanation: An invalid record length was specified on the RECORD parameter of the DATASET statement. The RECORD size must not exceed SIZE minus 6.

User response: Correct the RECORD size, and rerun DBDGEN.

DMAN600  THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference: DATASET statements (System Utilities)

DMAN601  THE VALUE OF THE REMARKS PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The comments specified on the REMARKS parameter in the DATASET statement contain one or more invalid characters.

The value specified on the REMARKS keyword cannot contain the following characters:

- Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

**CORRECT**

```plaintext
REMARKS='These remarks apply to the XYZ application'
```

**INCORRECT**

```plaintext
REMARKS='These remarks apply to the 'XYZ' application'
```

- Double quotation marks.
- Less than (<) symbols.
- Greater than (>) symbols.
- Ampersands (&).

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the comments that are specified on the REMARKS parameter in the DATASET statement and run the DBDGEN utility again.

Related reference: DATASET statements (System Utilities)
EXT messages for DBD Generation

This topic contains the following messages:

**EXT001 EXTERNAL REFERENCE TABLE FULL**

**Explanation:** You specified more than 255 external databases or edit/compression routines, or both, in this DBDGEN.

**System action:** The first 254 are entered in the table. The 255th entry is overlaid by any entries larger than 255. The last database referenced is the 255th entry.

**Programmer response:** Correct the error, and rerun the DBDGEN.

---

**FIN001 DBDGEN STATEMENT SHOULD PREcede THIS FINISH STATEMENT.**

---

FLD messages 100 to 615 for DBD Generation

This topic contains the following messages:

**FLD100 SEGM CARD MUST PREcede FIELD**

**Explanation:** A SEGM statement must precede a FIELD statement in the sequence of input to DBDGEN.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**FLD110 NAME OPERAND IS OMITTED OR INVALID**

**Explanation:** One of the following problems was encountered:

- The NAME operand was not specified.
- The NAME operand contains more than three parameters, or more than one parameter, but the second parameter is not SEQ.
- The NAME operand specifies a name value which exceeds 8 characters, or has invalid character content.
- The NAME operand specifies a third parameter value which is not M or U.
- An invalid sequence field has been specified for ACCESS=MSDB.
- A keyed DEDB-dependent segment specified M; however, only U is valid.

**System action:** The scan of the NAME operand is terminated at the point the error is detected.

**Programmer response:** Correct the error, and rerun the DBDGEN.

---

**FLD120 SEGMENT name HAS MULTIPLE SEQUENCE FIELDS**

**Explanation:** A segment can only have one sequence field, unless it is involved in a virtually paired bidirectional logical relationship. More than one FIELD statement had the SEQ parameter specified for the named segment.

**System action:** The specified operand information is used in subsequent validity checking.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**FLD130 TYPE OPERAND IS INVALID**

**Explanation:** You specified the TYPE operand with a value other than X, P, or C. If ACCESS=MSDB was specified on the DBD statement, the TYPE operand has been specified with a value other than X, P, C, F, or H. Or, this is an MSDB sequence field with a TYPE value other than X or C.

**System action:** The scan of the TYPE operand is terminated at the point the error is detected.

**Programmer response:** Correct the TYPE operand, and rerun DBDGEN.

---

**FLD135 ALL SEQUENCE SUBFIELDS MUST HAVE THE SAME UNIQUE OR MULTIPLE SPECIFICATIONS**

**Explanation:** Multiple sequence fields were specified for the current segment being processed, but some were defined as unique and others as nonunique.

**System action:** The specified operand information is used in subsequent validity checking.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**FLD140 NON-UNIQUE KEYS REQUIRE AN OVERFLOW DATA SET**

---
FLD145 • FLD180

Explanation: An index DBD with nonunique keys requires that an overflow data set ddname be coded on the DATASET macro.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Code an overflow data set ddname on the DATASET statement or specify unique keys on this FIELD statement.

FLD145 NONUNIQUE KEYS WITH DOSCOMP ARE INVALID

Explanation: You coded the FIELD macro with nonunique keys. The DBD indicated that this was DOS compatible. DOS/VS DL/I does not accept nonunique keys.

System action: IMS terminates the DBDGEN after checking all the following parameters.

Programmer response: Change the keys to unique keys.

FLD150 BYTES OPERAND IS OMITTED OR INVALID

Explanation: The BYTES operand is omitted or does not contain a self-defining term with a value less than or equal to 255 for non-system-related fields; for a /CK system-related field, the value must not exceed the length of the concatenated key of the index source segment. The BYTES operand cannot be zero or a negative value. If ACCESS=MSDB was specified on the DBD statement, the following field lengths are allowed:
- Type X bytes: 1-256
- Type P bytes: 1-16
- Type C bytes: 1-256
- Type F bytes: 4
- Type H bytes: 2

In addition, for an MSDB, a sequence field cannot exceed 240 bytes.

System action: The specified BYTES operand information is used in subsequent validity checking.

Programmer response: Correct the BYTES operand, and rerun DBDGEN.

FLD155 NON-UNIQUE ROOT SEGMENT KEYS ARE INVALID WITH ACCESS=access

Explanation: You must specify unique root segment keys in the database type specified in the DBD statement.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

FLD160 START OPERAND IS OMITTED OR INVALID

Explanation: You omitted the START operand in the FIELD statement, or it is not a positive numeric term within the maximum allowed. If this is an index DBDGEN, START must equal one if the SEQ parameter is coded on the FIELD statement.

System action: The specified START operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

FLD170 FIELD EXTENDS BEYOND DEFINED SEGMENT LENGTH

Explanation: The value that you specified in the BYTES operand in the FIELD statement added to the value minus 1 specified in the START operand exceeds the value specified in the BYTES operand on the SEGM statement.

System action: Some of the specified operand information is used in subsequent validity checking.

Programmer response: Correct the errors, and rerun DBDGEN.

FLD180 FIELD SPECIFICATION LIMIT EXCEEDED

Explanation: One of the following errors occurred:
- The combined total of FIELD statements that include the NAME parameter and XDFLD statements exceeds 1,000 in the DBD.
- The combined total of all the following statements exceeds 10,000 in the DBD:
  - FIELD statements that include the NAME parameter
  - FIELD statements that do not include the NAME parameter
  - XDFLD statements

Programmer response: Reduce the number of FIELD or XDFLD statements to less than or equal to 10000, and rerun DBDGEN.

Perform the following task to correct the error:
1. Reduce the number of FIELD statements, or XDFLD statements, or both to ensure the following conditions are true:
   - The combined total of FIELD statements that include the NAME parameter and XDFLD statements does not exceed 1,000.
   - The combined total of all FIELD statements and XDFLD statements does not exceed 10,000.
2. Rerun the DBDGEN utility.
FLD190  DUPLICATE FIELD NAME IN SEGMENT name

Explanation: The value specified in the NAME operand of this FIELD or XDFLD statement is a duplicate of one specified on another FIELD or XDFLD statement for this segment.

Programmer response: Ensure that each FIELD or XDFLD statement for a segment type has a unique name, and rerun DBDGEN.

FLD200  SEGMENT FIELD LIMIT EXCEEDED

Explanation: More than 255 FIELD or XDFLD statements have been defined in one segment.

Programmer response: Reduce the number of FIELD or XDFLD statements to less than or equal to 255 and rerun DBDGEN.

FLD210  FIELD STATEMENT IS INVALID FOR PRECEDING SEGM

Explanation: FIELD statements are invalid for nonpaired logical segments.

Programmer response: Remove the FIELD statements for this segment, and rerun DBDGEN.

FLD220  SEQUENCE FIELD INVALID FOR PRECEDING SEGM

Explanation: Sequence fields are invalid in an HD organization, if the segment does not contain TWIN, TWINBWD, HIER, or HIERBWD pointers.

Programmer response: Remove the SEQ keyword on this FIELD statement, or correct the SEGM statement, and rerun DBDGEN.

FLD225  SEQUENCE FIELD SPECIFICATION IS INVALID

Explanation: You specified a system-related field name as a sequence field. This is invalid.

Programmer response: Remove the SEQ parameter from this FIELD statement, and rerun DBDGEN.

FLD230  SEQUENCE FIELDS MUST IMMEDIATELY FOLLOW SEGM

Explanation: A FIELD or XDFLD statement containing the keyword SEQ must be the first FIELD or XDFLD statement following a SEGM statement as input to DBDGEN.

Programmer response: Ensure that the FIELD statements containing the SEQ keyword are in proper position in the input to DBDGEN, and rerun DBDGEN.

FLD235  SYSTEM RELATED FIELD IS INVALID WITH ACCESS=access

Explanation: The DL/I database organization specified on the DBD statement does not allow /SX or /CK system related fields.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

FLD300  INVALID FIELD OVERLAP FOR MSDB DBDS.

Explanation: One of the following occurred:

- The sequence field was specified as part of another field.
- The field contained an arithmetic field, but it did not contain the entire arithmetic field.
- The arithmetic field contained another field.
- If two fields fully overlap each other, the first one appears in the DBDGEN input stream and is defined as a containing field. The subsequent field is defined as a contained field.

System action: The system continues to process the parameter on the FIELD statement and the remaining statements.

Programmer response: Correct the START or BYTES operand on the FIELD statement, and rerun the DBDGEN.

FLD600  NEITHER THE NAME PARAMETER NOR THE EXTERNALNAME PARAMETER IS SPECIFIED

Explanation: Every FIELD statement must include either the NAME parameter, the EXTERNALNAME parameter, or both.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify a name for the field on either the NAME parameter or the EXTERNALNAME parameter in the FIELD statement and rerun the DBD Generation utility. To be able to specify the field name in an SSA, you must use the NAME parameter.

Related reference:
FIELD statements (System Utilities)

FLD601  DATATYPE = xxxxxxx is not a valid data type.

Explanation: The value specified on the DATATYPE parameter in the FIELD statement is not a valid value for the DATATYPE parameter.

In the message text:
The invalid value that is currently specified on the DATATYPE parameter.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a valid value on the DATATYPE parameter and rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)

---

**FLD602** WHEN DATATYPE = datatype, BYTES=1 MUST BE SPECIFIED.

**Explanation:** The data type currently specified on the DATATYPE parameter requires field length of 1 byte.

In the message text:

datatype

The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a value of 1 on the BYTES parameter of the FIELD statement that includes the DATATYPE value shown in the message text.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)

---

**FLD603** WHEN DATATYPE = datatype, BYTES=2 MUST BE SPECIFIED.

**Explanation:** The data type currently specified on the DATATYPE parameter requires field length of 2 bytes.

In the message text:

datatype

The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a value of 2 on the BYTES parameter of the FIELD statement that includes the DATATYPE value shown in the message text.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)

---

**FLD604** WHEN DATATYPE = datatype, BYTES=4 MUST BE SPECIFIED.

**Explanation:** The data type currently specified on the DATATYPE parameter requires field length of 4 bytes.

In the message text:

datatype

The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a value of 4 on the BYTES parameter of the FIELD statement that includes the DATATYPE value shown in the message text.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)

---

**FLD605** WHEN DATATYPE = datatype, BYTES=8 MUST BE SPECIFIED.

**Explanation:** The data type currently specified on the DATATYPE parameter requires field length of 8 bytes.

In the message text:

datatype

The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a value of 8 on the BYTES parameter of the FIELD statement that includes the DATATYPE value shown in the message text.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)

---

**FLD606** WHEN DATATYPE = datatype, THE NAME PARAMETER IS NOT SUPPORTED.

**Explanation:** The specification of the DATATYPE= parameter that is shown in the message text is invalid when the NAME parameter is specified. To specify this data type, the EXTERNALNAME parameter must be used instead.

In the message text:

datatype

The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** In the FIELD statement that specifies the invalid data type, replace the NAME parameter with the EXTERNALNAME parameter.

**Related reference:**
- [FIELD statements (System Utilities)](FLD602)
**FLD607** WHEN DATATYPE = datatype, THE EXTERNALNAME PARAMETER IS REQUIRED.

**Explanation:** The specification of the DATATYPE= parameter that is shown in the message text requires the EXTERNALNAME parameter. The NAME parameter is not supported when this data type is specified.

In the message text:
```
datatype
```
The data type value that is currently specified on the DATATYPE parameter in the FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** In the FIELD statement that specifies the invalid DATATYPE= specification, define the field name by specifying the EXTERNALNAME parameter. Do not specify the NAME parameter.

**Related reference:**
- [FIELD statements (System Utilities)](#)

---

**FLD608** THE PRECISION OR SCALE SPECIFICATION FOR DATATYPE=DECIMAL IS INVALID.

**Explanation:** The value specified on the EXTERNALNAME parameter exceeds 128 characters. External names must be 128 characters or less.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify an external name on the EXTERNALNAME parameter that is less than 128 characters and rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)

---

**FLD609** THE SCALE VALUE CANNOT BE GREATER THAN THE PRECISION VALUE IN THE DECIMAL PARAMETER.

**Explanation:** The value specified on the EXTERNALNAME parameter is the same as the value specified on the NAME parameter or the EXTERNALNAME parameter in a FIELD statement that was previously read by the DBD Generation utility.

In the message text:
```
xxxxxxx
```
The segment that contains both of the fields that specify the same name.
System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Specify a unique external name for this field and rerun the DBD Generation utility.

Related reference:
[FIELD statements (System Utilities)]

**FLD614**  THE VALUE OF THE EXTERNALNAME PARAMETER CANNOT BEGIN WITH "DFS".

Explanation:  The value specified on the EXTERNALNAME parameter begins with the characters DFS. The names that begin with DFS are reserved by IMS and cannot be used as an external name.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Specify an external name for this field that does not begin with DFS and rerun the DBD Generation utility.

Related reference:
[FIELD statements (System Utilities)]

**FLD messages 616 to 649 for DBD Generation**

This topic contains the following messages:

**FLD616**  THE VALUE OF EXTERNALNAME CANNOT BE A RESERVED SQL KEYWORD.

Explanation:  The value specified on the EXTERNALNAME parameter is a reserved SQL keyword and cannot be used as an external name for a field.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Specify an external name for this field that is not a reserved SQL keyword and rerun the DBD Generation utility.

Related reference:
[FIELD statements (System Utilities)]

**FLD617**  THE VALUE OF REDEFINES, value IS NOT A PREVIOUSLY DEFINED FIELD IN SEGMENT segname.

Explanation:  The value specified on the REDEFINES parameter must match the value specified on the EXTERNALNAME parameter in the FIELD statement of the field that is being redefined.

If the EXTERNALNAME parameter is not specified in the FIELD statement of the redefined field, the value on the NAME parameter can be used instead.

In the statement input order, the FIELD statement of the field that is being redefined must be coded before the FIELD statement that specifies the REDEFINES parameter.

In the message text:
value  The value specified on the REDEFINES parameter.
segname  The name of the segment in which a field with a name that matches the value specified on the REDEFINES parameter must be found.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Check that the correct field name is specified on the REDEFINES parameter. If the field name on the REDEFINES parameter is correct, change the DATATYPE parameter in the FIELD statement of the field that is being redefined. After the corrections are complete, rerun the DBD Generation utility.

Related reference:
[FIELD statements (System Utilities)]

**FLD618**  REDEFINES=fldname IS INVALID BECAUSE THE REFERENCED FIELD SPECIFIES DATATYPE=ARRAY.

Explanation:  The field referenced on the REDEFINES parameter is defined as an array by DATATYPE=ARRAY. A field defined as an array cannot be redefined.

In the message text:
fldname  The value specified on the REDEFINES parameter.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Check that the correct field name is specified on the REDEFINES parameter. If the field name on the REDEFINES parameter is correct, change the DATATYPE parameter in the FIELD statement of the field that is being redefined. After the corrections are complete, rerun the DBD Generation utility.

Related reference:
FIELD statements (System Utilities)

FLD619  THE VALUE OF BYTES IS LESS THAN THE BYTES FIELD OF THE REDEFINED FIELD fldname.

Explanation:  A field that is being redefined must have a size that is equal to or greater than the field that specifies the REDEFINES parameter.

In the message text:
fldname  The value that is specified on the REDEFINES parameter.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Specify a value for the field that has the REDEFINES parameter to be less than or equal to the BYTES parameter of the field that is being redefined. After the corrections are complete, rerun the DBD Generation utility.

Related reference:
FIELD statements (System Utilities)

FLD620  THE VALUE OF THE MINOCCURS PARAMETER IS NOT A NUMERIC VALUE.

Explanation:  The value specified on the MINOCCURS parameter contains one or more non-numeric characters. Only the numeric characters 0 through 9 are supported.

System action:  The DBD generation attempt fails with a MNOTE of 8.

Programmer response:  Change the value of MINOCCURS so that it contains only numeric characters and rerun the DBD Generation utility.

Related reference:
FIELD statements (System Utilities)

FLD621  THE MINOCCURS PARAMETER IS VALID ONLY WHEN DATATYPE=ARRAY IS ALSO SPECIFIED.

Explanation:  The MINOCCURS parameter is specified, but the field is not defined as an array by DATATYPE=ARRAY. The MINOCCURS parameter defines the minimum number of times an array element occurs in an array and therefore is invalid for any data type other than ARRAY.

System action:  The DBD generation attempt fails with a MNOTE of 8.

Programmer response:  Either delete the MINOCCURS parameter from the FIELD statement or specify DATATYPE=ARRAY. Then, rerun the DBD Generation utility.

Related reference:
FIELD statements (System Utilities)

FLD622  WHEN DATATYPE=ARRAY IS SPECIFIED, THE MINOCCURS PARAMETER IS REQUIRED.

Explanation:  DATATYPE=ARRAY is specified, but the MINOCCURS parameter is not specified. The MINOCCURS parameter defines the minimum number of times an array element can occur in an array and is required when DATATYPE=ARRAY is specified in a FIELD statement.

System action:  The DBD generation attempt fails with a MNOTE of 8.

Programmer response:  Specify the MINOCCURS parameter or change the value of the DATATYPE parameter and rerun the DBD Generation utility.

Related tasks:
Defining arrays in DBD source statements
(Database Administration)

Related reference:
FIELD statements (System Utilities)

FLD623  THE VALUE OF THE MAXOCCURS PARAMETER IS NOT A NUMERIC VALUE.

Explanation:  The value specified on the MAXOCCURS parameter contains one or more non-numeric characters. Only the numeric characters 0 through 9 are supported.

System action:  The DBD generation attempt fails with a MNOTE of 8.

Programmer response:  Change the value of MAXOCCURS so that it contains only numeric characters and rerun the DBD Generation utility.

Related reference:
FIELD statements (System Utilities)

FLD624  THE VALUE OF THE MAXOCCURS PARAMETER CANNOT BE 0.

Explanation:  The value of the MAXOCCURS parameter is specified as 0. The MAXOCCURS parameter defines the maximum number of times an array element can occur in an array. The value of MAXOCCURS must be greater than 0.

System action:  The DBD generation attempt fails with a MNOTE of 8.
**FLD625 • FLD628**

**Programmer response:** Specify a value greater than 0 on the MAXOCCURS parameter and rerun the DBD Generation utility.

**Related tasks:**
- Defining arrays in DBD source statements (Database Administration)

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD625**

WHEN DATATYPE=ARRAY IS SPECIFIED, THE MAXOCCURS PARAMETER IS REQUIRED.

**Explanation:** DATATYPE=ARRAY is specified, but the MAXOCCURS parameter is not specified. The MAXOCCURS parameter defines the maximum number of times an array element can occur in an instance of an array and is required when DATATYPE=ARRAY is specified in a FIELD statement.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Specify the MAXOCCURS parameter or change the value of the DATATYPE parameter and rerun the DBD Generation utility.

**Related tasks:**
- Defining arrays in DBD source statements (Database Administration)

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD626**

THE VALUE OF MAXOCCURS IS LESS THAN THE VALUE OF MINOCCURS.

**Explanation:** The value of the MAXOCCURS parameter must be equal to or greater than the MINOCCURS parameter. The MINOCCURS and MAXOCCURS parameters define the minimum and maximum number of array elements that can occur in an instance of an array field.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Correct the value of either the MINOCCURS or MAXOCCURS parameter in the FIELD statement and rerun the DBD Generation utility.

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD627**

THE DEPENDSON FIELD fieldname MUST HAVE A DATATYPE OF INT, SHORT, LONG, DECIMAL, BYTE, UB Trey, UINT, USHORT, or ULONG.

**Explanation:** The data type of the control field that is specified on the DEPENDSON parameter is not defined as INT, SHORT, LONG, DECIMAL, BYTE, UBYTE, UINT, USHORT, or ULONG. Because a control field that is specified on the DEPENDSON parameter contains a whole number that identifies how many array elements exist in an instance of an array, the DATATYPE parameter of the referenced field must have a value of INT, SHORT, LONG, DECIMAL, BYTE, UBYTE, UINT, USHORT, or ULONG.

In the message text:

`dfldname`

The name of the control field that this field depends on to identify the number of array elements that this array field contains. The name of the control field is defined on the EXTERNALNAME parameter in the FIELD statement of the control field.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Check that the correct field name is specified on the DEPENDSON parameter. If the correct field name is specified, correct the value of the DATATYPE parameter of the referenced field and rerun the DBD Generation utility.

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD628**

FIELD `dfldname` REFERENCED BY DEPENDSON MUST SPECIFY 0 FOR SS IN DATATYPE=DECIMAL(`pp,ss`).

**Explanation:** In the FIELD statement of the control field specified on the DEPENDSON parameter, scale specified for the decimal datatype is not 0. The control field contains a whole number that determines how many times an array element occurs in an instance of an array; therefore, if DATATYPE=DECIMAL(`pp,ss`) is specified as the data type of the control field, a scale of 0 must be specified as the value of `ss`.

In the message text:

`dfldname`

The name of the control field that this field depends on to identify the number of array elements that this array field contains. The name of the control field is defined on the EXTERNALNAME parameter in the FIELD statement of the control field.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Change the value of `ss` to 0 and rerun the DBD Generation utility.

**Related reference:**
- FIELD statements (System Utilities)
<table>
<thead>
<tr>
<th>FLD629</th>
<th>DEPENDSON IS REQUIRED IF MAXOCCURS AND MINOCCURS VALUES ARE DIFFERENT.</th>
</tr>
</thead>
</table>
| **Explanation:** | When the value of the MAXOCCURS parameter is greater than the value of the MINOCCURS parameter, the DEPENDSON parameter is required to reference a control field that specifies the number of array elements in a given instance of this field.  
  
**System action:** The DBD generation attempt fails with a MNOTE of 8.  
  
**Programmer response:** If the MINOCCURS and MAXOCCURS parameters are coded as intended, specify the DEPENDSON parameter. The value of the DEPENDSON parameter must reference a control field. If the control field is not yet defined, code a FIELD statement to define one. The FIELD statement of the control field must precede this FIELD statement in input order. Specify the name of the control field on the DEPENDSON parameter.  
  
Alternatively, if you specify equal values on the MINOCCURS and MAXOCCURS parameters, you do not need to specify the DEPENDSON parameter.  
  
After you correct the error, rerun the DBD Generation utility.  
  
**Related reference:**  
  
[FIELD statements (System Utilities)](URL) |

<table>
<thead>
<tr>
<th>FLD630</th>
<th>THE VALUE OF DEPENDSON, dfldname, IS NOT A PREVIOUSLY DEFINED FIELD IN SEGMENT segname.</th>
</tr>
</thead>
</table>
| **Explanation:** | The value specified on the DEPENDSON parameter in the current FIELD statement does not match a value of the EXTERNALNAME parameter of any preceding FIELD statement in the DBD generation input. The value specified on the DEPENDSON parameter must match the EXTERNALNAME value of a FIELD statement that precedes this FIELD statement in the DBD generation input order.  
  
In the message text:  
  
**dfldname**  
The name of the control field that this field depends on to identify the number of array elements that this array field contains. The name of the control field is defined on the EXTERNALNAME parameter in the FIELD statement of the control field.  
  
**segname**  
The segment in which these fields are defined.  
  
**System action:** The DBD generation attempt fails with an MNOTE of 8.  
  
**Programmer response:** Correct field name on either the DEPENDSON parameter of the current FIELD statement or on EXTERNALNAME parameter of the FIELD statement that defines the control field. In the input order of the DBD generation statements, confirm that the FIELD statement referenced by the DEPENDSON parameter precedes the FIELD statement that specifies the DEPENDSON parameters. When you are done, rerun the DBD Generation utility.  
  
**Related reference:**

<table>
<thead>
<tr>
<th>FLD632</th>
<th>THE VALUE OF MAXBYTES IN FIELD cfldname IS GREATER THAN THE BYTES OF PARENT pfldname.</th>
</tr>
</thead>
</table>
| **Explanation:** | A field that specifies another field as a parent cannot be larger than the parent field. The field cfldname in the message text specifies a byte size on the MAXBYTES parameter that is larger than the byte size that is specified for the parent field pfldname.  
  
In the message text:  
  
**cfldname**  
The value of the EXTERNALNAME parameter of the child FIELD statement that contains the MAXBYTES parameter.  
  
**pfldname**  
The value of the EXTERNALNAME parameter of the parent FIELD statement that contains the BYTES parameter.  
  
**System action:** The DBD generation attempt fails with a MNOTE of 8.  
  
**Programmer response:** Adjust the value of MAXBYTES or the byte size of the parent field and rerun the DBD Generation utility.  
  
**Related reference:**  
  
[FIELD statements (System Utilities)](URL) |
THE VALUE OF PARENT, *pfldname*, IS NOT A PREVIOUSLY DEFINED FIELD IN SEGMENT *segname*.

Explanation: The FIELD statement that defines the field referenced on the PARENT parameter must precede in the DBD generation input the FIELD statement that specifies the PARENT parameter.

In the message text:

*pfldname*  
The name of the parent field, as defined by the EXTERNALNAME parameter in the FIELD statement of the parent field.

*segname*  
The segment in which these fields are defined.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Move the FIELD statement that defines the parent field so that it precedes the FIELD statement that contains the PARENT parameter. If a FIELD statement does not exist for the referenced field, code one. When you are done, rerun the DBD Generation utility.

Related reference:  
FIELD statements (System Utilities)

THE PARENT FIELD *pfldname* MUST HAVE A DATATYPE OF ARRAY OR STRUCT.

Explanation: The PARENT parameter in the current FIELD statement specifies the external name of another field that is not defined as either a structure or an array. Only fields defined as a structure or an array can be specified on the PARENT parameter.

In the message text:

*pfldname*  
The name of the parent field, as defined by the EXTERNALNAME parameter in the FIELD statement of the parent field.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: In the FIELD statement of the field referenced by the PARENT parameter, specify DATATYPE=STRUCT or DATATYPE=ARRAY, as appropriate. Alternatively, delete the PARENT parameter from the FIELD statement that triggered this message. After you complete the changes, rerun the DBD Generation utility.

Related reference:  
FIELD statements (System Utilities)

THE VALUE OF CASENAME IS NOT A DFSCASE STATEMENT IN THE SEGMENT.

Explanation: The value of CASENAME must match the value specified on the NAME parameter of a DFSCASE statement that is coded before this FIELD statement in this segment. This error could be caused by any one of the following problems:

- A DFSCASE statement with that name is not defined in the segment
- A DFSCASE statement is defined with that name, but does not precede this FIELD statement in the input order
- The value specified on the CASENAME parameter is incorrect

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the name specified on the CASENAME parameter or code a DFSCASE statement before this FIELD statement in the input order that specifies the name CASENAME parameter. After you have corrected the error, rerun the DBD Generation utility.

Related reference:  
FIELD statements (System Utilities)

THE VALUE OF STARTAFTER, *fldname*, IS NOT A PREVIOUSLY DEFINED FIELD IN SEGMENT *segname*.

Explanation: The value specified on the STARTAFTER parameter must match the value of the EXTERNALNAME parameter of a FIELD statement that precedes the FIELD statement that contains the STARTAFTER parameter.

In the message text:

*fldname*  
The name of the field that this field starts after, as defined by the EXTERNALNAME parameter in the FIELD statement of the parent field.

*segname*  
The segment in which these fields are defined.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Correct the field name specified on the STARTAFTER parameter and rerun the DBD Generation utility.

Related reference:  
FIELD statements (System Utilities)
FLD637  YOU CANNOT SPECIFY BOTH STARTAFTER AND START IN THE SAME FIELD STATEMENT.

Explanation: The START and STARTAFTER parameters are mutually exclusive and cannot both be specified in the same FIELD statement. Use the START parameter when you can calculate the starting position of a field relative to the start of the segment. Use the STARTAFTER parameter when you cannot calculate the starting position of a field relative to the start of the segment and the field does not specify an array field on the PARENT parameter.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Remove either the START parameter or the STARTAFTER parameter as appropriate and rerun the DBD Generation utility.

Related reference:
- FIELD statements (System Utilities)

FLD638  YOU CANNOT SPECIFY BOTH MAXBYTES AND BYTES IN THE SAME FIELD STATEMENT.

Explanation: The BYTES and MAXBYTES parameters are mutually exclusive and cannot both be specified in the same FIELD statement. Use the MAXBYTES parameter only when a field is defined as either an array with a variable number of array elements or as a structure that contains an array with a variable number of array elements. In all other field types, use the BYTES parameter.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Remove either the BYTES parameter or the MAXBYTES parameter as appropriate and rerun the DBD Generation utility.

Related reference:
- FIELD statements (System Utilities)

FLD639  THE VALUE OF THE MAXBYTES PARAMETER IS NOT A NUMERIC VALUE.

Explanation: The value specified on the MAXBYTES parameter contains one or more non-numeric characters. Only the numeric characters 0 through 9 are supported.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Specify a numeric value on the MAXBYTES parameter and rerun the DBD Generation utility.

Related reference:
- Defining DBD and PSB metadata to the generation utilities (Database Administration)

FLD640  THE VALUE OF THE MAXBYTES PARAMETER MUST BE GREATER THAN 0.

Explanation: The MAXBYTES parameter specifies the maximum possible size of either an array field with a variable number of array elements or a structure that contains an array with a variable number of array elements. The value of MAXBYTES must be specified as a numeric value greater than 0.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Specify a numeric value on the MAXBYTES that is greater than 0 and rerun the DBD Generation utility.

Related reference:
- FIELD statements (System Utilities)

FLD641  MAXBYTES IS INVALID IN THE CURRENT SPECIFICATION OF THE FIELD STATEMENT.

Explanation: The MAXBYTES parameter can be specified only in a FIELD statement that defines a dynamic array or that defines a structure that contains a dynamic array. In all other FIELD statements, the BYTES parameter must be used.

A FIELD statement that defines a dynamic array must include the following parameters:
- EXTERNALNAME=<fldname>
- DATATYPE=ARRAY
- DEPENDSON=cntrlfld
- MINOCCURS=<min_elmnts>
- MAXOCCURS=<max_elmnts>

If the dynamic array is contained within a structure, the FIELD statement also includes the PARENT parameter with the name of the structure field specified. The FIELD statement that defines the structure specifies DATATYPE=STRUCT.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Either specify BYTES instead of MAXBYTES or change the FIELD statement to define a variable-length array or a structure. After the changes are complete, rerun the DBD Generation utility.

Related concepts:
- Defining DBD and PSB metadata to the generation utilities (Database Administration)

Related reference:
- FIELD statements (System Utilities)
**FLD642**  THE MAXBYTES PARAMETER IS REQUIRED WHEN DATATYPE=ARRAY AND DEPENDSON ARE SPECIFIED.

**Explanation:** The specification of DATATYPE=ARRAY and DEPENDSON=cntrfld indicate that this FIELD statement defines a dynamic array, but the MAXBYTES parameter is not specified.

A FIELD statement for a dynamic array must include the following parameters:

- EXTERNALNAME=fldname
- DATATYPE=ARRAY
- DEPENDSON=cntrfld
- MINOCCURS=min_elmnts
- MAXOCCURS=max_elmnts

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** If you are defining a dynamic array, specify the MAXBYTES parameter instead of the BYTES parameter. If you are defining a static array, remove the DEPENDSON parameter. After you are done modifying the parameters of the FIELD statement, rerun the DBD Generation utility.

**Related tasks:**
- Defining arrays in DBD source statements (Database Administration)

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD645**  THE MAXOCCURS PARAMETER IS VALID ONLY WHEN DATATYPE=ARRAY IS SPECIFIED.

**Explanation:** The MAXOCCURS parameter is specified, but the field is not defined as an array by DATATYPE=ARRAY. The MAXOCCURS parameter defines the maximum number of times an array element occurs in an array and therefore is invalid for any data type other than ARRAY.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Either delete the MAXOCCURS parameter from the FIELD statement or specify DATATYPE=ARRAY. Then, rerun the DBD Generation utility.

**Related tasks:**
- Defining arrays in DBD source statements (Database Administration)

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD646**  THE NAME PARAMETER CANNOT BE SPECIFIED ON FIELDS THAT ARE ELEMENTS OF AN ARRAY OR STRUCT.

**Explanation:** A byte size for this field must be specified by using either the BYTES parameter or, if this field is defined as either a dynamic array or a structure that contains a dynamic array, the MAXBYTES parameter.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Specify the BYTES or MAXBYTES parameter and rerun the DBD Generation utility.

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD642**  THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.

**Explanation:** The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

**Related reference:**
- FIELD statements (System Utilities)

---

**FLD646**  THE NAME PARAMETER CANNOT BE SPECIFIED ON FIELDS THAT ARE ELEMENTS OF AN ARRAY OR STRUCT.

**Explanation:** The EXTERNALNAME parameter must be used instead of the NAME parameter in the current FIELD statement, because the name of an array field or structure field is specified on the PARENT parameter. A field that specifies an array or structure field as a parent is considered an element of that array or structure. An element of an array or structure can only have an external name.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Replace the NAME parameter with the EXTERNALNAME parameter and rerun the DBD Generation utility.

**Related concepts:**
- Defining DBD and PSB metadata to the generation utilities (Database Administration)

**Related reference:**
- FIELD statements (System Utilities)
YOU CANNOT SPECIFY BOTH STARTAFTER AND NAME IN THE SAME FIELD STATEMENT.

Explanation: Both the NAME and STARTAFTER parameters are specified in the current FIELD statement, but the NAME and STARTAFTER parameters cannot both be specified in the same FIELD statement. For fields that require the STARTAFTER parameter, define the field name with the EXTERNALNAME parameter. For fields that require the NAME parameter, define the starting position with the START parameter.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Either replace the NAME parameter with the EXTERNALNAME parameter or replace the STARTAFTER parameter with the START parameter and rerun the DBD Generation utility.

Related concepts:
- Defining DBD and PSB metadata to the generation utilities (Database Administration)

Related reference:
- FIELD statements (System Utilities)

YOU CANNOT SPECIFY STARTAFTER OR START IN THE SAME FIELD STATEMENT WITH RELSTART.

Explanation: The RELSTART parameter and either the START parameter or the STARTAFTER parameter are specified in the current FIELD statement. RESTART, START, and STARTAFTER are all mutually exclusive. If one of the parameters is specified, the others cannot be specified.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Modify the FIELD statement so that only RELSTART, START, or STARTAFTER is used to define the starting position of the field and rerun the DBD Generation utility.

Related reference:
- FIELD statements (System Utilities)

THE VALUE OF RELSTART MUST BE A NUMERIC VALUE BETWEEN 1 AND 32767.

Explanation: The value specified on the RELSTART parameter is not a numeric value between 1 and 32767.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Specify a value between 1 and 32767 on the RELSTART parameter and rerun the DBD Generation utility.

Related reference:
- FIELD statements (System Utilities)

THE VALUE SPECIFIED ON THE URL PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The URL parameter can accept a string of up to 256 characters. The value currently entered on the URL parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the value specified on the URL parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)

THE ENCODING PARAMETER IS VALID ONLY WHEN INTERNALTYPECONVERTER=CHAR.

Explanation: The ENCODING parameter is specified,
but **INTERNAL** **TYPECONVERTER=CHAR** is not specified.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either remove the **ENCODING** parameter from the **DFSMARSH** statement or specify **INTERNAL** **TYPECONVERTER=CHAR**. After the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)]

---

**FLD653**

**THE VALUE SPECIFIED ON THE ENCODING PARAMETER EXCEEDS 25 BYTES.**

**Explanation:** The **ENCODING** parameter can accept a string of up to 25 characters. The value currently entered on the parameter exceeds that limit.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the value specified on the **ENCODING** parameter so that it is 25 characters or less and rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)]

---

**FLD654**

**THE VALUE SPECIFIED ON THE PATTERN PARAMETER EXCEEDS 50 CHARACTERS.**

**Explanation:** The **PATTERN** parameter can accept a string of up to 50 characters. The value currently entered on the parameter exceeds that limit.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the value specified on the **PATTERN** parameter so that it is 50 characters or less and rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)]

---

**FLD655**

**THE PATTERN PARAMETER IS VALID ONLY WHEN THE FIELD DATATYPE IS DATE, TIME, OR TIMESTAMP.**

**Explanation:** The **PATTERN** parameter is specified in the **DFSMARSH** statement, but the preceding **FIELD** statement to which the **DFSMARSH** statement applies does not specify **DATE**, **TIME**, or **TIMESTAMP** on the **DATATYPE** parameter.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either remove the **PATTERN** parameter from the **DFSMARSH** statement or change the value of **DATATYPE** in the preceding **FIELD** statement to **DATE**, **TIME**, or **TIMESTAMP**. When the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)]
- [DFSMARSH statements (System Utilities)]

---

**FLD656**

**THE PATTERN PARAMETER IS VALID ONLY WHEN INTERNAL** **TYPECONVERTER=CHAR.**

**Explanation:** The **PATTERN** parameter is specified in the **DFSMARSH** statement, but **INTERNAL** **TYPECONVERTER=CHAR** is not specified.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** In the **DFSMARSH** statement, either remove the **PATTERN** parameter or specify **INTERNAL** **TYPECONVERTER=CHAR**. After the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)]

---

**FLD657**

**THE VALUE SPECIFIED ON THE PATTERN PARAMETER MUST BE ENCLOSED IN APOSTROPHES.**

**Explanation:** The value specified on the **PATTERN** parameter is not enclosed in single quotation marks. The **PATTERN** parameter requires single quotation marks around the specified value.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Add the single quotation marks and rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)]

---

**FLD658**

**THE SEGMENT segment1 SPECIFIED ON OVERFLOW DOES NOT SPECIFY segment2 AS PARENT.**

**Explanation:** A segment that is specified on the **OVERFLOW** parameter of a **DFSMARSH** statement is used to store any remainder of an XML document that does not fit into the field that this **DFSMARSH** statement applies to. The **SEGM** statement that defines the overflow segment must specify the name of the segment that contains the applicable field on the **PARENT** parameter of the **SEGM** statement.

In the message text:

```plaintext
segment1
```

The name of the segment that requires the
correction to the PARENT parameter in its SEGM statement. This is the segment that is used to contain any overflow portion of an XML document.

**segment2**

The segment name that must be specified on the PARENT parameter in the SEGM statement of segment1. This is the segment in which the XML-document field and the associated marshall attributes are defined.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Correct the specification of the PARENT parameter in the SEGM statement that defines the overflow segment or change the value of the OVERFLOW parameter to refer to a child segment of the current segment. When the corrections are complete, rerun the DBD Generation utility.

**Related reference:**
- DFSMARSH statements (System Utilities)

**FLD659**

YOU CANNOT SPECIFY BOTH INTERNALTYPECONVERTER AND USERTYPECONVERTER IN THE SAME DFSMARSH STATEMENT.

**Explanation:** Both the INTERNALTYPECONVERTER and USERTYPECONVERTER parameters are specified in the current DFSMARSH statement. The parameters are mutually exclusive and cannot both be specified in the same DFSMARSH statement,

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Remove either the INTERNALTYPECONVERTER parameter or the USERTYPECONVERTER parameter from the DFSMARSH statement and rerun the DBD Generation utility.

**Related reference:**
- DFSMARSH statements (System Utilities)

**FLD660**

FOR DATATYPES OF DATE/TIME/TIMESTAMP, THE ONLY VALID INTERNALTYPECONVERTER VALUES ARE LONG & CHAR.

**Explanation:** The specification of the INTERNALTYPECONVERTER in the DFSMARSH statement is not consistent with the specification of the DATATYPE parameter in the preceding FIELD statement to which the DFSMARSH statement applies. The DATATYPE parameter in the FIELD statement is set to DATE, TIME, or TIMESTAMP, which requires the INTERNALTYPECONVERTER parameter in the DFSMARSH statement to be set to LONG or CHAR.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either change the value of the INTERNALTYPECONVERTER parameter in the DFSMARSH statement or change the value of the DATATYPE parameter in the preceding FIELD statement. When the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- DFSMARSH statements (System Utilities)
- FIELD statements (System Utilities)

**FLD661**

THE VALUE SPECIFIED ON THE INTERNALTYPECONVERTER PARAMETER IS NOT A SUPPORTED CONVERTER TYPE.

**Explanation:** The INTERNALTYPECONVERTER supports the following converter types:
- ARRAY
- BINARY
- BIT
- BLOB
- BYTE
- CHAR
- CLOB
- DOUBLE
- FLOAT
- INT
- LONG
- PACKEDDECIMAL
- SHORT
- STRUCT
- XML_CLOB
- ZONEDDECIMAL

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Change the value of the INTERNALTYPECONVERTER parameter or use the USERTYPECONVERTER parameter instead. After your changes are complete, rerun the DBD Generation utility.

**Related reference:**
- DFSMARSH statements (System Utilities)

**FLD662**

AN INTERNALTYPECONVERTER OF PACKEDDECIMAL OR ZONEDDECIMAL MUST SPECIFY A DATATYPE OF DECIMAL.

**Explanation:** The value of the INTERNALTYPECONVERTER parameter in the current DFSMARSH statement is PACKEDDECIMAL or ZONEDDECIMAL, but the preceding FIELD statement to which the DFSMARSH statement applies does not
specify DATATYPE=DECIMAL.

The PACKEDDECIMAL or ZONEDDECIMAL values can be specified on the INTERNALTYPECONVERTER parameter only when DATATYPE=DECIMAL is specified in the preceding FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either change the value of the INTERNALTYPECONVERTER parameter in the DFSMARSH statement or specify the DA

**Related reference:**

---

**FLD668**

WHEN INVOKING DFSMARSH, AN INTERNALTYPECONVERTER OR USERTYPECONVERTER MUST BE SPECIFIED.

**Explanation:** The current DFSMARSH statement does not include either the INTERNALTYPECONVERTER parameter or the USERTYPECONVERTER parameter. The DFSMARSH statement requires that one of these two parameters be specified.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify either the INTERNALTYPECONVERTER parameter or the USERTYPECONVERTER parameter in the DFSMARSH statement. The type converter you specify must be consistent with the specification of DATATYPE parameter in the FIELD statement to which this DFSMARSH statement applies.

After your changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)
- [DFSMARSH statements (System Utilities)](#)

---

**FLD669**

AN INTERNALTYPECONVERTER OF CHAR MUST SPECIFY A DATATYPE OF CHAR, DATE, TIME OR TIMESTAMP.

**Explanation:** The value of the INTERNALTYPECONVERTER parameter in the current DFSMARSH statement is CHAR, but the preceding FIELD statement to which the DFSMARSH statement applies does not specify CHAR, DATE, TIME, or TIMESTAMP on the DATATYPE parameter.

The CHAR value can be specified on the INTERNALTYPECONVERTER parameter only when CHAR, DATE, TIME, or TIMESTAMP is specified on the DATATYPE parameter in the preceding FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either change the value of the INTERNALTYPECONVERTER parameter in the DFSMARSH statement or change the value of the DATATYPE parameter in the preceding FIELD statement. When the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)
- [DFSMARSH statements (System Utilities)](#)

---

**FLD670**

AN INTERNALTYPECONVERTER OF LONG MUST SPECIFY A DATATYPE OF LONG, DATE, TIME OR TIMESTAMP.

**Explanation:** The value of the INTERNALTYPECONVERTER parameter in the current DFSMARSH statement is LONG, but the preceding FIELD statement to which the DFSMARSH statement applies does not specify LONG, DATE, TIME, or TIMESTAMP on the DATATYPE parameter.
The LONG value can be specified on the INTERNALTYPECONVERTER parameter only when LONG, DATE, TIME, or TIMESTAMP is specified on the DATATYPE parameter in the preceding FIELD statement.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Either change the value of the INTERNALTYPECONVERTER parameter in the DFSMARSH statement or change the value of the DATATYPE parameter in the preceding FIELD statement. When the changes are complete, rerun the DBD Generation utility.

Related reference:

**FLD675** OVERFLOW IS SPECIFIED, BUT THE FIELD IS NOT DEFINED WITH DATATYPE=XML.

Explanation: OVERFLOW is specified on the DFSMARSH statement, but the DATATYPE value specified on the current FIELD statement is not XML. The OVERFLOW parameter is only valid on the DFSMARSH statement when the FIELD statement that it applies to specifies DATATYPE=XML.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify DATATYPE=XML on the FIELD statement or, if the OVERFLOW parameter is not needed, remove it from DFSMARSH. Rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)
- FIELD statements (System Utilities)

**FLD676** THE VALUE SPECIFIED ON THE USERTYPECONVERTER PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The USERTYPECONVERTER parameter can accept a character string no greater than 256 characters.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the value specified on the USERTYPECONVERTER parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)

**FLD677** A NAME AND VALUE PAIR SPECIFIED ON THE PROPERTIES PARAMETER IS INCOMPLETE.

Explanation: The specification of the name and value of a property on the PROPERTIES parameter is incomplete in the current DFSMARSH statement.

Each value specified on the PROPERTIES parameter must conform to the following format: `propertyname=propertyvalue`. If multiple properties are specified, each name-and-value pair must be separated by a comma.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the specification of the name and value of the property and rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)

**FLD678** THE PROPERTIES PARAMETER IS SPECIFIED BUT THE USERTYPECONVERTER PARAMETER IS NOT.

Explanation: The USERTYPECONVERTER parameter is required when the PROPERTIES parameter is specified in a DFSMARSH statement.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: In the DFSMARSH statement, either specify the USERTYPECONVERTER parameter or remove the PROPERTIES parameter. After the changes are complete, rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)

**FLD679** THE VALUE OF THE URL PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The value specified on the URL parameter in the DFSMARSH statement contains one or more of the following invalid characters:
- Single and double quotation marks
- Blanks
- Less than (<) and greater than (>) symbols
- Ampersands (&)

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the value specified on the URL parameter in the DFSMARSH statement and run the DBDGEN utility again.

Related reference:
- DFSMARSH statements (System Utilities)

**FLD680** THE VALUE OF THE USERTYPECONVERTER PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The value specified on the USERTYPECONVERTER parameter in the DFSMARSH
statement contains one or more of the following invalid characters:

- Single and double quotation marks
- Blanks
- Less than (< ) and greater than ( >) symbols
- Ampersands (&)

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Remove the invalid characters from the value specified on the USERTYPECONVERTER parameter in the DFSMARSH statement and run the DBDGEN utility again.

**Related reference:**
- [DFSMARSH statements (System Utilities)](#)

---

**FLD681** THE VALUE OF THE ENCODING PARAMETER CONTAINS INVALID CHARACTERS.

**Explanation:** The value specified on the ENCODING parameter in the DFSMARSH statement contains one or more of the following invalid characters:

- Single and double quotation marks
- Blanks
- Less than (< ) and greater than ( >) symbols
- Ampersands (&)

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Remove the invalid characters from the value specified on the ENCODING parameter in the DFSMARSH statement and run the DBDGEN utility again.

**Related reference:**
- [DFSMARSH statements (System Utilities)](#)

---

**FLD682** THE ONLY VALID VALUE FOR THE ISSIGNED PARAMETER IS Y OR N.

**Explanation:** In the current DFSMARSH statement, the value of the ISSIGNED parameter is not either Y or N.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** In the DFSMARSH statement, change the value of the ISSIGNED parameter to either Y or N. After the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)](#)

---

**FLD683** THE ISSIGNED PARAMETER IS VALID ONLY WHEN DATATYPE=DECIMAL ON THE FIELD STATEMENT.

**Explanation:** The ISSIGNED parameter is specified in the current DFSMARSH statement, but the preceding FIELD statement to which this DFSMARSH statement applies does not specify DATATYPE=DECIMAL.

The ISSIGNED parameter can be specified only when DATATYPE=DECIMAL is specified in the preceding FIELD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Either specify DATATYPE=DECIMAL in the preceding FIELD statement or delete the ISSIGNED parameter from the DFSMARSH statement. When the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)
- [DFSMARSH statements (System Utilities)](#)

---

**FLD684** THE VALUE SPECIFIED ON THE REMARKS PARAMETER IN THE DFSMARSH STATEMENT EXCEEDS 256 CHARACTERS.

**Explanation:** The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

**Related reference:**
- [DFSMARSH statements (System Utilities)](#)

---

**FLD685** A NAME AND VALUE PAIR SPECIFIED ON THE PROPERTIES PARAMETER EXCEEDS 128.

**Explanation:** A specification of the name and value of a property on the PROPERTIES parameter exceeds 128 characters in length.

Each name-and-value pair for each property must be 128 characters or less. If multiple properties are specified, the name-and-value pairs must be separated by a comma. The name and value of a property must be specified in the following format: `propertyname=propertyvalue`
System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the specification of the name and value of the property and rerun the DBD Generation utility.

Related reference: DFSMARSH statements (System Utilities)

FLD686 THE PROPERTIES PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The value specified on the PROPERTIES parameter in the DFSMARSH statement contains one or more of the following invalid characters:

- Single and double quotation marks
- Blanks
- Less than (<) and greater than (>) symbols
- Ampersands (&)

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the value specified on the PROPERTIES parameter in the DFSMARSH statement and run the DBDGEN utility again.

Related reference: DFSMARSH statements (System Utilities)

FLD692 YOU CANNOT SPECIFY BOTH STARTAFTER AND RELSTART IN THE SAME FIELD STATEMENT.

Explanation: The RELSTART parameter and the STARTAFTER parameter are specified in the current FIELD statement. RESTART, START, and STARTAFTER are all mutually exclusive. If one of the parameters is specified, the others cannot be specified.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Modify the FIELD statement so that only RELSTART, START, or STARTAFTER is used to define the starting position of the field and rerun the DBD Generation utility.

Related reference: FIELD statements (System Utilities)

FLD687 THE PATTERN PARAMETER CONTAINS INVALID CHARACTERS

Explanation: The value specified on the PATTERN parameter in the DFSMARSH statement contains one or more invalid characters.

Except for single quotation marks that are used as delimiters for the keyword value, the value specified on the PATTERN parameter cannot contain the following characters:

- Single and double quotation marks
- Less than (<) and greater than (>) symbols
- Ampersands (&)

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the value specified on the PATTERN parameter in the DFSMARSH statement and run the DBDGEN utility again.

Related reference: DFSMARSH statements (System Utilities)
FLD messages 700 to 999 for DBD Generation

This topic contains the following messages:

**FLD700**  
A DFSCASE STATEMENT MUST BE PRECEDED BY A DFSMAP STATEMENT.

**Explanation:** No DFSMAP statement is coded in the DBD generation input that precedes the current DFSCASE statement in the input order. The DFSMAP statement that a DFSCASE statement references on the MAPNAME parameter must precede the DFSCASE statement in the input order of the DBD generation statements.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Modify the DBD generation input statements so that the DFSCASE statement follows the DFSMAP statement that is specified on the MAPNAME parameter of the DFSCASE statement. After the changes are complete, rerun the DBD Generation utility.

**Related reference:**
- [DFSCASE statements (System Utilities)](#)
- [DFSMAP statements (System Utilities)](#)

**FLD701**  
THE NAME PARAMETER IS REQUIRED ON A DFSCASE STATEMENT.

**Explanation:** The NAME parameter is not specified in the current DFSCASE statement. The NAME parameter is required.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify the NAME parameter in the DFSCASE statement and rerun the DBD Generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)

**FLD702**  
The value specified on the NAME parameter in the DFSCASE statement exceeds 128 characters.

**Explanation:** The NAME parameter on a DFSCASE statement cannot accept a character string greater than 128 characters.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the value specified on the NAME parameter so that it is 128 characters or less and rerun the DBD Generation utility.

**Related reference:**
- [DFSCASE statements (System Utilities)](#)

**FLD703**  
The value of the NAME parameter in the DFSCASE statement contains invalid characters.

**Explanation:** The value specified on the NAME parameter of the current DFSCASE statement contains invalid characters. A DFSCASE name can be specified by using only the following characters:
- Alphabetic characters a through z and A through Z
- National characters @, $, and #
- Digits 0 through 9
- Underscore character _

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Modify the value of the NAME parameter to include only valid characters and rerun the DBD generation utility.

**Related reference:**
- [FIELD statements (System Utilities)](#)

**FLD705**  
The value of the NAME parameter in the DFSCASE statement cannot begin with "DFS".

**Explanation:** The value specified on the NAME parameter in the current DFSCASE statement begins with the characters DFS. Names that begin with DFS are reserved by IMS and cannot be used as a name of a DFSCASE statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a name for this DFSCASE statement that does not begin with DFS and rerun the DBD Generation utility.

**Related reference:**
- [DFSCASE statements (System Utilities)](#)

**FLD706**  
The value of the NAME parameter is not unique within the DFSMAP statement.

**Explanation:** The NAME parameter in the current DFSCASE statement begins with the characters DFS. Names that begin with DFS are reserved by IMS and cannot be used as a name of a DFSCASE statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a name for this DFSCASE statement that does not begin with DFS and rerun the DBD Generation utility.

**Related reference:**
- [DFSCASE statements (System Utilities)](#)
**Explanation:** The name of the current DFSCASE statement is a duplicate of the name of another DFSCASE statement that specifies the same DFSMAP statement on the MAPNAME parameter.

A DFSCASE statement name must be unique within a set of DFSCASE statements that reference the same DFSMAP statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a unique name for this DFSCASE statement and rerun the DBD Generation utility.

**Related tasks:**
- Defining alternative field maps for a segment (Database Administration)

**Related reference:**
- DFSCASE statements (System Utilities)
- DFSMAP statements (System Utilities)

---

**FLD707**

**THE CASEID PARAMETER IS REQUIRED ON A DFSCASE STATEMENT.**

**Explanation:** The CASEID parameter is not specified in the current DFSCASE statement. A CASEID parameter is required.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify the CASEID parameter in the DFSCASE statement and rerun the DBD Generation utility.

**Related tasks:**
- Defining alternative field maps for a segment (Database Administration)

**Related reference:**
- DFSCASE statements (System Utilities)

---

**FLD710**

**THE VALUE OF THE CASEID PARAMETER IN THE DFSCASE STATEMENT CONTAINS INVALID CHARACTERS.**

**Explanation:** The value that is specified on the CASEID parameter of the current DFSCASE statement contains invalid characters.

Depending on the value of the CASEIDTYPE parameter, the characters that you can use in a DFSCASE statement name are different.

When CASEIDTYPE=C, a DFSCASE name can contain the following characters:

- Alphabetic characters a through z and A through Z
- Digits 0 through 9
- National characters @, $, and #
- Underscore character _

When CASEIDTYPE=X, a DFSCASE name can contain only the following characters:

- Alphabetic characters a through z and A through Z
- Digits 0 through 9

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Modify the value of the CASEID parameter to include only valid characters and rerun the DBD generation utility.

**Related reference:**
- DFSCASE statements (System Utilities)

---

**FLD712**

**THE LENGTH OF THE CASEID PARAMETER EXCEEDS 128.**

**Explanation:** The CASEID parameter on a DFSCASE statement cannot accept a character string greater than 128 characters.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Revise the value specified on the CASEID parameter so that the length is 128 characters or less and rerun the DBD Generation utility.

**Related reference:**
- DFSCASE statements (System Utilities)

---

**FLD713**

"C" OR "X" IS THE ONLY VALID VALUE FOR THE CASEIDTYPE PARAMETER.

**Explanation:** In the current DFSCASE statement, the value of the CASEIDTYPE parameter is not C or X.

A value of C indicates that the ID of the DFSCASE...
statement is specified as character data. A value of X indicates that the ID of the DFSCASE statement is specified as hexadecimal data.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: In the DFSCASE statement, change the value of the CASEIDTYPE parameter to either C or X. After the changes are complete, rerun the DBD Generation utility.

Related reference:
- DFSMARSH statements (System Utilities)

---

DFL714 • THE CASEIDTYPE PARAMETER IS REQUIRED ON A DFSCASE STATEMENT.

Explanation: The CASEIDTYPE parameter is not specified in the current DFSCASE statement.

A CASEIDTYPE parameter, which indicates whether the value of the CASEID parameter is a character or hexadecimal value, is required.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify the CASEIDTYPE parameter in the DFSCASE statement and rerun the DBD Generation utility.

Related tasks:
- Defining alternative field maps for a segment (Database Administration)

Related reference:
- DFSCASE statements (System Utilities)

---

DFL715 • THE MAPNAME PARAMETER IS REQUIRED ON A DFSCASE STATEMENT.

Explanation: The MAPNAME parameter is not specified in the current DFSCASE statement.

The MAPNAME parameter, which specifies the DFSMAP statement that this DFSCASE statement belongs to, is required.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify the MAPNAME parameter in the DFSCASE statement and rerun the DBD Generation utility.

Related tasks:
- Defining alternative field maps for a segment (Database Administration)

Related reference:
- DFSCASE statements (System Utilities)

---

DFL717 • THE VALUE SPECIFIED ON THE REMARKS PARAMETER IN THE DFSCASE STATEMENT EXCEEDS 256 CHARACTERS.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference:
- DFSCASE statements (System Utilities)
A DFSMAP STATEMENT WAS ENTERED WITHOUT A DFSCASE STATEMENT.

Explanation: No DFSCASE statements are specified in the DBD generation input. When no DFSCASE statements are specified, a DFSMAP statement is not needed.

A DFSCASE statement defines a map case, an alternative field map for a segment. A DFSMAP statement links a set of map cases to a control field that determines which map case is in effect in a given instance of a segment.

No DFSCASE statements are specified in the DBD generation input, a DFSMAP statement is not needed.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Either code at least one DFSCASE statement or delete the DFSMAP statement. After the changes are complete, rerun the DBD Generation utility.

Related tasks:
- Defining alternative field maps for a segment (Database Administration)

Related reference:
- DFSCASE statements (System Utilities)
- DFSMAP statements (System Utilities)

THE NAME PARAMETER IS REQUIRED ON THE DFSMAP STATEMENT.

Explanation: The NAME parameter is not specified in the current DFSMAP statement. The NAME parameter is required.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify the NAME parameter in the DFSMAP statement and rerun the DBD Generation utility.

Related reference:
- DFSCASE statements (System Utilities)

THE VALUE SPECIFIED ON THE NAME PARAMETER IN THE DFSMAP STATEMENT EXCEEDS 128 CHARACTERS.

Explanation: The NAME parameter on a DFSMAP statement cannot accept a character string greater than 128 characters.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the value specified on the NAME parameter so that it is 128 characters or less and rerun the DBD Generation utility.

Related reference:
- DFSCASE statements (System Utilities)

THE VALUE OF THE NAME PARAMETER IN THE DFSMAP STATEMENT CONTAINS INVALID CHARACTERS.

Explanation: The value specified on the NAME parameter of the current DFSMAP statement contains invalid characters. A DFSMAP name can be specified by using only the following characters:
- Alphabetic characters a through z and A through Z
- National characters @, $, and #
- Digits 0 through 9
- Underscore character _

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Modify the value of the NAME parameter to include only valid characters and rerun the DBD generation utility.

Related reference:
- DFSCASE statements (System Utilities)

THE VALUE OF THE NAME PARAMETER IN THE DFSCASE STATEMENT IS NOT UNIQUE IN SEGMENT.

Explanation: The value specified on the NAME parameter of the current DFSCASE statement is not unique within the current segment.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify a unique name for this DFSCASE statement and rerun the DBD Generation utility.

Related reference:
- DFSCASE statements (System Utilities)

THE VALUE OF THE NAME PARAMETER IN THE DFSMAP STATEMENT CANNOT BEGIN WITH DFS.

Explanation: The value specified on the NAME parameter in the current DFSMAP statement begins with the characters DFS. Names that begin with DFS are reserved by IMS and cannot be used as a name of a DFSMAP statement.
The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Specify a name for this DFSMAP statement that does not begin with DFS and rerun the DBD Generation utility.

Related reference:

Related tasks:

Defining alternative field maps for a segment (Database Administration)

Related reference:

THE VALUE OF DEPENDINGON, dfldname, DOES NOT MATCH ANY PREVIOUSLY DEFINED FIELD NAMES.

Explanation: The field name specified on the DEPENDINGON parameter of the current DFSMAP statement does not match the field name specified on any FIELD statement in the preceding DBD generation input.

The FIELD statement referenced on the DEPENDINGON parameter must be coded before the DFSMAP statement in the DBD generation input order.

In the message text:

dfldname

The name of the control field that determines which DFSCASE statement is used in an instance of the segment. The name of the control field is the value of the EXTERNALNAME parameter in the FIELD statement that defines the control field.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct field name on either the DEPENDINGON parameter of the DFSMAP statement or on EXTERNALNAME parameter of the FIELD statement that defines the field referenced by the DEPENDINGON parameter. Confirm that the FIELD statement referenced by the DEPENDINGON parameter precedes the DFSMAP statement in the input order of the DBD generation statements. When you are done, rerun the DBD Generation utility.

Related tasks:

Defining alternative field maps for a segment (Database Administration)

Related reference:

THE LENGTH OF THE REMARKS PARAMETER ON THE DFSMAP STATEMENT EXCEEDS 256 CHARACTERS.

Explanation: The REMARKS parameter can accept a string of up to 256 characters. The comments currently entered on the REMARKS parameter exceed the 256-character limit.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Revise the comment string entered on the REMARKS parameter so that it is 256 characters or less and rerun the DBD Generation utility.

Related reference:

Explanation: The byte length of the control field that is identified in the message text does not support the length of the hexadecimal CASEID value that is defined in the current DFSCASE statement. The length of the hexadecimal CASEID value must be exactly twice the byte length of the control field.

In the message text:

dfldname

The external name of the control field, as specified on the DEPENDINGON parameter of the DFSMAP statement.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Either change the value specified on the BYTES parameter of the FIELD statement that defines the control field or change the value of the CASEID parameter so that it is twice the byte length of the control field. After the changes are complete, rerun the DBD Generation utility.

Related tasks:

Defining alternative field maps for a segment (Database Administration)

Related reference:

Explanation: The byte length of the control field that is identified in the message text is too short to support the CASEID value that is defined in the current DFSCASE statement. The byte length of the control field must be equal to or greater than the length of the CASEID.

In the message text:

dfldname

The external name of the control field, as specified on the DEPENDINGON parameter of the DFSMAP statement.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Either change the value specified on the BYTES parameter of the FIELD statement that defines the control field or change the value of the CASEID parameter to be less than or equal to the length of the control field. After the changes are complete, rerun the DBD Generation utility.

Related tasks:

- Defining alternative field maps for a segment [Database Administration]

Related reference:

- DFSMAP statements (System Utilities)
- DFSCASE statements (System Utilities)

FLD752  THE BYTES VALUE AND THE PRECISION VALUE IN THE DECIMAL PARAMETER ARE INCONSISTENT FOR FIELD dfldname.

Explanation: The byte size of the field that is named

CORRECT

REMARKS='These remarks apply to the XYZ application'

- Double quotation marks.
- Less than (<) symbols.
- Greater than (>) symbols.
- Ampersands (&).

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Adjust the value specified on the MAXBYTES parameter of this field, or adjust the byte sizes of the fields that specify this field as a parent. After the changes are complete, rerun the DBD Generation utility.

Related concepts:

- Defining DBD and PSB metadata to the generation utilities (Database Administration)

<tr>
<td>FLD997</td>
<td>START AND BYTES OPERAND FOR EACH SEQUENCE FIELD IN A MULTI-INDEX DBD MUST EQUAL START AND BYTES OPERANDS OF EACH PREVIOUSLY DEFINED SEGMENT SEQUENCE FIELD</td>
</tr>
</tbody>
</table>

**Explanation:** The NAME operand on the DBD 
statement specified multiple database names. This 
indicated to DBDGEN that a shared secondary index 
database was being defined. The segments in a shared 
secondary index must have the same physical 
characteristics. This includes the position of the 
sequence field in each segment.

**Programmer response:** Ensure that each FIELD 
statement defining a sequence field for a segment in a 
shared secondary index has START and BYTES 
operands equal to the START and BYTES operands of 
the other FIELD statements defining sequence fields.

</table>
Programmer response: Correct the INDEX operand, and rerun DBDGEN.

LCHD170  LCHILD STMT INVALID FOR LOGICAL SEGMENTS
Explanation: If the SEGM statement specifies the SOURCE operand, no LCHILD statement can be specified for that SEGM.
System action: The specified LCHILD operand information is used in subsequent validity checking.
Programmer response: Correct the error, and rerun DBDGEN.

LCHD180  A LOGICAL CHILD SEGMENT CANNOT BE A LOGICAL PARENT OR BE INDEXED.
Explanation: Segments with a logical parent cannot also have logical children. If the SEGM statement specifies a logical parent segment name in the PARENT operand, no LCHILD statements for index or logical relationships can be specified for that SEGM.
Programmer response: Remove the LCHILD statements, or do not specify a logical parent name and rerun DBDGEN.

LCHD190  RULES OPERAND IS INVALID; DEFAULT ASSUMED
Explanation: This is a warning message. The RULES operand must specify a value of FIRST, LAST, or HERE.
System action: Default rules value of LAST is used.
Programmer response: Correct the RULES operand if a value other than LAST is desired, and rerun DBDGEN.

LCHD200  REFERENCED LCHILD CANNOT PRECEDE LCHILD STMT
Explanation: The segment name specified in the NAME operand of this LCHILD statement cannot be the same as the segment name specified in the NAME operand of the immediately preceding SEGM statement. That is, the segment cannot be a logical child of itself.
Programmer response: Correct the NAME operand in the LCHILD statement, and rerun DBDGEN.

LCHD205  NAME OPERAND CANNOT REFERENCE THE SAME SEGMENT AS THE LCHILD STATEMENT UNDER SEGMENT name
Explanation: The NAME operand of this LCHILD statement cannot reference the same segment name and database as the LCHILD statement under the referenced segment.
System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the INDEX operand, and rerun DBDGEN.

LCHD210  LCHILD STATEMENT IS INVALID
Explanation: An LCHILD statement is not valid for a DBD which defined ACCESS=SHISAM.
System action: Succeeding LCHILD parameters are not checked. The remaining DBDGEN statements are scanned for validity.
Programmer response: Remove the LCHILD statement, or change the ACCESS operand on the DBD statement, and rerun DBDGEN.

LCHD215  LCHILD STATEMENT FOR PRIMARY HIDAM INDEX MUST PRECEDE ALL SECONDARY INDEX LCHILD STATEMENTS
Explanation: The LCHILD statement for the primary HIDAM index with PTR=INDX must precede all secondary index LCHILD statements with PTR=SYMB.
System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the error, and rerun DBDGEN.

LCHD230  THE LCHILD STATEMENT IS INVALID FOR A DEDB SDEP SEGMENT
Explanation: The LCHILD statement is specified for a DEDB Sequential Dependent (SDEP) segment. This specification is an invalid option for a Fast Path secondary index database. An SDEP segment cannot be used as a source segment or a target segment for a Fast Path secondary index.
System action: The DBD generation attempt fails with a MNOTE of 8.
Programmer response: Delete the LCHILD statement for the DEDB SDEP segment for the DBD and rerun the DBD Generation utility.

LCHD240  THE NUMBER OF USER PARTITION DATABASES EXCEEDED THE 500 LIMIT
Explanation: The limit on the number of HISAM secondary index partition databases or SHISAM secondary index databases in a user data partition group specified in the NAME operand on a LCHILD statement exceeded 500.
**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Reduce the number of partition databases in the user data partition group for the DEDB DBD and rerun the DBD Generation utility.

---

**LCHD241**  
**A USER PARTITION GROUP CONTAINS DUPLICATE USER PARTITION DATABASES**

**Explanation:** The user partition databases in a user partition group (defined in the NAME operand on an LCHILD statement) must be unique. The HISAM secondary index partition databases or SHISAM secondary index databases in a user partition group specified in the NAME operand on an LCHILD statement for a primary DEDB DBD contains one or more user partition databases.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Change the duplicate names of the user partition databases in the user partition group to unique names and rerun the DBD Generation utility.

---

**LCHD242**  
**THE NAME OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

**Explanation:** A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The NAME operands on the LCHILD statements of the multiple secondary index segments are different. If HISAM or SHISAM user data partitioning is requested, either the user partition database names or the order of the user partition databases is different. The NAME operands must specify the same target segment names and the same secondary index database names for the multiple secondary index segments.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:**
1. Correct the NAME operands to specify the same target segment name and the same secondary index database names for the multiple secondary index segments. If HISAM or SHISAM user data partitioning is requested, correct the NAME operands to specify the same target segment names, the same user partition database names, and the same order of user partition database names for the multiple secondary index segments.
2. Rerun the DBDGEN utility.

---

**LCHD243**  
**THE PAIR OPERAND IS INVALID FOR A FAST PATH SECONDARY INDEX DATABASE**

**Explanation:** The PAIR operand on an LCHILD statement is used for logical relationships and is not valid for a Fast Path secondary index database in a primary DEDB DBD.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Remove the PAIR operand on the LCHILD statement and rerun the DBD Generation utility.

---

**LCHD244**  
**THE RULES OPERAND IS INVALID FOR A FAST PATH SECONDARY INDEX DATABASE**

**Explanation:** The RULES operand on an LCHILD statement is used for logical relationships and is not valid for a Fast Path secondary index database in a primary DEDB database DBD.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Remove the RULES operand on the LCHILD statement and rerun the DBD Generation utility.

---

**LCHD245**  
**THE MULTISEG OPERAND IS ONLY VALID FOR A DEDB**

**Explanation:** The MULTISEG operand is valid only on an LCHILD statement for a data entry database (DEDB), but was specified for a non-DEDB database.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Remove the MULTISEG operand on the LCHILD statement and rerun the DBDGEN utility.

---

**LCHD246**  
**THE MULTISEG OPERAND MUST BE MULTISEG=YES OR MULTISEG=NO**

**Explanation:** The specified value for the MULTISEG= operand is invalid. You can only use the MULTISEG operand on an LCHILD statement for a data entry database (DEDB). The MULTISEG= operand can have the following specifications:
- MULTISEG=NO is the default and it identifies that a set of LCHILD and XDFLD statements do not belong to a multiple-secondary index segment group.
- MULTISEG=YES identifies a set of LCHILD and XDFLD statements as belonging to a multiple-secondary index segment group.

**System action:** The DBD generation attempt fails with a MNOTE of 8.
Programmer response: Change the MULTISEG operand to MULTISEG=YES or MULTISEG=NO on the LCHILD statement and rerun the DBDGEN utility.

LCHD300  LCHILD STMT IS INVALID FOR access DBDS

Explanation: The LCHILD statement was specified for an invalid database type.

System action: DBDGEN ignores all operands specified on the LCHILD statement and continues to process the remaining statements.

Programmer response: Remove the LCHILD statement from the DBDGEN input stream or change the DL/I database organization, and rerun DBDGEN.

---

LCHD320  RKSIZE NOT VALID

Explanation: The RKSIZE operand was either not defined for an ACCESS=PSINDEX database or the operand was defined for a database organization other than ACCESS=PSINDEX.

System action: DBDGEN is terminated. Subsequent statement validation will continue.

Programmer response: Remove the RKSIZE operand or change the ACCESS parameter to one of the allowed organizations.

---

SEGM messages 100 to 480 for DBD Generation

This topic contains the following messages:

SEGM100  PRIOR DATASET/AREA STATEMENT IS MISSING OR INVALID

Explanation: A prior DATASET/AREA statement which is required for the database type being created was not specified. Or, a LOGICAL DATASET statement was specified, but this is not a LOGICAL database.

System action: No DATASET/AREA parameters are assumed. Unpredictable results can occur in subsequent checking.

Programmer response: Correct the error, and rerun DBDGEN.

---

SEGM105  multisegment SHSAM DATA BASE SHOULD SPECIFY ACCESS=HSAM IN ITS DBD

Explanation: ACCESS=SHSAM was specified on the DBD statement, but more than one SEGM statement was specified.

System action: This multisegment SHSAM database is treated like an HSAM database.

Programmer response: Correct the error, and rerun DBDGEN.

---

SEGM110  SEGM SPECIFICATION LIMIT EXCEEDED

Explanation: One of the following occurred:

- More than 255 SEGM statements were provided.
- ACCESS=SHISAM was specified on the DBD statement, but more than one SEGM statement was specified.
- ACCESS=HISAM was specified on the DBD statement and the DATASET statement did not specify an OVLFW operand, but more than one SEGM statement was specified.
- ACCESS=INDEX was specified on the DBD statement, but more than 255 SEGM statements were specified.

System action: The information on this SEGM statement can overlay the prior SEGM statement. Unpredictable results can occur in subsequent validity checking.

Programmer response: Remove the SEGM statement or change the ACCESS parameter to one of the allowed organizations.

---

SEGM120  NAME OPERAND IS OMITTED OR INVALID

Explanation: The NAME operand is required and must be a 1- to 8-character alphanumeric value, #, $ or $.

System action: The specified name is used for validity checking. If it is omitted, a null value is inserted.

Programmer response: Correct the NAME operand, and rerun DBDGEN.

---

SEGM130  POSITIONAL PARAMETERS ARE INVALID FOR SEGM

Explanation: You coded a positional parameter in a macro that will only accept keywords. An equal or a parenthesis sign is missing, or a keypunch error occurred.

System action: Terminate the DBDGEN prior to expansion.

Programmer response: Remove the positional parameter, and rerun the DBDGEN.
SEGM140  SEGMENT NAME IS A DUPLICATE NAME

Explanation: The value specified in the NAME operand is a duplicate of one specified on a SEGM statement elsewhere in this DBDGEN. This is not permitted.

System action: The name is used as many times as it is specified for validity checking.

Programmer response: Change the segment name, and rerun DBDGEN.

SEGM150  PHYSICAL PARENT PARAMETER IS OMITTED OR INVALID

Explanation: One of the following occurred:
• More parameters were specified than are valid for the syntax of this operand.
• The SNGL/DBLE option was specified for a root segment or a segment in an INDEX or DEDB database. Or, the SNGL/DBLE option for a dependent segment was incorrectly specified.
• The PARENT operand for a root segment was specified, but specified as PARENT=0.

System action: The value given is used for further validity checking. If none is given, a null value is assumed.

Programmer response: Correct the PARENT operand, and rerun DBDGEN.

SEGM160  PHYSICAL PARENT PARAMETER IS INVALID

Explanation: The physical parent name was omitted or specified as 0 for a dependent segment.

System action: The value given is used in subsequent validity checking. If none is given, a null value is assumed.

Programmer response: Correct the PARENT operand, and rerun DBDGEN.

SEGM170  SEGMENT PHYSICAL PARENT IS NOT DEFINED

Explanation: The segment name specified in the PARENT operand has not been defined in a previous SEGM statement NAME operand.

System action: The name specified is used for validity checking.

Programmer response: Correct the PARENT operand to specify a valid parent segment, and rerun DBDGEN.

SEGM180  IF SOURCE SEGMENT OPERAND IS SPECIFIED, ALL OTHER OPERANDS ARE INVALID EXCEPT THE SEGMENT NAME, PARENT NAME, AND PTR=PAIRED (FOR VIRTUAL LOGICAL CHILDREN) PARAMETERS

Explanation: Self-explanatory.

System action: Processing on the SEGM statement is terminated. The following DBDGEN statements are processed for validity. DBDGEN is terminated prior to expansion of the DBDGEN macro.

Programmer response: Remove the invalid operands, and rerun DBDGEN.

SEGM190  LOGICAL PARENT PARAMETER IS INVALID

Explanation: One of the following occurred:
• The logical parent name of the PARENT operand was omitted.
• A value other than VIRTUAL, V, PHYSICAL, or P was specified for the second subparameter.
• A logical parent was specified for a root segment, or a segment in an INDEX or DEDB database.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the logical parent parameter, and rerun DBDGEN.

SEGM195  VIRTUAL DEFAULTED TO PHYSICAL FOR ACCESS=

Explanation: This is an informational message which indicates that only PHYSICAL is supported for HALDBs.

System action: VIRTUAL is ignored and PHYSICAL is used.

Programmer response: No response is necessary. You can remove the message from DBDGEN output by changing the VIRTUAL specification to PHYSICAL.

SEGM200  LOGICAL PARENT DBNAME IS INVALID—name

Explanation: The entered logical parent database name does not begin with an alpha character or contains more than 8 characters.

System action: The entered name is used.

Programmer response: Correct the logical parent database name in the PARENT operand, and rerun DBDGEN.
SEGM210  BYTES OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred.
• The BYTES operand was omitted or more than two parameters have been specified or the parameter values are not self-defining.
• The maximum bytes value exceeds 32767.
• The minimum bytes value exceeds the maximum bytes value, or has been specified for a SHISAM or INDEX database, or a database without VSAM.
• If ACCESS=MSDB was specified on the DBD statement, the minimum bytes value was specified, or only the maximum bytes value was specified but it is not an unsigned decimal number which is a multiple of 4.
• If ACCESS=DEDB was specified on the DBD statement, both the minimum and maximum bytes values have not been specified, or the minimum bytes value is less than 4.
• If ACCESS=DEDB was specified on the DBD statement, the BYTES= value specified is less than 4.

System action: The specified operand information can be used for subsequent validity checking or a value of zero can be assumed.

Programmer response: Correct the BYTES operand, and rerun DBDGEN.

SEGM211  BYTES OPERAND FOR MULTI-INDEX DBDGENS MUST BE EQUAL ON ALL SEGM STATEMENTS

Explanation: A shared secondary index database with segments of different lengths was specified.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM220  FREQ OPERAND IS INVALID

Explanation: The FREQ operand must be an unsigned decimal number in the range 0.01 to (2²⁴ -1).

System action: No default is assumed, if the operand is omitted.

Programmer response: Correct the FREQ operand, and rerun DBDGEN.

SEGM240  ptrparm CHANGED TO TWINBWD FOR access

Explanation: This is an informational message that is produced when POINTER=(HIER, or HIERBWD was specified on the SEGM statement for PHDAM or PHIDAM. Hierarchic pointing is not valid for HALDBs.

System action: POINTER=(TWINBWD, ...) is used.

Programmer response: No response is necessary. You can remove the message from DBDGEN output by changing the pointer specification to TWIN, TWINBWD, or NOTWIN.

SEGM250  POINTER AND PTR OPERANDS ARE EXCLUSIVE

Explanation: PTR is the abbreviation for the POINTER operand, and this operand can only be specified once on each SEGM statement.

System action: Further scan of the SEGM statement is terminated. The remaining DBDGEN statements are scanned for validity. The DBDGEN is terminated prior to expansion of the DBDGEN macro.

Programmer response: Specify PTR or POINTER, and rerun DBDGEN.

SEGM260  SEGMENT SIZE EXCEEDS SPECIFIED BLOCK SIZE

Explanation: The length specified in the BYTES operand on the SEGM statement exceeds the length specified in the BLOCK/SIZE operand on the DATASET statement.

System action: The value specified in the BYTES operand is used for validity checking.

Programmer response: Reduce the length specified in the BYTES operand, and rerun DBDGEN.

SEGM270  POINTER OR PTR OPERAND CONTAINS INVALID OR CONFLICTING KEYWORD VALUES

Explanation: Self-explanatory.

System action: The scan of the PTR operand is terminated at the point the error is detected.

Programmer response: Correct the POINTER operand, and rerun DBDGEN.

SEGM280  RULES OPERAND IS INVALID

Explanation: One of the following occurred:
• More than one RULES operand was specified on this SEGM statement.
• The first parameter was not equal to the value of P, L, V, or B.
• The first parameter contained more than three characters.
• The second parameter was not equal to the value FIRST, LAST, or HERE.

System action: The scan of the RULES operand is terminated at the point the error is detected.

Programmer response: Correct the RULES operand, and rerun DBDGEN.
SEGM285  POINTER OPTIONS
PTR=LT/LTB/LPARENT REQUIRE THAT THE SEGMENT BE A LOGICAL CHILD

Explanation: Self-explanatory.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM290  SEGMENT LENGTH IS GREATER THAN SPECIFIED RECORD LENGTH PLUS ROOT SEGMENT KEY

Explanation: The length specified in the BYTES operand on the SEGM statement exceeds the length specified in the RECORD operand on the DATASET statement.

Programmer response: Correct the erroneous operand, and rerun DBDGEN.

SEGM300  SOURCE SEGMENT IS INVALID FOR INDEX DBD'S

Explanation: Either a SOURCE operand is specified for an index segment in an index database, or more than two segments were specified in the SOURCE operand.

Programmer response: Correct the SOURCE operand, and rerun DBDGEN.

SEGM302  SOURCE OPERAND IS INVALID FOR access DBDS

Explanation: You specified the SOURCE operand for a database type that does not allow the specification of this operand.

System action: The user specified SOURCE operand information is used in subsequent validity checking. Unpredictable results can occur in the following validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM305  EXCESSIVE SUBLISTS SPECIFIED IN SOURCE= OPERAND; SYNTAX: SOURCE=((...)),(...) OR SOURCE=((...),(...))

Explanation: The SOURCE operand has a maximum of two sublists to describe up to two source segments. More than two sublists or a second sublist for other than a DL/I organization of LOGICAL was specified. Only one sublist can be specified when defining a virtual logical child.

System action: The SOURCE operand information as specified by the user is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM310  SOURCE OPERAND MUST BE SPECIFIED FOR A LOGICAL DBD

Explanation: You specified ACCESS=LOGICAL on the DBD statement, but the SOURCE operand was not specified on this SEGM statement.

System action: No default is assumed. Unpredictable results can occur in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM315  THE PARENT OF THIS SEGMENT CANNOT BE A LOGICAL SEGMENT

Explanation: The parent of this segment is a virtual logical child segment. It is invalid for a virtual logical child segment to have children.

System action: The given operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGM320  HIERARCHY SEQUENCE ERROR

Explanation: The named PARENT operand of the current segment violated hierarchic sequence. The maximum number of segment levels might have been exceeded.

System action: The specified PARENT operand might be in error or is ignored because the hierarchic sequence was incorrect. Some unpredictable results might occur in subsequent validity checking.

Programmer response: Check the PARENT operand for a possible error, correct the hierarchic sequence, and rerun DBDGEN.

SEGM330  SEGMENT name LENGTH PLUS PREFIX=n IS GREATER THAN SPECIFIED RECORD LENGTH

Explanation: The length that you specified in the SEGM BYTES operand plus the length of the segment prefix is greater than the record length specified in the RECORD operand on the DATASET statement.

System action: The specified operand information is used in subsequent validity checking.
Programmer response: Correct the erroneous length, and rerun DBDGEN.

SEG340  SEGMENT name LENGTH PLUS PREFIX—n EXCEEDS SPECIFIED BLOCK/CI SIZE

Explanation: The length that you specified in the SEGMBYTES operand plus the length of the segment prefix is greater than the block/CI size specified in the BLOCK/SIZE operand on the DATASET statement.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the erroneous length, and rerun DBDGEN.

SEG350  SEGMENT (name) SIZE EXCEEDS {TRACK LENGTH | CI SIZE}, SEGMENT SIZE=m (TRACK LENGTH=m | MAXIMUM CI SIZE=32256)

Explanation: The length that you specified in the bytes operand cannot exceed the smaller of 32K bytes, the track length of the device specified in the DEVICE/MODEL operand on the DATASET statement, or the maximum control interval size for a VSAM data set.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Reduce the length specified in the BYTES operand, and rerun DBDGEN.

SEG351  SEGMENT (name) SIZE EXCEEDS MAXIMUM CI SIZE MINUS VSAM OVERHEAD. SEGMENT SIZE=m MAXIMUM ALLOWED=30713

Explanation: The length that you specified in the SEGMBYTES operand plus the length of the segment prefix exceeds the maximum usable control interval size of 30720-7 for a VSAM data set.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEG352  SEGMENT (name) SIZE EXCEEDS MAXIMUM BLOCK ALLOWED. SEGMENT SIZE=m MAXIMUM BLOCK=n

Explanation: The length that you specified in the SEGMBYTES operand plus the length of the segment prefix exceeds the maximum (keyed or nonkeyed) block on a track of the device specified in the DEVICE/MODEL operand on the DATASET statement.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEG354  SEGMENT (name) SIZE EXCEEDS LIMIT. SEGMENT SIZE=m MAXIMUM LIMIT=n

Explanation: The length that you specified in the BYTES operand exceeds the maximum allowable.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEG360  PHYSICAL PARENT MUST RESIDE IN THE SAME DATA SET GROUP AS ITS PHYSICAL CHILDREN

Explanation: This physical child segment cannot be in a different data set group from its physical parent, unless the physical parent is the root segment (HISAM database) or the physical parent does not specify HIER pointing in the POINTER operand on its SEGMB statement (HDAM or HIDAM database).

System action: The given operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEG380  CHILD MUST CONTAIN SAME NUMBER OF PHYSICAL TWIN POINTER AS ITS PARENT

Explanation: If the parent segment specified POINTER=HIER, the child segment must specify POINTER=HIER or POINTER=TWIN. If the parent segment specified POINTER=HIERBWD, the child segment must specify POINTER=HIERBWD or POINTER=TWINBWD.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEG400  [SNGL|DBLE] PTR FROM HIERARCHICAL PARENT IS IGNORED

Explanation: If you specified PTR=HIER or PTR=HIERBWD for the parent segment, then the SEGMB statement for the child segment cannot specify SNGL or DBLE in the PARENT operand.
SEGMA10  INVALID OR INCOMPLETE SEGMENT PAIRING

Explanation: The PTR operand on the SEGM statement specified PAIRED. One of the following occurred:
• Its parent does not have an LCHILD statement naming it in the LCHILD's PAIR operand.
• The parent segment has no associated LCHILD statement.
• The segment is the root segment.

System action: No default is assumed. The available operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

SEGMA15  SEGM SOURCE= OPERAND MUST SPECIFY SAME NAME AS PAIRED LCHILD NAME= OPERAND

Explanation: The logical child name in the SOURCE operand of this SEGM statement must specify the same segment name and database as the paired LCHILD NAME operand.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Correct the incorrect operand name value, and rerun DBDGEN.

SEGMA20  LCHILD STMT—name—MUST [NOT] SPECIFY POINTERS WHEN PAIRED WITH A [PHYSICAL | LOGICAL] SEGMENT

Explanation: The following conditions apply to an LCHILD statement paired with a virtual logical child:
• POINTER=SNGL or POINTER=DBLE must be specified.
• The paired segment specifies the SOURCE operand.
• SNGL is the default when POINTER is not specified.

The following conditions apply to an LCHILD statement paired with a real logical child:
• POINTER=NONE must be specified.
• The paired segment does not specify the SOURCE operand.
• NONE is the default when POINTER is not specified.

System action: If the paired segment has the SOURCE operand specified, SNGL is assumed. Otherwise, the specified operand information on the control statements is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN. If this error is corrected for the DBD of an existing database, you might wish to ensure that the prefix of the logical parent in the new DBD is the same as in the old DBD. In particular, be aware that if the erroneous LCHILD statement specified PTR=NONE or omitted the PTR operand, a counter field (CTR) was implicitly placed in the prefix of the logical parent of the old DBD.

SEGMA30  PTR/POINTER OPERAND IS INVALID

Explanation: The POINTER/PTR operand cannot be specified on a SEGM statement within a DBD where the ACCESS operand specified HSAM, SHSAM, or SHISAM.

System action: Terminate any further scanning of the SEGM statement.

Programmer response: Correct the PTR/POINTER operand, and rerun DBDGEN.

SEGMA40  COMPRRTN OPERAND IS INVALID

Explanation: One of the following occurred:
• The operand was specified for a dependent segment which participates in a logical relationship.
• The operand was specified without VSAM as the system access method.
• The operand was specified for a DBD which had defined ACCESS=INDEX or ACCESS=SHISAM.
• KEY parameter is invalid for ACCESS=DEDB.
• KEY compression was specified for the root segment of a HISAM DBD.
• More than three parameters were specified.
• The first parameter has invalid character content.
• The second parameter was specified, but was not specified as KEY or DATA.
• The third parameter was specified, but was not specified as INIT.

System action: The scan of the COMPRRTN is terminated at the point the error is detected.

Programmer response: Correct the COMPRRTN operand, and rerun DBDGEN.

SEGMA50  SEGMENT NAME IS INVALID FOR COMPRESSION

Explanation: A segment name which is a duplicate of one of the internally used DBD labels was specified.

System action: The specified operand information is used in subsequent validity checking.

Programmer response: Change the segment name, and rerun DBDGEN.

SEGMA60  INDEX SOURCE SEGMENT IS A LOGICAL SEGMENT. REFERENCE XDFLD STATEMENT NAME—name

Explanation: The XDFLD statement referenced above specifies this logical child segment as the index source segment. This is invalid.

System action: The specified operand information is
used in subsequent validity checking.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**SEGM470**  
**SEGM STMT IS NOT APPLICABLE TO GSAM.**

**Explanation:** The SEGM control statement is not allowed for a DBDGEN with ACCESS=GSAM.

**System action:** DBDGEN is terminated because of the control statement error.

**Programmer response:** Correct the error, and resubmit the job.

---

**SEGM475**  
**PHYSICAL PARENT OF THIS LOGICAL CHILD CANNOT ALSO BE A LOGICAL CHILD.**

**Explanation:** This logical child segment has a physical parent which is also a logical child segment. This is not allowed.

**System action:** The specified operand information is used in subsequent validity checking.

---

**SEGM480**  
**WARNING: THIS LOGICAL CHILD SEGMENT HAS A NON-VIRTUAL DELETE RULE. THIS MAY CAUSE DL/I DELETE PROCESSING TO ORPHAN LOGICAL CHILDREN THAT EXIST HIERARCHICALLY ABOVE THIS SEGMENT.**

**Explanation:** This is a warning message. See the “Insert, delete, and replace rules for logical relationships” topic for a discussion of the use of the DL/I delete rules.

**System action:** DBDGEN continues with a warning message.

**Programmer response:** If you do not want to restore the logical relationships of the segment, change the delete rules to virtual and rerun the job.

**Related concepts:**

- Insert, delete, and replace rules for logical relationships (Database Administration)

---

### SEGM messages 500 to 840 for DBD Generation

This topic contains the following messages:

**SEGM500**  
**INVALID KEYWORD PARAMETERS SPECIFIED FOR ACCESS={MSDB|DEDB}**

**Explanation:** One of the following occurred:
- An invalid operand was specified on the SEGM statement for ACCESS=MSDB. The valid operands for this statement are NAME and BYTES.
- An invalid operand was specified on the SEGM statement for ACCESS=DEDB. The valid operands for this statement are NAME, PARENT, BYTES and TYPE.
- The COMPRTN operand is invalid for ACCESS=MSDB.

**System action:** The system continues to process the parameter on the SEGM statement and the remaining statements.

**Programmer response:** Remove any invalid operands from the SEGM statement, and rerun the DBDGEN.

**SEGM510**  
**TYPE OPERAND IS INVALID.**

**Explanation:** The TYPE= operand contains an invalid value or was inappropriately specified. The valid value for this operand is SEQ.

**System action:** The system continues to process the parameter on the SEGM statement and the remaining statements.

**Programmer response:** Correct the TYPE operand, and rerun the DBDGEN.

**SEGM520**  
**SEGM SIZE EXCEEDS SPECIFIED CI SIZE. SEGM SIZE=nnn CI SIZE-120=nnn**

**Explanation:** The length specified in the first parameter of the BYTES operand exceeds the length specified in the SIZE operand on the AREA statement minus 120.

**System action:** The system continues to process the parameter on the SEGM statement and the remaining statements.

**Programmer response:** Correct the BYTES operand, and rerun the DBDGEN.

**SEGM530**  
**INVALID SEGM LEVEL SPECIFIED FOR DEDB DBDS. THE LEVEL LIMIT IS 2.**

**Explanation:** An invalid segment hierarchical structure was specified in the SEGM statement for DEDB DBDs.

**System action:** The system continues to process the remaining statements.

**Programmer response:** Correct the PARENT operand, and rerun the DBDGEN.
**SEGM540**  
**SUBSET POINTER IS NOT SUPPORTED**

**Explanation:** One of the following occurred:
- The SSPTR operand is specified to the non-DEDB database.
- The segment is a root segment or a sequential dependent segment.
- The value specified in the SSPTR operand is not greater than or equal to 0 and less than or equal to 8.

**System action:** The specified operand information is used in subsequent validity checking.

**Programmer response:** Correct the error, and rerun DBDGEN.

---

**SEGM600**  
**THE VALUE SPECIFIED ON THE ENCODING PARAMETER EXCEEDS 25 CHARACTERS**

**Explanation:** The value specified on the ENCODING parameter in the SEGM statement exceeds the maximum length of 25 characters.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Correct the value on the ENCODING parameter, and rerun DBDGEN.

**Related reference:** [SEGM statements (System Utilities)](#)

---

**SEGM601**  
**THE VALUE OF THE EXTERNALNAME PARAMETER CONTAINS INVALID CHARACTERS**

**Explanation:** The value specified on the EXTERNALNAME parameter contains characters that are not supported. An external name must be specified as an uppercase alphanumeric character string. An external name can include underscore characters.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Correct the EXTERNALNAME keyword, and rerun DBDGEN.

**Related reference:** [SEGM statements (System Utilities)](#)

---

**SEGM602**  
**THE VALUE SPECIFIED ON THE EXTERNALNAME PARAMETER EXCEEDS 128 CHARACTERS**

**Explanation:** The value specified on the EXTERNALNAME parameter in the SEGM statement exceeds the maximum length of 128 characters.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

---

**SEGM603**  
**NEITHER NAME NOR EXTERNALNAME ARE SPECIFIED**

**Explanation:** Neither the NAME parameter nor the EXTERNALNAME parameter have been specified on the SEGM statement. The NAME parameter, the EXTERNALNAME parameter, or both must be specified on a SEGM statement.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Specify either the NAME parameter or the EXTERNALNAME parameter on the SEGM statement, and rerun DBDGEN.

**Related reference:** [SEGM statements (System Utilities)](#)

---

**SEGM604**  
**THE VALUE OF THE EXTERNALNAME PARAMETER IS NOT UNIQUE**

**Explanation:** The value specified on the EXTERNALNAME parameter is not unique within the database definition.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Specify a unique value on the EXTERNALNAME parameter, and rerun DBDGEN.

**Related reference:** [SEGM statements (System Utilities)](#)

---

**SEGM605**  
**THE VALUE OF THE EXTERNALNAME PARAMETER CANNOT BEGIN WITH “DFS”**

**Explanation:** An external name cannot begin with the characters DFS. Values beginning with DFS are reserved by IMS.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Change the value of the EXTERNALNAME parameter so that it does not begin with DFS, and rerun DBDGEN.

**Related reference:** [SEGM statements (System Utilities)](#)
SEGM607  THE VALUE OF EXTERNALNAME CANNOT BE THE RESERVED SQL KEYWORD: sqlkeyword.

Explanation: The value specified on the EXTERNALNAME parameter is a reserved SQL keyword that cannot be used as an external name.

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Define a different external name on the EXTERNALNAME parameter, and rerun DBDGEN.

Related reference:
- SEGM statements (System Utilities)
- Portable SQL keywords restricted by the IMS Universal JDBC drivers (Application Programming)

SEGM608  THE VALUE SPECIFIED ON THE REMARKS PARAMETER EXCEEDS 256 CHARACTERS.

Explanation: The value specified on the REMARKS parameter in the SEGM statement exceeds the maximum length of 256 characters.

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Shorten the comments on the REMARKS parameter, and rerun DBDGEN.

Related reference:
- SEGM statements (System Utilities)

SEGM610  THE VALUE OF THE REMARKS PARAMETER CONTAINS INVALID CHARACTERS.

Explanation: The comments specified on the REMARKS parameter in the SEGM statement contain one or more invalid characters. The value specified on the REMARKS keyword cannot contain the following characters:
- Single quotation marks, except when they are used to enclose the full comment string. If a single quotation mark is entered before the end of the full comment string, the remainder of the comment string is truncated. The following examples show correct and incorrect usages of single quotation marks on the REMARKS keyword:

  **CORRECT**
  ```
  REMARKS='These remarks apply to the XYZ application'
  ```

  **INCORRECT**
  ```
  REMARKS='These remarks apply to the 'XYZ' application'
  ```
- Double quotation marks.
- Less than (<) symbols.
- Greater than (>) symbols.
- Ampersands (&).

System action: DBDGEN terminates. Subsequent statement validation continues.

Programmer response: Remove the invalid characters from the comments that are specified on the REMARKS parameter in the SEGM statement and run the DBDGEN utility again.

Related reference:
- SEGM statements (System Utilities)

SEGM700  XXXXXXX IGNORER FOR EXIT yyyyyyyyyy BECAUSE zzzzzzzzzz ALREADY SPECIFIED

Explanation: The exit option xxxxxxx in the SEGM statement for exit yyyyyyyyyy was found, but the option is ignored because the zzzzzzzzzz option is contradictory. The zzzzzzzzzz option is used.

Programmer response: Correct the EXIT specification on the SEGM statement.

Problem determination: 2, 3, 8 and 18

Related information:
- Chapter 2, “IMS problem determination,” on page 13

SEGM750  EXIT NOT SUPPORTED FOR DB ORGANIZATION. HDAM, HIDAM, DEDB, HISAM, OR SHISAM DATA BASE ORGANIZATION IS REQUIRED

Explanation: An EXIT= parameter in the DBD
statement was found, but for that database organization it is not supported.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the SEGM statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

**SEGMENT755**

**EXIT NAME xxxxxx IS INVALID**

**Explanation:** An EXIT= parameter on the SEGM statement with the exit name xxxxxx was found, but the name is not a valid module name. The exit name length is greater than 8 bytes or the first character is not alphabetic.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the SEGM statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

**SEGMENT760**

**EXIT OPTION SPECIFIED FOR EXIT yyyyyyyyy IS NOT A VALID OPTION. KEY, NOKEY, DATA, NODATA, PATH, NOPATH, FLD, NOFLD, INPOS, NOINPOS, SSPCMD, NOSSPCMD, BEFORE, NOBEFORE, DLET, NODLET, CASCADE, NOCASCADE ARE VALID OPTIONS**

**Explanation:** An EXIT= parameter was found on the SEGM statement with the invalid option xxxxxx.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the SEGM statement.

**Problem determination:** 2, 3, 8 and 18

**Related information:**

Chapter 2, “IMS problem determination,” on page 13

---

**SEGMENT765**

**EXIT CASCADE OPTION SPECIFIED FOR EXIT yyyyyyyyy IS NOT A VALID OPTION. KEY, NOKEY, DATA, NODATA, PATH, NOPATH ARE VALID OPTIONS**

**Explanation:** An EXIT= parameter was found on the SEGM statement with the invalid option xxxxxx for CASCADE.

**System action:** Processing terminates with RC=8.

**Programmer response:** Correct the EXIT specification on the SEGM statement.

---

Chapter 15. DBDGEN messages (AREA, DBD, DGEN, DMAN, EXT, FIN, FLD, LCHD, SEGM, SOUR, XDFLD) 545
SEGM820

**DSGROUP KEYWORD NOT VALID FOR ACCESS=**

**Explanation:** The DSGROUP operand is only valid for ACCESS=PHDAM and PHIDAM.

**System action:** DBDGEN terminates. Subsequent statement validation continues.

**Programmer response:** Remove the DSGROUP specification or change the ACCESS parameter to one of the allowed organizations.

---

SEGM830

**DSGROUP SPECIFICATION MUST BE CONTIGUOUS A-J.**

**Explanation:** Gaps are not allowed in the specification of multiple data set groups in HALDBs. For example, if data set group B is defined on a SEGM statement, then data set groups B and C must also be defined.

**System action:** DBDGEN terminates.

**Programmer response:** Correct the DSGROUP specifications and reprocess the DBDGEN.

---

**SOUR messages for DBD Generation**

This topic contains the following messages:

**SOUR100**  **SOURCE SEGMENT TABLE LIMIT EXCEEDED**

**Explanation:** The size of the table which is used to contain SEGM SOURCE operand values and XDFLD SRCH, DDATA, SUBSEQ, EXTRTN, and NULLVAL operand values has been exceeded.

**System action:** The SEGM SOURCE operand value which caused the table overflow is ignored.

**Programmer response:** Reduce the number of operand values, and rerun the DBDGEN.

**SOUR110**  **SOURCE SEGMENT NAME IS OMITTED**

**Explanation:** You omitted the segment name parameter from the SOURCE operand on the SEGM statement.

**System action:** The remaining source operand values are scanned for validity.

**Programmer response:** Provide a segment name, and rerun DBDGEN.

**SOUR120**  **SOURCE SEGMENT DATA OPTION IS INVALID OPTION=opt**

**Explanation:** The DATA parameter in the SOURCE operand on the SEGM statement is invalid, because it does not specify KEY or DATA.

**System action:** The remaining source operand values are scanned for validity.

**Programmer response:** Correct the SOURCE operand, and rerun DBDGEN.

**SOUR130**  **SOURCE SEGMENT DATABASE IS INVALID—name**

**Explanation:** The entered database name (name) parameter in the SOURCE operand on the SEGM statement is invalid, because it is the same as the name on the DBD statement, or because it has invalid character content.

**System action:** The remaining source operand values are scanned for validity.

**Programmer response:** Correct the dbname parameter on the SOURCE operand.

**SOUR140**  **A SOURCE SEGMENT OPTION OF DATA SHOULD BE SPECIFIED WHEN DEFINING A VIRTUAL LOGICAL CHILD SEGM**

**Explanation:** This is a warning message.

---

**XDFLD messages for DBD Generation**

This topic contains the following messages:

**XDFLD001**  **XDFLD STATEMENT INVALID FOR HSAM, INDEX, AND (HSAM,ISAM) MULTIPLE DATA SET DBDS**

**Explanation:** An XDFLD statement is invalid when the access method specified for the DBD generation is HSAM or INDEX.
Programmer response: Remove the XDFLD statement and rerun DBDGEN.

XDFLD002 SECONDARY INDEX LCHILD STATEMENT WITH PTR=INDX/SYMB MUST PRECEDE THIS XDFLD STATEMENT.

Explanation: This XDFLD statement must be paired to a preceding LCHILD statement which has a POINTER value of INDX or SYMB. This required LCHILD statement is missing.

System action: The specified XDFLD operand information is used in subsequent validity checking.

Programmer response: Correct the error, and rerun DBDGEN.

XDFLD003 SEGM CARD MUST PRECEDE XDFLD CARD

Explanation: The input sequence of DBDGEN requires that a SEGM statement must precede an XDFLD statement.

System action: There is no default given.

Programmer response: Correct the error, and rerun DBDGEN.

XDFLD004 NAME OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred:
• The NAME operand was not specified.
• More than one parameter was specified.
• The specified operand contained more than 8 characters, or had invalid character content.

Programmer response: Correct the NAME operand, and rerun DBDGEN.

XDFLD005 SRCH OPERAND IS OMITTED OR INVALID

Explanation: One of the following occurred:
• The SRCH operand was not specified.
• More than five parameters were specified.
• A specified parameter contained more than 8 characters.
• A system related field was specified.

Programmer response: Correct the SRCH operand, and rerun DBDGEN.

XDFLD006 SUBSEQ OPERAND IS INVALID

Explanation: Either more than five parameters were specified, or a specified parameter contained more than 8 characters.

Programmer response: Correct the SUBSEQ operand, and rerun DBDGEN.

XDFLD007 DDATA OPERAND IS INVALID

Explanation: Either you specified more than five parameters, or a specified parameter contained more than 8 characters, or a /SX system related field was specified.

Programmer response: Correct the DDATA operand, and rerun DBDGEN.

XDFLD008 EXTRTN OPERAND IS INVALID

Explanation: One of the following occurred:
• More than one parameter was specified.
• The operand contains more than 8 characters, or has invalid character content.

Programmer response: Correct the EXTRTN operand, and rerun DBDGEN.

XDFLD009 CONST OPERAND IS INVALID

Explanation: The CONST operand was not specified as a 1-byte self-defining term. The CONST operand is not supported for:
• HALDBs
• DEDBs

Programmer response: Correct or delete the CONST operand and rerun the DBDGEN utility.

XDFLD010 NULLVAL OPERAND IS INVALID

Explanation: The NULLVAL operand was not specified as a one byte self-defining term, zero, or blank.

Programmer response: Correct the NULLVAL operand, and rerun DBDGEN.

XDFLD011 SEGMENT OPERAND IS INVALID

Explanation: Either more than one parameter was specified, or the specified parameter contains more than 8 characters.

Programmer response: Correct the SEGMENT operand, and rerun DBDGEN.

XDFLD012 SRCH/DDATA/SUBSEQ/EXTRTN/NULLVAL NAME TABLE LIMIT EXCEEDED

Explanation: The size of the table which is used to contain SEGM SOURCE operand values and XDFLD SRCH, DDATA, SUBSEQ, EXTRTN, and NULLVAL operand values has been exceeded.

System action: The XDFLD operand value which caused the table overflow is ignored. Processing of this XDFLD statement is terminated.

Programmer response: Reduce the number of operand values, and rerun DBDGEN.
XDFLD013  SEGMENT XDFLD LIMIT EXCEEDED
Explanation: Only 32 XDFLD statements are allowed for each SEGM statement.
Programmer response: Reduce the number of XDFLD statements to less than or equal to 32, and rerun DBDGEN.

XDFLD014  SPECIFIED NAME MAY NOT BE THE OBJECT OF PREVIOUS XDFLD SRCH, DDATA, OR SUBSEQ
Explanation: The specified NAME operand is invalid, because it is a duplicate of a name that appeared in a previous XDFLD statement in the SRCH, DDATA, or SUBSEQ operand.
Programmer response: Correct the NAME operand, and rerun DBDGEN.

XDFLD015  SEGMENT KEYWORD MAY NOT SPECIFY A PREVIOUSLY DEFINED SEGMENT NAME
Explanation: The segment name specified in the SEGMENT operand must be the name of a subsequently defined segment type which is hierarchically below the index target segment type, or it can be the name of the index target segment type itself.
Programmer response: Correct the SEGMENT operand, and rerun DBDGEN.

XDFLD016  SPECIFIED INDEX SOURCE SEGMENT NAME NOT FOUND. NAME EQUALS—name
Explanation: The segment name (name) that you specified in the SEGMENT operand could not be found.
Programmer response: Correct the SEGMENT operand, and rerun DBDGEN.

XDFLD017  SPECIFIED SRCH FIELD NAME—name NON-EXISTENT IN INDEX SOURCE SEGMENT
Explanation: The value specified in the SRCH operand on the XDFLD statement could not be found on any of the FIELD statements for the index source segment defined in the SEGMENT operand.
Programmer response: Correct the SRCH operand, and rerun DBDGEN.

XDFLD018  SPECIFIED SUBSEQ FIELD NAME—name NON-EXISTENT IN INDEX SOURCE SEGMENT
Explanation: The value specified in the SUBSEQ operand on the XDFLD statement could not be found on any of the FIELD statements for the index source segment defined in the SEGMENT operand.
Programmer response: Correct the SUBSEQ operand, and rerun DBDGEN.

XDFLD019  SPECIFIED DDATA FIELD NAME—name NON-EXISTENT IN INDEX SOURCE SEGMENT
Explanation: The value specified in the DDATA operand on the XDFLD statement could not be found on any of the FIELD statements for the index source segment defined in the SEGMENT operand.
Programmer response: Correct the DDATA operand, and rerun DBDGEN.

XDFLD020  PREVIOUS LCHILD POINTER OPERAND INVALID
Explanation: You specified PTR=SYMB and the symbolic pointer to the index target segment is not unique.
Programmer response: Correct the PTR operand on the LCHILD statement, and rerun DBDGEN.

XDFLD021  INDEX SOURCE SEGMENT (name) IS NOT HIERARCHICALLY BELOW INDEXED SEGMENT (name)
Explanation: The segment name that you specify in this SEGMENT operand must be the name of a subsequently defined segment type which is hierarchically below the index target segment type, or it can be the name of the index target segment type itself.
Programmer response: Correct the SEGMENT operand, and rerun DBDGEN.

XDFLD022  INDEX SOURCE SEGMENT IS A LOGICAL SEGMENT
Explanation: The segment name specified in the SEGMENT operand must not be a logical child segment.
Programmer response: Correct the SEGMENT operand, and rerun DBDGEN.

XDFLD023  XDFLD STATEMENT IS INVALID FOR A LOGICAL CHILD SEGMENT OR A PHYSICAL DEPENDENT OF A LOGICAL CHILD SEGMENT. REFERENCE SEGM STATEMENT name
Explanation: You specified secondary indexes for the referenced segment type. This is invalid.
System action: DBDGEN terminates.
Programmer response: Correct the SEGMENT name, and rerun DBDGEN.
XDFLD077  HDAM LCHILD STATEMENTS WITH POINTER=INDX MUST HAVE A CORRESPONDING XDFLD STATEMENT

Explanation:  An HDAM LCHILD statement with PTR=INDX defines a secondary index relationship; following each LCHILD statement of this type there must be a corresponding XDFLD statement. This required XDFLD statement is missing.

System action:  No default is assumed. The user specified statements are used in subsequent validity checking.

Programmer response:  Correct the error, and rerun the DBDGEN.

XDFLD111  SPECIFIED SRCH FIELD NAME NON-EXISTENT. FIELD NAME EQUALS—name

Explanation:  The value that you specified in the SRCH operand on the XDFLD statement could not be found on any of the FIELD statements in this DBD.

Programmer response:  Correct the SRCH operand, or provide a FIELD statement with the correct name, and rerun DBDGEN.

XDFLD112  SPECIFIED SUBSEQ FIELD NAME NON-EXISTENT. FIELD NAME EQUALS—name

Explanation:  The value (name) that you specified in the SUBSEQ operand on the XDFLD statement could not be found on any of the FIELD statements in the DBD.

System action:  None.

Programmer response:  Correct the SUBSEQ operand, or provide a FIELD statement with the correct name, and rerun DBDGEN.

XDFLD113  SPECIFIED DDATA FIELD NAME NON-EXISTENT. FIELD NAME EQUALS—name

Explanation:  The value specified in the DDATA operand on this XDFLD statement could not be found on any of the FIELD statements in this DBD.

System action:  None.

Programmer response:  Correct the DDATA operand, or provide a FIELD statement with the correct name, and rerun DBDGEN.

XDFLD115  SRCH HAS INVALID PARAMETER LIST

Explanation:  The SRCH operand (/CK:start,length) format was not followed, or the specified start or length value is not numeric.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Correct the SRCH operand, and rerun the DBD Generation utility.

XDFLD116  SUBSEQ HAS INVALID PARAMETER LIST

Explanation:  The SUBSEQ operand (/CK:start,length) format was not followed, or the specified start or length value is not numeric.

System action:  The DBD generation attempt fails with an MNOTE of 8.

Programmer response:  Correct the SUBSEQ operand, and rerun the DBD Generation utility.

XDFLD120  COMBINED LENGTH OF CONSTANT, SEARCH, AND SUBSEQUENCE FIELDS FOR XDFLD STATEMENT—name—EXCEEDS 240 BYTES

Explanation:  The XDFLD statement identified in the message by name has specified object fields whose combined length exceeds the maximum allowed.

System action:  None.

Programmer response:  Correct the error, and rerun DBDGEN.

XDFLD124  THIS XDFLD STATEMENT —name— REFERENCES ANOTHER XDFLD STATEMENT IN ITS SEARCH, SUBSEQUENCE, OR DUPLICATE DATA OPERAND

Explanation:  The XDFLD statement identified by name in the message has a SRCH operand object FIELD, or SUBSEQ operand object FIELD, or DDATA operand object FIELD, where the named FIELD is the name of an XDFLD. Fields defined by FLD statements are the only permitted operands.

System action:  None.

Programmer response:  Correct the XDFLD statement, and rerun DBDGEN.
**XDFLD126**  
THIS XDFLD STATEMENT —name— HAS A PACKED DECIMAL (TYPE=P) SEARCH FIELD, BUT THE NULLVAL= OPERAND CONTAINS AN UNACCEPTABLE PACKED DECIMAL VALUE

**Explanation:** This is a warning message. The XDFLD statement named in the message has a SRCH operand with TYPE=P, but the XDFLD NULLVAL operand does not contain a valid packed decimal value.

**System action:** None.

**Programmer response:** No action is required.

---

**XDFLD230**  
The XDFLD statement is invalid for a DEDB SDEP segment

**Explanation:** The XDFLD statement is specified for a DEDB Sequential Dependent (SDEP) segment. This is an invalid option for a Fast Path secondary index database. A SDEP segment cannot be used as a source segment or a target segment for a Fast Path secondary index.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Delete the XDFLD statement for the DEDB SDEP segment for the DBD, and rerun the DBDGEN utility.

---

**XDFLD231**  
**PSELRTN OPERAND IS OMITTED BUT USER PARTITIONING IS REQUESTED**

**Explanation:** A primary DEDB database requests user data partitioning in the NAME operand by specifying two or more HISAM secondary index databases, or two or more SHISAM secondary index databases on an LCHILD statement. However, user partition routine is specified in the XDFLD statement for the corresponding LCHILD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** If user data partitioning is intended (as defined in the NAME operand on the LCHILD statement with two or more HISAM secondary index databases, or two or more SHISAM secondary index databases):
- Add two or more names of the partition databases in the NAME operand on the corresponding XDFLD statement for the LCHILD statement.
- Specify either PSELOPT=MULT or PSELOPT=SNGL (on either the PCB statement with the PROCSEQD operand or the XDFLD statement for the primary DEDB DBD) to show how partitions are processed in the user partition group. The default is PSELOPT=MULT for the PSELOPT operand on XDFLD statements. The PSELOPT operand must be explicitly specified on the PCB statement with the PROCSEQD operand and there is no default for the PSELOPT operand in the PCB statement.
- If the PSELOPT operand is specified on both the PCB statement with the PROCSEQD operand and the XDFLD statement of the primary DEDB DBD, the PSELOPT operand on the PCB statement overrides the PSELOPT operand on the XDFLD statement of the primary DEDB DBD.

**If user data partitioning is not intended (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database, or one SHISAM secondary index database):**
- Ensure that only one database name is specified in the NAME operand on the LCHILD statement of the primary DEDB DBD and rerun the DBDGEN utility.
If user data partitioning is not intended (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database, or one SHISAM secondary index database):

- Delete the PSELRTN operand on the XDFLD statement.

**XDFLD233**
**PSELOPT OPERAND IS SPECIFIED BUT USER PARTITIONING IS NOT REQUESTED**

**Explanation:** A primary DEDB database did not request user data partitioning in the NAME operand by specifying two or more HISAM secondary index databases, or two or more SHISAM secondary index databases on an LCHILD statement. However, a user partition selection option is specified in the PSELOPT operand on the corresponding XDFLD statement for the LCHILD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** If user data partitioning is intended (as defined in the NAME operand on the LCHILD statement with two or more HISAM secondary index partition databases, or two or more SHISAM secondary index partition databases):

- Specify PSELOPT=MULT or PSELOPT=SNGL to show how partitions are processed in the user partition group on the PCB statement with the PROCSEQD operand, or on the XDFLD statement for the primary DEDB DBD.

If the PSELOPT operand is specified on both the PCB statement with the PROCSEQD operand and the XDFLD statement of the primary DEDB DBD, the PSELOPT operand on the PCB statement overrides the PSELOPT operand on the XDFLD statement of the primary DEDB DBD.

If user data partitioning is not requested (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database or one SHISAM secondary index database):

- Delete the PSELOPT operand and PSELRTN operand on the XDFLD statement.

- If the PSELOPT operand is specified on both the PCB statement with the PROCSEQD operand and the XDFLD statement of the primary DEDB DBD, the PSELOPT operand on the PCB statement overrides the PSELOPT operand on the XDFLD statement of the primary DEDB DBD.

Rerun the DBD or the PSB generation utilities as necessary.

**Related reference:**

- XDFLD statements (System Utilities)
- Full-function or Fast Path database PCB statement (System Utilities)

**XDFLD235**
**THE PSELRTN OPERAND SPECIFIED IS INVALID**

**Explanation:** The user partition selection exit specified in the PSELRTN operand violates one or more of the naming rules:

- The name of the routine cannot be longer than 8 characters.
- The first character of the name must be alphabetic.
- The remaining characters must be either alphabetic, numeric, or one of the following symbols: #, @, $.

**System action:** The DBD generation attempt fails with a MNOTE of 8.

**Programmer response:** Correct the user partition selection exit name in the PSELRTN operand, and rerun the DBD Generation utility.

The valid values for the PSELOPT operand are:

- PSELOPT=MULT for multiple partitions
- PSELOPT=SNGL for a single partition

If user data partitioning is not intended (as defined in the NAME operand on the LCHILD statement with one HISAM secondary index database, or one SHISAM secondary index database):

- Delete the PSELOPT operand on the XDFLD statement.

**XDFLD234**
**THE PSELOPT OPERAND MUST BE PSELOPT=MULT OR PSELOPT=SNGL**

**Explanation:** The user partition selection option specified in the PSELOPT operand is invalid.

The valid values for the PSELOPT operand are:
XDFLD236 • XDFLD244

XDFLD236  THE PSELRTN OPERAND IS INVALID FOR A FULL FUNCTION DATABASE

Explanation: The PSELRTN operand on an XDFLD statement is valid only for a DEDB database with Fast Path user partitioning secondary index databases defined. However, the PSELRTN operand is specified on an XDFLD statement for a full-function database.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Remove the PSELRTN operand on the XDFLD statement and rerun the DBD Generation utility.

XDFLD237  THE PSELOPT OPERAND IS INVALID FOR A FULL FUNCTION DATABASE

Explanation: The PSELOPT operand on an XDFLD statement is valid only for a DEDB database with Fast Path user partitioning secondary index databases defined. However, the PSELOPT operand is specified on an XDFLD statement for a full-function database.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Remove the PSELOPT operand on the XDFLD statement and rerun the DBD Generation utility.

XDFLD240  THE SEARCH KEY LENGTHS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The total lengths of the search keys on the SRCH operands and the SUBSEQ operands on the XDFLD statements of the multiple secondary index segments are different. The search key lengths of the multiple secondary index segments must be the same.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the fields in the SRCH operands and the SUBSEQ operands to make the total search key lengths of the multiple secondary index segments identical, and then rerun the DBDGEN utility.

XDFLD241  THE SRC OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE NOT DIFFERENT

Explanation: In a primary DEDB database with multiple secondary index segments, at least one field in the SRCH operands on the XDFLD statements of multiple secondary index segments must be different to create a unique search key for each multiple secondary index segment. However, the SRCH operands on the XDFLD statements of multiple secondary index segments are not different.

System action: The DBD generation attempt fails with an MNOTE of 8.

XDFLD242  THE NAME OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The NAME operands on the XDFLD statements of the multiple secondary index segments are different. The NAME operands must specify the same secondary index field name for the multiple secondary index segments.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the NAME operands on the XDFLD statements to specify the same secondary index field name for the multiple secondary index segments, and rerun the DBDGEN utility.

XDFLD243  THE SEGMENT OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The SEGMENT operands on the XDFLD statements of the multiple secondary index segments are different. The SEGMENT operands must specify the same source segment name for the multiple secondary index segments.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the SEGMENT operands to specify the same source segment name for the multiple secondary index segments, and rerun the DBDGEN utility.

XDFLD244  THE PSELRTN OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The PSELRTN operands on the XDFLD statements of the multiple secondary index segments are different. The PSELRTN operands must specify the same user partition selection exit for the multiple secondary index segments.

System action: The DBD generation attempt fails with an MNOTE of 8.
Programmer response: Correct the PSELRTN operands to specify the same user partition selection exit for the multiple secondary index segments, and rerun the DBD Generation utility.

**XDFLD245 THE PSELOPT OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The PSELOPT operands on the XDFLD statements of the multiple secondary index segments are different. The PSELOPT operands must specify the same user partition selection option of PSELOPT=MULT or PSELOPT=SNGL for the multiple secondary index segments.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Correct the PSELOPT operands to specify the same user partition selection option for the multiple secondary index segments, and rerun the DBD Generation utility.

**XDFLD246 THE EXTRTN OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The EXTRTN operands on the XDFLD statements of the multiple secondary index segments are different. The EXTRTN operands must specify the same user-specified index maintenance exit for the multiple secondary index segments.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Correct the EXTRTN operands to specify the same user-specified index maintenance exit routine for the multiple secondary index segments, and rerun the DBD Generation utility.

**XDFLD247 THE NULLVAL OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The NULLVAL operands on the XDFLD statements of the multiple secondary index segments are different. The NULLVAL operands must specify the same 1-byte value for the multiple secondary index segments.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Correct the NULLVAL operands to specify the same 1-byte value for the multiple secondary index segments, and rerun the DBD Generation utility.

**XDFLD248 THE SUBSEQ OPERANDS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The SUBSEQ operands on the XDFLD statements of the multiple secondary index segments are different. The SUBSEQ operands must specify the same fields for the multiple secondary index segments.

System action: The DBD generation attempt fails with a MNOTE of 8.

Programmer response: Correct the SUBSEQ operands to specify the same fields for the multiple secondary index segments, and rerun the DBD Generation utility.

**XDFLD249 THE DDATA LENGTHS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The total lengths of DDATA operands on the XDFLD statements of the multiple secondary index segments are different. The DDATA lengths of the multiple secondary index segments must be the same.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the fields in the DDATA operands to make the total DDATA lengths of multiple secondary index segments identical, and rerun the DBD Generation utility.

**XDFLD250 THE SEARCH KEY LENGTHS OF MULTIPLE SECONDARY INDEX SEGMENTS ARE DIFFERENT: XDFLD NAME=xdfldname**

Explanation: A primary DEDB database with multiple secondary index segments defined contains inconsistent properties. The total lengths of search keys on the SRCH operands on the XDFLD statements of the multiple secondary index segments are different. The search key lengths of the multiple secondary index segments must be the same.

In the message text, xdfldname indicates the name of the indexed data field of an index target segment as specified in the XDFLD statement.

System action: The DBD generation attempt fails with an MNOTE of 8.

Programmer response: Correct the fields in the SRCH
In the message text, that was previously read by the DBD generation utility.

**Explanation:** A primary DEEDB database with multiple secondary index segments defined contains inconsistent properties. The total lengths of DDATA operands on the XDFLD statements of the multiple secondary index segments are different. The DDATA lengths of the multiple secondary index segments must be the same.

In the message text, 

```
xdfldname
```

Indicates the name of the indexed data field of an index target segment as specified in the XDFLD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Correct the fields in the DDATA operands to make the total DDATA lengths of multiple secondary index segments identical, and rerun the DBD Generation utility.

**XDFLD300** XDFLD STMT IS INVALID FOR `database_type` DBDS

**Explanation:** In the message text, `database_type` can be:

- MSDB
- DEEDB

The XDFLD statement was inappropriately specified for a DBDGEN with ACCESS=MSDB or ACCESS=DEEDB specified on the DBD statement.

**System action:** The system ignores all operands specified on the XDFLD statement and continues to process the remaining statements.

**Programmer response:** Remove the XDFLD statement from the DBDGEN input stream, and rerun the DBD Generation utility.

**XDFLD600** THE VALUE OF THE EXTERNALNAME PARAMETER IS NOT UNIQUE IN SEGMENT `xxxxxxx`.

**Explanation:** The value that is specified on the EXTERNALNAME parameter is the same as the value specified on the NAME parameter or the EXTERNALNAME parameter in a FIELD statement that was previously read by the DBD generation utility.

In the message text, 

```
xxxxxxx
```

The segment that contains both of the fields that specify the same name.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** Specify a unique external name for this XDFLD statement, and rerun the DBD Generation utility.

**XDFLD601** THE VALUE OF EXTERNALNAME CANNOT BE A RESERVED SQL KEYWORD.

**Explanation:** The value that is specified on the EXTERNALNAME parameter is a reserved SQL keyword and cannot be used as an external name for an XDFLD statement.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** For this XDFLD statement, specify an external name that is not a reserved SQL keyword, and rerun the DBD Generation utility.

**Explanation:** The value that is specified on the EXTERNALNAME parameter exceeds 26 characters. External names must be 26 characters or less.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** On the EXTERNALNAME parameter, specify an external name of 26 characters or less, and rerun the DBD Generation utility.

**XDFLD603** THE VALUE OF THE EXTERNALNAME PARAMETER CANNOT BEGIN WITH "DFS".

**Explanation:** The value that is specified on the EXTERNALNAME parameter begins with the characters DFS. The names that begin with DFS are reserved by IMS and cannot be used as an external name.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** For this XDFLD statement, specify an external name that does not begin with DFS, and rerun the DBD Generation utility.

**XDFLD604** THE VALUE OF THE EXTERNALNAME PARAMETER CONTAINS INVALID CHARACTERS.

**Explanation:** The value that is specified on the EXTERNALNAME parameter contains invalid characters. An external name must be specified on the EXTERNALNAME parameter by using uppercase letters.

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** For this XDFLD statement, specify an external name that does not contain invalid characters, and rerun the DBD Generation utility.
alphanumeric characters. The following additional characters are also allowed:

- (underscore)
- $
- #
- @

**System action:** The DBD generation attempt fails with an MNOTE of 8.

**Programmer response:** On the EXTERNALNAME parameter, specify an external name that includes only uppercase alphanumeric characters and, optionally, the underscore character, $, #, and @.
Notices

This information was developed for products and services offered in the US. This material might be available from IBM in other languages. However, you may be required to own a copy of the product or product version in that language in order to access it.

IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user’s responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:
