Preface

This information is about upgrading to CICS® Transaction Server for z/OS®, Version 5 Release 2. This information set provides the relevant information for users who are upgrading from CICS Transaction Server for z/OS, Version 5 Release 1.

If you are upgrading from an older release, select the information set for the release from which you are upgrading. The information sets for older releases include additional information about changes that took place in the intervening releases.

Note: The oldest release for which information about upgrading is provided with CICS Transaction Server for z/OS, Version 5 Release 2 is CICS Transaction Server for z/OS, Version 3 Release 1. If you are upgrading from a release of CICS earlier than this, you are recommended to read the information about upgrading and about changes to functions that was provided in the documentation for any additional intervening releases.

The information about upgrading is designed to tell you about:
• Any changes to the installation process for the product.
• New, changed and obsolete externals of the product, such as commands and messages.
• Tasks that you perform to upgrade from your previous release of the product, to the new release, so that the applications that ran under your previous release can continue to run under the new release at an equivalent level of function. Some tasks apply to all users, and some apply only if your applications use a particular function, such as support for Java™.
• Tasks that you perform if you want to enable new functions that are available in this release, or change your existing system settings or applications to use the new functions.

This information assumes that you are familiar with CICS and CICSPlex® System Manager, either as a systems administrator, or as a system or application programmer. You should also have read about the new function in this release of CICS Transaction Server as described in the CICS Transaction Server for z/OS What’s New.

Notes on terminology

CICS refers to the CICS element of CICS Transaction Server for z/OS.

CICS TS, unless stated otherwise, refers to the release of CICS Transaction Server for z/OS to which you are upgrading.

CICSPlex SM refers to the CICSPlex System Manager element of CICS Transaction Server for z/OS.

MVS™ is sometimes used for the operating system, the Base Control Program (BCP) element of z/OS.
Part 1. Changes to CICS externals

CICS externals, such as resource definitions and programming interfaces, have changed to support the changes in function for this CICS release. Read these topics to check which changes might affect your system.
Chapter 1. Changes to installation procedures

When you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2, note these changes to the installation process.

You can install this release of CICS Transaction Server using the SMP/E RECEIVE, APPLY, and ACCEPT commands. Use the SMP/E dialogs to complete the SMP/E installation steps. The process meets IBM® Corporate Standards and might be familiar to you if you have installed other z/OS products.

The DFHISTAR process is still available if you prefer this method for installing CICS Transaction Server.

You must install the activation module. For more information, see Installing the CICS TS activation module in Installing.

For information about all the processes for installing CICS Transaction Server, see Installing.

Authorization routines

In z/OS, do not install SVCs or PC routines that return control to their caller in any authorized mode: that is, in supervisor state, system PSW key, or APF-authorized. Such action contravenes the z/OS Statement of Integrity.

If you invoke such services from CICS, you might compromise your system integrity, and IBM Service will not resolve any resulting problems.

Value for the z/OS MEMLIMIT parameter

To provide sufficient 64-bit (above-the-bar) storage for a CICS TS for z/OS, Version 5.2 region, set the value for the z/OS MEMLIMIT parameter equal to or greater than 6 GB. The default value in z/OS for MEMLIMIT is 2 GB.

CICS requires a MEMLIMIT value of 6 GB; any additional use by applications or JVMs should be allowed for with a larger value of MEMLIMIT. If you attempt to start a CICS region with a MEMLIMIT value that is less than 6 GB, message DFHSM0602 is issued, a system dump with the dump code KERNDUMP is produced, and CICS terminates.

You cannot alter the MEMLIMIT value for the CICS region while CICS is running. You can specify a new MEMLIMIT value on the next start of the CICS region.

A suitable MEMLIMIT value for a CICS region must provide sufficient storage for the facilities that use 64-bit storage that you plan to use. When upgrading, it is recommended that you check your MEMLIMIT calculation and take into account any changes in the use of 64-bit storage that may occur. For more information, see Estimating, checking, and setting MEMLIMIT in Improving performance.

This storage is not allocated on initialization; CICS allocates it as the need arises.
Release levels on INQUIRE SYSTEM command

You use the EXEC CICS INQUIRE SYSTEM CICSTSLEVEL command to determine the version and release number of CICS. Use the EXEC CICS INQUIRE SYSTEM OSLEVEL command to determine the level of z/OS.

To ensure compatibility with previous releases, the CICS base element maintains its own level (identification) number. Each time new function is added to CICS and shipped with the CICS Transaction Server product, the CICS level number is incremented.

The CICS level number in CICS TS 5.2 is 0690. This number is returned in the RELEASE parameter of the INQUIRE SYSTEM command.

The level number also appears in the alternative decimal form 6.9 in output from offline utilities such as statistics and dump formatters to identify the level of utility being used, and as the suffix in module names such as DFHPD690.

Changing start procedures to include the activation module

If you use a common, release-independent procedure to start CICS regions, you must include the data set for the activation module in the procedure.

The following JCL is an example of how you can add the data set for the activation module:

CICS procedure:
//CICSTS PROC REL=52
//CICS EXEC PGM=DFHSIP,PARM='SI',REGION=0K,TIME=1439
//STELIB DD DISP=SHR,DSN=CICS&REL..SDFHAUTH ...
... plus other CICS datasets
// INCLUDE MEMBER=LIC&REL

The PROCLIB has the following members for CICS TS for z/OS V5.2 and V5.1:

LIC52
// DD DISP=SHR,DSN=CICS52.SDFHLIC

LIC51
// No activation module dataset required
Chapter 2. Changes to system initialization parameters

In CICS Transaction Server for z/OS, Version 5 Release 2, new system initialization parameters are available, and you might find that some system initialization parameters that you used previously are now obsolete. Also, the scope, default, or range of possible values for some existing system initialization parameters has changed. You might need to make changes to your system initialization table or your CICS startup JCL because of these changes.

To upgrade with the changes to CICS system initialization parameters described in this section, follow these instructions.

Use the default system initialization table

The unsuffixed default system initialization table (DFHSIT) is supplied in the CICS SDFHAUTH library. You can use the default table to start a CICS region using the default values. CICS loads DFHSIT by default if your JCL does not contain a SIT parameter.

Override defaults using the SYSIN data set

To override default values, specify system initialization parameters in a permanent member of a SYSIN data set. You can vary these during testing by changing the data set member, avoiding the need to reassemble suffixed system initialization tables. Nearly all system initialization parameters entered at run time are used even on a warm start. The main exceptions are the FCT and CSD parameters.

Obsolete system initialization parameters

Remove these obsolete parameters from your system initialization table or from your CICS startup JCL (for example, the SYSIN data set) before upgrading. If you specify any of these parameters, they are rejected and a message is issued.

No system initialization parameters were made obsolete in CICS Transaction Server for z/OS, Version 5 Release 2.

Changed system initialization parameters

For some system initialization parameters, the default is now changed, or the values that you can specify are changed, or the scope of the system initialization parameter is changed. You might need to modify your system initialization table (SIT) or CICS startup JCL because of these changes.

APAR PI28039 update

The default setting for the ENCRYPTION system initialization parameter, ENCRYPTION=STRONG, no longer allows the use of the SSL version 3.0 security protocol. The minimum security protocol allowed with ENCRYPTION=STRONG is now TLS version 1.0.

If you have clients that still require the SSL version 3.0 protocol, you can enable support for that protocol by specifying the system initialization parameter ENCRYPTION=SSLV3 for the CICS region. SSL 3.0 should only be used for a migration period while clients that still require this protocol are upgraded. Any connections
that require encryption automatically use the TLS protocol, unless the client
specifically requires SSL 3.0.

**System initialization parameters changed in CICS Transaction
Server for z/OS, Version 5 Release 2**

ENCRIPTION={ALL|TLS12|STRONG|SSLV3} 

Before CICS TS for z/OS, Version 5.2, the ENCRYPTION system initialization
parameter supported these values: STRONG, ALL, and TLS12FIPS. The value
TLS12FIPS is no longer supported. The new value TLS12 is added. To obtain
the same result as using the old TLS12FIPS option, use TLS12, and also code the
new system initialization parameter **NISTSP800131A=CHECK**.

If your system initialization table contains an invalid value, the default value,
STRONG, is used instead. If you specify an override with an invalid value in
your CICS JCL, CICS pauses during startup and prompts you to respecify the
override. To avoid these occurrences, update any system initialization tables or
JCL overrides to specify a valid value.

JVMPROFILEDIR={/usr/lpp/cicsts/cicsts52/JVMProfiles|directory} 

From CICS TS for z/OS, Version 5.2, JVM servers can be defined in CICS
bundles. For these JVM servers, the JVM profile is packaged in the CICS
bundle with the JVMSERVER resource definition. CICS does not load these
JVM profiles from the directory that is specified by JVMPROFILEDIR. Instead,
they are stored in a suitable directory for the CICS bundle, and the location is
specified by the CICS bundle.

MXT={250|number} 

Before CICS TS for z/OS, Version 5.1, the minimum, default, and maximum
values of the MXT parameter were 1, 5, and 999. In CICS TS for z/OS, Version
5.1, the minimum, default, and maximum values were changed to 10, 500, and
2000. From CICS TS for z/OS, Version 5.2, the minimum value is 10, the
default value is 250, and the maximum value is 2000. These adjustments were
made to ensure that CICS regions operate efficiently with the default setting
and can process more workload.

**New system initialization parameters**

The default values for these parameters have minimal impact when you are
upgrading from an earlier release of CICS.

**New system initialization parameters added in CICS Transaction
Server for z/OS, Version 5 Release 2**

- The **NISTSP800131A** system initialization parameter specifies whether the CICS
  region is to check for conformance to the NIST SP800-131A standard.

  NISTSP800131A={NOCHECK|CHECK} 

    NOCHECK  
    Conformance checking is not required in this CICS region. This is
    the default value. 

    CHECK  
    The CICS region is required to check for conformance with the NIST
    SP800-131A security standard. If this value is set, CICS issues a
    message if an actual or potential violation is detected.

    This option also causes the CICS SSL environment to use only TLS v
    1.2 with FIPS 140-2 standards applied.
The checks that are performed are as follows:

**Web services**

If the `<wsse_handler>` tag is specified in a pipeline configuration file, it implies that the pipeline is to be used for web services security. Because not all of the encryption algorithms that can be used for web services security are SP800-131A conformant, installing a pipeline that uses web services means that CICS might be non-conformant. CICS issues message DFHXS1300, which warns of potential nonconformance.

If you receive message DFHXS1300, check whether you are using DFHWSSE as the web services security handler. If you are not using DFHWSSE, inspect your security handler to check which encryption and signing algorithms it uses. If these algorithms are SP800-131A conformant, you can ignore the message. If they are not conformant, consider whether to use conformant algorithms instead. Otherwise, if the CICS region that issues the message must be conformant, consider moving the web service security workload to a different CICS region where conformance is not required.

CICS also checks for certain things that are not conformant to SP800-131A. If any of these situations are found, CICS issues message DFHXS1301:

- An `<algorithm>` element exists within the `<authentication>` element of the `<wsse_handler>` definition in the pipeline configuration file. The only algorithms that can be used are SHA-1 routines, which are not conformant with NIST SP800-131A.
- A `<sign_body>` element exists in the pipeline configuration file. The only algorithms that can be used are SHA-1 routines, which are not conformant with SP800-131A.
- An `<encrypt_body>` element in the pipeline configuration file. Of the four algorithms that can be used, three are conformant with SP800-131A but one is not. If the nonconformant algorithm is specified, DFHXS1301 is issued.

If you receive message DFHXS1301, consider not performing the encryption or signing operations in this CICS region. If the nonconformant algorithm is specified in the `<encrypt_body>` element, consider using a conformant algorithm.

**Sockets**

If SSL is active, setting NISTSP800131A=CHECK forces ENCRYPTION=TLS12 if it is not already set. If ENCRYPTION=TLS12 is forced, message DFHSS00144 is issued. Sockets domain initializes the SSL environment with the FIPS option on and the System SSL started task runs in FIPS mode. The effect of this is that SSL allows fewer ciphers to be used on a successful handshake.
To use FIPS with z/OS Version 2 Release 1 or later, ICSF (Integrated Cryptographic Services Facility) must be active on your system. If you have not already done so, apply APAR OA14956 to z/OS.

If SSL is inactive because no KEYRING parameter is specified, then setting NISTSP800131A has no effect on sockets domain.

**JVM servers**

When a JVM server is started, CICS sets the Java properties to make Java NIST SP800-131A conformant.

If you set NISTSP800131A=CHECK, you should also set ENCRYPTION=TLS12. However, if you do not do so, CICS overrides the value of ENCRYPTION to ENCRYPTION=TLS12 and issues a warning message.

- The USSCONFIG system initialization parameter specifies the name and path of the root directory for CICS Transaction Server configuration files on z/OS UNIX.

  USSCONFIG=/var/cicsts/dfhconfig | directory

  Specifies the directory in which z/OS UNIX configuration files are stored. The default value is /var/cicsts/dfhconfig.
Chapter 3. Changes to the application programming interface

CICS Transaction Server for z/OS, Version 5 Release 2 includes some new API commands to support new CICS functions, and some existing commands have changes to options and error conditions.

Program compatibility

CICS provides API compatibility from release to release. However, functional changes to some CICS components can affect some CICS API commands.

Except for the specific cases described in these topics, CICS Transaction Server provides compatibility with future releases, at source and object level, for all CICS application programs that are written to the CICS application programming interface and which run correctly under the previous release.

For information about CICS support for application programming languages, see the CICS Transaction Server for z/OS What’s New.

Application program mask setting following a handled condition

CICS TS for z/OS, Version 5.2 resolves the problem reported in APAR PM73097. Previously, when CICS handled a condition encountered by an application as requested by an earlier EXEC CICS HANDLE CONDITION command, the application’s program mask was set to zero in the PSW. As a consequence, in the event of a subsequent program exception in a PL/I program, such as an overflow, no interrupt occurred. Now, when CICS handles a condition, the application’s program mask is correctly restored to the value that it had when the EXEC CICS HANDLE CONDITION command was issued.

Changed API commands

Some API commands are extended with new options or RESP2 values. Also, the usage of certain options on existing API commands has changed. Check the new descriptions to ensure that you are using these options in the best way.

ASSIGN

New options ERRORMSG and ERRORMSGLEN on the ASSIGN command return the error message for the CICS task:

- **ERRORMSG(data-area)**
  - Returns the error message up to a maximum of 500 bytes that is currently referenced in the transaction abend control block for the CICS task. Following a failure of a DPL request, the message is that returned from the remote system. For messages shorter than 500 bytes the message is padded with nulls.
  - If no message is present, the 500 byte area contains nulls.

- **ERRORMSGLEN(data-area)**
  - Returns a halfword binary value representing the length of the message returned for ERRORMSG. If the message referenced in the transaction abend control block exceeds 500 bytes, the message is truncated and the length is set to 500.
If no message is present the length returned is 0.

The new option LINKLEVEL on the ASSIGN command returns the program link level:

**LINKLEVEL**(data-area)

Returns a halfword binary value representing the program link level in the local system. The topmost link level is level one and for each EXEC CICS LINK the link level is incremented by one. The link level is not incremented for a language CALL statement. If a program is the target of a DPL request, the link level returned is that within the CICS region it is executing and not the wider distributed transaction. If a program is DPLed to, then link level one will be the CICS mirror program DFHMIRO.

New options APPLICATION, MAJORVERSION, MICROVERSION, MINORVERSION, OPERATION and PLATFORM on the ASSIGN command return the current application context associated with the task:

**APPLICATION**(data-area)

Returns the 64 character name of the current application associated with the task. It is part of the application context that is made up of the application name, the platform name, the operation name and the major, minor and micro version number of the application. If there is no application context associated with the task, then blanks are returned.

**MAJORVERSION**(data-area)

Returns the fullword binary value representing the major version of the current application associated with the task, which is part of the application context. If there is no application context associated with the task, then -1 is returned.

**MICROVERSION**(data-area)

Returns the fullword binary value representing the micro version of the current application associated with the task, which is part of the application context. If there is no application context associated with the task, then -1 is returned.

**MINORVERSION**(data-area)

Returns the fullword binary value representing the minor version of the current application associated with the task, which is part of the application context. If there is no application context associated with the task, then -1 is returned.

**OPERATION**(data-area)

Returns the 64 character name of the current operation associated with the task, which is part of the application context. If there is no application context associated with the task, then blanks are returned.

**PLATFORM**(data-area)

Returns the 64 character name of the platform associated with the task, which is part of the application context. If there is no application context associated with the task, then blanks are returned.

For more information see ASSIGN.

**DELAY**

The DELAY command has been enhanced to allow a value to be specified in milliseconds. However, CICS checks for delay expiry every 250 milliseconds, so the actual interval might vary depending on where in the scan cycle your request is made.
MILLISECS\textit{(data-value)} specifies a fullword binary value in the range 0–999, when HOURS, MINUTES or SECONDS are also specified, or 0-359999999 when MILLISECS is the only option specified.

For more information see \texttt{DELAY}.

**FORMATTIME**

The new option STRINGZONE on the \texttt{FORMATTIME} command specifies in what timezone the DATESTRING value should be returned, UTC or local time.

\texttt{STRINGZONE(cvda)}

Specifies the timezone in which the time stamp returned in DATESTRING is to be returned. The CVDA values are as follows:

\begin{itemize}
  \item \texttt{UTC} DATESTRING is to be returned in UTC. This value is the default setting.
  \item \texttt{LOCAL} DATESTRING is to be returned in LOCAL timezone.
\end{itemize}

For more information see \texttt{FORMATTIME}.

**LINK**

This command operates in the current application context. If the command is issued by a program that is running under a task for an application deployed on a platform, CICS searches first for the named program in the private program directory for the application. If the named program is not found there, CICS then searches the public program directory.

When this command is used to link to a program that is declared as an application entry point for an application deployed on a platform, the CICS bundle where the application entry point is declared must have a status of AVAILABLE. The link is made to the highest numbered version of the application that is installed, enabled, and available. To link to a specified version of an application deployed on a platform, use the \texttt{INVOKE APPLICATION} command instead of the \texttt{LINK} command.

For more information see \texttt{LINK}.

**New API commands**

CICS Transaction Server for z/OS, Version 5 Release 2 includes some new API commands that you can use to create application programs that use new CICS functions.

**EXEC CICS VERIFY TOKEN**

Verify that a Kerberos token is valid, as determined by an external security manager, and optionally allow the caller to extract the RACF user ID that is associated with the principal in the Kerberos token.

**EXEC CICS INVOKE APPLICATION**

Invoke an application entry point program. \texttt{EXEC CICS INVOKE APPLICATION} allows invocation of an application by naming an operation that
corresponds to one of its program entry points, without having to know
the name of the application entry point program and regardless of whether
the program is public or private.

### API commands that have been made threadsafe

These application programming interface commands were not threadsafe when
they were first introduced in CICS, but they have now been made threadsafe.

No existing API commands were made threadsafe in this release.
Chapter 4. Changes to the JCICS application programming interface

The JCICS application programming interface has new methods and other new elements to provide Java support for some of the new functions available through the EXEC CICS application programming interface.

The methods in the JCICS API do not map exactly to the functions available through the EXEC CICS API. For example, the function of a single EXEC CICS command might be provided by multiple JCICS methods, or some functions of an EXEC CICS command might not be supported by any JCICS method. This topic lists the changes to the JCICS API with the EXEC CICS commands that provide the same functions, but the JCICS method and EXEC CICS command do not necessarily provide equivalent functions.

A new method in the Task class returns the current application context of the task:

```java
com.ibm.cics.server.Task.getApplicationContext()
```

The JCICS API provides an equivalent for the following new API command:

```
INVOKE APPLICATION
```

The support is provided by the following new JCICS class:

```java
com.ibm.cics.server.Application
```

This class is the Java implementation of the EXEC CICS INVOKE APPLICATION command.
Chapter 5. Changes to resource definitions

Changes to the resource definitions available in CICS relate to new, changed, or obsolete CICS functions. The changes might involve complete resource definitions or individual attributes. The resource definitions supplied by CICS have corresponding changes, which you can implement by running the UPGRADE function of the CSD utility program (DFHCSDUP).

Resources that can be defined and installed in CICS bundles

The updated BUNDLE resource has additional features to support the use of CICS bundles as part of applications that are deployed on platforms.

You can now create resource definitions in CICS bundles for the following additional CICS RDO resources:

- FILE
- JVMSERVER
- PIPELINE
- TCPIPSERVICE
- WEBSERVICE

For the list of all artifacts that you can define and deploy in CICS(r) bundles, including further RDO resources, JSON transforms, web applications, OSGi bundles and events, see [resource.bundle.artifacts](#).

Obsolete resource definition types and attributes

Some resource definition types and some attributes are now obsolete. You must replace obsolete resource definitions, and obsolete attributes as appropriate.

DNSGROUP in TCPIPSERVICE resource

The DNSGROUP attribute on TCPIPSERVICE resource definitions specified the group name with which CICS registered to Workload Manager, for connection optimization. DNSGROUP is obsolete as part of the removal of support for DNS Connection Optimization. DNSGROUP is supported for CSD compatibility for earlier releases of CICS where it is still valid.

EXPIRYINT in TSMODEL resource

The EXPIRYINT attribute on TSMODEL resource definitions specified the expiry interval for matching temporary storage queues in hours. It has been replaced by the EXPIRYINTMIN attribute, which specifies the expiry interval in minutes. EXPIRYINT is supported for CSD compatibility, and an expiry interval specified using EXPIRYINT is accepted in compatibility mode. New models should use the EXPIRYINTMIN attribute.

GRPCRITICAL in TCPIPSERVICE resource

The GRPCRITICAL attribute on TCPIPSERVICE resource definitions marked the service as a critical member of the DNS group. GRPCRITICAL is obsolete as part of the removal of support for DNS Connection Optimization. GRPCRITICAL is supported for CSD compatibility for earlier releases of CICS where it is still valid.
Obsolete CICS-supplied resource definitions

Some CICS-supplied resource definition groups are now obsolete, and they have been removed from the CICS-supplied default startup group list, DFHLIST. If you use customized startup group lists, you must remove any obsolete definition groups from them.

No CICS-supplied resource definitions were made obsolete in CICS Transaction Server for z/OS, Version 5 Release 2.

Changed resource definitions

Some existing resource definitions have new attributes added, or have changes to the values or scope of existing attributes. You can use the new attributes to add support for new CICS functions. If you have resource definitions that use the changed attributes, check that the value you are using is still the best for your situation.

If you have existing resource definitions that were created before the new attributes for the resources were available, check those resource definitions after you upgrade to this CICS release, to ensure that the default values are suitable for your situation. In some situations, CICS enforces certain values for options if these are required for compatibility with existing options in your resource definition.

**DB2CONN resource definition: changed TCBLIMIT attribute**

The CICS-DB2 interface has been enhanced to detect a mismatch between the number of threads defined and the number of TCBs defined. If the sum of the THREADLIMIT value for the pool (specified in the DB2CONN) and the THREADLIMIT values for all the DB2ENTRYs exceeds the TCBLIMIT value in the DB2CONN, then message DFHDB210 is issued.

**IPCONN resource definition: new HA attribute**

The new HA attribute specifies whether or not the IPCONN definition can be used to connect to a high-availability cluster. The default setting, NO, means that it cannot be used to connect to a high-availability cluster.

**IPCONN resource definition: changed APPLID attribute**

The APPLID attribute specifies the application identifier of the remote system, such as a remote CICS region. If the IPCONN definition is used to connect to a high-availability cluster, you must specify a 1 to 8 character value that identifies the cluster.

**TCPIPSERVICE resource definition: new SPECIFTCPS attribute**

The new SPECIFTCPS attribute names the specific TCPIPSERVICE when you define a generic TCPIPSERVICE as part of a high-availability cluster. Use this parameter with the IPIC protocol, when the IP end point defined by the PORT and HOSTNAME or IPADDRESS attributes is the generic end point of an HA cluster of CICS regions.

**TSMODEL resource definition: new EXPIRYINTMIN attribute**

Support for expiration of temporary storage queues is extended to include temporary storage queues in shared temporary storage pools. A new attribute, EXPIRYINTMIN, specifies the expiry interval, in minutes, for a temporary storage queue that matches the temporary storage model. EXPIRYINTMIN replaces the EXPIRYINT attribute, which is still accepted for compatibility.

EXPIRYINTMIN specifies the expiry interval in minutes, rather than hours. TSMODEL resource definitions that specify the expiry interval in hours,
using the EXPIRYINT attribute, are accepted. New models should specify the interval in minutes. CICS rounds the minutes value up to a multiple of ten minutes. For more information, see TSMODEL resources in Reference -> System definition.

New resource definitions

You can use the new resource definitions that are available in CICS Transaction Server for z/OS, Version 5 Release 2 to define support for new CICS functions.

No new resource definition types were added in this release.

New CICS-supplied resource definition groups

New groups of CICS-supplied resource definitions are added to your CSD when you run the UPGRADE command.

DFHFCRL

The CICS-supplied group DFHFCRL, introduced in CICS Transaction Server for z/OS, Version 5 Release 2, contains definitions for new file control resources.

Group DFHFCRL is in DFHLIST. It contains a TRANSACTION resource definition for transaction CFCR, which is used by CICS to disable files that are defined in CICS bundles, and a PROGRAM resource definition for the program DFHFCRN which it runs.

Changed CICS-supplied resource definition groups

Changed groups of CICS-supplied resource definitions are added to your CSD when you run the UPGRADE command.

DFHPGAIP

The resource definitions for programs DFHPGADX, DFHPGAHX, DFHPGALX, and DFHPGAOX now specify CONCURRENCY(THREADSAFE).

For more information, see "DFHPGAIP"

DFHPGAIP

In CICS TS 5.2, the definitions for the CICS-supplied default autoinstall program, in the CICS-supplied group DFHPGAIP, changed to specify CONCURRENCY(THREADSAFE) to avoid TCB switching during program autoinstall.

The resource definitions for the following programs now specify CONCURRENCY(THREADSAFE):

- DFHPGADX, Assembler program
- DFHPGAHX, C program
- DFHPGALX, PL/I program
- DFHPGAOX, COBOL program

If you are using the CICS-supplied default program for program autoinstall, examine any code added to the exit to ensure it is threadsafe. If the code is not threadsafe, you must either make changes to make it threadsafe, or change the resource definition to specify CONCURRENCY(QUASIRENT).
For more information about threadsafe programming techniques, see Threadsafe programs in Developing applications.

Changes to control tables (macro resource definition)

When upgrading to CICS Transaction Server for z/OS, Version 5 Release 2, reassemble all CICS control tables using the CICS TS 5.2 macro libraries, even if the macro externals have no changes. You must also reassemble any DFHCNV data conversion tables that you use, because CICS initialization fails if you try to load DFHCNV tables assembled using macros from an earlier release.

DFHMCT monitoring control table

The performance class data fields added for CICS Transaction Server for z/OS, Version 5 Release 2, have corresponding new values, which can be defined on the INCLUDE and EXCLUDE operands of the DFHMCT TYPE=RECORD macro. You can use these values to include or exclude specific fields from performance class monitoring records. Control data recording - DFHMCT TYPE=RECORD in the CICS Resource Definition Guide lists all the fields that can now be included or excluded using the macro.
Chapter 6. Changes to the system programming interface

CICS Transaction Server for z/OS, Version 5 Release 2 has some new SPI commands to control new system resources, and some existing commands have new options, or new values for existing options. Some system programming commands, options, or values are now obsolete because they relate to obsolete CICS functions.

Program compatibility

The system programming commands operate on CICS system resources, such as control blocks and tables of resource definitions, and not on user resources, such as data, on which the API operates.

The SPI is also sensitive to the underlying environment in which it is implemented and, as a consequence, compatibility with future releases of CICS cannot be guaranteed.

This section describes the effect on the SPI of the functional changes in CICS, explaining where incompatibilities exist, to enable you to make programming changes where necessary.

Except for the instances given in this section, CICS continues to provide compatibility with future releases, at source and object level, for application programs that use the unaffected SPI commands.

Obsolete SPI commands and options

These system programming interface commands and options are obsolete. Remove these commands and options from your applications, because they represent functions that are no longer available, so the behavior of applications that use these commands changes.

CREATE TCPIPSERVICE
The DNSGROUP and GRPCRITICAL options, which were used in connection with DNS Connection Optimization, are obsolete. DNSGROUP specified the group name with which CICS registered with the z/OS Workload Manager (WLM) for connection optimization. GRPCRITICAL specified whether the TCPIPSERVICE resource was a critical member of the DNS group.

INQUIRE TCPIPSERVICE
The DNSGROUP, DNSSTATUS, and GRPCRITICAL options, which were used in connection with DNS Connection Optimization, are obsolete. DNSGROUP returned the group name with which CICS registered with the z/OS Workload Manager (WLM) for connection optimization. DNSSTATUS returned the Domain Name System (DNS) and Workload Manager (WLM) registration status of the TCPIPSERVICE resource. GRPCRITICAL identified whether the TCPIPSERVICE resource was a critical member of the DNS group.

SET TCPIPSERVICE
The DNSSTATUS option is obsolete. DNSSTATUS was used to specify the
Changed SPI commands

A number of existing system programming interface commands have new options or changes to the values that are available for options.

Inquiring on private resources for applications

A resource that is defined as part of an application installed on a platform is private to that version of that application. For supported resource types, a resource is private if the resource is defined in a CICS bundle that is packaged and installed as part of an application, either as part of the application bundle, or as part of the application binding bundle. A resource that is defined by any other method is publicly available for all tasks, and is known as a public resource.

The following CICS resources are supported as private resources for applications:

- **LIBRARY** resources, which represent one or more data sets, known as dynamic program LIBRARY concatenations, from which program load modules can be loaded.
- **POLICY** resources, which represent one or more rules that manage the behavior of user tasks in CICS regions.
- **PROGRAM** resources, which represent an application program. A program that is auto-installed by a task for an application that is deployed on a platform is also private to that version of the application.

You can inquire on or browse private resources using the `EXEC CICS INQUIRE` system programming command for the resource type. By default, CICS searches for the resources that are available to the program where the `EXEC CICS INQUIRE` command is issued. You can also choose to browse private resources for a specified application.

- When you issue an `EXEC CICS INQUIRE` command from a public program, information is returned about the named public resource. If the resource is not available as a public resource, a “not found” response is returned.
- When you issue an `EXEC CICS INQUIRE` command from a program that is running under a task for an application deployed on a platform, information is returned about the named private resource for that application, if it exists. If the application does not have a private resource with that name, information is returned about a public resource with the specified name. If the resource is not available as a private resource for that application or as a public resource, a “not found” response is returned.
- When you use an `EXEC CICS INQUIRE` command in browse mode from a public program, if you do not specify any other input parameters, the set of public resources of the specified type is returned. If the same browse command is issued from a program that is running under a task for an application deployed on a platform, the browse returns a set of resources consisting of any private resources of the specified type for the application, and the public resources of the specified type.
- To browse the private resources for an application, from either a public program or a private program, issue the `EXEC CICS INQUIRE` command with the START option and specify as input the application context, consisting of the platform, application, and application version. The browse returns a set of resources.
consisting of only the private resources of the specified type for the application. If no application is found with the specified application context, the APPNOTFOUND condition is returned.

For more information about browsing private resources, including examples of browsing resources for a different application from the application where you issue the command, see Browsing resource definitions in Developing system programs.

**CREATE IPCONN**

A new option HA is added to the **CREATE IPCONN** command.

```
HA({NO | YES})
```

Specifies whether the IPCONN can be used to connect to a high-availability cluster.

- **NO** This is the default value. The IPCONN cannot be used to connect to a high-availability cluster.
- **YES** The IPCONN must connect to a region that is part of a high-availability cluster.

The APPLID option specifies the application identifier of the remote system, such as a remote CICS region. If the IPCONN definition is used to connect to a high-availability cluster, you must specify a 1 to 8 character value that identifies the cluster.

**CREATE TCPIPSERVICE**

A new option SPECIFTCPS is added to the **CREATE TCPIPSERVICE** command.

```
SPECIFTCPS
```

This parameter specifies the 8-character name of the specific TCPIPSERVICE when defining a generic TCPIPSERVICE as part of a high-availability cluster. This parameter is only valid when the protocol is IPIC and the IP end point defined by the PORT and HOSTNAME or IPADDRESS attributes is the generic end point of an HA cluster of CICS regions.

Acceptable characters:

```
A-Z 0-9 $ @ #
```

Unless you are using the CREATE command, any lowercase characters are converted to uppercase.

**CREATE TSMODEL**

A new option EXPIRYINTMIN is added to the **CREATE TSMODEL** command.

```
EXPIRYINTMIN({0 | number})
```

Specifies the expiry interval, in minutes, for a temporary storage queue that matches this model. CICS uses the value rounded up to the nearest multiple of 10 minutes. The interval count begins after each use of the temporary storage queue. If the queue is not used again before the expiry interval is reached, the queue becomes eligible for CICS to delete it automatically.

- **0** No expiry interval applies to temporary storage queues that match this model, and they are never eligible for automatic deletion. This setting is the default.
number

An expiry interval in minutes, in the range 1 - 900000. After this expiry
interval, a temporary storage queue that matches this model becomes
eligible for automatic deletion if it has not been used again.

Expiry intervals apply to temporary storage queues in the following locations:

- Main temporary storage in the local CICS region.
- Nonrecoverable auxiliary temporary storage (DFHTEMP data set) associated
  with the local CICS region.
- Temporary storage queues in shared temporary storage pools (CICS TS 5.2
  and higher).

Expiry intervals do not apply to the following types of temporary storage
queues, so CICS never deletes them automatically:

- Queues in auxiliary temporary storage that are defined as recoverable.
- Queues in a remote CICS region. To make CICS delete remote temporary
  storage queues, specify an expiry interval in a suitable TSMODEL resource
definition in the region that owns the queues.
- Queues that CICS creates for its own use.

If you change the expiry interval in a TSMODEL resource definition, existing
temporary storage queues that match the model are not affected. Those queues
continue to use the expiry interval that applied when they were created. If all
the TSMODEL resource definitions with a nonzero expiry interval are deleted
from a CICS region, CICS stops scanning for expired temporary storage
queues.

**EXTRACT STATISTICS and COLLECT STATISTICS**

When you use the `EXEC CICS EXTRACT STATISTICS` or `EXEC CICS COLLECT
STATISTICS` command to request resource statistics for a specific resource of a
resource type that is supported as a private resource, the command operates
according to the context in which the task is running:

- If the command is issued from a public program, statistics are returned for the
  named public resource.
- If the command is issued from a program that is part of an application deployed
  on a platform, so is running with an application context, the private resources
  for the application are searched first for the named resource. If a private
  resource is not found, statistics are returned for the named public resource.
- For the `EXEC CICS EXTRACT STATISTICS` command only, you can specify a
different application context to be searched for private resources. When you
request statistics for a different application, if a private resource is not found for
that application, no statistics are returned.

When you use the `EXEC CICS EXTRACT STATISTICS` or `EXEC CICS COLLECT
STATISTICS` command to return statistics for a specified program that is declared as
an application entry point, only one statistics record is returned. If the command is
issued in or for an application context, and the program was defined as a private
resource for the application, the DSECT for private resources is used to format the
data, even if the program has currently been promoted to a public program in
order to make the application entry point available.

The following new options are added to the `EXTRACT STATISTICS` command to
specify an application context:
APPLICATION\(\text{data-value}\)

Specifies the application name element of the application context. The application name can be up to 64 characters in length.

Specify the application context to return statistics for a private resource that is part of an application deployed on a platform. Statistics for private resources can only be returned as specific, or resource, statistics for a named resource of the JVMPROGRAM, LIBRARY, PROGRAM, or PROGRAMDEF resource types, which are supported as private resources. You must specify a complete application context, including the platform name, application name, and full application version number. If the private resource that you name on the RESID option is not found in the specified application context, no statistics are returned.

You do not need to specify an application context if the command is issued from a program that is part of the relevant application. By default, CICS returns statistics for a private resource from the application where the command is issued, or statistics for a public resource if no private resource can be found.

APPLMAJORVER\(\text{data-value}\)

Specifies the application major version element of the application context, in fullword binary form.

APPLMICROVER\(\text{data-value}\)

Specifies the application micro version element of the application context, in fullword binary form.

APPLMINORVER\(\text{data-value}\)

Specifies the application minor version element of the application context, in fullword binary form.

PLATFORM\(\text{data-value}\)

Specifies the platform name element of the application context. The platform name can be up to 64 characters in length.

INQUIRE ASSOCIATION

New attributes ACAPPLNAME, ACMAJORVER, ACMICROVER, ACMINORVER, ACOPERNAME, and ACPLATNAME return the current application context for the application that is associated with the task:

ACAPPLNAME\(\text{data-area}\)

Returns, in a 64-character area, the name of the application that is associated with the task. If no application context is associated with the task, this option is blank.

ACMAJORVER\(\text{data-area}\)

Returns, in fullword binary form, the major version number of the application associated with the task. If no application context is associated with the task, this option returns 0.

ACMICROVER\(\text{data-area}\)

Returns, in fullword binary form, the micro version number of the application associated with the task. If no application context is associated with the task, this option returns 0.

ACMINORVER\(\text{data-area}\)

Returns, in fullword binary form, the minor version number of the application associated with the task. If no application context is associated with the task, this option returns 0.
ACOPERNAME(data-area)
Returns, in a 64-character area, the name of the application operation that is associated with the task. If no application context is associated with the task, this option is blank.

ACPLATNAME(data-area)
Returns, in a 64-character area, the name of the platform that is associated with the task. If no application context is associated with the task, this option is blank.

INQUIRE BUNDLE and INQUIRE BUNDLEPART
The new AVAILSTATUS option on the INQUIRE BUNDLE and INQUIRE BUNDLEPART commands returns the availability status for the CICS bundle.

AVAILSTATUS(cvda)
Returns the status of the BUNDLE resource that represents the CICS bundle:

AVAILABLE
Callers can access all the resources identified in the CICS bundle as application entry points.

UNAVAILABLE
Callers cannot access any of the resources identified in the CICS bundle as application entry points.

SOMEAVAIL
Some application entry points are available and some are unavailable.

NONE
The bundle does not contain any statements of application entry points.

INQUIRE IPCONN
The new HA option on the INQUIRE IPCONN command shows whether the IPCONN definition can be used to connect to a high-availability cluster.

HA(cvda)
Returns a CVDA value indicating whether the IPCONN can be used to connect to a high-availability cluster. CVDA values are as follows:

NOTREQUIRED
The IPCONN cannot be used to connect to a high-availability cluster.

REQUIRED
The IPCONN must connect to a region that is part of a high-availability cluster.

The APPLID, IPRESOLVED, and PORT options of the INQUIRE IPCONN command, when used with HA IPCONNs that are acquired, now return the values for the specific region in the high-availability cluster to which the IPCONN connected.

INQUIRE JVMSERVER
The PROFILEDIR option of the INQUIRE JVMSERVER command now displays the JVM profile directory for JVM servers that are packaged in CICS bundles.

PROFILEDIR(data-area)
Returns a 240-character data value of the directory on z/OS UNIX that contains the JVM profile for the JVM server. For a JVM server that is defined in a local CICS region, which uses a JVM profile stored in the local CICS
region, the value is the directory specified by the JVMPROFILEDIR system initialization parameter in Reference -> System definition system initialization parameter for the CICS region. For a JVM server that is defined in a CICS bundle, which uses a JVM profile packaged in the CICS bundle, the value is the CICS bundle subdirectory where the JVM profile is stored.

**INQUIRE LIBRARY**

New options are added to the INQUIRE LIBRARY command to specify the application context for browsing private resources.

APPLICATION(data-area)

Specifies the application name element of the application context. The application name can be up to 64 characters in length.

To browse private resources for an application deployed on a platform, use the APPLICATION, APPLMAJORVER, APPLMINORVER, APPLMICROVER, and PLATFORM options with the browse command START to specify the platform, application name, and full version number for the application whose resources you want to browse.

APPLMAJORVER(data-area)

Specifies the application major version element of the application context, in fullword binary form.

APPLMINORVER(data-area)

Specifies the application minor version element of the application context, in fullword binary form.

APPLMICROVER(data-area)

Specifies the application micro version element of the application context, in fullword binary form.

PLATFORM(data-area)

Specifies the platform name element of the application context. The platform name can be up to 64 characters in length.

**INQUIRE PIPELINE**

The INQUIRE PIPELINE command now includes a MSGFORMAT parameter for determining the message format processed by a pipeline:

MSGFORMAT(data-area)

Returns an 8-byte character string that indicates the message format processed by the PIPELINE.

SOAP11

The pipeline processes the SOAP 1.1 message format.

SOAP12

The pipeline processes the SOAP 1.2 message format, and can also process the SOAP 1.1 message format.

JSON

The pipeline processes the JSON message format.

OTHER

The pipeline processes other message formats, such as customer-specified formats.
INQUIRE PROGRAM

A new option RESIDENCY is added to the INQUIRE PROGRAM command.

RESIDENCY(cvda) (programs only)
Returns a CVDA value that indicates the program's residency attributes. The
CVDA values are as follows:

RESIDENT
The program is permanently resident. It is defined as RESIDENT(YES).

NONRESIDENT
The program has been defined as RESIDENT(NO).

New options are added to the INQUIRE PROGRAM command to specify the
application context for browsing private resources. For the INQUIRE PROGRAM
command only, the application context is used to specify a different application for
browsing private resources, and also to return information for an inquiry on a
public PROGRAM resource that is defined as an application entry point. For other
resource types that are supported as private resources, the application context is
not used to return information.

APPLICATION(data-area)
Specifies or returns the application name element of the application context.
The application name can be up to 64 characters in length.

To browse private resources for an application deployed on a platform, use the
APPLICATION, APPLMAJORVER, APPLMINORVER, APPLMICROVER, and
PLATFORM options with the browse command START, to specify the platform,
application name, and full version number for the application whose resources
you want to browse.

For an inquiry on a public PROGRAM resource, the APPLICATION,
APPLMAJORVER, APPLMINORVER, APPLMICROVER, and PLATFORM
options return the name, version number, and platform of the application for
which the program is defined as an application entry point. The OPERATION
option returns the name of the relevant operation in the application. If the
program is not defined as an application entry point, APPLICATION returns
64 blanks.

APPLMAJORVER(data-area)
Specifies or returns the application major version element of the application
context, in fullword binary form. For an inquiry on a public PROGRAM
resource, if the program is not defined as an application entry point,
APPLMAJORVER returns a value of -1.

APPLMINORVER(data-area)
Specifies or returns the application minor version element of the application
context, in fullword binary form. For an inquiry on a public PROGRAM
resource, if the program is not defined as an application entry point,
APPLMINORVER returns a value of -1.

APPLMICROVER(data-area)
Specifies or returns the application micro version element of the application
context, in fullword binary form. For an inquiry on a public PROGRAM
resource, if the program is not defined as an application entry point,
APPLMICROVER returns a value of -1.

PLATFORM(data-area)
Specifies or returns the platform name element of the application context. The
platform name can be up to 64 characters in length. For an inquiry on a public
PROGRAM resource, if the resource is not defined as an application entry
point, PLATFORM returns 64 blanks.

INQUIRE SYSTEM

Three new keywords have been added to the INQUIRE SYSTEM command. These are
MESSAGECASE, MVSSMFID and MVSSYSNAME.

MESSAGECASE(cvida)
Returns a CVDA value that shows how the message domains display mixed
case messages, as set by the MSGCASE system initialization parameter. CVDA
values are as follows:

MIXED
All messages displayed by the CICS message domain or the CICSPlex
SM message domain remain in mixed case.

UPPER
The message domain displays all mixed case messages in uppercase
only.

MVSSMFID(data-area)
Returns a 4-byte value indicating the MVS system identification. This field is
copied from the SMCASID field of the SMCA MVS control block.

MVSSYSNAME(data-area)
Returns an 8-byte value indicating the MVS system name. This field is copied
from the CVTSNAME field of the MVS CVT control block.

INQUIRE TCPIPSERVICE

New options are added to the INQUIRE TCPIPSERVICE command to support access
to high-availability clusters of CICS regions over IP interconnectivity (IPIC)
connections.

GENERICTCPS(data-area)
Returns the 8-character generic TCPIPSERVICE name that this specific TCP/IP
service is associated with when used as part of the configuration within an
IPIC high-availability cluster. This information is only present when both
TCP/IP services are opened. It is blank when there is no generic
TCPIPSERVICE or when this generic TCPIPSERVICE is closed.

SPECIFICTCPS(data-area)
Returns the 8-character specific TCPIPSERVICE name that this generic TCP/IP
service uses when receiving a high-availability IPIC connection request.

When the TCP/IP service is in OPEN or CLOSING status, the value returned by
the BACKLOG option of the INQUIRE TCPIPSERVICE command is now the actual value
for the maximum number of queued requests that the local TCP/IP stack permits
for this service, taking into account the setting for the SOMAXCONN parameter in
the PROFILE.TCPIP data set for the z/OS Communications Server port. When the
TCP/IP service is in CLOSED or OPENING status, the value returned by the
BACKLOG option is the value defined in the BACKLOG attribute of the
TCPIPSERVICE resource definition.

A new value BUNDLE is added for the INSTALLAGENT option of the INQUIRE
TCPIPSERVICE command, to show that the TCPIPSERVICE resource was installed by
a bundle deployment.
INQUIRE UOWLINK

The new PORT option on the INQUIRE UOWLINK command returns the port number of the partner system for IPIC connections.

```plaintext
PORT(data-area)
    For TYPE value IPIC, returns the TCP/IP port number that the partner system was listening on when the connection was acquired. Port is a number in the range 1 to 65535 and will be zero for other TYPE values.
```

INQUIRE URIMAP

New options are added to the INQUIRE URIMAP command to return the details of the application entry point for the URIMAP resource, and of the resulting availability status of the URIMAP resource.

```plaintext
AVAILSTATUS(cvda)
    Returns the availability status of the URIMAP resource as an application entry point for an application deployed on a platform.

    AVAILABLE
        The URIMAP resource is declared as an application entry point, and the application entry point controls its availability and is available, so the URIMAP resource is available to callers.

    UNAVAILABLE
        The URIMAP resource is declared as an application entry point, but the application entry point that controls its availability is unavailable, so the URIMAP resource is not available to callers.

    NONE
        The URIMAP resource is available to callers. Either the URIMAP resource is not declared as an application entry point, or it is declared as an application entry point but the application entry point is disabled or does not control the availability of the URIMAP resource.

APPLICATION(data-value)
    Returns a 64-character area containing the application name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, APPLICATION returns blanks.

APPLMAJORVER(data-value)
    Returns the fullword binary form of the major version number of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, APPLMAJORVER returns -1.

APPLMINORVER(data-value)
    Returns the fullword binary form of the minor version number of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, APPLMINORVER returns -1.

APPLMICROVER(data-value)
    Returns the fullword binary form of the micro version number of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, APPLMICROVER returns -1.
```
OPERATION(data-value)
Returns a 64-character area containing the operation name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, OPERATION returns blanks.

PLATFORM(data-value)
Returns a 64-character area containing the platform name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not defined as an application entry point, PLATFORM returns blanks.

INQUIRE WEBSERVICE

The STATE option of the INQUIRE WEBSERVICE command returns two new states, DISABLING and DISABLED, which apply only for web services that are packaged in CICS bundles.

DISABLED
This state is only available for WEBSERVICE resources that are defined in a CICS bundle. The web service has completed quiescing and is not accepting new work.

DISABLING
This state is only available for WEBSERVICE resources that are defined in a CICS bundle. The web service is quiescing. It is not accepting new work, but is allowing currently-executing work to complete. When the web service is no longer in use, the state of the WEBSERVICE resource changes to DISABLED.

PERFORM STATISTICS RECORD

Continue to use the existing keywords on the EXEC CICS PERFORM STATISTICS RECORD system programming command to write statistics for program, program definition, JVM program, or library resource types to the SMF data set. If a resource is a public resource, the existing DSECT is used to map its data, and if a resource is a private resource, the new DSECT is used to map its data.

Programs that are declared as application entry points are identified by a field in the DSECTs for public and private program definitions (PROGRAMDEF statistics keyword) and JVM programs (JVMPROGRAM keyword). When interval statistics, end-of-day statistics, requested statistics, requested reset statistics, or unsolicited statistics are produced for a program definition or JVM program that is declared as an application entry point, two statistics records are written, one mapped by the DSECT for public resources, and one mapped by the DSECT for private resources. For the program statistics that are produced by the loader domain (PROGRAM keyword), application entry points are not identified, and only one private program statistics record is written.

SET BUNDLE

A new option AVAILSTATUS on the SET BUNDLE command gives or removes access to application entry points that are declared in the CICS bundle. For a CICS bundle that declares application entry points, you must first enable the bundle, then make it available, to give users access to the resources. For a CICS bundle that does not declare application entry points, you only need to enable the bundle.

AVAILSTATUS(cvda)
Changes the status of the BUNDLE resource that represents the CICS bundle:
AVAILABLE
CICS gives callers access to the resources identified in the CICS bundle as application entry points, so that they can access all the resources in the CICS bundle.

UNAVAILABLE
CICS removes access to the resources identified in the CICS bundle as application entry points, so callers cannot access any of the private resources in the CICS bundle.

SET FILE
To change the status of a FILE resource that was defined and installed in a CICS bundle, change the status of the CICS bundle or the application with which it is deployed. When you perform the disable action on a CICS bundle that defines a FILE resource, the action completes when the file is no longer in use and any retained locks have been resolved.

If you are experiencing a problem with disabling a CICS bundle that defines a FILE resource, you may issue the EXEC CICS SET FILE DISABLED or EXEC CICS SET FILE CLOSED command with the FORCE option against the dynamically generated resource, if this action is required. Follow the troubleshooting procedure in Diagnosing application errors to diagnose the problem and take suitable action.

SET JVMSERVER
To disable a JVMSERVER resource that is defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If the disable process does not complete, because the resource is still in use, you can now use the SET JVMSERVER PURGE, FORCEPURGE, or KILL command on the dynamically generated resource in the CICS region. If you attempt to issue the command before performing the disable action on the CICS bundle, CICS issues error message DFHSJ1203.

SET TCPIPSERVICE
To disable a TCPIPSERVICE resource that is defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If the disable process does not complete, because the resource is still in use, you can now use the SET TCPIPSERVICE IMMCLOSE command on the dynamically generated resource in the CICS region. If you attempt to issue the command before performing the disable action on the CICS bundle, CICS issues error message DFHSO0140.

New SPI commands
CICS Transaction Server for z/OS, Version 5 Release 2 includes some new SPI commands that you can use to control new system resources or to work in new ways with existing resources.

No new system programming commands were added in CICS Transaction Server for z/OS, Version 5 Release 2.
SPI commands that have been made threadsafe

These system programming interface commands were not threadsafe when they were first introduced in CICS, but they have now been made threadsafe.

Chapter 7. Changes to CEMT

The commands available in the CEMT transaction have been modified to reflect changes to resource definitions and new functions.

The CICS transactions accept as few characters of a keyword as needed to identify the keyword uniquely in the request. Minimum abbreviations might change between CICS releases because of the introduction of new commands. If you use automated processes or programs to issue commands for CICS transactions, and you use abbreviations for the keywords, check for any changes to these abbreviations in the new release. In the syntax displays on your screen, the minimum permitted abbreviation is shown in uppercase characters, and the remainder is shown in lowercase.

Obsolete CEMT commands and options

These CEMT commands and options represent functions that are no longer available, so are no longer displayed in the CEMT transaction.

CEMT INQUIRE TSMODEL, CEMT INQUIRE TSQUEUE, and CEMT INQUIRE TSQNAME

The EXPIRYINT option is obsolete. EXPIRYINT was used to set the expiry interval for temporary storage queues in hours. It has been superseded by the EXPIRYINTMIN option, which sets the expiry interval for temporary storage queues in minutes.

CEMT INQUIRE DISPATCHER

The ACTJVMTCBS option and the MAXJVMTCBS option are obsolete. ACTJVMTCBS was used to inquire on the number of J8 and J9 mode TCBs currently allocated to user tasks. MAXJVMTCBS was used to inquire on the maximum number of J8 and J9 mode TCBs allowed in the JVM pool.

CEMT PERFORM STATISTICS

The BEAN, CORBASERVER, JVMPOOL, JVMPROFILE, and REQUESTMODEL options are obsolete. These options were used to request statistics for enterprise beans, CorbaServer entries, pooled JVMs and their profiles, and request models, which CICS no longer supports.

CEMT SET DISPATCHER

The MAXJVMTCBS option is obsolete. MAXJVMTCBS was used to change the maximum number of J8 and J9 mode open TCBs allowed in the JVM pool, which no longer exists.

Changed CEMT commands

These CEMT commands have new options or new values for options.

Inquiring on private resources for applications

A resource that is defined as part of an application installed on a platform is private to that version of that application. For supported resource types, a resource is private if the resource is defined in a CICS bundle that is packaged and installed as part of an application, either as part of the application bundle, or as part of the application binding bundle. A resource that is defined by any other method is publicly available for all tasks, and is known as a public resource.
The following CICS resources are supported as private resources for applications:

- **LIBRARY** resources, which represent one or more data sets, known as dynamic program LIBRARY concatenations, from which program load modules can be loaded.
- **POLICY** resources, which represent one or more rules that manage the behavior of user tasks in CICS regions.
- **PROGRAM** resources, which represent an application program. A program that is auto-installed by a task for an application that is deployed on a platform is also private to that version of the application.

Private LIBRARY and PROGRAM resources cannot be viewed using the CEMT INQUIRE LIBRARY and CEMT INQUIRE PROGRAM commands. To inquire on or browse these resources, use the CICS Explorer®, or the EXEC CICS INQUIRE LIBRARY and EXEC CICS INQUIRE PROGRAM CICS system programming commands.

LIBRARY concatenations and programs that are defined as a dependency or import for an application bundle or an application binding bundle, and LIBRARY concatenations and programs that are defined to CICS using any other method, remain publicly available for all tasks. These LIBRARY concatenations and programs can be viewed using the CEMT commands.

**CEMT INQUIRE BUNDLE**

The new AVAILSTATUS option for the CEMT INQUIRE BUNDLE command returns the availability status for the CICS bundle.

```
AVAILSTATUS(value)
```

Displays the availability status of the bundle. The possible values are as follows:

- **AVAILABLE**
  
  Callers can access all the resources identified in the CICS bundle as application entry points.

- **UNAVAILABLE**
  
  Callers cannot access any of the resources identified in the CICS bundle as application entry points.

- **SOMEAVAIL**
  
  Some application entry points are available and some are unavailable.

- **NOTAPPLIC**
  
  The bundle does not contain any statements of application entry points.

**CEMT INQUIRE JVMSERVER**

The PROFILEDIR option for the CEMT INQUIRE JVMSERVER command now displays the JVM profile directory for JVM servers that are packaged in CICS bundles.

```
PROFILEDIR(directory)
```

Displays the directory on z/OS UNIX that contains the JVM profile for the JVM server. For a JVM server that is defined in a local CICS region, which uses a JVM profile stored in the local CICS region, this is the directory specified by the JVMPROFILEDIR system initialization parameter for the CICS region. For a JVM server that is defined in a CICS bundle, which uses a JVM profile packaged in the CICS bundle, this is the CICS bundle subdirectory where the JVM profile is stored.
CEMT INQUIRE PROGRAM

The CEMT INQUIRE PROGRAM command has a new option RESIDENCY.

RESIDENCY(value)
Displays the program's residency attributes:

RESIDENT
  The program is permanently resident. It is defined as RESIDENT(YES).

NONRESIDENT
  The program is defined as RESIDENT(NO).

CEMT INQUIRE URIMAP

New options are added to the CEMT INQUIRE URIMAP command to return the details of the application entry point for the URIMAP resource, and of the resulting availability status of the URIMAP resource.

AVAILSTATUS(value)
Displays the availability status of the URIMAP resource as an application entry point for an application deployed on a platform.

AVAILABLE
  The URIMAP resource is declared as an application entry point, and the application entry point controls its availability and is available, so the URIMAP resource is available to callers.

UNAVAILABLE
  The URIMAP resource is declared as an application entry point, but the application entry point that controls its availability is unavailable, so the URIMAP resource is not available to callers.

NOTAPPLIC
  The URIMAP resource is available to callers. Either the URIMAP resource is not declared as an application entry point, or it is declared as an application entry point but the application entry point is disabled or does not control the availability of the URIMAP resource.

APPLICATION(data-value)
Displays the application name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not declared as an application entry point, APPLICATION displays blanks.

APPLMAJORVER(data-value)
Displays the major version number of the application. If the URIMAP resource is declared as an application entry point, the major version number of this application is returned. If the URIMAP resource is not declared as an application entry point, APPLMAJORVER returns -1.

APPLMINORVER(data-value)
Displays the minor version number of the application. If the URIMAP resource is declared as an application entry point, the minor version number of this application is returned. If the URIMAP resource is not declared as an application entry point, APPLMINORVER returns -1.

APPLMICROVER(data-value)
Displays the micro version number of the application. If the URIMAP resource is declared as an application entry point, the micro version number of this application is returned. If the URIMAP resource is not declared as an application entry point, APPLMICROVER returns -1.
OPERATION(data-value)
Displays the operation name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not declared as an application entry point, OPERATION displays blanks.

PLATFORM(data-value)
Displays the platform name of the application for which this URIMAP resource is declared as an application entry point. If the URIMAP resource is not declared as an application entry point, PLATFORM displays blanks.

CEMT INQUIRE WEBSERVICE
The STATE option of the CEMT INQUIRE WEBSERVICE command displays two new states, DISABLING and DISABLED, which apply only for web services that are packaged in CICS bundles.

DISABLED
This state is only available for WEBSERVICE resources that are defined in a CICS bundle. The web service has completed quiescing and is not accepting new work.

DISABLING
This state is only available for WEBSERVICE resources that are defined in a CICS bundle. The web service is quiescing. It is not accepting new work, but is allowing currently-executing work to complete. When the web service is no longer in use, the state of the WEBSERVICE resource changes to DISABLED.

CEMT PERFORM DUMP and CEMT PERFORM SNAP
A new DUMPCODE parameter has been added to the CEMT PERFORM DUMP and CEMT PERFORM SNAP commands to specify a dump code for the dump request.

DUMPCODE(data-value)
Specifies a maximum 8-character dump code for this dump request. The value is a user defined code which can be any character string that does not contain leading or imbedded blank characters. If a dump code is not specified, CICS uses a default dump code of MT0001.

CEMT SET BUNDLE
New AVAILABLE and UNAVAILABLE options on the SET BUNDLE command give or remove access to application entry points that are declared in the CICS bundle. For a CICS bundle that declares application entry points, you must first enable the bundle, then make it available, to give users access to the resources. For a CICS bundle that does not declare application entry points, you only need to enable the bundle.

AVAILABLE
Make one or more BUNDLE resources available. CICS gives callers access to the resources identified in the CICS bundle as application entry points.

UNAVAILABLE
Make one or more BUNDLE resources unavailable. CICS removes access to the resources identified in the CICS bundle as application entry points, so callers cannot access any of the private resources in the CICS bundle.
CEMT SET FILE

To disable a file that is defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If you are experiencing a problem with disabling a CICS bundle that defines a FILE resource, you can now issue the CEMT SET FILE command with the FORCECLOSE option against the dynamically generated resource, if this action is required. Follow the troubleshooting procedure in Diagnosing application errors to diagnose the problem and take suitable action.

CEMT SET JVMSERVER

To disable a JVMSERVER resource that is defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If the disable process does not complete, because the resource is still in use, you can now use the CEMT SET JVMSERVER PURGE, FORCEPURGE, or KILL command on the dynamically generated resource in the CICS region.

CEMT SET TCPIPSERVICE

To disable a TCPIPSERVICE resource that is defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If the disable process does not complete, because the resource is still in use, you can now use the CEMT SET TCPIPSERVICE IMMCL0SE command on the dynamically generated resource in the CICS region.

New CEMT commands

These CEMT commands support new CICS functions.

For detailed information on all the new and changed CEMT transactions and options, see the CICS Supplied Transactions.

No new CEMT commands were added in CICS Transaction Server for z/OS, Version 5 Release 2.
Chapter 8. Changes to the CICS management client interface (CMCI)

The CICS management client interface (CMCI) supports additional CICSPlex SM and CICS resources, and you can query the resources using external resource names.

No new CICSPlex SM resources were added in CICS Transaction Server for z/OS, Version 5 Release 2.
Chapter 9. Changes to the CICS-supplied transactions

Some CICS-supplied transactions are new, or have changed to support new functions.

The CICS transactions accept as few characters of a keyword as needed to identify the keyword uniquely in the request. Minimum abbreviations might change between CICS releases because of the introduction of new commands. If you use automated processes or programs to issue commands for CICS transactions, and you use abbreviations for the keywords, check for any changes to these abbreviations in the new release. In the syntax displays on your screen, the minimum permitted abbreviation is shown in uppercase characters, and the remainder is shown in lowercase.

Changes to CSFE

The CSFE terminal and system test transaction can now be used to check on the status of a previous debug request.

CSFE now allows the status of DEBUG parameters to be queried, so for example to report if the global trap is active, or whether storage violation checking is active.

This transaction is mainly intended to be used by system programmers and IBM field engineers.

New transaction CFCR

CFCR was introduced in CICS Transaction Server for z/OS, Version 5 Release 2. CICS uses this transaction to disable files that are defined in CICS bundles.

CFCR, and the program DFHFCRN that it runs, are defined in the new CICS-supplied resource definition group DFHFCRL. When you perform the disable action on a CICS bundle that contains a definition for a FILE resource, CICS attaches CFCR to manage the disable process for the file.

CFCR is a RACF® Category 1 transaction.
Chapter 10. Changes to global user exits and task-related user exits

CICS Transaction Server for z/OS, Version 5 Release 2 has changes to some existing global user exit programs and task-related user exit programs. Check your existing global user exit programs against the changes summarized here.

Reassembling global user exit programs

The CICS global user exit programming interface is product-sensitive, and depends on the facilities that are set up in your CICS system. It is advisable to reassemble global user exit programs for each CICS release, because changes to CICS internals might affect structures used by the CICS global user exit programming interface, even if there are no changes to the externals of the programming interface.

For other areas of the XPI, check the changes to externals that are summarized in this section, and modify your global user exit programs to allow for changes to relevant parameters. After you complete your program changes, reassemble the affected global user exit programs against the CICS Transaction Server for z/OS, Version 5 Release 2 libraries.

A global user exit or task-related user exit might be assembled using CICS libraries from one CICS release and make an XPI call on a system that runs a different CICS release. In this situation, whether or not control is successfully transferred from the exit to the correct CICS module to handle that XPI call depends on the combination of CICS releases, and whether the XPI call is a release-sensitive call. For the user exit to succeed, you must also check other factors, for example whether XPI parameters have changed between releases.

If a user exit fails, an error message is issued and the transaction that called the exit might abend.

The following table summarizes the effect of different CICS releases on user exits. Release-sensitive XPI calls are not available in releases before CICS TS 4.1.

Table 1. User exits with different CICS releases

<table>
<thead>
<tr>
<th>CICS release of the libraries used to assemble the XPI call</th>
<th>Release-sensitive XPI call?</th>
<th>CICS system that the XPI call is made on</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CICS TS 5.2, CICS TS 5.1, CICS TS 4.2, or CICS TS 4.1</td>
<td>Yes</td>
<td>All currently supported CICS releases</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
<tr>
<td>CICS TS 5.2, CICS TS 5.1 or CICS TS 4.2</td>
<td>No</td>
<td>CICS TS 5.2, CICS TS 5.1 or CICS TS 4.2</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
<tr>
<td>CICS TS 5.2, CICS TS 5.1 or CICS TS 4.2</td>
<td>No</td>
<td>CICS TS 4.1, CICS TS 3.2, and CICS TS 3.1</td>
<td>Unpredictable result</td>
</tr>
</tbody>
</table>
Changes to the DFHUEPAR standard parameter list

DFHUEPAR is a standard parameter list of TCB 2-character codes and symbolic values addressed by the global user exit task indicator field, UEPGIND. TCB modes are represented in DFHUEPAR as both a 2-character code and a symbolic value.

No changes were made to the DFHUEPAR standard parameter list in CICS Transaction Server for z/OS, Version 5 Release 2.

Changes to global user exits

Some existing global user exits have new parameters, new values or return codes, or changes to how the exits are used.

Resource management installation and discard exit: XRSINDI

The new UEPAPCTX and UEPANPTK parameters of the XRSINDI global user exit now supply the application context information for private resources for applications that are deployed on platforms.

UEPAPCTX

For private resources for applications that are deployed on platforms, this parameter contains the address of a variable-length list, which corresponds to the list in UEPIDNAM, containing the application context information for the resource. The information is listed in the following order:

<table>
<thead>
<tr>
<th>CICS release of the libraries used to assemble the XPI call</th>
<th>Release-sensitive XPI call?</th>
<th>CICS system that the XPI call is made on</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CICS TS 4.1</td>
<td>No</td>
<td>CICS TS 5.2, CICS TS 5.1, CICS TS 4.2, or CICS TS 4.1</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
<tr>
<td>CICS TS 4.1</td>
<td>No</td>
<td>CICS TS 3.2 and CICS TS 3.1</td>
<td>Unpredictable result</td>
</tr>
<tr>
<td>CICS TS 3.2 or CICS TS 3.1</td>
<td>No</td>
<td>CICS TS 5.2, CICS TS 5.1, CICS TS 4.2, or CICS TS 4.1</td>
<td>Back level XPI call detected, and user exit fails</td>
</tr>
<tr>
<td>CICS TS 3.2</td>
<td>No</td>
<td>CICS TS 3.2</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
<tr>
<td>CICS TS 3.2</td>
<td>No</td>
<td>CICS TS 3.1</td>
<td>Unpredictable result</td>
</tr>
<tr>
<td>CICS TS 3.1</td>
<td>No</td>
<td>CICS TS 3.2 or CICS TS 3.1</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
</tbody>
</table>
1. The platform name, padded with spaces to 64 characters.
2. The application name, padded with spaces to 64 characters.
3. The major version number for the application, which is a fullword binary value.
4. The minor version number for the application, which is a fullword binary value.
5. The micro version number for the application, which is a fullword binary value.

CICS supplies a DSECT named DFHUEACD which maps this information. For more information about DFHUEACD, see UEACD - User exit application context in Data Areas.

UEPAPPTK
Address of a variable-length list, containing an 8-character token representing the application instance to which this resource belongs. For public resources, this address is zero.

New global user exit points

New global user exit points help you customize new or existing CICS functions.

No new global user exit points were added in this release.

Changes to task-related user exits

Task-related user exit programs may be invoked and used in new ways in new CICS releases.

In CICS Transaction Server for z/OS, Version 5 Release 2 there were no changes to task-related user exits.
Chapter 11. Changes to the exit programming interface

CICS Transaction Server for z/OS, Version 5 Release 2 has changes to some existing programming interface. Check your existing global user exit programs against the changes summarized here.

Reassembling global user exit programs

The CICS global user exit programming interface is product-sensitive, and depends on the facilities that are set up in your CICS system. It is advisable to reassemble global user exit programs for each CICS release, because changes to CICS internals might affect structures used by the CICS global user exit programming interface, even if there are no changes to the externals of the programming interface.

For other areas of the XPI, check the changes to externals that are summarized in this section, and modify your global user exit programs to allow for changes to relevant parameters. After you complete your program changes, reassemble the affected global user exit programs against the CICS Transaction Server for z/OS, Version 5 Release 2 libraries.

A global user exit or task-related user exit might be assembled using CICS libraries from one CICS release and make an XPI call on a system that runs a different CICS release. In this situation, whether or not control is successfully transferred from the exit to the correct CICS module to handle that XPI call depends on the combination of CICS releases, and whether the XPI call is a release-sensitive call. For the user exit to succeed, you must also check other factors, for example whether XPI parameters have changed between releases.

If a user exit fails, an error message is issued and the transaction that called the exit might abend.

The following table summarizes the effect of different CICS releases on user exits. Release-sensitive XPI calls are not available in releases before CICS TS 4.1.

Table 2. User exits with different CICS releases

<table>
<thead>
<tr>
<th>CICS release of the libraries used to assemble the XPI call</th>
<th>Release-sensitive XPI call?</th>
<th>CICS system that the XPI call is made on</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>CICS TS 5.2, CICS TS 5.1, CICS TS 4.2, or CICS TS 4.1</td>
<td>Yes</td>
<td>All currently supported CICS releases</td>
<td>Control transfers to the correct CICS module for the XPI call</td>
</tr>
<tr>
<td>CICS TS 5.2, CICS TS 5.1 or CICS TS 4.2</td>
<td>No</td>
<td>CICS TS 5.2, CICS TS 5.1 or CICS TS 4.2</td>

</tbody>
</table>

Changes to the exit programming interface (XPI)

Changes to the exit programming interface (XPI) mean that you might need to change global user exit programs that contain XPI calls. Check whether your global user exit programs are affected by these changes to the XPI, and modify your programs accordingly.

**Changed INQUIRE_APP_CONTEXT call**

The INQ_APP_CONTEXT call now returns the current application context for the most recent application that has been set onto the task.

For details, see The INQUIRE_APP_CONTEXT call in Reference -> System programming reference and Application context in Product overview.

**Changed INQUIRE_PROGRAM and START_BROWSE_PROGRAM calls - application context**

You can use new options on the INQUIRE_PROGRAM and START_BROWSE_PROGRAM calls to inquire on private programs for applications deployed on platforms. To inquire on private programs for applications deployed on platforms, you must specify the AC_APPLICATION_NAME, AC_MAJOR_VERSION, AC_MINOR_VERSION, AC_MICRO_VERSION, and AC_PLATFORM_NAME fields to provide a complete application context. The SHOW_PROGRAMS option specifies whether to search for private programs only, or both private and public programs.
New exit programming interface (XPI) calls

CICS provides XPI calls that you can use in exit programs to retrieve information about functions in CICS.

In CICS Transaction Server for z/OS, Version 5 Release 2 there were no changes to XPI calls.
Chapter 12. Changes to user-replaceable programs

Reassemble all user-replaceable programs, checking whether any changes to the user-replaceable program interface affect your own customized programs.

For each CICS release, you must reassemble all user-replaceable programs, whether or not you make any changes to them. Before reassembling the programs, check whether these changes to the user-replaceable program interface affect your own customized programs, and make any necessary changes.

For example, there might be changes to the parameters passed to the programs or there might be new actions that the programs need to take. To help you to identify any code changes that are required, compare your customized programs with the sample code in the user-replaceable sample programs provided with this CICS release.

See Customizing with user-replaceable programs in the CICS Customization Guide for programming information about user-replaceable programs.

Obsolete user-replaceable programs

These user-replaceable programs are no longer used in CICS Transaction Server for z/OS, Version 5 Release 2.

No user-replaceable programs were made obsolete in CICS Transaction Server for z/OS, Version 5 Release 2.

Changed user-replaceable programs

Check whether the changes listed for this release to the user-replaceable program interface affect your own customized programs, and make any necessary changes. For example, the parameters passed to the programs might be changed, or the programs might need to take new actions. To help you to identify any code changes that are required, compare your customized programs with the sample code in the user-replaceable sample programs provided with this CICS release.

DFHDSRP, distributed routing program: DFHDYPDS copybook

There are changes to the copybook DFHDYPDS that defines the communication area for the CICS-supplied sample distributed routing program DFHDSRP.

The following changes were introduced in CICS TS 5.2:

- The following DFHDYPDS tokens are new:

  DYRCLOUD
  Cloud Routing Data.

  DYRPLATFORM
  Platform name.

  DYRAPPLICATION
  Application name.
DYRAPPLVER
Application version.

DYRAPPLMAJOR
Application major version.

DYRAPPLMINOR
Application minor version.

DYRAPPLMICRO
Application micro version.

DYROPERATION
Operation name.

The DYRVER token is incremented by 1 to indicate that this module is changed for this CICS TS release.

If you use your own routing program, you might have to make adjustments for these changes. Because the length of DFHDYPDS has changed, you must recompile your user-written dynamic routing and distributed routing programs if they check the length of DFHDYPDS as the CICS-supplied samples do.

DFHPGADGX, program autoinstall program

In CICS TS 5.2, the definitions for the CICS-supplied default autoinstall program, in the CICS-supplied group DFHPGAIP, changed to specify CONCURRENCY(THREADSAFE) to avoid TCB switching during program autoinstall. The resource definitions for the following programs now specify CONCURRENCY(THREADSAFE):

- DFHPGADX, Assembler program
- DFHPGAHX, C program
- DFHPGALX, PL/I program
- DFHPGAOX, COBOL program

If you are using the CICS-supplied default program for program autoinstall, examine any code added to the exit to ensure it is threadsafe. If the code is not threadsafe, you must either make changes to make it threadsafe, or change the resource definition to specify CONCURRENCY(QUASIRENT).

For more information about threadsafe programming techniques, see Threadsafe programs in Developing applications.

EYU9WRAM, dynamic routing program: EYURWCOM communication area

EYURWCOM is the communication area that is used by the dynamic routing user-replaceable module EYU9WRAM.

The following EYURWCOM tokens were added in CICS TS 5.2:

WCOM_APPL_CONTEXT
Application context.

WCOM_PLATFORM
Requesting platform name.

WCOM_APPLICATION
Requesting application name.
WCOM_APPLVER
Application version.

WCOM_APPLMAJORVER
Application major version.

WCOM_APPLMINORVER
Application minor version.

WCOM_APPLMICROVER
Application micro version.

WCOM_OPERATION
Requesting operation name.

The following EYURWCOM tokens were changed in CICS TS 5.2:

- WCOM_FILL3 has a new value of WCOM_VERSION. In CICS TS 5.2 it is initialized with the character value 01.

If you have customized EYU9WRAM, you might have to make adjustments for these changes.

**EYU9XLOP, dynamic routing program: EYURWTRA communication area**

EYURWTRA is the communication area for the dynamic routing program EYU9XLOP.

The following EYURWTRA tokens were added in CICS TS 5.2:

WTRA_APPL_CONTEXT
Application context.

WTRA_PLATFORM
Requesting platform name.

WTRA_APPLICATION
Requesting application name.

WTRA_APPLVER
Application version.

WTRA_APPLMAJORVER
Application major version.

WTRA_APPLMINORVER
Application minor version.

WTRA_APPLMICROVER
Application micro version.

WTRA_OPERATION
Requesting operation name.

The following EYURWTRA tokens are changed in CICS TS 5.2:

- WTRA_FILL1 has a new value of WTRA_VERSION.

Note: Existing applications that use this field should have the field initialized to nulls. In CICS TS 5.2 only new fields in the WTRA COMMAREA that are commensurate with the version number are extracted and passed forwards. The
version is in character format, and the version number for the Application Context additions is 01. A new declaration is added to the EYURWTRA member for Version 1:

```plaintext
DCL WTRA_VERSION_01 CHAR(2) CONSTANT('01'); /* EYURWTRA Version 1 */
```

If you want to pass the application contexts through to your own WRAM program, you must initialize the WTRA_APPL_CONTEXT fields with the appropriate values, and must also set:

```plaintext
WTRA_VERSION = WTRA_VERSION_01;
```

If you have customized EYU9XLOP, you might have to make adjustments for these changes.

**New user-replaceable programs**

CICS Transaction Server for z/OS, Version 5 Release 2 includes user-replaceable programs to support new CICS functions.

No new user-replaceable programs were added in CICS Transaction Server for z/OS, Version 5 Release 2.
Chapter 13. Changes to CICS utilities

Changes to CICS utilities in CICS Transaction Server for z/OS, Version 5 Release 2 relate to new, changed, or obsolete CICS functions. The existing utility programs DFHCSDUP, DFHSTUP, and DFH0STAT support new resources. The trace formatting utility program DFHTUxxx and IPCS dump exit routine DFHPDxxx support new resources and are renamed for the release.

DFH0STAT, sample statistics utility program

DFH0STAT, the sample statistics utility program, produces additional statistics reports for any new resource types that are added in each CICS release. Statistics reports relating to any obsolete resource types are no longer produced.

In CICS TS 5.2, no new statistics reports were added.

DFH0STAT does not report any private resources for applications deployed on platforms, and it does not identify programs that are declared as application entry points.

DFHCSDUP, CSD utility program

The CSD utility program supports all the new and changed resource types and attributes. See Chapter 5, “Changes to resource definitions,” on page 15 for details of all the changes to CSD resource definitions that are supported by DFHCSDUP.

If you are sharing the CSD with earlier releases of CICS and want to alter definitions that are used only on earlier releases, you must use the latest DFHCSDUP, even if some attributes are obsolete in the latest releases of CICS. To use the latest DFHCSDUP to update obsolete options on resource definitions, specify the COMPAT option in the PARM string to indicate that you want DFHCSDUP to operate in compatibility mode.

DFHPD690, IPCS dump exit routine

The dump formatting utility program is renamed to DFHPD690. When formatting a dump data set always ensure that you use the dump formatting program with the same level number for the release of CICS TS that created the dump data set.

The dump exit routine for formatting CICS system dumps formats the control blocks for the new domains. To select or ignore dump data for any domains, specify the dump component keywords for those domains. The dump component keywords for use with the CICS IPCS dump exit routine are the same as the CETR trace component codes.

DFHSTUP, statistics formatting utility program

The statistics formatting utility program formats additional statistics reports for new and updated resource types. Statistics reports relating to obsolete resource types are no longer produced. See Chapter 15, “Changes to statistics,” on page 59 for information about changes to resource types and new and obsolete keywords on the SELECT TYPE and IGNORE TYPE parameters.
DFHSTUP reports private resources for applications deployed on platforms, and identifies programs that are declared as application entry points.

**DFHTU690, trace formatting utility program**

The trace formatting utility program is renamed to DFHTU690. When formatting a dump data set always ensure that you use the dump formatting program with the same level number for the release of CICS TS that created the dump data set.

The program formats trace entries written by the new domains and functions. The new identifiers that you can specify to DFHTU690 on the `TYPETR` parameter for these functional areas are the same as the CETR trace component codes.
Chapter 14. Changes to monitoring

Changes to CICS monitoring data might affect user-written and vendor-written utilities that analyze and print CICS SMF 110 monitoring records.

Check your utility programs that process CICS SMF records to ensure that they can still process SMF 110 records correctly. If you have utility programs provided by independent software vendors, you must ensure that they can handle the SMF 110 records correctly. You can identify SMF 110 records from different releases by using the record-version field in the SMF product section.

- The length of a standard performance class monitoring record, as output to SMF, has increased to 3260 bytes. The length does not allow for any user data that you add, or any system-defined data fields that you exclude, by using a monitoring control table (MCT).
- The offsets have changed for a number of the default CICS dictionary entries in the dictionary data sections of CICS monitoring SMF 110 records.

Obsolete monitoring data fields

Some obsolete data fields are no longer available in the CICS monitoring facility. If you have any of these fields specified in a DFHMCT TYPE=RECORD macro, you must remove them.

No performance class data fields were made obsolete in CICS Transaction Server for z/OS, Version 5 Release 2.

Changed monitoring data fields

Existing data fields can change from release to release in the performance class data, identity class data, transaction resource class data, and exception class data produced by CICS monitoring.

No monitoring data fields were changed in CICS Transaction Server for z/OS, Version 5 Release 2.

New monitoring data fields

New data fields are added in the exception class data, identity class data, performance class data, and transaction resource class data produced by CICS monitoring.

No monitoring data fields were added in CICS Transaction Server for z/OS, Version 5 Release 2.

Monitoring sample program DFH$MOLS: support for data for earlier CICS releases

The CICS Transaction Server for z/OS, Version 5 Release 2 release of DFH$MOLS processes monitoring data for earlier supported CICS releases, but the UNLOAD control statement has additional restrictions.
In CICS Transaction Server for z/OS, Version 5 Release 2, DFH$MOLS can process SMF 110 monitoring data records for the following supported releases:

- CICS Transaction Server for z/OS, Version 5 Release 2
- CICS Transaction Server for z/OS, Version 5 Release 1
- CICS Transaction Server for z/OS, Version 4 Release 2
- CICS Transaction Server for z/OS, Version 4 Release 1
- CICS Transaction Server for z/OS, Version 3 Release 2
- CICS Transaction Server for z/OS, Version 3 Release 1

However, the UNLOAD control statement (which unloads performance class monitoring data into a fixed length record format) can be used only with monitoring data for CICS Transaction Server for z/OS, Version 3 Release 2 onwards. Any version or release of DFH$MOLS cannot process monitoring data for a version or release later than itself, so you must always use the DFH$MOLS from the highest version or release available to you.
Chapter 15. Changes to statistics

CICS statistics records contain changes because of new domains or because of enhancements to CICS. Statistics types are added or removed and some statistics types have new or changed fields. You must recompile application programs using the changed DSECTs.

CEMT and EXEC CICS statistics commands

You can retrieve all the new statistics described in this section using the **EXEC CICS EXTRACT STATISTICS** command, the **EXEC CICS PERFORM STATISTICS RECORD** command, and the **CEMT PERFORM STATISTICS** command.

The options on the **EXEC CICS EXTRACT STATISTICS** command, the **EXEC CICS PERFORM STATISTICS RECORD** command, and the **CEMT PERFORM STATISTICS** command for the obsolete resource types described in this section are no longer valid. For details of what happens if you use the obsolete options, see the command documentation.

The list of resources supported by the **EXEC CICS COLLECT STATISTICS** command is now closed. All new resources introduced from CICS Transaction Server for z/OS, Version 3 Release 1 onwards are supported by the **EXEC CICS EXTRACT STATISTICS** command, which operates in the same way.

Obsolete statistics types

CICS no longer provides statistics for these obsolete resource types.

No statistics types were made obsolete in CICS Transaction Server for z/OS, Version 5 Release 2.

Changed statistics types

Changes have been made to the statistics fields for these CICS statistics types. The old DSECTs are not compatible with the new DSECTs, and you must recompile application programs using the changed DSECTs.

Statistics for private resources and application entry points

CICS now produces different SMF statistics records for private resources for applications that are deployed on platforms. A statistics record for a private resource has information about the application for which the resource was defined. The existing DSECTs for program and library resources, which are used to map the data for public resources, have corresponding new DSECTs that are used to map the data for private resources.

<table>
<thead>
<tr>
<th>Resource type</th>
<th>Statistics command keyword</th>
<th>Existing DSECT for public resources</th>
<th>New DSECT for private resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIBRARY resource statistics</td>
<td>LIBRARY</td>
<td>DFHLDDBDS (STID value 31)</td>
<td>DFHLDYDS (STID value 32)</td>
</tr>
</tbody>
</table>
Table 3. DSECTs for public and private resources (continued)

<table>
<thead>
<tr>
<th>Resource type</th>
<th>Statistics command keyword</th>
<th>Existing DSECT for public resources</th>
<th>New DSECT for private resources</th>
</tr>
</thead>
<tbody>
<tr>
<td>Program resource statistics</td>
<td>PROGRAM</td>
<td>DFHLDRDS (STID value 25)</td>
<td>DFHLDPDS (STID value 36)</td>
</tr>
<tr>
<td>PROGRAM definition resource statistics</td>
<td>PROGRAMDEF</td>
<td>DFHPGDDS (STID value 120)</td>
<td>DFHPGEDS (STID value 147)</td>
</tr>
<tr>
<td>JVM program resource statistics</td>
<td>JVMPROGRAM</td>
<td>DFHPGRDS (STID value 119)</td>
<td>DFHPGPDS (STID value 146)</td>
</tr>
</tbody>
</table>

When you use the EXEC CICS PERFORM STATISTICS RECORD command to write resource statistics, use the same resource type keyword whether the resource is public or private. If a resource is a public resource, the public DSECT is used to map its data, and if a resource is a private resource, the private DSECT is used to map its data.

When you use the EXEC CICS EXTRACT STATISTICS or EXEC CICS COLLECT STATISTICS command to request resource statistics for a specific resource of a resource type that is supported as a private resource, the command operates according to the context in which the task is running:

- If the command is issued from a public program, statistics are returned for the named public resource.
- If the command is issued from a program that is part of an application deployed on a platform, so is running with an application context, the private resources for the application are searched first for the named resource. If a private resource is not found, statistics are returned for the named public resource.
- For the EXEC CICS EXTRACT STATISTICS command only, you can specify a different application context to be searched for private resources. When you request statistics for a different application, if a private resource is not found for that application, no statistics are returned.

Programs that are declared as application entry points are identified by a field in the DSECTs for public and private program definitions (PROGRAMDEF statistics keyword) and JVM programs (JVMPROGRAM keyword). When interval statistics, end-of-day statistics, requested statistics, requested reset statistics, or unsolicited statistics are produced for a program definition or JVM program that is declared as an application entry point, two statistics records are written, one mapped by the DSECT for public resources, and one mapped by the DSECT for private resources. For the program statistics that are produced by the loader domain (PROGRAM keyword), application entry points are not identified, and only one private program statistics record is written.

When you use the EXEC CICS EXTRACT STATISTICS or EXEC CICS COLLECT STATISTICS command to return statistics for a specified program that is declared as an application entry point, only one statistics record is returned. If the command is issued in or for an application context, and the program was defined as a private resource for the application, the DSECT for private resources is used to format the data, even if the program has currently been promoted to a public program in order to make the application entry point available.
The statistics formatting utility program DFHSTUP produces separate reports for private resources. DFHSTUP lists programs that are defined as application entry points twice, in both the report for public program definitions or JVM programs, and the report for private program definitions or JVM programs. The sample statistics utility program, DFH0STAT, does not report any private resources or identify programs that are declared as application entry points.

**Other changed statistics types**

*Table 4. Changed statistics types*

<table>
<thead>
<tr>
<th>Copybook</th>
<th>Functional area</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHPGDDS</td>
<td>Program statistics</td>
</tr>
<tr>
<td>DFHPGRDS</td>
<td>JVM program statistics</td>
</tr>
<tr>
<td>DFHPIRDS</td>
<td>Pipeline manager statistics</td>
</tr>
</tbody>
</table>

Changed statistics types might increase the amount of statistics data that is written to the MVS systems management facility (SMF). To avoid any problems caused by multiple CICS regions writing increased interval statistics to the SMF at the same time, you can use the DFHSSTED sample utility program. This program varies the statistics interval occurrence time for each CICS region. For more information, see Stagger end-of-day time sample utility program (DFHSSTED) in Reference -> Utilities.

**New statistics types**

New CICS statistics types are added because of new domains or because of enhancements to CICS.

*Table 5. New statistics types*

<table>
<thead>
<tr>
<th>Copybook</th>
<th>Functional area</th>
</tr>
</thead>
<tbody>
<tr>
<td>DFHLDPDS</td>
<td>Program loader statistics for private programs</td>
</tr>
<tr>
<td>DFHLDYDS</td>
<td>LIBRARY resource statistics for private LIBRARY resources</td>
</tr>
<tr>
<td>DFHPGEDS</td>
<td>PROGRAM resource definition statistics for private programs</td>
</tr>
<tr>
<td>DFHPGPDS</td>
<td>JVM program resource statistics for private Java programs</td>
</tr>
</tbody>
</table>

**New values in DFHSTIDS (statistics record identifiers)**

The new DSECTs have corresponding values in the common statistics record copybook, DFHSTIDS. The revised list of the statistics record identifiers is shown in CICS statistics data section in the CICS Customization Guide.

The new values for CICS Transaction Server for z/OS, Version 5 Release 2 are as follows:

| STILDY 32  | DFHLDYDS | LIBRARY resources - private |
| STILDP 36  | DFHLDPDS | Private Loader (Resid) id   |
| STIPGP 146 | DFHPGPDS | JVM programs - private      |
| STIPGE 147 | DFHPGEDS | Program definitions - private |

New statistics types might increase the amount of statistics data that is written to the MVS systems management facility (SMF). To avoid any problems caused by multiple CICS regions writing increased interval statistics to the SMF at the same time.
time, you can use the DFH$STED sample utility program. This program varies the
statistics interval occurrence time for each CICS region. For more information, see
the CICS Operations and Utilities Guide.

The statistics formatting utility program, DFHSTUP

The statistics formatting utility program now formats additional statistics reports
for the new statistics. You can include or exclude the new statistics reports by
using these keywords on the SELECT TYPE and IGNORE TYPE parameters:
• JVMPROGRAM - now reports private as well as public resources
• LIBRARY - now reports private as well as public resources
• PROGRAM - now reports private as well as public resources
• PROGRAMDEF - now reports private as well as public resources

DFHSTUP produces separate reports for private resources for applications that are
deployed on platforms. These reports are located after the report for public
resources of the same type. DFHSTUP lists programs that are defined as
application entry points twice, in both the report for public program definitions or
JVM programs, and the report for private program definitions or JVM programs.
Chapter 16. Changes to sample programs

In each CICS release, check for changes to the samples provided to demonstrate the use of different CICS functions. New samples might be provided and existing samples modified or withdrawn. If you have custom programs or other items based on the samples, update them to reflect changes in the samples. Unless otherwise stated, sample programs are supplied in the SDFHSAMP library.

There were no changes to the sample programs in CICS TS 5.2.
Chapter 17. Changes to problem determination

CICS provides information to help you diagnose problems relating to new functions.

Part 5, “Changes to CICS messages and codes,” on page 143 lists messages and abend codes that have been removed, changed, and added for CICS Transaction Server for z/OS, Version 5 Release 2.

There were no other changes to problem determination in CICS Transaction Server for z/OS, Version 5 Release 2.
Chapter 18. Changes to security

When you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2, note these changes to security.

**APAR PI28039 update**

The default setting for the ENCRYPTION system initialization parameter, ENCRYPTION=STRONG, no longer allows the use of the SSL version 3.0 security protocol. The minimum security protocol allowed with ENCRYPTION=STRONG is now TLS version 1.0.

If you have clients that still require the SSL version 3.0 protocol, you can enable support for that protocol by specifying the system initialization parameter ENCRYPTION=SSLV3 for the CICS region. SSL 3.0 should only be used for a migration period while clients that still require this protocol are upgraded. Any connections that require encryption automatically use the TLS protocol, unless the client specifically requires SSL 3.0.

**Security for CICS bundles**

For resources that are dynamically created by CICS bundles, no additional CICS command security checks and resource security checks take place for those resource types, either when the resources are dynamically created at bundle installation time, or when you manipulate the resources by making changes to the CICS bundle. You need authority only to perform the actions on the CICS bundle, or for bundles that are installed with applications and platforms, to perform the actions on the application or platform with which the CICS bundle was deployed. However, CICS command security and resource security for the individual resource types do apply when you inquire on the dynamically created resources, or if you manipulate the dynamically created resources directly.

If you used CICS bundles in earlier CICS releases, check the security permissions that you gave to users for those bundles. Depending on how you set up security for CICS bundles, users with authority to act on individual CICS bundles might now be able to act on new or existing resources that are dynamically created as part of the installation of a bundle. Ensure that the levels of authority for BUNDLE resources are still appropriate.

**Permission to make applications and CICS bundles available or unavailable**

Operators with UPDATE access for the CLOUD.APPLICATION.context security profile now have permission for the new actions to make applications that are deployed on platforms available or unavailable to users, which is required in addition to enabling or disabling them. In releases before CICS TS 5.2, the action of enabling or disabling an application also made it available or unavailable to users, so the new permission is still appropriate for the same operators.

The same situation applies to operators with UPDATE access for a security profile that specifies the BUNDLE resource type and the resource name $*, as described in
Security for platforms and applications in Administering. These operators can make BUNDLE resources that are created for platforms and applications available and unavailable.

Stand-alone CICS bundles need to be made available or unavailable only if they contain application entry points. Operators with UPDATE access for the security profile for a stand-alone CICS bundle, which specifies the BUNDLE resource type and the name of the BUNDLE resource, can make the resource available or unavailable.

**Security for programs declared as application entry points**

If you apply security measures to individual PROGRAM resources, for applications that are deployed on platforms, secure the programs that are declared as application entry points, but do not secure other programs in the applications. The security settings that you specify for a program that is part of an application deployed on a platform apply to both public and private programs, and do not take into account the version of the application. Programs that are declared as an application entry point must have a unique PROGRAM resource name in your environment. However, if you secure programs that run at a lower level in the application, programs with the same names might be running in different applications, which can lead to unforeseen consequences. In this situation, a user might have permission to access a program that is declared as an application entry point, but not have permission to access a program that runs at a lower level in the application, because the security settings from another instance of the program name are in effect. Consider the security measures that you apply to a program that is declared as an application entry point program, as applying to the whole application.

**Integrated support for SAML**

In CICS TS for z/OS, Version 4.2 and CICS TS for z/OS, Version 5.1, support for Security Assertion Markup Language (SAML) was provided in the CICS Transaction Server for z/OS Feature Pack for Security Token Extensions. The functions of that feature pack are now incorporated into CICS itself. You cannot use the feature pack with CICS Version 5.2.

In addition, the following functions are added:

- Support for using a SAML token in a requester application
- Support for adding attributes to a validated SAML token, for use in a requester application
- Support for signing modified SAML tokens
- Support for using the transaction channel for SAML containers to enable verified SAML information to be available to the whole application without the need to restructure the application.
- Support for configuring the clock skew time to allow flexibility in the time validity of SAML tokens

The SAML output containers have been enhanced with additional information extracted from the SAML token.

The SAML IVP has been enhanced to support easier validation of customer defined tokens.
Support for Kerberos

Previously, support for Kerberos tokens was provided remotely by using a web service. You can now validate a Kerberos token with a local external security manager (ESM) by using the CICS API. For more information, see VERIFY TOKEN. If your ESM is RACF, support is provided for Kerberos Version 5 and Generic Security Services. For the Kerberos support level of other ESMs, refer to their documentation.

Support is provided for validating Kerberos tokens in inbound web service requests. Optionally, the target application can also be set to run under the user ID associated with the client principal in the Kerberos token. To use Kerberos token validation, set the mode of the <authentication> element to the new value basic-kerberos. For more information, see The <authentication> attribute.

Extended support for cryptographic standards

The enhancements to support NIST SP800-131A compliant cipher suites and certificates, which were supplied in APAR PM97207 for CICS TS for z/OS Version 5.1 are now incorporated into CICS itself. For more information, see Making your CICS TS system conformant with NIST SP800-131A.

Additions to CICS RACF category 1 transactions

The list of category 1 transactions has some new CICS internal system transactions. These transactions must be defined to your external security manager, and the CICS region user ID must be authorized to use them, so that CICS can initialize successfully when it is running with security enabled (SEC=YES).

For a full list of all the CICS category 1 transactions, see Category 1 transactions. Also see the DFH$CAT1 CLIST, supplied in the SDFHSAMP library.

The new category 1 transactions are as follows:

- CFRCR
- CJLR

Changes to command and resource security

New resource types, their resource identifiers, and associated commands are subject to command security checking and resource security checking.

No new resource types were added in CICS Transaction Server for z/OS, Version 5 Release 2.
Part 2. Upgrading CICS Transaction Server

To upgrade your CICS regions to CICS Transaction Server for z/OS, Version 5 Release 2, carry out the tasks described here. There are some general upgrading tasks which you must always perform. There are also upgrading tasks for some specific functional areas where there is a need for special considerations.
Chapter 19. Upgrade procedures for all CICS regions

Complete these tasks when you upgrade any CICS Transaction Server region to CICS Transaction Server for z/OS, Version 5 Release 2.

Important: Before you upgrade you must install the CICS TS for z/OS V5.2 - activation module or CICS TS for z/OS Value Unit Edition V5.2 - activation module for the version of CICS that you are going to use.

You must also add the SDFHLIC or SDFHVUE library in the STEPLIB of the CICS TS JCL. The SDFHLIC or SDFHVUE library must be APF-authorized. If you use coupling facility data table servers, temporary storage servers, region status servers, or named counter servers, you must also add the SDFHLIC or SDFHVUE library to the STEPLIB of the JCL for each of the servers.

Redefining and initializing the local and global catalogs

When you upgrade to a new CICS release, delete, redefine, and initialize the CICS local catalog and global catalog.

Procedure

1. Delete your existing local catalog and global catalog.
2. Define and initialize new local and global catalogs, following the instructions in the CICS System Definition Guide. When you initialize the catalogs, make sure that you use the CICS Transaction Server for z/OS, Version 5 Release 2 versions of the DFHRMUTL and DFHCCUTL utility programs and the sample jobs.
3. When you start the CICS region for the first time after upgrading, make sure that it is an initial start with the START=INITIAL parameter.

Enabling z/OS conversion services

To obtain the benefits of z/OS conversion services for data conversion, perhaps because your system requires support for the conversion of UTF-8 or UTF-16 data to EBCDIC, you must enable the z/OS conversion services and install a conversion image that specifies the conversions that you want CICS to perform.

For the instructions to set up and configure conversions supported through the operating system services, see z/OS Unicode Services User's Guide and Reference

If z/OS conversion services are not enabled, CICS issues a message. If such a message is issued when starting a CICS region that is expected to use the z/OS conversion services, an IPL is necessary to enable these services.

If you do not need the z/OS conversion services, you can suppress that message.

To discover the status of z/OS conversion services after an IPL, use one of the following commands from an MVS console:

• D UNI
  This command shows whether z/OS conversion services were enabled.
• D UNI,ALL
This command shows whether z/OS conversion services were enabled and which conversion the system supports.

If you want to enter the command from SDSF, add a / to the beginning of the command.

---

**Upgrading the CSD for CICS-supplied and other IBM-supplied resource definitions**

Upgrade the CICS-supplied resource definitions using the UPGRADE function of the CSD utility program DFHCSDUP. If you have resource definitions in your CSD that support other IBM products, such as z/OS, you might need to upgrade these also.

**About this task**

If you need to share your upgraded CSD with different CICS releases, see "CSD compatibility between different CICS releases" on page 77.

**Procedure**

1. Run the DFHCSDUP utility program, specifying the UPGRADE command, to upgrade the CICS-supplied definitions in your CSD to the latest CICS TS level. You can create a new CSD using the DFHCSDUP INITIALIZE command. For information about running DFHCSDUP with the UPGRADE command, see the CICS Operations and Utilities Guide. To help estimate the space you need in your CSD for definition records, see the CICS System Definition Guide.

2. If you have resource definitions in your CSD that support other IBM products, upgrade these as required. For example, if your Language Environment® resource definitions are not at the correct z/OS level, you should delete and replace the CSD group containing these. The Language Environment resource definitions are in the SCEESAMP library in member CEECCSD. "Sample job for additional CSD modification" has an example job to delete and replace the CSD group containing these.

**Sample job for additional CSD modification**

If you need to upgrade the Language Environment resource definitions in your CSD, you can use a job like this.
Upgrading user-modified CICS-supplied resource definitions

When you run the UPGRADE function of the CSD utility program DFHCSDUP, ensure that you manually upgrade any CICS-supplied definitions that you have modified in earlier releases.

About this task

It is important to upgrade your modified definitions to ensure that they are defined correctly with nondefault values for attributes that are new. If you fail to upgrade modified definitions, CICS assigns default values to any new attributes, and these might be inappropriate for CICS-supplied resource definitions.

Procedure

- If you are not sure whether your CSD contains any modified CICS-supplied definitions, use the DFHCSDUP SCAN command to compare the CICS-supplied resource definitions with any user-modified versions. The DFHCSDUP SCAN command searches for the CICS-supplied version of a specified resource name of a specific resource type and compares it with any other resource definition of the same name and type. DFHCSDUP reports any differences it finds between the CICS-supplied definition and a user-modified version. If you have copied and changed the name of a CICS-supplied definition, the SCAN command enables you to specify the changed name as an alias.

- The safest way to upgrade your definitions is to copy the upgraded CICS-supplied definitions and reapply your modifications. This action is necessary because the UPGRADE command does not operate on your own groups or on CICS groups that you have copied.

- If the CICS region uses CICSPlex SM, manually upgrade any of the dynamically created CICSPlex SM resource definitions that you modified in your previous
release, using the equivalents in Version 5.2. The dynamically created resource
definitions and their attributes are in the following members of the SEYUSAMP
sample library:
- EYUCDEF contains the default resource definitions for a CMAS.
- EYUSMDEF contains the default resource definitions for a MAS.
- EYUSWDEF contains the default resource definitions for a WUI server.

**Upgrading copies of CICS-supplied resource definitions**

If you have made copies of CICS-supplied resource definitions, you might need to
change your copies to match the changes that have been made to the supplied
definitions for this release. To help you, member DFH$CSDU in library
SDFHSAMP contains ALTER commands that you can apply using the CSD utility
program DFHCSDUP.

**Procedure**

1. Review your resource definitions to determine if you have copied any
   CICS-supplied definitions.
2. Review DFH$CSDU to determine if the changes that it contains should apply
to your resource definitions.
3. Make any necessary changes to DFH$CSDU. It is advisable to make a copy of
   DFH$CSDU and apply any changes to the copy.
4. Run DFHCSDUP using your modified version of DFH$CSDU as input. As
   supplied, the ALTER commands in DFH$CSDU specify GROUP(*), which means
   that DFHCSDUP attempts to change resources in the CICS-supplied groups.
   This action is not permitted and results in message DFH5151. You can ignore
   this message.

**Example**

Program DFHD2EDF is now defined as CONCURRENCY(THREADSAFE).
Therefore, DFH$CSDU contains the following command:

```
ALTER PROGRAM(DFHD2EDF) GROUP(*) CONCURRENCY(THREADSAFE)
```

When you run DFHCSDUP, the attribute is added to the definitions of program
DFHD2EDF in all groups. Other attributes not mentioned in DFH$CSDU are
unchanged.

**DSA size limits**

It is not advisable to set the size of individual dynamic storage areas (DSAs), and
usually it is not necessary. However, it is possible to set the size of some DSAs by
using the CDSASZE, UDSASZE, RDSASZE, ECDSASZE, EUDSASZE, ESDSASZE, and ERDSASZE
system initialization parameters.

For example, CDSASZE sets the size of the CICS dynamic storage area (CDSA), and
ECDSASZE specifies the size of the extended CICS dynamic storage area (ECDSA).
The default value for these parameters is 0, indicating that the size of the DSA can
change dynamically. If you specify a nonzero value, the DSA size is fixed.

If you specify DSA size values that in combination do not allow sufficient space for
the remaining DSAs, CICS fails to initialize.
The limit on the storage available for the DSAs in 24-bit storage (below 16 MB) is specified by the DSALIM system initialization parameter. You must allow at least 256K for each DSA in 24-bit storage for which you have not set a size.

The limit on the storage available for the DSAs in 31-bit storage (above 16 MB but below 2 GB) is specified by the EDSALIM system initialization parameter. You must allow at least 1 MB for each DSA in 31-bit storage for which you have not set a size.

You cannot set the size of individual DSAs in 64-bit storage; that is, in the above-the-bar DSA (GDSA).

CSD compatibility between different CICS releases

You can share the CICS system definition data set (CSD) between different CICS releases by using the appropriate compatibility groups.

Most releases of CICS change the CICS-supplied groups of resource definitions that are included in the DFHLIST group list. The old versions of the CICS resource definitions are retained in compatibility groups. If you share the CSD between different CICS releases, these compatibility groups are needed to support earlier releases.

After you upgrade a CSD, if you plan to share the CSD with earlier releases of CICS, include the appropriate DFHCOMPx compatibility groups in your startup group list. Table 6 shows you which DFHCOMPx groups to include for each earlier release.

Do not attempt to share a CSD with a CICS region that is running at a higher release level than the CSD.

You must install the compatibility groups in the correct order, as shown in the table. For example, to run a CICS TS 4.1 region with a CSD that is upgraded to CICS TS 5.2, add the DFHCOMPG compatibility group, followed by the DFHCOMPF compatibility group, followed by the DFHCOMPE compatibility group, to the end of your group list.

Table 6. Required compatibility groups for earlier releases of CICS

<table>
<thead>
<tr>
<th>CICS TS 5.2 CSD</th>

Upgrading CICS Explorer

You must upgrade the CICS Explorer to Version 5.2 before you can connect to CICS regions at CICS TS Version 5.2. When you upgrade CICS Explorer you can use it to work with CICS TS 5.2 regions, and also with other CICS TS regions that are not yet upgraded.

For CICS Explorer Version 5.1.1 and later, you can use the facilities that the Eclipse platform provides to update your CICS Explorer, or other software, or add new software plug-ins, such as CICS Tools.

The update site for the CICS Explorer is already coded in the product. The site address is displayed on the Installed Software page in the Software Updates window. If you choose not to use the composite update site, you must specify the
address of your preferred update site, which can be either on your local workstation or a remote location. You can add multiple update sites, each containing one or more software downloads.

For CICS Explorer versions earlier than Version 5.1.1, you must install a new copy of CICS Explorer. You cannot upgrade in the way described earlier because earlier versions of CICS Explorer use a different version of Eclipse than CICS Explorer Version 5.1.1. Before you install the new copy of CICS Explorer, it is advisable to back up your CICS Explorer workspace so that you can restore the workspace to a previous version, if required.

For more information about upgrading CICS Explorer, see Updating and installing software in the CICS Explorer product documentation. Taking a backup of the CICS Explorer workspace in Installing.
Chapter 20. Upgrading application programs

CICS translator support for pre-Language Environment compilers is withdrawn. Runtime support is provided for existing application programs that were developed using these compilers, except for OS/VS COBOL and OO COBOL programs, which do not have runtime support.

Withdrawal of support for pre-Language Environment compilers

CICS translator support is withdrawn for the following compilers:

- OS/VS COBOL (5740-CB1, 5740-LM1, and 5734-CB4)
- VS COBOL II (5668-958 and 5688-023)
- OS PL/I Version 1 (5734-PL1)
- OS PL/I Version 2 (5668-910 and 5668-909)
- SAA AD/Cycle C/370™ (5688-216)

For details of the compilers that are supported by CICS, see High-level language support in What’s new.

The following JCL procedures that were supplied in earlier releases for translating, compiling, and link-editing using the unsupported compilers are also withdrawn:

COBOL

- The DFHEITVL, DFHEXTVL, DFHEBTVL, DFHEITCL, and DFHEXTCL procedures.

PL/I

- The DFHEITPL, DFHEXTPL, and DFHEBTPPL procedures.

C

- The DFHEITDL and DFHEXTDL procedures.

CICS now supplies the following procedures only, for use with compilers that conform to Language Environment:

<table>
<thead>
<tr>
<th>Language</th>
<th>CICS-online</th>
<th>EXCI</th>
<th>Integrated translator</th>
</tr>
</thead>
<tbody>
<tr>
<td>C</td>
<td>DFHYITDL</td>
<td>DFHYXTDL</td>
<td>DFHZITDL (without XPLINK)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>DFHZITFL (with XPLINK)</td>
</tr>
<tr>
<td>C++</td>
<td>DFHYITEL</td>
<td>DFHYXTEL</td>
<td>DFHZITEL (without XPLINK)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>DFHZITGL (with XPLINK)</td>
</tr>
<tr>
<td>COBOL</td>
<td>DFHYITVL</td>
<td>DFHYXTVL</td>
<td>DFHZITCL</td>
</tr>
<tr>
<td>PL/I</td>
<td>DFHYITPL</td>
<td>DFHYXTPL</td>
<td>DFHZITPL</td>
</tr>
</tbody>
</table>

The following CICS translator options, which all relate to the unsupported compilers, are obsolete:

- ANSI85
- LANGLVL
- FE
The CICS translators ignore these translator options and issue a return code 4 warning message.

**Runtime support for programs developed using pre-Language Environment compilers**

Although application program development support for obsolete compilers is withdrawn, CICS usually continues to provide runtime support for your existing application programs that were developed using these old compilers. However, to apply maintenance to these application programs, use one of the supported compilers that conforms to Language Environment.

Applications compiled and linked with pre-Language Environment compilers usually run successfully using the runtime support provided by Language Environment. These applications do not usually need to be recompiled or re-link-edited. If required, adjust Language Environment runtime options to allow these applications to run correctly. For more information, see the [z/OS Language Environment Run-Time Application Migration Guide](#) and the migration information for the language in use. Because pre-Language Environment compilers are not Language Environment-conforming, programs compiled by these compilers cannot take advantage of all Language Environment facilities in a CICS region.

Runtime libraries provided by Language Environment replace the runtime libraries that were provided with older compilers such as VS COBOL II, OS PL/I, and C/370. The runtime libraries provided with pre-Language Environment compilers are not supported. Language libraries, other than the Language Environment libraries, must not be present in your CICS startup JCL.

**Withdrawal of runtime support for OO COBOL**

In this CICS release, you cannot use COBOL class definitions and methods (object-oriented COBOL). This restriction includes both Java classes and COBOL classes.

Modules using OO features and compiled in earlier CICS releases with the OOCOBOL translator option cannot run in this CICS release. The OOCOBOL translator option was used for the older SOM-based (System Object Manager-based) OO COBOL, and runtime support for this form of OO COBOL was withdrawn in z/OS V1.2. The newer Java-based OO COBOL, which is used in Enterprise COBOL, is not supported by the CICS translator.
Chapter 21. Upgrading Business Transaction Services (BTS)

When you upgrade your BTS environment to CICS Transaction Server for z/OS, Version 5 Release 2, you might need to migrate the DFHLRQ data set. Be aware that even if you are not explicitly making use of BTS services in your applications, it is possible that they are being exploited by vendor code or IBM-supplied products executing within your CICS environment.

Migrating the DFHLRQ data set

The local request queue data set stores pending BTS requests, such as timer requests, or requests to run activities. It is recoverable and is used to ensure that, if CICS fails, no pending requests are lost.

Requests that CICS can execute immediately, such as requests to run activities, are stored on the data set only briefly. Requests that CICS cannot execute immediately, such as timer or unserviceable requests, might be stored for longer periods. When CICS has processed a request, the request is deleted from the data set.

If you have outstanding BTS activities for BTS processes in CICS, you must migrate the contents of your DFHLRQ data set as part of the upgrade. You can use a utility such as IDCAMS COPY to update the CICS TS for z/OS, Version 5.2 DFHLRQ data set with the contents of the DFHLRQ data set from your previous CICS release.

Be aware that even if you are not explicitly making use of BTS services in your applications, it is possible that they are being exploited by vendor code or IBM-supplied products executing within your CICS environment.

Repository data sets

When a process is not executing under the control of the CICS business transaction services domain, its state and the states of its constituent activities are preserved by being written to a VSAM data set known as a repository.

To use BTS, you must define at least one BTS repository data set to MVS. You may decide to define more than one, assigning a different set of process-types to each. One reason for doing this might be storage efficiency, for example, if some of your process-types tend to produce longer records than others.

If you operate BTS in a sysplex, several CICS regions may share access to one or more repository data sets. This sharing enables requests for the processes and activities stored on the data sets to be routed across the participating regions. As you upgrade your CICS releases, you may therefore still share older versions of repository data sets. The expectation is that you define and use different repository data sets whenever you want to assign different sets of process-types, rather than because a CICS upgrade has occurred.
Chapter 22. Communicating over IPIC with different levels of CICS

If both an APPC or MRO connection and an IPIC connection exist between two CICS regions, and both have the same name, the IPIC connection takes precedence. However, if your terminal-owning region (TOR) and application-owning region (AOR) are in CICS systems that are using different levels of CICS, the rules can differ.

An APPC or MRO connection is defined using the CONNECTION resource. An IPIC connection is defined using the IPCONN resource.

If both CONNECTION resources and IPCONN resources are active in a CICS region, CICS searches for an IPIC connection first, so that when resources with the same name exist, the preference for an IPCONN resource can be maintained. However, if an IPCONN resource is not available, CICS attempts to route over an APPC or MRO connection using a CONNECTION resource. If the request fails, a SYSID error is returned to the application that scheduled the request. For more information about how IPIC overrides default connections, see Changes to resource definitions.

Table 12 and Table 13 on page 88 show how the resources are used depending on the level of CICS installed at the communicating regions, the availability of resources, and the intercommunication method that is being used.

CICS TS for z/OS 5.2: Upgrading from CICS TS Version 5.1
Chapter 23. Upgrading multiregion operation (MRO)

To upgrade CICS multiregion operation (MRO) support, install the latest DFHIRP and DFHCSVC modules in the MVS link pack area (LPA) and carry out tests.

About this task

For MRO, the interregion communication program DFHIRP is installed in the link pack area (LPA). The CICS TS for z/OS, Version 5.2 DFHIRP module is compatible with earlier releases, and works with all releases of CICS. However, the CICS TS for z/OS, Version 5.2 version of DFHIRP, required for multiple XCF group support, can be used only on z/OS Version 1.7 or later.

DFHIRP can be used only from the LPA. Therefore in an MVS image you can have only one version of the module named DFHIRP, which must be at the highest release level of the CICS regions that run in that MVS image.

In a Parallel Sysplex®, where MRO communication between MVS images is through XCF/MRO, the DFHIRP programs installed in the different MVS images can be at different release levels. However, the DFHIRP in an MVS image must still be installed from the highest release of CICS running in that MVS image. For example, a CICS TS 3.2 DFHIRP can communicate with a CICS TS for z/OS, Version 5.2 DFHIRP across XCF/MRO, but the CICS regions running in the MVS with the CICS TS 3.2 DFHIRP cannot be later than CICS TS 3.2.

These steps are a guide to the upgrading process for MRO, to install the latest DFHIRP and DFHCSVC modules in the MVS link pack area (LPA). For information about how to perform some of these steps, such as installing the SVC or IRP modules in the LPA, see [Installing CICS modules in the MVS link pack area in the CICS Transaction Server for z/OS Installation Guide]. These steps assume that RACF is your external security manager (ESM).

Procedure

1. Install the CICS SVC routine, DFHCSVC, in the LPA, and specify a new CICS SVC number for this routine in the MVS SVCMPARM table. If the new DFHCSVC must coexist with an older version, rename one of them so that both versions can be installed in the LPA. However, coexistence is not recommended or necessary: DFHCSVC is compatible with earlier releases and the latest CICS TS version supports all the earlier releases of CICS.

2. Test the new SVC on stand-alone CICS regions, without using any MRO. You can do this running the CICS IVP, DFHIVPOL.

3. Install the CICS interregion communication program, DFHIRP, in a suitable LPA library. If you have a strategy whereby all users of DFHIRP on the z/OS image being upgraded can be quiesced, then you can use the dynamic LPA function to replace DFHIRP. Otherwise you must IPL MVS with the CLPA option. Failing to shut down all users of DFHIRP during the upgrade process can cause incompatibility between control blocks resulting in abends.

To dynamically update DFHIRP perform the following steps:

a. Quiesce all users of DFHIRP. For example, WebSphere® EXCI, CTG EXCI, all CICS regions including any CMASs must either be shutdown or logged off from MRO/XM, and finally all other work using EXCI must be shut down.
Important: The process described here does not include upgrading CICSpex SM to the CICS TS 5.2 level. For more information, see Chapter 36, “Upgrading a CMAS,” on page 135.

b. Update LPA modules DFHCVSC, DFHDSPEX, DFHUMPX, DFHIRP, DFHSSEN and DFHSV99 using the dynamic LPA facility specifying the ADD verb.

c. Run the CICS TS 5.2 supplied utility DFHCSVCU to update the z/OS SVC table as documented in Running the DFHCSVCJ job.

d. Restart MRO by either setting IRC connected in all executing CICS regions or restarting the CICS regions.

e. As dynamic changes are discarded by an IPL, you must schedule an IPL for a convenient time to ensure that all dynamically applied changes have been correctly applied to the z/OS system libraries.

Important: If you do not follow these steps an IPL is required to shut everything down and use the new DFHIRP module.

4. Test your production MRO CICS regions, under your existing release of CICS, but using the new SVC number and the new DFHIRP. For this test, run without any logon or bind-time security checking; that is, do not define any RACF FACILITY class profiles.

5. Define the required DFHAPPL.applid profiles in the RACF FACILITY general resource class. When the profiles are ready for all the MRO regions, test the production regions again with the new SVC and DFHIRP, this time using the FACILITY class profiles for logon and bind-time security checking.

6. If the production MRO regions successfully log on to the new IRP with the new SVC, and bind-time security checking works successfully, use the new DFHIRP and SVC for the production regions.

7. With the production regions running successfully under the CICS SVC and IRP, you can initialize and test some CICS Transaction Server regions using MRO. These test regions can coexist in the same MVS image as the production regions, all using the same SVC and IRP.
Chapter 24. Upgrading the Java environment

When you upgrade to a new CICS release, you might require changes to your JVM profiles and to other aspects of your Java environment. You might also require changes to your Java applications.

Earlier versions of Java

Java programs that ran under CICS Transaction Server for z/OS, Version 3 and CICS Transaction Server for z/OS, Version 4 can also run under CICS Transaction Server for z/OS, Version 5.

When you upgrade from one version of Java to another, check for compatibility issues between the Java APIs, and compatibility issues specific to the IBM SDK for z/OS. You can find this information at [Java Standard Edition Products on z/OS](https://www.ibm.com). To avoid potential problems with deprecated APIs, develop all new Java programs for CICS Transaction Server for z/OS, Version 5 Release 2 using an application development environment that supports the same version of Java as the environment used by CICS. You can run code compiled with an older version of Java in a new runtime environment, if the environment does not use APIs that are removed in the newer version of Java or CICS. For further details refer to the Target Platform setting when using the CICS Explorer SDK.

JVM profiles

If you already have JVM profiles that you set up in a previous CICS release, upgrade these profiles. Settings that are suitable for use in JVM profiles can change from one CICS release to another, so check the CICS documentation for any significant changes. You must also compare your existing JVM profiles to the latest samples supplied with CICS. Changes to the JVM profile options are described in [“Changes to options in JVM profiles” on page 92](https://www.ibm.com). A list of suitable options for this release is in [JVM profiles: options and samples in Deploying](https://www.ibm.com). Use the new samples supplied with CICS Transaction Server for z/OS, Version 5 Release 2 to help you create new profiles, rather than upgrading your existing files.

Copy your JVM profiles to a new location on z/OS UNIX to use with the new CICS release then apply the required upgrades. Do not try to use JVM profiles with more than one CICS release at the same time, because the settings are not compatible.

Ensure that the JVM profiles that you want to use are in the z/OS UNIX directory that is specified by the JVMPROFILEDIR system initialization parameter.

Key changes to CICS support for Java applications

Check for changes that can affect your Java environment when you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2.

Be aware of the following significant changes that can affect your Java environment when you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2:
• The supported Axis2 version is changed to Axis2 V1.6.2 and its corequisite software.
• The Liberty Angel process must be started if you use the CICS Liberty security feature.
• Only one Liberty JVM server can be run per region with the CICS Liberty security feature enabled.
• You can no longer use OSGi bundles in a Liberty JVM server. A CICS bundle containing OSGi bundles resources will no longer deploy to a Liberty JVM server, and a Liberty JVM server will not enable if it has the OSGI_BUNDLES option in its JVM profile. OSGi bundles can only be deployed to a Liberty JVM server as part of an enterprise bundle archive (EBA), or as library bundles using the bundle repository of Liberty. You therefore cannot specify the DB2 .jar files in OSGi bundles. Instead, specify the <cicsts_jdbcDriver> element in the server.xml file.

Changes to options in JVM profiles

When you upgrade to a new release of CICS TS, there are normally some changes to the options available in JVM profiles and to their possible or suggested settings.

The JVM server supports a variety of Java workloads. The following sample JVM profiles are supplied with CICS TS for z/OS, Version 5.2:
• DFHJVMAX.jvmprofile is a JVM profile that specifies the options for initializing the JVM server to support SOAP processing by Axis2 applications. Axis2 is an open source web services engine from the Apache foundation that supports a number of the web service specifications and provides a programming model to create Java applications that can run in Axis2.
• DFHJVMST.jvmprofile is a JVM profile that allows the JVM server to be configured for a Security Token Service.
• DFHOSGI.jvmprofile is a JVM profile that specifies the options for initializing the JVM server for Java applications that comply with the OSGi specification.
• DFHWLP.jvmprofile is a JVM profile to run workloads for the Liberty profile, a lightweight application server that can support JSP and servlet applications for developing modern web interfaces for CICS. Liberty profile servers must use a file encoding of ISO-8859-1 or UTF-8. The supplied sample profile DFHWLP is configured to use ISO-8859-1.

JVM profiles must have a file extension of .jvmprofile. The JVM server fails to enable if this extension is not present. The sample JVM profiles that are shipped with CICS TS for z/OS, Version 5.2 have this file extension.

When you upgrade to a new release of CICS TS, there are normally some changes to the options available in JVM profiles and to their possible or suggested settings. A good practice is to use the sample JVM profiles that are shipped with the new release, and reapply the customization that you made to those JVM profiles in previous releases. Using the latest JVM profiles ensures that you do not miss important updates to the options and their settings.

The obsolete, changed, and new options in JVM profiles are summarized here. For more details about the options, see JVM profiles: options and samples in Deploying.
Table 14. New options in JVM profiles

<table>
<thead>
<tr>
<th>Option</th>
<th>Status</th>
<th>CICS and Java launcher action</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>JNDI_REGISTRATION</td>
<td>For CICS sample profiles</td>
<td>Accepted</td>
<td>Specifies that the JNDI registration JAR files are automatically added to the JVM runtime environment.</td>
</tr>
<tr>
<td>SECURITY_TOKEN_SERVICE</td>
<td>For CICS sample profiles</td>
<td>Accepted</td>
<td>Controls whether the JVM server can use security tokens. This option must be set to YES for a JVM server to use security tokens. If this configuration option is set to NO, the JVM server is initialized as an OSGi JVM server and Security Token Service support is disabled for that JVM server. SECURITY_TOKEN_SERVICE=YES is not compatible with JAVA_PIPELINE=YES, which configures the JVM to support Axis2.</td>
</tr>
<tr>
<td>WSDL_VALIDATOR</td>
<td>For CICS sample profiles</td>
<td>Accepted</td>
<td>Enables validation for SOAP requests and responses against their definition and schema.</td>
</tr>
</tbody>
</table>

<th>Status</th>
<th>CICS and Java launcher action</th>
<th>Replace with</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>OSGI_BUNDLES</td>
<td>Not supported in Liberty JVM server</td>
<td>Liberty JVM server does not enable with this option</td>
<td>n/a</td>
<td>Deploy OSGi bundles in a Liberty JVM server as part of an enterprise bundle archive (EBA) or as library bundles.</td>
</tr>
</tbody>
</table>

Changes to JVM profile symbols

&CONFIGROOT;

When you use this symbol in a JVM profile, the absolute path of the directory where the JVM profile is located is substituted at run time.

For information about the other supported JVM profile symbols, see [JVM profiles: options and samples in Deploying](#).
Chapter 25. Upgrading the CICS-WebSphere MQ connection

If you use the CICS-WebSphere MQ adapter, bridge, trigger monitor, or API crossing exit to connect CICS to WebSphere MQ, check your configuration and make any necessary changes.

When you upgrade to a new version or release of WebSphere MQ, ensure that you specify the new versions of the WebSphere MQ libraries in the STEPLIB and DFHRPL concatenations in your CICS procedure, replacing the previous versions of these libraries. The libraries are thlqual.SCSQAUTH, thlqual.SCSQCICS, and thlqual.SCSQLOAD, where thlqual is the high-level qualifier for the WebSphere MQ libraries. The SCSQAUTH library is included in both concatenations, but the SCSQLOAD library and the optional SCSQCICS library are included in the DFHRPL concatenation only. Include the WebSphere MQ libraries after the CICS libraries to ensure that the correct code is used.

Support for WebSphere MQ Version 7 API calls

New or changed CICS applications that use the new API calls in WebSphere MQ Version 7 must be link-edited with the WebSphere MQ API stub modules that are shipped with CICS.

The new API calls are MQBUFMH, MQCB, MQCTL, MQCRTMH, MQDLTMH, MQDLTMP, MQINQMP, MQMHBUF, MQSETMP, MQSTAT, MQSUB, and MQSUBRQ. These Version 7 API calls are only supported in CICS when you use the stubs shipped with CICS, not the stubs shipped with WebSphere MQ. New and existing CICS applications that do not use the Version 7 API calls can use the stubs shipped with CICS or WebSphere MQ.

If you use the new Version 7 API calls MQCB and MQCTL for asynchronous message consumption by CICS applications, you must code your program using information given in the CICS documentation, in addition to the WebSphere MQ programming documentation. The requirements for asynchronous message consumption in a CICS environment are listed in Asynchronous message consumption and callback routines.
Chapter 26. Upgrading the CICS DB2 connection

This information enables you to plan and carry out installation or upgrade procedures in the CICS DB2® environment.

CICS provides an attachment facility (the CICS DB2 adapter) that works with all supported releases of DB2. The CICS DB2 attachment facility is shipped with CICS Transaction Server and you must use this version of the attachment facility to connect a CICS region to DB2. Always use the correct attachment facility for the release of CICS under which a region is running.
Chapter 27. Upgrading SOAP web services

If you have used SOAP web services in earlier CICS releases, be aware of the following changes when you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2.

- WEBSERVICE resources can now be defined and packaged in CICS bundles. The resource is dynamically installed in the CICS region when you install the BUNDLE resource. You can import a web service binding file and a WSDL document or WSDL archive file to be packaged with the resource definition, and for a service provider you can include a PROGRAM definition in the bundle. You can also use an existing WEBSERVICE definition in a CICS bundle to generate related URIMAP resources and alias transactions.

Data mapping

SOAP web services are enhanced to provide additional data mapping.

CICS now provides data mapping to support COBOL OCCURS DEPENDING ON and OCCURS INDEXED BY clauses.

- The OCCURS DEPENDING ON clause is supported at a mapping level of 4.0 or higher. Complex OCCURS DEPENDING ON is not supported. This limitation means that OCCURS DEPENDING ON is only supported for the last field of a structure.
- The OCCURS INDEXED BY clause is supported at any mapping level.

CICS now provides support for transforming application data encoded in UTF-16 at a mapping level of 4.0 or higher.

- You can enable this behavior by using language-specific data types for UTF-16 when you use the DFHLS2JS, DFHLS2SC, or DFHLS2WS assistants.
- You can enable this behavior by setting CCSID=1200 when you use the DFHJS2LS, DFHSC2LS, or DFHW2LS assistants.
Chapter 28. Upgrading JSON web services

If you used JSON web services in earlier releases, be aware of the following changes when you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2.

In previous releases support for JSON web services was provided by CICS TS Feature Pack for Mobile Extensions. In CICS TS 5.2 this function is incorporated into CICS, therefore there is no longer a requirement to install the feature pack.

JSON web services are enhanced to provide additional data mapping.

CICS now provides data mapping to support COBOL OCCURS DEPENDING ON and OCCURS INDEXED BY clauses.
- The OCCURS DEPENDING ON clause is supported at a mapping level of 4.0 or higher. Complex OCCURS DEPENDING ON is not supported. This limitation means that OCCURS DEPENDING ON is only supported for the last field of a structure.
- The OCCURS INDEXED BY clause is supported at any mapping level.

CICS now provides support for transforming application data encoded in UTF-16 at a mapping level of 4.0 or higher.
- You can enable this behavior by using language-specific data types for UTF-16 when you use the DFHLS2JS, DFHLS2SC, or DFHLS2WS assistants.
- You can enable this behavior by setting CCSID=1200 when you use the DFHJS2LS, DFHSC2LS, or DFHWS2LS assistants.

Upgrading the JSON web services assistant

In previous releases, the JSON assistant batch jobs DFHJS2LS and DFHLS2JS were provided as part of CICS TS Feature Pack for Mobile Extensions. These functions are now incorporated into CICS TS, so you must change any JCL that calls the assistant.

Procedure

1. Change the JCL procedure library where DFHJS2LS or DFHLS2JS are located. In CICS TS 5.2, these batch jobs are in the HLQ.XDFHINST library.
2. Review the values of the symbolic parameters Javadir, Pathpref, and USSdir. In CICS TS 5.2, you might not need to specify them at all, as the DFHJS2LS and DFHLS2JS procedures are customized by DFHISTAR. For more information about these parameters, see DFHJS2LS: JSON schema to high-level language conversion for request-response services and DFHLS2JS: High-level language to JSON schema conversion for request-response services.
Chapter 29. Upgrading SAML support

If you used Security Assertion Markup Language (SAML) support in earlier CICS releases, follow this procedure to upgrade to CICS Transaction Server for z/OS, Version 5 Release 2.

About this task

In previous releases, support for SAML was provided by CICS TS Feature Pack for Security Extensions V1.0. In CICS TS 5.2, this function is incorporated into CICS and the feature pack is not supported.

Procedure

1. Copy your STS configuration file to a new location on z/OS UNIX to use with the new CICS release.
2. Upgrade your java.policy file.
   a. If you are using a user java.policy file, copy it to a new location on z/OS UNIX to use with the new CICS release.
   b. Update the following rule to refer to the new CICS root directory.
      ```
      :// All permissions granted to CICS codesource protection domain
      grant codeBase "file://USSHOME/-" {
       permission java.security.AllPermission;
      };
      ```
      where USSHOME is the name and path of the root directory for CICS Transaction Server files on z/OS UNIX.
   c. Remove the rule that applies to the feature pack files:
      ```
      grant codeBase "file:fp_dir-" { permission java.security.AllPermission;
      };
      ```
      where fp_dir is the Feature Pack installation directory.
3. Upgrade your JVM profile by following the general instructions for upgrading JVM profiles, which are given in Chapter 24, “Upgrading the Java environment,” on page 91. Perform the following additional steps:
   a. Delete the CLASSPATH_SUFFIX line from your JVM server profile.
   b. If you are using a user java.policy file, update the java.security.policy property to refer to the new location of this file.
4. When no CICS instances are using it, uninstall the feature pack.
Chapter 30. Upgrading platforms, applications, policies, and CICS bundles

If you have used platforms, applications, policies, and CICS bundles in CICS in earlier releases, be aware of the following changes when you upgrade to CICS Transaction Server for z/OS, Version 5 Release 2.

Requirements for application entry points and operation names

In CICS regions from CICS TS 5.2, applications that are deployed on platforms must have application entry points declared for all the resources that are an access point to the application. Application entry points are now used to control users' access to different versions of an application that is deployed on a platform. An application that defines a PROGRAM resource cannot be made available to callers in CICS TS 5.2 regions unless it declares an application entry point for that resource.

The resource for an application entry point does not have to be defined in the same CICS bundle as the application entry point. CICS adds the application operation to the specified resource when the application is installed. For PROGRAM resources that are declared as application entry points, the application entry point controls users' access to the program regardless of the location of the PROGRAM resource. However, for URIMAP resources that are declared as application entry points, the application entry point only controls access to the URIMAP resource if it is declared in the same CICS bundle where the URIMAP resource is defined.

You can declare an application entry point for a resource that is not defined in any CICS bundle, but already exists in the CICS regions where the bundle will be deployed. You can also declare an application entry point for a PROGRAM resource that can be autoinstalled in the CICS regions where the bundle will be deployed. When you install an application, if the resource targeted by an application entry point is not present and cannot be autoinstalled, the CICS bundle containing the declaration of the application entry point does not install and is marked with a warning.

CICS bundles that are installed as part of platform bundles, or added to a running platform, must not contain declarations of application entry points in the bundle manifest. Application entry points are not supported for CICS bundles installed directly on platforms, and CICS does not enable the application entry points in this situation, although the CICS bundle and its resources are installed. Standalone CICS bundles that are installed directly in CICS regions can contain declarations of application entry points to enable scoping of region level policies.

Application entry points only control users' access to the resources that are specified in the application entry points. If an application includes any public resources that are not named as application entry points, when the application is installed and enabled, these resources can be accessed by other applications installed on the platform or in the CICS region regardless of the availability status of the application. Private resources for an application version cannot be accessed by other applications.
Each application entry point names an operation. For example, you could declare
application entry points for create, read, update, or delete operations in the
application. In CICS regions from CICS TS 5.2, an operation name must now be
unique within an application. An application cannot be made available to callers in
CICS TS 5.2 regions if it contains duplicate operation names. Operation names are
case sensitive, so you may use operation names that are differentiated only by
case, such as “browse” and “Browse”.

Making applications and CICS bundles available

A new availability status has been introduced for applications that are deployed on
platforms, so that you can install and verify installation of an application version
before making the application version available to users of the platform.
Applications that are deployed on platforms therefore now require an additional
step to make them available for users in CICS regions from CICS TS 5.2. After
installing and enabling the application, you must perform the Make Available
action in the CICS Explorer to make the application available to users.

You can make an installed application version available or unavailable in the
Cloud Explorer view, or in the online application editor for installed applications.
Making an application available makes the application entry points, and therefore
the resources for the application, available to callers. For more details, see
“Multi-versioning for applications deployed on platforms” on page 113.

Standalone CICS bundles must also be made available in CICS regions from CICS
TS 5.2 if they contain application entry points. After installing and enabling the
CICS bundle, you can perform the Make Available action in the CICS Explorer, or
use the new AVAILSTATUS option on the EXEC CICS SET BUNDLE command to set
the status of the CICS bundle to AVAILABLE.

Before you disable or discard an application that is deployed on a platform in
CICS regions from CICS TS 5.2, you must perform the Make Unavailable action in
the CICS Explorer. Before you disable or discard a standalone CICS bundle that
contains application entry points, you must perform the Make Unavailable action
in the CICS Explorer, or use the AVAILSTATUS option on the EXEC CICS SET
BUNDLE command to set the status of the CICS bundle to UNAVAILABLE.

If your platform includes any CICS regions that are still at CICS TS 5.1, the Make
Available and Make Unavailable actions are not required or supported for
applications or standalone CICS bundles installed in those CICS regions. In CICS
TS 5.1 regions, applications or standalone CICS bundles are assumed to be
available when they have been enabled using the Enable action, and unavailable
when they have been disabled using the Disable action, as was the case for all
applications in CICS TS 5.1.

The availability status of an application version is not applied at the start of a
CICS region that is defined as part of a platform, and it is not recovered during a
restart of a CICS region. The CICS bundles for all application versions are in an
unavailable state in a started or restarted CICS region. Use the Cloud Explorer
view in the CICS Explorer to make the appropriate version of the application
available.

CICS bundles that are deployed with platform bundles, or added to a platform, do
not require the Make Available and Make Unavailable actions, because these
actions are performed on the application entry points for applications.
Changes to resources defined in CICS bundles

You can now create resource definitions in CICS bundles for the additional CICS resource types FILE, JVMSERVER, PIPELINE, TCPIPSERVICE, and WEBSERVICE. You can issue commands to change the status of dynamically generated JVMSERVER and TCPIPSERVICE resources. A URIMAP resource defined in a CICS bundle can be specified as an application entry point to control access to the service that it provides.

You use new wizards in the CICS Explorer to define FILE, JVMSERVER, PIPELINE, TCPIPSERVICE, and WEBSERVICE resources in CICS bundles.

When you define resources in CICS bundles, they can be packaged, deployed, and managed as part of applications on a platform. You can also deploy the CICS bundles at the level of the platform, to provide services to all the applications on the platform, or you can install them as standalone CICS bundles in CICS regions that are not part of a platform.

The full list of CICS resource types for which you can create resource definitions in CICS bundles is as follows:

- FILE
- JVMSERVER
- LIBRARY
- PIPELINE
- PROGRAM
- TCPIPSERVICE
- TRANSACTION
- URIMAP
- WEBSERVICE

For the list of all artifacts that you can define and deploy in CICS bundles, including OSGi bundles and events, see Artifacts that can be deployed in bundles in Administering.

Some characteristics of CICS resources change because they are defined in a CICS bundle and dynamically created as part of a bundle deployment.

FILE resources

The following file types are supported for definition in CICS bundles:

- VSAM files (including files that refer to CICS-maintained, user-maintained, and coupling facility data tables, as well as files that refer to VSAM data sets)
- Remote VSAM files
- Remote BDAM files

The initial status of a FILE resource that is dynamically created from a CICS bundle is derived from the initial status of the CICS bundle that defines the resource. As a result, it is not possible to define a FILE resource with a STATUS of UNENABLED to inhibit the implicit opening of files by applications.

The PASSWORD attribute is not supported for dynamically created FILE resources.
**JVMSERVER resources**

For JVM servers that are packaged in CICS bundles, the JVM profiles are packaged with the resource definitions in the CICS bundles. You can therefore install the JVM server in any CICS region without needing to set up a JVM profile in the local JVM profile directory for the CICS region.

When creating a JVM server, you can create the JVM profile using sample templates for an OSGi JVM server, an Axis2 JVM server, or a Liberty JVM server, or import an existing JVM profile to the CICS bundle from elsewhere in the workspace or from the local file system.

The set of acceptable characters in the JVM profile name is more restricted when the JVMSERVER resource is defined in a CICS bundle. For details, see [JVMSERVER attributes](#).

A JVM server that is defined in a CICS bundle must be installed and enabled before you install OSGi bundles or other application artifacts for Java applications that run in it. It is good practice to deploy a CICS bundle containing the definition for a JVMSERVER resource as part of a platform bundle, and to then deploy the CICS bundles containing OSGi bundles or other Java application artifacts as part of applications that are deployed on the platform. This architecture ensures that when the resources are first installed in a CICS region or if the CICS region is restarted, the JVM server and the Java application resources are installed and enabled in the correct order.

**PIPELINE resources**

For pipelines that are packaged in CICS bundles, the pipeline configuration files are also packaged with the resource definitions in the CICS bundles. You can create a pipeline configuration file using one of the CICS-supplied sample pipeline configuration files, or import an existing pipeline configuration file from the local file system.

If a PIPELINE resource is packaged in a CICS bundle, it should be deployed as part of a platform for hosting WEBSERVICE resources that are defined using CICS bundles. PIPELINE resources that are defined in CICS bundles can only be used with WEBSERVICE resources that are defined in CICS bundles or created dynamically by a pipeline scan. WEBSERVICE resources defined using the CICS CSD or BAS are not compatible with PIPELINE resources that are defined in CICS bundles.

A PIPELINE resource that is packaged in a CICS bundle must be installed and enabled before you install the WEB SERVICE resources that require it. It is good practice to deploy a CICS bundle containing the definition for a PIPELINE resource as part of a platform bundle, and to then deploy the CICS bundles containing WEB SERVICE resources as part of applications that are deployed on the platform. This architecture ensures that when the resources are first installed in a CICS region or if the CICS region is restarted, the PIPELINE resource and the WEBSERVICE resources are installed and enabled in the correct order.

A PIPELINE resource that is defined in a CICS bundle can specify a WSDIR attribute, but this is discouraged. The SHELF attribute is not used for PIPELINE resources that are defined in CICS bundles.
WEBSERVICE resources

For web services that are packaged in CICS bundles, you can import a web service binding file and a WSDL document or WSDL archive file to be packaged in the bundle along with the resource definition. To support the web service, you can use a WEBSERVICE definition packaged in a CICS bundle to generate a URIMAP definition in a separate bundle. You can also create an alias transaction for the URI map, and an optional URIMAP definition for WSDL discovery.

Web services that are packaged in CICS bundles have additional states of DISABLING and DISABLED, which do not apply to web services created using other methods. When disabling is in progress for a CICS bundle, WEBSERVICE resources defined in the bundle enter DISABLING state. Work that is currently executing is allowed to complete, but the web service does not accept new work. When the web service is no longer in use, the WEBSERVICE resource enters DISABLED state. Requests to a web service in DISABLING or DISABLED state are rejected and a SOAP fault, “Web service is not in service”, is sent. If CICS is the web service requestor, the INVOKE SERVICE command returns a RESP code of INVREQ and a RESP2 value of 8.

If the CICS bundle is enabled again, the WEBSERVICE resource returns to INSERVICE state. Otherwise, the WEBSERVICE resource can be discarded by discarding the CICS bundle. You can inquire on the state of a WEBSERVICE resource using the EXEC CICS or CEMT INQUIRE WEBSERVICE command, the CICSPlex SM web user interface, or the CICS Explorer, but you cannot set it manually.

Direct access to bundle resources

You can now issue commands to change the status of certain CICS resources that are defined in a CICS bundle and dynamically generated in the CICS region. With this function, in a situation that requires immediate removal of a resource, you can force completion of the disable process when the resources are still in use.

With the default disable process, FILE, JVMSERVER, and TCPIPSERVICE resources are not disabled until all the current tasks have finished using them. When these resources are defined in a CICS bundle, you must first disable the CICS bundle or the application with which it is deployed. If the disable process does not complete, because the resource is still in use, you can now take the following actions:

- For a JVMSERVER resource, if you want to disable the JVM server immediately and purge the tasks that are running in it, you can use the SET JVMSERVER PURGE, FORCEPURGE, or KILL command on the dynamically generated resource in the CICS region. You can also perform this action in CICS Explorer.

- For a TCPIPSERVICE resource, if you want to disable the service immediately and close all the connections, you can use the SET TCPIPSERVICE IMMCLOSE command on the dynamically generated resource in the CICS region. You can also perform this action in CICS Explorer.

- If you are experiencing a problem with disabling a CICS bundle that defines a FILE resource, you may issue the EXEC CICS SET FILE DISABLED or EXEC CICS SET FILE CLOSED command with the FORCE option, or the CEMT SET FILE FORCECLOSE command, against the dynamically generated resource, if this action is required. CICS also issues message DFHFC6043 when you have attempted to disable a file defined in a CICS bundle, but the file is still in use, or there is a retained lock on the file.
Follow the troubleshooting procedure in [Diagnosing application errors] to diagnose the problem and take suitable action.

The **EXEC CICS SET BUNDLE** command also has a new option **AVAILSTATUS** to make available or unavailable an individual CICS bundle that contains application entry points. This action is normally performed using the CICS Explorer at the level of the application that packages the CICS bundle, but you can use the command to operate directly on the individual CICS bundle.

**URIMAP resources as application entry points**

When you define a URIMAP resource in a CICS bundle, you can use an application entry point declaration to control users' access to the service provided by the URIMAP resource. For this function, declare the application entry point and define the URIMAP resource in the same CICS bundle. In this case, when you install and enable the application, the service provided by the URIMAP resource is not yet available to callers. When you choose to provide the service to users, you make the CICS bundle containing the application entry point and the URIMAP resource available using the CICS Explorer. This action makes the application entry point, and therefore the service provided by the URIMAP resource, available to callers.

If you do not want the application entry point to control access to the service provided by the URIMAP resource, declare the application entry point and define the URIMAP resource in different CICS bundles. You can also declare as an application entry point a URIMAP resource that is defined outside the application and declared as a dependency, or import, for the application. In either of these cases, the service becomes available to users as soon as you install and enable the URIMAP resource.

**Private resources for application versions on platforms**

When you define certain CICS resources in CICS bundles as part of an application installed on a platform, the resources are private to that version of that application. You can therefore install more than one resource of those types with the same name, at the same time.

This facility avoids resource name clashes between applications that were developed independently, but used the same resource names. The requirement for unique resource names for the supported CICS resources can be removed by managing the resources as part of applications deployed on a platform. You can use this process to assist with server consolidation.

For supported resource types, a CICS resource is private if the resource is defined in a CICS bundle that is packaged and installed as part of an application, either as part of the application bundle, or as part of the application binding. When you create a CICS resource in this way, the resource is not available to any other application or version installed on the platform, and it is not available to other applications in the CICS region. It can only be used by the version of the application where the resource is defined. These resources are known as private resources.

The following CICS resources are supported as private resources for applications:

- **LIBRARY** resources, which represent one or more data sets, known as dynamic program LIBRARY concatenations, from which program load modules can be loaded.
• POLICY resources, which represent one or more rules that manage the behavior of user tasks in CICS regions.

• PROGRAM resources, which represent an application program. A program that is auto-installed by a task for an application that is deployed on a platform is also private to that version of the application.

CICS resources of other resource types that are defined as part of applications, and CICS resources that are defined by any other methods, are publicly available for all tasks. These resources are known as public resources. In applications that have only a single version, private resources that are declared as application entry points become public resources when the application entry point is made available. For multi-versioned applications, if the application is the highest available version, a program that is declared as an application entry point is public. The programs that are declared as application entry points for the other versions of the same application are private.

If you do not want a resource of the supported resource types to be private, do not package the resource definition as part of an application. Instead, define the CICS resource using a standalone CICS bundle, a CICS bundle that is installed at the level of a platform, the CICS CSD, or the CICSPlex SM data repository. If an application requires the CICS resource to be available in the CICS region, add the resource as a dependency for the application or the application binding, in an <import> element of the bundle manifest.

Policies, which are not a CICS resource, have the same support as private resources when they are defined in a CICS bundle that is deployed as part of an application. You can therefore use policies with the same name in different applications and application versions.

**Managing private resources in CICS bundles**

When you make changes to an application, you use the CICS Explorer to modify the relevant elements of the application that are packaged in CICS bundles, apply a new version number to those CICS bundles to identify the change, and then reversion and reinstall the application. You leave any unmodified CICS bundles at the same version number as before, because CICS manages the process of multiple installations of CICS bundles with the same ID and version number.

Reinstallation of unmodified CICS bundles is only available for CICS bundles that are installed as part of an application deployed on a platform. Standalone CICS bundles cannot be reinstalled if they are already installed with the same ID and version, or in the case of CICS bundles created in releases before CICS TS 5.1, installed with no ID and version. However, the same CICS bundle can be installed in CICS regions as a standalone CICS bundle, and also installed and reinstalled as part of one or more applications deployed on a platform.

Special CICS messages are issued when actions such as installing and discarding are performed on private resources. The messages provide the same information as for the corresponding actions on public resources of that type, but they also state the platform, application, and application version to which the private resource applies, so that you can audit or troubleshoot the actions in the relevant context.

To view the private resources for each installed version of an application, use the CICS Explorer. In the online application editor, you can view the private resources and the application entry points for the application by resource type, and filter them by CICS region or by CICS bundle to help locate particular resources. You
can also view the DD names that z/OS has generated for the LIBRARY concatenation of data sets for private LIBRARY resources.

You can inquire on or browse private resources using the EXEC CICS INQUIRE system programming command for the resource type. By default, CICS searches for the resources that are available to the program where the EXEC CICS INQUIRE command is issued. You can also choose to browse private resources for a specified application.

To support private resources in CICSPlex SM's real-time analysis (RTA) function, you must specify the application context parameters PLATFORM, APPLICATION, APPLMAJORVER, APPLMINORVER and APPLMICROVER in the evaluation definition (EVALDEF) for the resource. For instructions to create and maintain real-time analysis definitions using user-defined CICSPlex SM WUI views and resource objects, see [Real-time analysis](#).

CICS produces separate statistics records for private resources. A statistics record for a private resource has information about the application for which the resource was defined. The statistics DSECTs and DFHSTUP reports for public program and library resources have corresponding DSECTs and DFHSTUP reports for private resources. Programs that are declared as application entry points are identified and reported in both the public and private statistics, because, while the entry point is publicly accessible, it is also part of the application.

**Private LIBRARY resources in CICS bundles**

LIBRARY resources represent one or more data sets, known as dynamic program LIBRARY concatenations, from which program load modules can be loaded. The LIBRARY resource is supported as a private resource for an application version. Each version of an application should include at least one private LIBRARY resource representing the version-specific data sets containing the load modules for the application.

If any of the private LIBRARY concatenations for an application are disabled, because the CICS bundle that defines the relevant LIBRARY resource is disabled, CICS does not search any other private LIBRARY concatenations, or any public LIBRARY concatenations that are defined for the whole CICS region. All subsequent program loads by the application therefore fail until the CICS bundle that defines the LIBRARY resource is enabled.

For a private LIBRARY resource that is defined in a CICS bundle that is packaged and installed as part of an application bundle or application binding bundle, the name of the LIBRARY resource is not used as the DD name for the LIBRARY concatenation of data sets. Instead, CICS requests a unique DD name for the LIBRARY concatenation of data sets when the application is installed on the platform. The resource name can therefore be the same as LIBRARY names used elsewhere in the installation, or by different versions of the application. CICS issues message DFHLD0518 to state the DD name that z/OS has generated for the LIBRARY concatenation. You can also view the data set names for an installed application in the CICS Explorer.

**Private PROGRAM resources in CICS bundles**

A PROGRAM resource represents a program load module that is stored in the program library. The PROGRAM resource is supported as a private resource for an
application version. A program that is auto-installed by a task for an application that is deployed on a platform is also private to that version of the application.

Only one copy of each version of each program is loaded in CICS storage. Before loading a private program, CICS checks whether that version of the program has already been loaded from the same data set (PDS or PDSE) with a matching PROGRAM resource definition. If so, CICS uses the existing copy. The following rules therefore apply when you are reusing PROGRAM resource names:

- Multiple applications that are intended to share the same program loaded from the same PDS or PDSE must use the same attributes in the PROGRAM resource definition.
- If multiple applications use the same name for different program resources, each application must load the programs from a different data set (PDS or PDSE).

If you specify `RELOAD=YES` in the PROGRAM resource definition for a private program, its behavior for program loading changes to be the same as for a public program. A program control link, load, or XCTL request brings a fresh copy of the program into storage. RELOAD(YES) programs cannot be reused, and they cannot be shared by multiple applications. Each of the program copies must be removed from storage explicitly, using a storage control FREEMAIN request, when it is no longer required and before the transaction terminates.

If a program that is required by an application is not found in the private program directory for the application, CICS searches the public program directory.

Programs that are declared as an application entry point must have a unique PROGRAM resource name in your environment. To enable these programs to be called from outside the application, they must be public resources. When you make an application available that contains an application entry point for a private PROGRAM resource, the PROGRAM resource that is named as the application entry point changes from a private resource to a public resource. Only one instance of a public resource with a particular name can exist in a CICS region. The PROGRAM resource therefore cannot have the same name as a public program that is installed in the CICS region, or the same name as a public program that is defined as an application entry point by a different installed application. However, multiple versions of the same PROGRAM resource defined as an application entry point can be installed for multiple versions of the same application, because CICS manages the promotion of PROGRAM resources to public status for the versions of an application.

---

**Multi-versioning for applications deployed on platforms**

You can now install and manage multiple versions of an application at the same time on the same platform instance. New versions of an application can be deployed to the platform without the need to disable or remove the previous version. When you have installed and enabled a version of an application, you take an additional step to make it available to users.

Applications deployed on platforms that use the CICS resources that are supported as private resources, in combination with other resources designed for applications and with imported resources, are eligible for multi-versioning. The following resources are supported as part of multi-versioned applications:

- PROGRAM resources defined in CICS bundles that are part of the application
- LIBRARY resources defined in CICS bundles that are part of the application
- Policies
• Statements of application entry points
• Any resource that is defined as a dependency, or import, for the application

For more details about the CICS resources that are supported as private resources, see Private resources for application versions in Configuring.

Other resources may be involved with multi-versioned applications if you manage the resources appropriately to avoid resource name clashes between different versions of the application. For example, a URIMAP resource that is part of an application can be renamed when packaging and installing a new version of the application. Or an application can be architected so that a resource not supported for multi-versioning is managed outside the application, but declared as a dependency, or import, for the application. For resources that are, or could be, used by different applications, such as JVMSERVER resources, deploy and manage the resource at the level of the platform, where it can be used by any version of any application deployed on the platform.

Applications that are eligible for multi-versioning benefit from more sophisticated management capabilities:
• You can install multiple versions of the application, at the same time, on the same platform instance.
• New versions of an application can be deployed to the platform and phased in without the need to remove the previous versions.
• You can install and verify installation of an application version before making the application version available to users of the platform.
• Users can be moved over to a new version of the application without a break in service, and quickly moved back to another version if necessary.
• Programs that are not aware of multi-versioning automatically link to the highest version of the application that you have made available on the platform.
• Programs can exploit multi-versioning by invoking any available version of the application using the INVOKE APPLICATION command.

You control users’ access to the resources in a multi-versioned application by declaring application entry points. PROGRAM and URIMAP resources can be declared as application entry points, which can be set as available or unavailable to users. With application entry points, you can install the application and its resources in the CICS regions in the platform, then enable them to verify the installation. When you choose to provide the service to users, you make the application entry points, and therefore the resources that they control for the application, available to callers.

You can use the CICS Cloud perspective in the CICS Explorer to view, update, and remove all the versions of an application that are deployed on a platform. You can open an installed application version in the online application editor to view more details about it, including the private resources and application entry points for the application. You can make available or unavailable, enable or disable, and install or discard an installed application version in the Cloud Explorer view, and you can also modify its state in the online application editor for installed applications.

Application context enhancements

You can now use the application context of the current application set onto the task instead of the initial application context of the first application set onto the task.
A task may pass through one or more applications as it executes. Each task can have up to two application contexts associated with it at any time:

- The **initial** application context of a task is used for monitoring and measuring how much resource an application or a particular application operation is using across CICS regions and multiple tasks. The initial application context can be used when applying a policy to tasks that are part of an application, to define threshold conditions to manage the behavior of the tasks. The initial application context can be inherited from an invoking task, or set when the task first passes through an application entry point.

- The **current** application context of a task is used for loading private libraries and WLM user exits. The current application context can be queried using XPI, SPI, and API calls. The current application context changes each time the task passes through an application entry point.

The initial or current application context can be used with the transaction tracking capability in the CICS Explorer to quickly identify and diagnose application-related problems. Both the initial and the current application contexts are propagated from task to task.

The behaviour when a CICS TRANSACTION names an initial program that is an entry point, is changed from CICS TS 5.1. When issuing EXEC CICS START TRANSACTION, where the initial program named on the started transaction is an entry point, the application context is not passed from the issuing task to the newly started task.

The TASK base table and the HTASK base tables contain the initial application context values, the TASKASSC base table contains the current application context values.

The behavior of the EXEC CICS INQUIRE ASSOCIATION, EXEC CICS ASSIGN, and XPI - INQUIRE_APP_CONTEXT commands are changed to refer to the current application context. You can also use the new JCICS Task.getApplicationContext() method to return the current application context.

For more information, see [Application context in Product overview](#).

### New policy rule types and rule items

Some new policy rule types and rule items are available to help you manage the run time behavior of your CICS applications and platforms.

#### New policy rule types

The following new policy rule types are now available to take an automatic action if a specified threshold is exceeded:

**Table 16. New policy rule types**

<table>
<thead>
<tr>
<th>New policy rule type</th>
<th>Policy rule items</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Start request</strong></td>
<td>Used to define a threshold for the number of EXEC CICS START requests issued by a user task.</td>
</tr>
<tr>
<td><strong>START command</strong></td>
<td>The <strong>START</strong> command rule item allows a user to define a threshold for the number of EXEC CICS START requests issued by a user task.</td>
</tr>
</tbody>
</table>
Table 16. New policy rule types (continued)

For more information about policies, see [Policies in Product overview](#).
Part 3. Changes to CICSPlex SM externals

CICSPlex SM views and functions have changed to support the changes in function for this release of CICS and CICSPlex SM. Check which changes might affect your system.
Chapter 31. Changes to CICSPlex SM installation and definition

Changes to CICSPlex SM installation, initialization parameters, resource definition, or setup are summarized here.

Change to generic alert structures used by CICSPlex SM

When you upgrade to a new version of CICS TS, there is a change to SNA generic alerts and resolutions as they are used by CICSPlex SM.

“Product Set ID” (X’10’) MS common subvector is a “Product ID” (X’11’) common subvector that identifies the product as IBM Software (X’04’). It contains a “Product Number” (X’08’) Product ID subfield that identifies the product number. In CICS Transaction Server for z/OS, Version 5, this product number has changed to 5655Y04.

The previous product numbers were as follows, depending on the version of CICS TS from which you are upgrading:

- In CICS Transaction Server for z/OS, Version 2, the product number was 5695081.
- In CICS Transaction Server for z/OS, Version 3, the product number was 5655M15.
- In CICS Transaction Server for z/OS, Version 4, the product number was 5655S97.
Chapter 32. Changes to CICSPlex SM views and resource tables

These changes affect CICSPlex SM views, resource tables, and Business Application Services definition objects.

Changed CICSPlex SM views and resource tables

A number of changed CICSPlex SM views and resource tables now support new or changed CICS resource types and functions.

Changed CICSPlex SM views

Table 18. Changed CICSPlex SM views

<table>
<thead>
<tr>
<th>Changed CICS resource type or function</th>
<th>Corresponding CICSPlex SM views that have changed</th>
</tr>
</thead>
<tbody>
<tr>
<td>WEBSERVICE resources in CICS bundles</td>
<td>1. CICS operations views &gt; TCP/IP service operations views &gt; Web services</td>
</tr>
</tbody>
</table>

Changed CICSPlex SM resource tables

Review the following resource tables for possible effects on any RTA evaluation definitions (EVALDEF) or CICSPlex SM API programs that you are using:

- APACTV
- APPLCTN
- BUNDLE
- BUNDLPART
- LIBDSN
- LIBRARY
- MGMTPART
- PIPELINE
- PROGRAM
- RTAACTV
- URIMAP
- WEBSERV

New CICSPlex SM views and resource tables

New CICSPlex SM views and resource tables support CICS resource types and functions.
## New views and resource tables by functional area

*Table 19. New CICSp lex SM views and resource tables*

<td>Real Time Analysis (RTA) views &gt; Real Time Analysis (RTA) installed analysis and status definitions</td>
<td>RTAACTV</td>
</tr>
</tbody>
</table>
Chapter 33. Programs that connect to a previous release of CICSPlex SM

CICSPlex SM API programs that use the CONNECT verb specifying a VERSION keyword for a previous release of CICSPlex SM can experience significant increases in both CPU consumption by the CMAS address space and data space storage use by the Environment Services System Services (ESSS) address space.

API programs that specify a CRITERIA string to limit the size of a result set on a GET or PERFORM OBJECT request, or use the SPECIFY FILTER verb, can experience the increase in CMAS CPU and ESSS storage. Batch job run times might also increase.

You are not required to recompile your CICSPlex SM API programs when you upgrade to the new release. However, if you do not recompile affected programs, the CMAS has to convert the records from the current release format to the level specified on the VERSION keyword on the CONNECT verb. This transformation process is highly intensive for CPU and storage when the result set is very large, for example, 300,000 to 500,000 records. The increases are observed in most cases when a criteria string is used to filter the result set; for example, specifying a criteria for the PROGRAM object using the NAME key for a specific or generic program. In this case, CICSPlex SM has to retrieve all program objects and return them to the CMAS where the API is connected, transform the records to the version of the API, and then apply the filtering.

If you recompile your programs to specify the VERSION keyword to match the current release of CICSPlex SM, this conversion does not take place, and storage and CPU consumption do not increase significantly.
Part 4. Upgrading CICSPlex SM

To upgrade CICSPlex SM to the CICS Transaction Server for z/OS, Version 5 Release 2 level, carry out the tasks described here. Also check the important information here about the compatibility of CICSPlex SM with previous releases of CICS Transaction Server.

Make sure that you complete all your upgrades to CICS TS for z/OS, Version 5.2 CICSPlex SM, including your CMAS, all MASs that are connected to it, and all MASs that act as Web User Interface servers for it, before you restart CICSPlex SM.

Several skeleton postinstallation members are distributed with CICSPlex SM. You must generate these postinstallation members for use during the upgrade. For information about generating the postinstallation members, see CICS Transaction Server for z/OS Installation Guide.

So that you can revert to the previous release of CICSPlex SM if you encounter problems during the upgrade to CICS TS for z/OS, Version 5.2 CICSPlex SM, take backup copies of the previous release components such as JCL, CLISTs, CICS tables, CMAS data repositories, and WUI repositories before you start the upgrade process.
Chapter 34. Conditions for running CICSPlex SM Version 5.2 and earlier releases concurrently

You can run CICSPlex SM Version 5.2 and earlier releases concurrently, but you must take account of a number of conditions for compatibility.

The CICSPlex SM releases referred to in this information are the CICSPlex SM element of CICS Transaction Server for z/OS releases. They are not available as separate products. For example, CICSPlex SM Version 5.2 is the CICSPlex SM element of CICS Transaction Server for z/OS, Version 5 Release 2.

You can run CICSPlex SM Version 5.2, Version 5.1, Version 4.2, Version 4.1, Version 3.2, and Version 3.1 at the same time, with interconnected CMASs at different levels. The ability to do this allows gradual upgrading of the environment to Version 5.2. However, in CICS TS for z/OS, Version 5.2, a CICSPlex SM CMAS will run only in a CICS system at Version 5.2.

CICS systems (MASs) running the following supported CICS releases can be connected to CICSPlex SM Version 5.2:

- CICS TS for z/OS, Version 5.2
- CICS TS for z/OS, Version 5.1
- CICS TS for z/OS, Version 4.2
- CICS TS for z/OS, Version 4.1
- CICS TS for z/OS, Version 3.2
- CICS TS for z/OS, Version 3.1

To be connected to CICSPlex SM Version 5.2, CICS systems must use the CICSPlex SM Version 5.2 MAS agent, so they must have the CICSPlex SM Version 5.2 libraries in their CICS JCL. For a CICS system running CICS TS for z/OS, Version 3.1, you must also apply the compatibility APAR PK17360 to the CICS system.

If you have difficulty running CICSPlex SM with CICS TS for z/OS, Version 3.2 because of a recursive 0c4 protection exception in module DFHSMSR, apply PTF UK43094 for apar PK77484 and restart the system.

If you have any CICS systems at the release levels listed here that are connected to an earlier release of CICSPlex SM, you are recommended to migrate them to the current release of CICSPlex SM to take full advantage of the enhanced management services.

If you want to manage CICS systems at an earlier release level than those listed here, connect them to a CMAS running at an earlier release level that supported those systems. This CMAS can be connected to your CICSPlex SM Version 5.2 CMAS, so that the older CICS systems are indirectly connected to the Version 5.2 CMAS.

The following conditions apply to environments in which CICSPlex SM Version 5.2 and earlier releases of CICSPlex SM are running concurrently:

- For a CMAS and a MAS (including those MASs that act as Web User Interface servers) to communicate, they must be running at the same release of CICSPlex SM.

In a CICSplex that consists of CMASs at the Version 5.2 level and at one or more earlier levels, the maintenance point CMAS must be at the Version 5.2 level. So, when a CICSplex contains CMASs at more than one level, the first CMAS upgraded to Version 5.2 must be the maintenance point.

If you are using the API or Web User Interface to manage MASs connected to a CMAS at an earlier release, you must ensure that the MASs are managed indirectly from the Version 5.2 CMAS:
- All WUI servers must connect to the Version 5.2 CMAS.
- All API programs must run in such a way that they are connected to the Version 5.2 CMAS. This requirement applies only if the API program accesses new fields or later-level CICS systems. If the API program connects to an earlier-level CMAS, any resource tables that contain new or updated fields for the new release are not returned to the API program connected to the earlier release level CMAS.

You cannot view all resources of a CICS TS for z/OS, Version 5.2 region using a CMAS running at an earlier release.

A WUI server at an earlier release that is connected to a CMAS at an earlier release can retrieve data from a MAS connected to a Version 5.2 CMAS if the CMAS participates in the management of the CICSplex. However, the WUI server cannot retrieve data about resource types that were not available in the earlier release.

If you want to create any of the following CICSplex SM objects, you must create them using a WUI server that is running at the same CICSplex SM release level as the maintenance point CMAS:
- CPLEXDEF (CICSplex definition)
- CMTCMDEF (CMAS to CMAS link definition)
- CSYSGRP (system group definition)
- PERIODDEF (time period definition)
- MONSPEC (monitor specification)
- MONGROUP (monitor group)
- MONDEF (monitor definition)
- RTAGROUP (RTA group)
- RTADEF (RTA definition)
- WLMSPEC (WLM specification)
- WLMGROUP (WLM group)
- WLMDEF (WLM definition)
- TRANGRP (transaction group)

If you use the API or the BATCHREP batched repository-update facility to create these objects, CICSplex SM and the maintenance point CMAS release level must, again, be at the same release level.

If you are using workload management, to use the unit of work (UOW) affinities introduced in CICS TS for z/OS, Version 4.2, the CMAS that owns the workload must be at the Version 4.2 level or later.

Workload function is controlled by the CMAS that owns a workload. The workload owner is assigned to the CMAS that manages the first started TOR that causes the workload to be initialized. If the workload is not shown as ACTIVE, the first started TOR associated with the workload will cause its associated CMAS to be the workload owner. If the workload owning CMAS is
not at the Version 4.2 level or later, any UOW affinity definitions cannot be
honored, which means that affinities will not be correctly created and obeyed,
and will be denied to any other CMASs that subsequently join the workload,
even if those CMASs are at the Version 4.2 level or later.

To ensure that UOW affinities can be exploited by a workload, ensure that the
existing workload is cloned to a new name, and that any required UOW affinity
definitions are applied to the new name. You must then ensure that the first
TOR that is started for the new name is at the Version 4.2 level or later. This will
cause UOW affinities to be honoured by any other region joining the workload
name that is at the Version 4.2 level or later. If any regions that are at earlier
release levels join the workload, they are not able to use the UOW affinity
function, and must continue to make routing decisions on the basis of the
standard workload routing algorithms.

If you believe that your defined UOW affinities are not being implemented, use
the **System ID of workload owner** hyperlink in any of the WUI workload
data runtime views to determine the CICSPlex SM version of the workload owning
CMAS. If the **CPSM version of CMAS** attribute is not at least at the 0420 level, the
workload is not capable of exploiting any defined UOW affinities.
Chapter 35. Upgrading CICSPlex SM API programs

CICSPlex SM API programs that were written to run in a MAS at a previous release can be run in a Version 5.2 MAS.

You can either continue to access the data provided by the previous release or access the new data available from Version 5.2. For information about using API programs with different releases of CICSPlex SM, see the CICSPlex System Manager Application Programming Guide.

New EYUDA values

The following new EYUDA general values are added for the CICSPlex SM API:

- AVAILABLE (778)
- UNAVAILABLE (779)
- SOMEAVAIL (780)
Chapter 36. Upgrading a CMAS

You must upgrade your CICSPlex SM CMAS to Version 5.2 at the same time as you upgrade the CICS system on which it runs. A CICSPlex SM CMAS runs only in a CICS system of the same release level. During startup, the CMAS checks the CICS release level and stops with message EYUXL0142 if the release does not match.

Before you begin

In a CICSpinx that consists of CMASs at the Version 5.2 level and at one or more earlier levels, the maintenance point CMAS must be at the Version 5.2 level. So, when a CICSpinx contains CMASs at more than one level, the first CMAS upgraded to Version 5.2 must be the maintenance point.

Before you upgrade a CMAS, check that the maintenance point CMAS for the CICSpinx has been upgraded in every CICSpinx where the CMAS is a member. Remove the CMAS from any CICSpinx where the maintenance point CMAS is still at an earlier level. If the CMAS is started in a CICSpinx that has a maintenance point CMAS at an earlier level, message EYUCP0012E is issued. In an environment with multiple interconnecting CICSpinxes, this message and message EYUTS0012E can be issued repeatedly.

Note: When you upgrade a CMAS that is not a maintenance point CMAS, all of the CICSpinx records are removed from its data repository. It cannot connect to its MASs, or join MASs connected to other CMASs, until it reconnects to its maintenance point, at which point its data repository is resynchronized for the CICSpinx. Both the maintenance point and non-maintenance point issue EYULOG messages EYUCP0203I and EYUCP0204I. The data repository synchronize is not complete until both CMASs issue both messages. Depending upon the number of records in the CICSpinx, the maintenance point usually takes longer than the non-maintenance point, and so the time between the two messages on the non-maintenance point is short, while the time between the two messages on the maintenance point is longer.

Procedure

1. If the CMAS is running, stop it and upgrade the CICS modules to Version 5.2. For more information about dynamically updating DFHIRP, see Chapter 23, “Upgrading multiregion operation (MRO),” on page 89.

2. In the z/OS image that contains the CMAS, verify that the IEASYSxx member of the SYSLPARMLIB library that you use for z/OS initialization includes the MAXCAD and NSYSLLX parameters, with an appropriate value. the CICS Transaction Server for z/OS Installation Guide explains what values are suitable. If you are running both a previous release and Version 5.2 of CICSpinx SM, an Environment Services System Services (ESSS) space is started for each release, so you might need to modify the NSYSLLX value.

3. Authorize the Version 5.2 libraries by adding them to the list of APF-authorized libraries in the appropriate PROGxx or IEAAPFxx member in SYS1.PARMLIB. See in the CICS Transaction Server for z/OS Installation Guide.

4. Update the MVS linklist with the Version 5.2 modules that are required for CICS and CICSpinx SM. See the CICS Transaction Server for z/OS Installation Guide.
5. Upgrade the CSD file with the Version 5.2 group of resource definitions and CICS startup group list. See “Upgrading the CSD for CICS-supplied and other IBM-supplied resource definitions” on page 74. You do not need to carry out an additional upgrade using a release-dependent set of definitions for CICSplex SM.

6. If you modified the default resource definitions for your earlier release, supplied by CICSplex SM in the EYU$CDEF sample (which contains definitions for a CMAS), manually upgrade your modified resource definitions using the equivalents in the EYU$CDEF sample for Version 5.2. The safest way is to copy the upgraded default resource definitions and reapply your modifications. It is important to upgrade your modified definitions to ensure that they are defined correctly with nondefault values for attributes that are new. If you fail to upgrade modified definitions, CICS assigns default values to any new attributes. The default values might be inappropriate for your requirements.

7. Edit the JCL used to start the CMAS, changing the previous release of CICSplex SM library names to the Version 5.2 names. If you have BBACTDEF, BBVDEF, or BBIPARM DD statements in the JCL, delete them. For information about the CMAS startup JCL, see the CICS Transaction Server for z/OS Installation Guide.

8. Use the EYU9XDUT utility to upgrade the data repository (EYUDREP data set) for the CMAS to Version 5.2. For information about how to upgrade the data repository, see the CICS Transaction Server for z/OS Installation Guide. The conversion utility copies the contents of the existing data repository to a newly allocated data repository. The existing data repository is not modified.

**Note:** After upgrading the data repository for the CMAS, the next time the CMAS is started it must point to the upgraded EYUDREP data set. If it does not, data repository updates might be lost. This loss can lead to incorrect results, which can include other CMASs isolating themselves when they connect to this CMAS. If after upgrading you choose to roll back to the version you upgraded from, use the EYU9XDUT utility to downgrade the upgraded data repository for the CMAS. Failure to do this could result in CMASs becoming isolated.

9. Delete, redefine, and initialize the CICS local catalog and global catalog using the DFHCCUTL and the DFHRMUTL utility programs.

10. Verify the CICSplex SM system parameters referenced by the EYUPARM DD statement. If the CASNAME system parameter is present, delete it. For information about these parameters, see the CICS Transaction Server for z/OS Installation Guide.

11. Verify that the CICS system initialization parameter GRPLIST references the CICS supplied default startup group list, DFHLIST, and any CSD groups containing resource definitions that were modified.

12. Verify that the maintenance point CMAS for the CICSplex is running in every CICSplex where the CMAS is a member, then perform a cold start of the upgraded CMAS. Allow the upgraded CMAS to perform repository synchronization with the other CMASs in the network. EYULOG messages EYUCP0203I and EYUCP0204I are issued when repository synchronization begins and completes. After repository synchronization is complete, you can proceed to upgrade the MAS regions that are connected to the CMAS.
Chapter 37. Upgrading a Web User Interface server

A Web User Interface server and the CMAS to which it connects must be at the highest level of CICSPlex SM and CICS in the CICSpex. They must be at the same level as the maintenance point CMAS. Web User Interface servers that have not yet been upgraded to the same level as the maintenance point CMAS can be used, but they might return unreliable results until you upgrade them.

About this task

A Web User Interface server can connect only to a CMAS at the same release level. Before you upgrade a Web User Interface server, you must upgrade the CMAS to which it connects. If the CMAS to which the Web User Interface server connects is not the maintenance point CMAS, you must also upgrade the maintenance point CMAS before you start the Web User Interface server and the CMAS to which it connects. Upgrade the Web User Interface server to Version 5.2 before you start any other MASs, so that it is ready to manage the upgraded MASs.

A CICS system that acts as a Web User Interface server is a local MAS. However, when you upgrade a Web User Interface server, you must upgrade both the CICSPlex SM MAS agent and the CICS region to Version 5.2. In other MASs you may upgrade only the CICSPlex SM MAS agent, and you are not required to upgrade the CICS region.

Procedure

1. Increase the size of the DFHTEMP data set, which is used in the COVC import process. The standard CICS sample has only a primary allocation, but include a secondary allocation for RECORDS, as shown in the following statements:

```
//DEFTS JOB accounting info,name
//AUXTEMP EXEC PGM=IDCAMS
//SYSPRINT DD SYSOUT=A
//SYSIN DD *
DEFINE CLUSTER(NAME(CICSTS52.CICS.CNTL.CICSqualifier.DFHTEMP)-
 RECORDSIZE(4089,4089) -
 RECORDS(200 200) -
 NONINDEXED -
 CONTROLINTVALSIZE(4096) -
 SHAREOPTIONS(2 3) -
 VOLUMES(volid)) -
 DATA(NAME(CICSTS52.CICS.CNTL.CICSqualifier.DFHTEMP.DATA) -
 UNIQUE)
/*
```

2. With your Web User Interface server still running at your current release, use the export function of the COVC transaction to export your existing view set and menu definitions from the Web User Interface server repository (EYUWREP) to an extrapartition transient data queue. It is not necessary for the Web User Interface server to be connected to a CMAS. For information about exporting definitions, see the CICSPlex System Manager Web User Interface Guide. You will use this information when you upgrade the contents of the Web User Interface server repository in a later process.

3. Authorize the Version 5.2 CICS and CICSPlex SM libraries. See the CICS Transaction Server for z/OS Installation Guide.
If you use the link pack area (LPA), decide when you will replace the previous release modules in the LPA with the Version 5.2 modules. Every CICSPlex SM module installed in the LPA can be used only by the release of CICSPlex SM to which it relates.

a. If you put the Version 5.2 modules in the LPA immediately, change your previous release MASs to use the previous release modules from the STEPLIB and DFHRPL concatenations, instead of the LPA.

b. If you put the Version 5.2 modules in the LPA at the end of the upgrade process, make sure your upgraded MASs are using the Version 5.2 modules from the STEPLIB and DFHRPL concatenations instead of the LPA, then change them to use the LPA when you replace the modules.

For more information, see the CICS Transaction Server for z/OS Installation Guide.

5. Upgrade the CSD file with the Version 5.2 group of resource definitions and CICS startup group list. For information about upgrading the CSD, see “Upgrading the CSD for CICS-supplied and other IBM-supplied resource definitions” on page 74. You do not need to carry out an additional upgrade using a release-dependent set of definitions for CICSPlex SM.

6. If you made any modifications to the dynamically created resource definitions for your earlier release that were supplied by CICSPlex SM in the EYU$WDEF sample, manually upgrade your modified resource definitions using the equivalents in the EYU$WDEF sample for Version 5.2. The safest way to do this is to copy the Version 5.2 resource definitions and reapply your modifications. It is important to upgrade your modified definitions to ensure that they are defined correctly with nondefault values for attributes that are new. If you fail to upgrade modified definitions, CICS assigns default values to any new attributes, and these might be inappropriate for CICS-supplied resource definitions.

7. Edit the JCL used to start the Web User Interface server, changing library names for the previous release of CICSPlex System Manager to the Version 5.2 names. For information about the MAS startup JCL, see the CICS Transaction Server for z/OS Installation Guide.

8. Verify that the CICS system initialization parameter EDSALIM is specified for the CICS region, and set it to a value of 800 MB. 800 MB is the default EDSALIM value for a CICS region in Version 5.1 and later. This value may be tuned by the user in a similar manner to tuning CICS storage in a CMAS. System initialization parameters can be specified before startup in the following locations:
   • In the system initialization table specified in the DFHSITxx load module whose suffix (xx) is specified as a SIT= system initialization parameter.
   • In the PARM parameter of the EXEC PGM=DFHSIP statement.
   • In the SYSIN data set defined in the startup job stream.

9. Verify that the CICS system initialization parameter CPSMCONN=WUI is specified for the CICS region. This system initialization parameter initializes the CICS region as a Web User Interface server and dynamically creates the required resource definitions for CICSPlex SM.

10. Verify that the CICS system initialization parameter GRPLIST references the CICS-supplied default startup group list, DFHLIST, any CSD groups containing resource definitions that you have modified, and the lists of definitions for your own applications.
11. Ensure that you have deleted, redefined, and initialized the CICS local catalog and global catalog using the DFHCCUTL and the DFHRMUTL utility programs.

12. If you use MAS history recording, define new history data sets using the EYUJHIST sample job. If you prefer to upgrade your existing history data sets, you can also do this using the EYUJHIST sample job by following the upgrading instructions, supplied as comments, in the sample. The EYUJHIST sample is supplied uncustomized in the TDFHINST library, and customized by DFHISTAR in the XDFHINST library. Remember to edit the MAS startup JCL to include the history data sets.

13. Upgrade the contents of the Web User Interface server repository (EYUWREP). During this process you will start the Web User Interface server at Version 5.2. See “Upgrading the contents of the Web User Interface server repository (EYUWREP)” on page 140.

---

Phased upgrade scenario for Web User Interface servers

If you have CICSPlex SM Web User Interface servers connected to CMASs other than the maintenance point CMAS, which have many other MASs connected to them, you might not want to upgrade the other MASs at the same time as the CMAS. In that case, consider using this phased upgrade path.

### About this task

Assuming you are running the latest CICSPlex SM maintenance levels, you can upgrade one LPAR at a time.

### Procedure

1. Define a new Version 5.2 CMAS on the same z/OS image as the Web User Interface server.
2. Define CMAS to CMAS links between the new Version 5.2 CMAS and the maintenance point CMAS in the CICSpex where the Web User Interface server CMAS is connected.
3. Upgrade the maintenance point CMAS in the CICSpex to Version 5.2.
4. Assign the new Version 5.2 CMAS to the CICSpex.
5. Upgrade the Web User Interface server to Version 5.2 and, when you restart it, connect it to the Version 5.2 CMAS. If the Web User Interface server is configured to connect specifically to the original CMAS, you must change the configuration to connect to the Version 5.2 CMAS.
6. Upgrade the remaining MASs to Version 5.2 when required, and connect them to the Version 5.2 CMAS as you restart them. If the MASes are configured to connect specifically to the original CMAS, you must change their configuration to connect to the Version 5.2 CMAS.
7. When you have moved all the MASs to the Version 5.2 CMAS, you can remove the original CMAS from the CICSpex, and delete CMAS to CMAS links between the original CMAS and the other CMASes in the CICSpex.
Upgrading the contents of the Web User Interface server repository (EYUWREP)

With each release of CICS, internal Web User Interface repository record versions might be incremented to enable the new features in view definitions. For this reason, if your existing Web User Interface repository contains customized view sets or menus, you must upgrade your view set and menu definitions.

Before you begin

At the start of your upgrade of the Web User Interface server, when your Web User Interface server is still running at your current release, use the export function of the COVC transaction to export your existing view set and menu definitions from the Web User Interface server repository to an extrapartition transient data queue. This step is included in the upgrade instructions Chapter 37, “Upgrading a Web User Interface server,” on page 137.

About this task

When you upgrade the Web User Interface server repository to CICS TS for z/OS, Version 5.2, you can import a view set and menu definitions from a previous release into your new Web User Interface server repository.

You do not need to make any changes to existing customized views and menus, but you can consider modifying or creating view sets to take into account the new attributes and resources.

Procedure

1. Create a new Web User Interface server repository using the JCL described in the CICS Transaction Server for z/OS Installation Guide.
2. Start the CICS TS for z/OS, Version 5.2 Web User Interface server using the new Web User Interface server repository.
3. Use COVC to import the view set and menu definitions from your previous release from the extrapartition transient data queue to which you exported them. For information about the import function of the COVC transaction, see the CICSPlex System Manager Web User Interface Guide. This import is necessary for each type of resource (VIEW, MENU, USER, USERGRP, and so on) that you had previously customized.
4. Use COVC to import the new starter set definitions. Specify the OVERWRITE option on the Import option field of the COVC panel to ensure that none of the new starter set views are accidentally overwritten by views from a previous release. For information about using COVC, see the CICSPlex System Manager Web User Interface Guide.

What to do next

You can also export view set and menu definitions from a CICS TS for z/OS, Version 5.2 Web User Interface server and import them into a server repository of a previous release. However, any new attributes or resources that are new in this release are not accessible in previous releases. You can remove these attributes and view sets using the View Editor. For information about the View Editor, see the CICSPlex System Manager Web User Interface Guide.
Chapter 38. Upgrading a CICSPlex SM managed CICS system (MAS)

When you upgrade a CICSPlex SM MAS to CICSPlex SM Version 5.2, you might choose to upgrade only the CICSPlex SM MAS agent. You are not required to upgrade the CICS region to Version 5.2 at the same time.

Before you begin

Before you upgrade a CICSPlex SM MAS to CICSPlex SM Version 5.2, you must upgrade the CICSPlex SM CMAS to which it connects, following the instructions in Chapter 36, “Upgrading a CMAS,” on page 135. You must also upgrade the Web User Interface server for the CICSpex, following the instructions in Chapter 37, “Upgrading a Web User Interface server,” on page 137.

About this task

These steps explain how to upgrade the CICSPlex SM MAS agent in a CICS region to Version 5.2. For details of supported combinations of CICSPlex SM and CICS releases, see Chapter 34, “Conditions for running CICSPlex SM Version 5.2 and earlier releases concurrently,” on page 129.

Procedure

1. If you use the link pack area (LPA), decide when you will replace the previous release modules in the LPA with the Version 5.2 modules. Every CICSPlex SM module installed in the LPA can be used only by the release of CICSPlex SM to which it relates.
   a. If you put the Version 5.2 modules in the LPA immediately, change your previous release MASs to use the previous release modules from the STEPLIB and DFHRPL concatenations, instead of the LPA.
   b. If you put the Version 5.2 modules in the LPA at the end of the upgrade process, make sure your upgraded MASs are using the Version 5.2 modules from the STEPLIB and DFHRPL concatenations instead of the LPA, then change them to use the LPA when you replace the modules.

   For more information, see the CICS Transaction Server for z/OS Installation Guide.

2. If you made any modifications to the default resource definitions for your earlier release that were supplied by CICSPlex SM in the EYU$MDEF sample (which contains definitions for a MAS), or the EYU$WDEF sample (which contains definitions for a WUI), manually upgrade your modified resource definitions using the equivalents in the EYU$MDEF or EYU$WDEF sample for Version 5.2. The safest way to do this is to copy the upgraded default resource definitions and reapply your modifications. It is important to upgrade your modified definitions to ensure that they are defined correctly with nondefault values for attributes that are new. If you fail to upgrade modified definitions, CICS assigns default values to any new attributes, and these might be inappropriate for CICS-supplied resource definitions.

3. In the JCL that is used to start the MAS, replace the previous release SEYUAUTH library name in the STEPLIB concatenation, and the previous release SEYULOAD library name in the DFHRPL concatenation, with the Version 5.2 SEYUAUTH and SEYULOAD library names. The Version 5.2 SEYUAUTH library must be authorized for APF, which you did when you
upgraded the CMAS, but the SEYULOLOAD library must not be authorized. For information about the MAS startup JCL, see the *CICS Transaction Server for z/OS Installation Guide*.

4. Verify that the CICS system initialization parameter `EDSALIM` is specified for the CICS region, and set it to a value of 800 MB. 800 MB is the default EDSALIM value for a CICS region in Version 5.2. System initialization parameters can be specified before startup in the following locations:

   a. In the system initialization table specified in the DFHSITxx load module whose suffix (xx) is specified as a SIT= system initialization parameter.
   b. In the PARM parameter of the EXEC PGM=DFHSIP statement.
   c. In the SYSIN data set defined in the startup job stream.

5. Verify that the CICS system initialization parameter `CPSMCONN=LMAS` is specified for the CICS region. This system initialization parameter initializes the CICS region as a MAS and dynamically creates the required resource definitions for CICSPlex SM. If you made any modifications to the dynamically created resource definitions in your previous release, you must manually upgrade these using the equivalents in the EYUSMDEF sample for Version 5.2.

6. If you use MAS history recording, define new history data sets using the EYUJHIST sample job. If you prefer to upgrade your existing history data sets, you can also do this using the EYUJHIST sample job by following the upgrading instructions, supplied as comments, in the sample. The EYUJHIST sample is supplied uncustomized in the TDFHINST library, and customized by DFIHISTAR in the XDFHINST library. Remember to edit the MAS startup JCL to include the history data sets.

7. Optional: If you also want to upgrade the CICS region to Version 5.2 at this time, follow the instructions in Chapter 19, “Upgrade procedures for all CICS regions,” on page 73. You must upgrade the CSD for CICS as instructed, but you do not need to carry out any additional upgrade to your CSD to obtain the resource definitions for CICSPlex SM, because all CICSPlex SM resources are defined and installed dynamically.

**Results**

When you have completed this task, you can carry out a cold start of the MAS.
Part 5. Changes to CICS messages and codes

This section lists messages and abend codes that have been removed, changed, and added for CICS Transaction Server for z/OS, Version 5 Release 2.

The DFHCMACD file is not updated by PTFs that are applied to CICS. For the latest message updates, see the descriptions in CICS messages in Reference -> Diagnostics. The CMAC transaction uses the DFHCMACD file to provide online descriptions of the CICS messages and codes.
Chapter 39. Deleted messages

These messages are deleted for CICS Transaction Server for z/OS, Version 5 Release 2. Where a range of message numbers is specified, all the message numbers in that range were previously issued and have now been deleted.

Messages deleted in CICS Transaction Server for z/OS, Version 5 Release 2

- DFHSJ0902
- DFHCZ0357 to DFHCZ0362
Chapter 40. Changed messages

These messages are changed for CICS Transaction Server for z/OS, Version 5 Release 2.

Some of these new CICS messages are issued when actions such as installing and discarding are performed on private LIBRARY resources. The new messages provide the same information as for the corresponding actions on public LIBRARY resources, but they also state the platform, application, and application version to which the private LIBRARY resource applies, so that you can audit or troubleshoot the actions in the relevant context. Table 22 shows which new messages for private LIBRARY resources correspond to which existing CICS messages for public LIBRARY resources.

Table 22. Messages for private LIBRARY resources and public LIBRARY resources. Shows which new messages for private LIBRARY resources correspond to which existing CICS messages for public LIBRARY resources.

Notices

This information was developed for products and services offered in the U.S.A. IBM may not offer the products, services, or features discussed in this document in other countries. Consult your local IBM representative for information on the products and services currently available in your area. Any reference to an IBM product, program, or service is not intended to state or imply that only that IBM product, program, or service may be used. Any functionally equivalent product, program, or service that does not infringe any IBM intellectual property right may be used instead. However, it is the user's responsibility to evaluate and verify the operation of any non-IBM product, program, or service.

IBM may have patents or pending patent applications covering subject matter described in this document. The furnishing of this document does not give you any license to these patents. You can send license inquiries, in writing, to:

IBM Director of Licensing
IBM Corporation
North Castle Drive
Armonk, NY 10504-1785
U.S.A.

For license inquiries regarding double-byte (DBCS) information, contact the IBM Intellectual Property Department in your country or send inquiries, in writing, to:

Intellectual Property Licensing
Legal and Intellectual Property Law
IBM Japan, Ltd.

Some states do not allow disclaimer of express or implied warranties in certain transactions, therefore this statement may not apply to you.

This publication could include technical inaccuracies or typographical errors. Changes are periodically made to the information herein; these changes will be incorporated in new editions of the publication. IBM may make improvements and/or changes in the product(s) and/or the program(s) described in this publication at any time without notice.

Licensees of this program who want to have information about it for the purpose of enabling: (i) the exchange of information between independently created programs and other programs (including this one) and (ii) the mutual use of the information which has been exchanged, should contact IBM United Kingdom Laboratories, MP151, Hursley Park, Winchester, Hampshire, England, SO21 2JN.
Such information may be available, subject to appropriate terms and conditions, including in some cases, payment of a fee.

The licensed program described in this document and all licensed material available for it are provided by IBM under terms of the IBM Customer Agreement, IBM International Programming License Agreement, or any equivalent agreement between us.

Privacy Policy Considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering’s use of cookies is set forth below.

CICSPlex SM Web User Interface:

For the WUI main interface: Depending upon the configurations deployed, this Software Offering may use session and persistent cookies that collect each user’s user name and other personally identifiable information for purposes of session management, authentication, enhanced user usability, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the WUI Data Interface: Depending upon the configurations deployed, this Software Offering may use session cookies that collect each user’s user name and other personally identifiable information for purposes of session management, authentication, or other usage tracking or functional purposes. These cookies cannot be disabled.

For the WUI Hello World page: Depending upon the configurations deployed, this Software Offering may use session cookies that collect no personally identifiable information. These cookies cannot be disabled.

For CICS Explorer: Depending upon the configurations deployed, this Software Offering may use session and persistent preferences that collect each user’s user name and password, for purposes of session management, authentication, and single sign-on configuration. These preferences cannot be disabled, although storing a user’s password on disk in encrypted form can only be enabled by the user’s explicit action to check a check box during sign-on.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered trademarks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the Web at Copyright and trademark information at www.ibm.com/legal/copytrade.shtml.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Other CICS publications

The following publications contain further information about CICS, but are not provided as part of CICS Transaction Server for z/OS, Version 5 Release 2.
CICS Application Migration Aid Guide, SC33-0768
CICS Family: API Structure, SC33-1007
CICS Family: Client/Server Programming, SC33-1435
CICS Family: Interproduct Communication, SC34-6853
CICS Family: Communicating from CICS on System/390, SC34-6854
CICS Transaction Gateway for z/OS Administration, SC34-5528
CICS Family: General Information, GC33-0155
CICS 4.1 Sample Applications Guide, SC33-1173
CICS/ESA 3.3 XRF Guide, SC33-0661
Accessibility

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use software products successfully.

You can perform most tasks required to set up, run, and maintain your CICS system in one of these ways:

- using a 3270 emulator logged on to CICS
- using a 3270 emulator logged on to TSO
- using a 3270 emulator as an MVS system console

IBM Personal Communications provides 3270 emulation with accessibility features for people with disabilities. You can use this product to provide the accessibility features you need in your CICS system.
